modify_rp_groups

Modifies relative placement group by adding, removing, swapping or flipping rows or columns.

SYNTAX

```
status modify_rp_groups
  rp_group_list
  -add_rows          row_number    number_of_rows    |
  -add_columns       column_number number_of_columns |
  -remove_rows       row_number    number_of_rows    |
  -remove_columns    column_number number_of_columns |
  -flip_row          row                             |
  -flip_column       column                          |
  -swap_rows         first_row     second_row        |
  -swap_columns      first_column  second_column
```

Data Types

```
rp_group_list      list or collection
row_number         integer
column_number      integer
number_of_columns  integer
number_of_rows     integer
row                integer
column             integer
first_row          integer
second_row         integer
first_column       integer
second_column      integer
```

ARGUMENTS

rp_groups_list

Specifies the relative placement groups that should be modified.

-add_rows *row_number number_of_rows*

Specifies two arguments to add new rows to relative placement group. The first argument is the row number where you want to add new rows and the second argument specifies the number of consecutive rows to be added.

-add_columns *column_number number_of_columns*

Specifies two arguments to add new columns to relative placement group. The first argument is the column number where you want to add new columns and the second argument specifies the number of consecutive columns to be added.

-remove_rows ***row_number number_of_rows***

Specifies two arguments to remove rows from relative placement group. The first argument is the row number where you want to remove rows and the second argument specifies the number of consecutive rows to be removed.

-remove_columns ***column_number number_of_columns***

Specifies two arguments to remove columns from relative placement group. The first argument is the column number where you want to remove columns and the second argument specifies the number of consecutive columns to be removed.

-flip_row ***row***

Specifies the row to be flipped. This option flips the objects in the row around the center of the row.

-flip_column ***column***

Specifies the column to be flipped. This option flips the objects in the column around the center of the column.

-swap_rows ***first_row second_row***

Specifies two rows of the specified relative placement group to be swapped. This option swaps the objects (cells, blockages, and hierarchical relative placement groups) of two specified rows.

-swap_columns ***first_column second_column***

Specifies two columns of a relative placement group to be swapped. This option swaps the objects (cells, blockages and hierarchical relative placement groups) of two specified columns.

DESCRIPTION

This command modifies the structure of a specified relative placement group. You can add, remove, swap, or flip rows or columns of the specified relative placement group. If after modification, the location for *rp_location* anchor corner is empty then anchor corner will be removed from relative placement group.

EXAMPLES

The following example adds 3 new columns to all existing top-level relative placement groups at column position 0.

```
prompt> modify_rp_groups  [get_rp_groups -top] -add_columns {0 3}

1
```

The following example flips the first row of all top-level relative placement groups.

```
prompt> modify_rp_groups [get_rp_groups -top] -flip_row 0
1
```

The following example swaps the first and second columns of the my_rp_group relative placement group:

```
prompt> modify_rp_groups [get_rp_groups my_rp_group] -swap_columns {0 1}
1
```

The following example removes 2 rows from all existing top-level relative placement groups at row position 1

```
prompt> modify_rp_groups  [get_rp_groups -top] -remove_rows {1 2}

1
```

SEE ALSO

get_rp_groups(2)
write_rp_groups(2)

move_block

Moves a block to a new block. The block can be moved to a different library or view.

SYNTAX

block_return **move_block**
[-force]
[-from_block *blocks*]
[-lib *lib*]
-to_block *block_name*

Data Types

block_return Collection containing block or "".
block Block name in [libName:]blockName[/labelName][.viewName] format or a collection of one block.
block_name Name in form [libName:]designName[/labelName][.viewName]

ARGUMENTS

-force

Moves the block to the destination, even if it is opened and unsaved.

-from_block *blocks*

Specifies the source block name with optional library, label, and view specifications or a collection of blocks. If the library specification is not present, the **current_lib** is used. If the label specification is not present, then the default unnamed label is used. If the view specification is not present, the *design* view is used. By default, the **current_block** is used if this option is not specified.

-to_block *block_name*

Specifies the destination block name with optional library and view specifications. If the library, block, or view specifications are not present, the values from the source block are used.

-lib *lib*

Specifies the library to which the collection of blocks to be moved to. This option is exclusive to option **-to_block**.

DESCRIPTION

This command moves a source block(s) to the specified destination with the same or different library and block. Note that it is an error to attempt to move a block over itself. The command fails if the following conditions exist:

- The source library is opened in read-only mode
- The destination library is not open or is opened in read-only mode
- The destination block is open and has been modified but not saved and the **-force** option is not used
- An illegal name is given for the source or destination library, block, or view.
- The source block is a library cell block timing view. These views must be built "in place" in the library Manager because of library-level data.
- The destination block view is different than the source block view.

If successful, the destination block(s) can be further modified without any change in open mode. Note that the operation of this command is identical to the **copy_block**, except that the source block is removed (from memory, from the library, and from disk) after the block is successfully moved into its new location.

The command returns the block(s) if successful, or O if not. If an illegal name is given for the source or destination block names, a Tcl error is raised.

When no view is explicitly specified for both source and destination then all available views of source block are moved to destination block and all the moved blocks are returned.

EXAMPLES

This example moves a block *Top* to *Top2* to rename it. The destination library and view are taken from the original block.

```
prompt> move_block -from_block Top -to_block Top2
{"Lib:Top2.design"}
```

This example moves a block Mid into a new library RefLib1.

```
prompt> move_block -from_block Mid -to_block RefLib1:
{"RefLib1:Mid.design"}
```

SEE ALSO

open_block(2)
open_lib(2)
remove_blocks(2)
reopen_block(2)
save_block(2)

move_block_origin

Moves a block's origin to a new point in its own coordinate space.

SYNTAX

status **move_block_origin**
[-to *point*]
block

Data Types

point list of two floats: *x* and *y*
block Block name in [libName:]blockName[/labelName][.viewName] format or a collection of one block.

ARGUMENTS

-to

The point in *block*'s own coordinate space to become its new origin.

block

The block to move the origin of. If unspecified, the current block's origin will be moved.

DESCRIPTION

This command moves a block's origin to a new location in its own coordinate space. The new origin becomes (0, 0), and block's contents are shifted accordingly.

EXAMPLES

The following example moves the current block's origin to (100, 100), and illustrates the change in coordinates of one of block's member cells:

```
prompt> get_attribute [get_cells bot_0] origin
0.1250 -12.6000
```

```
prompt> get_attribute [get_cells bot_0] bbox
{0.1050 -12.6200} {12.6250 -0.1000}

prompt> move_block_origin -to {100 100}

prompt> get_attribute [get_cells bot_0] origin
-99.8750 -112.6000

prompt> get_attribute [get_cells bot_0] bbox
{-99.8950 -112.6200} {-87.3750 -100.1000}
```

SEE ALSO

set_attribute(2)
get_attribute(2)
get_blocks(2)
current_block(2)
move_objects(2)

move_lib

Moves a library and its contents from one place to another.

SYNTAX

lib_return **move_lib**
[-force]
[-from_lib *library*]
-to_lib *lib_name*

Data Types

lib_return Collection containing target library or "".
library Name or collection containing the source library.
lib_name name of the library.

ARGUMENTS

-force

This option is used to overwrite the destination library when the library is open, modified, but not yet saved.

-from_lib *lib_name*

Source library. If not given, the current_lib is used. This can either be a (full-path, relative-path, or simple) name, or a collection of a single library.

-to_lib *lib_name*

Specifies the destination library name.. This can be a simple, relative, or absolute path. If it is a relative or absolute path, the trailing portion of the path after he last '/' becomes the name of the library. It will be an error if the a library, file, or directory of the same name already exists on disk.

RETURN VALUE

Returns the library if successful, or 0 if not. If an illegal name is given, a TCL error is raised.

DESCRIPTION

This command moves a library from one place to another in the file system. It is largely unnecessary as the LINUX mv(1) command will work also, but it is in our system form completeness. For both **copy_lib** and **move_lib**, care is taken to not read into memory any of the designs that are already in memory, so copying a large library is as efficient as it can be.

EXAMPLES

This example moves RefLib1, calling it RefLibA.

```
prompt> move_lib -from_lib RefLib1 -to_lib RefLibA
{"RefLibA"}
```

SEE ALSO

close_lib(2)
copy_lib(2)
current_lib(2)
get_libs(2)
set_ref_libs(2)
search_path(3)

move_objects

Moves and rotates the specified objects.

SYNTAX

status **move_objects**
[-delta *delta*]
[-from *point*]
[-to *point*]
[-x *x*]
[-y *y*]
[-rotate_by *angle*]
[-group]
[-force]
[-simple]
[*object_list*]

Data Types

object_list collection or selection
delta list of two floats: *x* and *y*
point list of two floats: *x* and *y*
x float
y float
angle float

ARGUMENTS

object_list

Specifies a collection or selection set containing objects to move. If this option is not specified, the global selection set is used.

-delta *point*

Specifies the distance in the x- and y-directions to move the objects from the object's current location. This option is mutually exclusive with the **-to**, **-from**, **-x** and **-y** options.

-from *point*

Specifies the reference point on the object, or the collection of objects to be moved, for the **-to** option. By default, the command uses the lower-left corner of the bounding box of the given object, or collection of objects, as the reference point. This option must be used together with the **-to** option.

-to *point*

Specifies the new location of the reference point for the object or objects. This option is mutually exclusive with the **-delta**, **-x** and **-y** options.

-x ***float***

Specifies the x-coordinate for the given object or collection of objects. All objects are moved so that their left edge is placed at the specified x-coordinate. This option is mutually exclusive with the **-delta**, **-from** and **-to** options.

-y ***float***

Specifies the y-coordinate for the given object or collection of objects. All objects are moved so that their bottom edge is placed at specified y-coordinate. This option is mutually exclusive with the **-delta**, **-from** and **-to** options.

-rotate_by ***angle***

Specifies the rotation angle of the objects.

The valid values are:

0, **90**, **180**, **270**,
CW90, **CW180**, **CW270**, **CCW90**, **CCW180**, **CCW270**
FLIPX, **FLIPY**
R0, **R90**, **R180**, **R270**, **MX**, **MXR90**, **MY**, **MYR90**

The rotation value definitions are:

CW90 is 90 degrees clockwise
CW180 and **CCW180** are 180 degrees
CW270 is 270 degrees clockwise
CCW90 is 90 degrees counterclockwise
CCW270 is 270 degrees counterclockwise
FLIPX is the reflection about the x-axis
FLIPY is the reflection about the y-axis

The following values are synonymous:

0, **R0**
90, **CCW90**, **R90**
180, **CCW180**, **R180**
270, **CCW270**, **R270**,
FLIPX, **MY**
FLIPY, **MX**

-group

Specifies if rotation should be made around common pivot point. If omitted, the rotation is performed around the object centers.

-force

Resizes locked or fixed objects. By default, such objects are not resized according to global edit settings. Edit settings can be accessed using **get_edit_setting**.

-simple

Disable snapping and editing constraints. By default, objects are snapped according to global snap settings. Snap settings can be accessed using **get_snap_setting**.

DESCRIPTION

This command moves one or more specified objects to a given location skipping all fixed or locked objects. The command keeps pin/terminal on edge of parent block and updates its layer if corresponding edit setting is set. See the **set_edit_setting** command for details.

Snapping is done automatically using the global snap settings.

EXAMPLES

The following example moves all selected objects by delta (-100 100).

prompt> **move_objects -to {-100 100} -from {0 0}**

The alternative syntax uses collection to specify objects.

prompt> **move_objects [get_selection] -to {-100 100} -from {0 0}**

snap_objects(2)

name_format

Specifies the name format for the isolation cells and level shifters.

SYNTAX

status **name_format**
[-isolation_prefix *name*]
[-isolation_suffix *name*]
[-level_shift_prefix *name*]
[-level_shift_suffix *name*]

Data Types

name string

ARGUMENTS

-isolation_prefix

Specifies the prefix to use for the isolation cell names. The default is "".

-isolation_suffix

Specifies the suffix to use for the isolation cell names. The default is "_UPF_ISO".

-level_shift_prefix

Specifies the prefix to use for the level-shifter cell names. The default is "".

-level_shift_suffix

Specifies the suffix to use for the level-shifter cell names. The default is "_UPF_LS".

DESCRIPTION

This command specifies the suffix and prefix for the isolation and level-shifter cells. The name of the element that is being isolated or level shifted by the isolation or the level-shifter cell is used in the middle. For example, an isolation cell that isolates a port named *p1* is named *p1_UPF_ISO* by default.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following is an example of the **name_format** command:

```
prompt> name_format -isolation_prefix "MY_ISO" -level_shift_prefix "MY_LS"
```

SEE ALSO

set_isolation(2)
set_level_shifter(2)

open_attachment

Opens a file handle for the given attachment.

SYNTAX

status **open_attachment**
names
-mode *file_mode*
[-of_object *object*]

Data Types

names list
file_mode string
object collection

ARGUMENTS

names

List of attachment names to be reported. Supports glob style patterns.

-mode *file_mode*

Specifies the mode for opening the file. All the modes that work with Tcl "open" command are supported.

-of_object *object*

Specifies the object whose attachments will be opened. By default the current block and current library will be considered in that order as the owner object.

DESCRIPTION

This command opens a file handle for the attachment with the given name and for the specified owner object. The file handle is open in the mode specified. The command should be used in a similar fashion as the Tcl "open" command to open the file handle.

EXAMPLES

In the following example the file handle is opened and used for the given attachment.

```
prompt> set fh [open_attachment -of_object [current_block] -mode r test_att]
 file23
prompt> read $fh
 ATTACHMENT CONTENTS
```

SEE ALSO

add_attachment(2)
remove_attachments(2)
report_attachments(2)

open_block

Opens an existing saved block for editing or viewing and sets that block as the current block.

SYNTAX

collection **open_block**
[-edit | -read | -check]
[-ref_libs_for_edit]
[*block_name*]

Data Types

block_name string

ARGUMENTS

-edit

Opens the block in edit (read/write) mode, allowing you to modify and save the block. This is the default mode for opening a block in a design library. To open a block in edit mode, you must have write permission for the directory containing the block and library, and the block must not be already locked for editing by another user.

-read

Opens the block in read-only mode, allowing you to view but not modify or save the block.

-check

Checks for existence of the block in memory. Returns the block if it is already in memory, or returns an error message otherwise. Mutually exclusive with **-read** and **-edit**.

-ref_libs_for_edit

Opens lower-level design libraries (those appearing in the reference library list) in edit mode so that lower-level blocks can be modified. Reference libraries containing lib_cell blocks remain in read-only mode, even when this option is used. This option can only be used when opening a block in edit mode, either by using the default open mode or explicitly with **-edit** option.

block

A collection of one block or name of the block to open, with optional *library*, *label*, and *view* names specified. The default names are the current library, no label, and the design view.

DESCRIPTION

This command opens an existing saved block for editing or viewing and sets that block as the current block. The block is opened in edit mode by default or when the **-edit** option is used. The block is opened in read-only mode when the **-read** option is used. With the **-check** option, the command returns the block as a collection if it is already in memory, or an error message otherwise.

By default, when you open a block in edit mode, when the block is in an open read-only library, the command promotes the library to edit mode so that you can edit the block in the library. To prevent this action and protect the library from being accidentally modified, set the **design.edit_read_only_libs** application option to false.

An implementation tool can open library cell blocks in cell libraries only in read-only mode. To edit library cell blocks, use the library manager tool (lm_shell).

The **open_block** command increments the "open count" for a block (unless you are using the **-check** option). The open count can affect the read/write status of the block. For example, if you open a block using **-edit** and the again using **-read**, the read/write status of the block remains in "edit" mode due to the status of the earlier open operation (earlier open count).

EXAMPLES

The following example opens the existing block "Top" from the library "MyDesigns":

```
prompt> open_block -edit MyDesigns:Top
{"MyDesigns:Top.design"}
```

The following example opens the timing view of lib_cell AN2 from the library MyLibCells:

```
prompt> open_block -read MyLibCells:AN2.timing
{"MyLibCells:AN2.timing"}
```

open_drc_error_data

Opens an error data file so that you can query or modify the error data.

SYNTAX

collection **open_drc_error_data**
[*drc_error_data*]
[-file_name *file_name*]
[-readwrite]
[-readonly]
[-checkonly]

Data Types

drc_error_data collection
file_name string

ARGUMENTS

drc_error_data

Specifies the attached error data file to open. You can use the file name, such as zroute.err, or a collection that contains the error data file.

To determine the error data files attached to the current block, use the **get_drc_error_data -all** command. You must use the **-all** option to return both the open and unopened error data files.

This argument is mutually exclusive with the **-file_name** option; you must specify one of these arguments.

-file_name *file_name*

Specifies the file path of an external error data file to open.

This argument is mutually exclusive with the *drc_error_data* argument; you must specify one of these arguments.

-readwrite

Opens the specified external error data file in read/write mode.

When you enable this mode, the tool can modify the contents of the error data file. If you open a file in read/write mode, it stays in that mode even if you later open it in read-only mode.

This is the default open mode for external error data files, which are opened with the **-file_name** option.

The tool ignores this option when opening attached error data files and uses the open mode of the block.

The **-readwrite**, **-readonly**, and **-checkonly** options are mutually exclusive; you can specify only one.

-readonly

Opens the specified external error data file in read-only mode. However, if you previously opened the file in read/write mode, the file remains in read/write mode.

When you enable this mode, the tool cannot modify the contents of the error data file.

The tool ignores this option when opening attached error data files and uses the open mode of the block.

The **-readwrite**, **-readonly**, and **-checkonly** options are mutually exclusive; you can specify only one.

-checkonly

Checks if the specified error data file is already open and returns a collection that contains the error data object if the file is open. If the file is not open, it returns an empty string.

The **-readwrite**, **-readonly**, and **-checkonly** options are mutually exclusive; you can specify only one.

DESCRIPTION

The **open_drc_error_data** command opens an error data file so that you can query or modify the error data. The command supports both attached error data files and external error data files.

- Attached error data files are stored in the design library.
  To open an attached error data file, specify its name or a collection that contains the error data file as a command argument.

  When you open an attached error data file, the tool always opens the file using the current block's open mode.

- External error data files are stored on disk.
  To open an external error data file, specify its file path with the **-file_name** option.

  When you open an external error data file, by default, the tool opens the file in read/write mode. To explicitly specify the open mode, use the **-readwrite** or **-readonly** option. When you use these options, the **-readwrite** option has the highest precedence. If you open the error data the **-readwrite** option and then open it again with the **-readonly** option, the open mode remains read/write.If you first open the error data with the **-readonly** option, and then open it again with the **-readwrite** option, the open mode changes to read/write.

The **open_drc_error_data** command increments the open count for the error data, except when you use the **-checkonly** option. The **open_drc_error_data** commands must be balanced by an equal number of **close_drc_error_data** commands to close the error data object.

The command returns a collection that contains the opened error data file. If no file is opened, the command returns an empty string.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example opens the dppinassgn.err error data file attached to the current block and returns a collection that contains the error data file.

```
prompt> open_drc_error_data dppinassgn.err
```

```
{dppinassgn.err}
```

The following example opens the external error data file named "./my_design_dppinassgn.err" in read/write mode and returns a collection that contains the error data file.

```
prompt> open_drc_error_data -file_name ./my_design_dppinassgn.err
{my_design_dppinassgn.err}
```

open_ems_database

Opens an existing EMS database.

SYNTAX

collection **open_ems_database**
ems_database_name

Data Types

ems_database_name string

ARGUMENTS

ems_database_name

Specifies the name of the EMS database. If the specified EMS database does not exist, the command issues an error message.

DESCRIPTION

The **open_ems_database** command opens an existing EMS database and makes it the current, active database.

EXAMPLES

The following example returns the currently open EMS database, opens the EMS database named abc.ems, then shows that abc.ems is now the current EMS database.

```
prompt> get_current_ems_database
{def.ems}
prompt> open_ems_database abc.ems
{abc.ems}
prompt> get_current_ems_database
{abc.ems}
```

SEE ALSO

close_ems_databases(2)
create_ems_database(2)
get_current_ems_database(2)
get_ems_databases(2)
save_ems_database(2)
set_current_ems_database(2)

open_lib

Open an already-existing library for edit or read access.

SYNTAX

open_return **open_lib**
[-edit | -read]
[-ref_libs_for_edit]
[-recover]
library_name

Data Types

open_return Collection containing the library or "".
library_name Library name in simple, relative, or absolute path.

ARGUMENTS

-edit

Opens the library in edit mode.

This is the default for design libraries if you do not specify any options with this command.

In an implementation tool, cell libraries can be opened only in read mode. If you try to explicitly open a cell library in edit mode, the command issues a warning message and the library is opened in read mode.

This option is mutually exclusive with the **-read** option and is not available in the library manager.

-read

Opens the library is read-only mode.

This is the default open mode for cell libraries in an implementation tool.

This option is mutually exclusive with the **-edit** option and is not available in the library manager.

-ref_libs_for_edit

Open reference module libraries in edit mode so that lower-level designs can be modified. Lib-cell libraries will still be open in read mode even if this option is used. This option can only be used when opening a design library in edit mode, ether by using the default open mode or explicitly with -edit.

To edit cell libraries, use the edit flow in the library manager (lm_shell).

This option is not available in the library manager.

-recover

Recovers the latest auto-saved library of the given library. Auto-saved library will recovered and opened as a new library and won't be merged into the current or original library.

library_name

Specifies library to open.

Because library names become directory or file names, they cannot contain the slash ("/") or colon (":") character.

RETURN VALUE

Returns the library if successful, or 0 if not. If an illegal name is given, a Tcl error is raised.

DESCRIPTION

This command opens a pre-existing library. The library can be in is distributed (file-system hierarchical) form or a single-file form. The library name can be given as a full path name, a relative path name, or a single name. In the last two cases, the search_path is used to determine the full path for the library. When the library is opened, its design catalog is read in, but no designs are read in until they are opened explicitly (through open_block) or implicitly (by being bound to from another design). As a library is being opened through this command, all of the libraries on its ref-lib list are also opened in read-only mode. These reference libraries have their design catalogs read in, but their reference libs are not read in until and unless the reference lib is also explicitly opened. The technology section in the design library, or the technology section of the dedicated technology library in the reference libraries, or the first technology section found in its reference libraries if no technology library is specified, becomes the technology data for the design library. In the library manager,if an aggregate flow is created, this command adds the cell library to an aggregate library. To edit the cell library, use the edit flow in the library manager (lm_shell).

EXAMPLES

The following command opens the design library MyDesigns.

```
prompt> open_lib MyDesigns
INFO: loading technology data from "MyLibCells"
1
prompt> get_libs
{"MyDesigns"}

prompt> get_libs -all
{"MyDesigns" "RefLib1" "RefLib2" "MyLibCells"}
```

search_path(3)

open_rail_result

Opens the rail result data that is generated by the RedHawk Analysis Fusion rail analysis run.

SYNTAX

status **open_rail_result**
[result_name]
[-block_instance *block_instance_name*]
[-top_design *top_design_name*]
[-back_annotate]

Data Types

result_name string
block_instance_name string
top_design string

ARGUMENTS

result_name

Specifies the name of the rail result to open. The default name is "REDHAWK_RESULT".

block_instance *block_instance_name*

Specifies the full path of the block instance whose rail result data is to be shown. When specified, the **open_rail_result** command loads the rail result of the top design, crops the result by the given block instance, and then opens the cropped result. Note that the opened current design is a block design, not top design. This option must be used with the -top_design option to specify the name of the top design.

top_design *top_design_name*

Specifies the name of top design and crops the top design's rail result by the -block_instance option. The option must be used with -block_instance option.

back_annotate

Forces to reconvert RAIL_DATABASE from the RedHawk/RedHawk-SC result. This attempts to recover a previous result after a design change. Instance-based results will refresh geometry. while para-based results will not refresh geometry. Newly created design elements will not have any result.

DESCRIPTION

This command opens the rail result data that is generated by the **analyze_rail** command. With the rail result data loaded, you can then check the RedHawk Analysis Fusion analysis results by displaying maps or querying attributes.

The rail results are saved in the RAIL_DATABASE directory inside the RedHawk work directory. To list the available rail results, use the **report_rail_result** command.

You can use the **set_app_options -name rail.database -value _rail_database_path_** command to switch to a different RAIL_DATABASE, but not while a rail result is already open.

If you want to debug voltage drop issues in the block design with only rail analysis result data for the top design, use the **-block_instance** and **-top_design** options to crop the top design's rail result for the specified block instance. You can then display maps or query attributes based on the cropped result for the specified block instance.

EXAMPLE

The following example opens the rail result data with default result name.

```
prompt> open_rail_result
1
```

Assume the current design name is CORE and it's instantiated in the top design by instance name u_core_1, the following example opens the top design's rail result on u_core_1 only.

```
prompt> open_rail_result -top_design top -block_instance u_core_1
1
```

The following example force reconverts RAIL_DATABASE from RedHawk/RedHawk-SC result.

```
prompt> open_rail_result ... -back_annotate
1
```

optimize_dft

Performs timing-aware placement based or clock-aware scan reordering.

SYNTAX

status **optimize_dft**
  [-clock_aware]

ARGUMENTS

-clock_aware

Invokes clock-aware scan reordering, which aims to minimize the number of clock buffer crossings in the scan chain for better hold violation reduction along the scan path.

DESCRIPTION

The **optimize_dft** command performs scan chain reordering. By default, it performs timing friendly placement based reordering. It aims to reduce the scan chain wire length, minimize the setup timing violation along scan path, benefit congestion, and improve routability. Prior to using this command you must enable scandef into has been read into the design, and placement has been performed on the design.

When invoked with the **-clock_aware** option, the **optimize_dft** command performs clock-aware scan reordering. The reordering aims to minimize the number of clock driver crossings of the scan cells within the scan chain. Minimizing the number of clock driver crossings can reduce hold time violations in the scan chain. For best results, you should first perform timing friendly placement based scan reordering.

For best results, you should use the **place_opt** and **clock_opt** commands instead of the **optimize_dft** command. The **optimize_dft** command is provided for advanced users who want to have finer control over the placement and clock tree synthesis processes.

The standalone **optimize_dft** command does not update extraction or timing data so you must do that.

Moreover, before performing any optimization, you should run the **check_scan_chain** command because only "VALIDATED" scan chains are optimized with the **optimize_dft** command.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

place_opt(2)
clock_opt(2)
check_scan_chain(2)
report_scan_chains(2)

optimize_rdl_routes

Optimizes the RDL routing patterns.

SYNTAX

status **optimize_rdl_routes**
[-nets *collection_of_nets* | -nets_in_file *nets_file*]
[-objects *collection_of_objects*]
-layer *tech_layer_name*
[-reserve_power_resources true | false]

Data Types

collection_of_nets collection
nets_file string
collection_of_objects collection
tech_layer_name string

ARGUMENTS

-nets ***collection_of_nets***

Specifies the nets to be optimized. By default, all RDL nets are optimized.

-nets_in_file ***nets_file***

Specifies the name of a file that contains the list of nets to be optimized.

-nets has higher priority than **-nets_in_file**.

-objects ***collection_of_objects***

Specifies the RDL nets (see **-nets**) by cells or pins. Only the sub-nets which involve the cells or pins are affected.

If the app option **flip_chip.route.routing_style** is **spanning_tree**, the whole nets of the cells or pins are regarded as involved.

-layer ***tech_layer_name***

Specifies the metal layer on which to optimize the RDL wires. You specify the metal layer by using its technology file layer name.

This option is required.

Use the **create_routing_rule** command to specify the required width and spacing of the thin nets before using this function.

-reserve_power_resources true | **false**

Specifies whether to create additional routing channels for power routing. When this option is true, the command reserves power

resources by pushing RDL routing wires to create extra routing channels between the bump cells. After running the command with this option, the amount of 'U' and 'Z' routing shapes might increase. By default, the option is false and the command does not create additional routing channels.

DESCRIPTION

This command improves and enhances the RDL routing patterns by removing and reducing the amount of 'U' and 'Z' routing shapes in the design. In order to get better optimization result, floating or dangling RDL routes will be removed to gain more space for optimizing completed routed RDL paths. To keep the floating or dangling RDL routes, please change 'shape_use' to 'user_route' before executing this command.

RDL nets are nets in flip-chip designs or 3DIC designs which are routed on the redistribution layer. In a flip-chip design, RDL nets connect a bump cell to driver I/O cells. In a 3DIC or interposer design, RDL nets can connect the following elements:

- A micro-bump cell and a micro-bump cell
- A micro-bump cell and a TSV (through silicon via) cell
- A micro-bump cell and driver I/O cell

Micro-bump cells are also called flip-chip pads.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example optimizes the RDL routing patterns on the METAL9 layer.

```
prompt> optimize_rdl_routes -layer METAL9
```

The following example optimizes the RDL routing patterns in NET1 and NET2 nets on the METAL7 layer.

```
prompt> optimize_rdl_routes -layer METAL7 -nets {NET1 NET2}
```

SEE ALSO

push_rdl_routes(2)
route_rdl_flip_chip(2)
create_routing_rule(2)

optimize_routability

Optimizes the routability of a design.

SYNTAX

status **optimize_routability**
[-drc_rules *drc_rules_list*]
[-layer_rules *layer_list*]
[-keepout_width *width*]
[-flip]
[-route]
[-remove_keepouts]
[-check_drc_rules]

Data Types

drc_rules_list list
layer_list list

ARGUMENTS

-drc_rules *drc_rules_list*

Specifies the drc rules to work on. This should be a list consisting of one or more lists of the name of the drc rule and its corresponding layer. See an example of usage below. If this option or *-layer_rules* option is not specified, then all drc rules are considered.

-layer_rules *layer_list*

Specifies the layer names to work on. If this option or *-drc_rules* is not specified, then all drc rules are considered.

-keepout_width *width*

Specifies the keepout width to use, in microns. The default value is the site width.

-flip

Specifies that orientation changes are performed instead of spacing cells apart.

-route

Performs **route_eco** command and **check_routes** command. The route option used is **modified_nets_first_then_others.**

-remove_keepouts

Remove all optimize_routability inserted keepouts. This can be performed at the end of optimize_routability.

-check_drc_rules

Print information about DRC rules. If this option is specified, other options will be ignored. The design remains unchanged.

DESCRIPTION

The **optimize_routability** command helps to improve routability of a design by spacing cells further apart with the use of keepout_margins or by flipping cells. User should run **check_routes** command before using this command to ensure that the DRC error information is up-to-date.

EXAMPLES

The following example runs the **optimize_routability** command using specified DRC rules.

```
prompt> optimize_routability -drc_rules {{ "Local double pattern cycle" "M2" }
{ "Diff net spacing" "{M2  M2}" } { "Diff net via-cut spacing" "{VIA1  VIA2}" }
```

SEE ALSO

get_drc_error_data(2)
get_drc_errors(2)

optimize_routes

Optimizes the routing to improve the routing patterns and increase the yield during manufacturing.

SYNTAX

status **optimize_routes**
[-max_detail_route_iterations *num*]
[-nets *list* [-reroute_all_shapes_in_nets true | false]]

Data Types

num integer
list list

ARGUMENTS

-max_detail_route_iterations *num*

Specifies the number of search and repair loops to run after optimization.

Router runs the specified number of detail route iterations if using **set_app_options -list {route.detail.force_max_number_iterations true}** command.

The default value is 40. The range is 0 to 1000.

-nets *list*

Specifies the nets to optimize.

If you do not specify this option, router selects a group of nets to optimize based on their routing patterns and the value from the **route.detail.optimize_wire_via_effort_level** application option.

-reroute_all_shapes_in_nets true | false

Controls whether all shapes on the specified nets are rerouted by the command, regardless of the existing routing patterns.

The option has an effect only when used with the **-nets** option; it is ignored if you do not use the **-nets** option.

The default value is false.

DESCRIPTION

This command performs detail route optimization. It detects nonoptimal routing patterns on signal nets and clock nets and tries to

reroute them to improve the yield and minimize the wire length and via count. Router picks the nets to optimize based on their routing patterns and the optimize wire and via effort level, as specified by the **route.detail.optimize_wire_via_effort_level** application option.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example performs three search and repair loops after optimization.

```
prompt> optimize_routes -max_detail_route_iterations 3
1
```

The following example optimize nets N1, N2, and N3 by rerouting all of their shapes.

```
prompt> optimize_routes -nets {N1 N2 N3} \
     -reroute_all_shapes_in_nets true
```

SEE ALSO

route_detail(2)
route.detail.optimize_wire_via_effort_level(3)

optimize_topology_plans

Optimizes topology plans in the current block by creating routing topologies, pins, and feedthroughs based on command options.

SYNTAX

collection **optimize_topology_plans**
[-mode optimize_only | derive_topology_only | optimize_and_derive_topology | repeaters_only]
[-routing_style topology_plan_router | no_route | topology_router]
[*topology_plan_list*]

Data Types

topology_plan_list collection

ARGUMENTS

topology_plan_list

Specifies a list of topology plans to optimize or derive. The list can contain topology plan names, patterns, or collections. A collection can be specified by using the **get_topology_plans** command. When no topology plan is provided, the command will collect all the topology plans in the current design to optimize.

-mode optimize_only | derive_topology_only | optimize_and_derive_topology | repeaters_only

Direct the command to perform optimization only or derive topology as follows:

- optimize_only: Create feedthroughs, place pins.
- derive_topology_only: Derive the new topology plan based on global routing results. New topology nodes will be created based on the global routing location at the boundary of physical blocks. New topology edges will created to connect those new nodes based on global routing results. In addition, insert virtual register/buffer locations per net estimation rule. The command doesn't modify netlist in the design, i.e., no feedthroughs or pins will be created.
- optimize_and_derive_topology: Create feedthroughs and pins based on global routing results. In addition, topology nodes/edges will be created based on the new created feedthroughs/pins and virtual registers/buffers will be inserted based on the net estimation rule.
- repeaters_only: Insert virtual register/buffer locations per net estimation rule. The command doesn't add new topology nodes or edges.

-routing_style topology_plan_router | topology_router | no_route

Direct the command to perform optimization with specified routing mode as follows. By default, the topology_plan_router will be used.

- topology_plan_router: Use the global router to route the topology plan and generate one set of shape layer list to represent

whole routing together. The global router will consider the demand for all the associated nets when generating the topologies for the plan.

- topology_router: Route the nets separately that are associated with plan. It may result in increased runtime due to more net routings.
- no_route: Create feedthroughs and pins based on the plan definition. In order to create feedthroughs in no_route mode, users need to define the topology plan with complete routing topology. For instance, users will need to specify the blocks that the topologies going through. If the plan definition missed feedthrough blocks, single pins maybe created in fully abutted designs.

DESCRIPTION

The **optimize_topology_plans** command derives routing topologies based on user specified topology plans using global routing. The new block pins or feedthroughs might be created using this command. The command will create routing shape layer list for each topology edge and insert virtual registers and buffers based on net estimation rule defined in topology plan. The new created shape layer list can be used to guide detail route in later planning stage. The virtual register/buffer can be used to guide later real register/buffer insertion.

EXAMPLES

The following example optimize all the topology plans using topology plan router in the current block:

```
prompt> optimize_topology_plans
```

The following example optimize topology plan with name "myplan" with no_route style to create feedthroughs/pins without global routing:

```
prompt> optimize_topology_plans [get_topology_plans myplan] -routing_style no_route
```

create_topology_plan(2)
current_topology_plan(2)
report_topology_plans(2)
write_topology_plans(2)

parallel_execute

Executes a list of read-only commands in parallel.

SYNTAX

status **parallel_execute**
[-commands_only]
[-list_allowed_commands]
[-max_cores *count*]
[*command_list*]

Data Types

count integer
command_list string

ARGUMENTS

-commands_only

Specifies that all commands listed in the *command_list* argument are specified without a log file. The output of every command is written out after all commands have completed.

-list_allowed_commands

Lists all the allowed read-only commands supported by the **parallel_execute** command.

This option cannot be used with any other options or arguments.

-max_cores *count*

Specifies the maximum number of commands that can be executed concurrently at any given time. You can specify any positive integer greater than or equal to 1.

The default for this option is as specified by the **set_host_options -max_cores** command. If the **set_host_options -max_cores** command was not run, the default is 1.

When the maximum number of cores is 1, the command runs the specified commands sequentially.

If you use the **parallel_execute** command within the **redirect -bg** command, the specified value must be less than the value specified with the **-max_cores** option of the **redirect -bg** command. Otherwise, the maximum number of cores for the **parallel_execute** command is reduced to the maximum number of cores specified for the **redirect -bg** command.

command_list

Specifies the list of commands to execute in parallel. Use the following syntax to specify each command to run and the log file for

its output:

{*command*} *log_file*

Each command must be specified on its own line. If the command has no options, the braces {} are optional.

Instead of creating a log file for each command, you can output the results for all of the commands to the console after all the commands complete by using the **-commands_only** option. In this case, do not specify a log file for each command.

DESCRIPTION

The **parallel_execute** command provides a mechanism to easily execute a set of read-only commands in parallel on the same machine where the main process is running. The spawned commands access the same in-memory data for the same design. The parent process is blocked until the longest running command completes. To run the commands in parallel in the background, run the **parallel_execute** command with the **redirect -bg** command.

The commands must be independent of each other, must not change the design database, and are not inherently multithreaded, thereby saving time on their sequential execution. User-defined procedures can be executed; however, they must use only supported commands. The commands supported by the **parallel_execute** command are primarily reporting and querying commands. To list the supported commands, use the **-list_allowed_commands** option. Nested **parallel_execute** commands are not allowed.

If you specify unsupported commands, the **parallel_execute** command issues an error message and continues executing the remaining commands.

When you use this command consider the following guidelines:

- Some reporting commands perform a timing update internally if the design timing is not up-to-date. If these commands are executed in parallel, each command runs the timing update independently.

  To reduce runtime and memory usage, run the **update_timing** command before running the **parallel_execute** command.

- The spawned commands cannot pass variables back to the parent process.

  To pass variables from a child process to the parent process, you must write the contents of the variables to a file during the child process, and then read that file in the parent process.

- The **parallel_execute** command implicitly links the design if needed.

The **parallel_execute** command itself does not check out any license keys. The commands specified within **parallel_execute** check out licenses as required. A license key checked out in this way can be reused by all the other commands inside the **parallel_execute**. If the required keys are already checked out when you run the **parallel_execute** command, those keys are reused by the child commands inside **parallel_execute**, and no extra keys are checked out. If a command within **parallel_execute** checks out a license on its own, it checks it back in at the end of its invocation. Thus the status of licenses checked out before and after **parallel_execute** are the same.

Each spawned command is run in a single core. If the **parallel_execute** command fails to spawn a command, it executes the command sequentially after all other spawned commands have completed.

In the following cases, the **parallel_execute** command runs the commands sequentially:

- There is only one command inside **parallel_execute**.
- The number of commands to run in parallel is set to 1 with the **-max_cores** option.

In these cases, there is not any parallelization. Single threading is not enforced and the number of licenses checked out is proportional to the **set_host_options -max_cores** value. If a command within **parallel_execute** checks out a license on its own, the

license is not checked back in for these special cases.

EXAMPLES

The following example lists all allowed read-only commands.

```
prompt> parallel_execute -list_allowed_commands

Allowed read-only commands are:
- cmd1
- cmd2
 ...
```

The following example executes a single command and writes the output to the log file named log1. The command is directly executed, not spawned.

```
prompt> parallel_execute {
? {report_clock_qor -clocks [get_clocks test*]} log1
? }
? ? Only one command specified, running it in serial manner.
Running command : 'report_clock_qor -clocks [get_clocks test*]' > log1

All command runs are done. Below is the status.

Completed 'report_clock_qor -clocks [get_clocks test*]' successfully.
Output is in log 'log1'
```

The following example executes three commands by spawning them and writing out their output. The maximum number of concurrent commands is 5 as set by the **set_host_options** command.

```
prompt> set_host_options -max_cores 5
prompt> parallel_execute -commands_only {
? report_cells
? {report_site_defs -nosplit}
? {report_delay_calculation -from pin1 -to pin2}
? }
Dispatching command : 'report_cells'
Dispatching command : 'report_site_defs -nosplit'
Dispatching command : 'report_delay_calculation -from pin1 -to pin2'
Waiting for all dispatched commands to complete ...
Done.

All command runs are done. Below is the status.

Completed 'get_cells' successfully.
Output given below:

****************************************
Report : cell
 ...

Completed 'report_site_defs -nosplit' successfully.
Output given below:
```

```
****************************************
Report : report_site_defs
 ...

Completed 'report_delay_calculation -from pin1 -to pin2' successfully.
Output given below:

****************************************
Report : delay_calculation
 ...
```

The following example is the same as the previous example except that only two commands can run in parallel.

```
prompt> parallel_execute -commands_only -max_cores 2 {
? report_cells
? {report_site_defs -nosplit}
? {report_delay_calculation -from pin1 -to pin2}
? }
```

SEE ALSO

redirect(2)
set_host_options(2)

parse_proc_arguments

Parses the arguments passed into a Tcl procedure.

SYNTAX

string **parse_proc_arguments** -args *arg_list*
result_array

list *arg_list*
string *result_array*

ARGUMENTS

-args *arg_list*

Specified the list of arguments passed in to the Tcl procedure.

result_array

Specifies the name of the array into which the parsed arguments should be stored.

DESCRIPTION

The **parse_proc_arguments** command is used within a Tcl procedure to enable use of the -help option, and to support argument validation. It should typically be the first command called within a procedure. Procedures that use **parse_proc_arguments** will validate the semantics of the procedure arguments and generate the same syntax and semantic error messages as any application command (see the examples that follow).

When a procedure that uses **parse_proc_arguments** is invoked with the -help option, **parse_proc_arguments** will print help information (in the same style as using **help -verbose**) and will then cause the calling procedure to return. Similarly, if there was any type of error with the arguments (missing required arguments, invalid value, and so on), **parse_proc_arguments** will return a Tcl error and the calling procedure will terminate and return.

If you didn't specify -help, and the specified arguments were valid, the array variable *result_array* will contain each of the argument values, subscripted with the argument name. Note that the argument name here is NOT the names of the arguments in the procedure definition, but rather the names of the arguments as defined using the **define_proc_attributes** command.

The **parse_proc_arguments** command cannot be used outside of a procedure.

EXAMPLES

The following procedure shows how **parse_proc_arguments** is typically used. The argHandler procedure parses the arguments it receives. If the parse is successful, argHandler prints the options or values actually received.

```
proc argHandler args {
  parse_proc_arguments -args $args results
  foreach argname [array names results] {
    echo "  $argname = $results($argname)"
  }
}
define_proc_attributes argHandler -info "argument processor" \
  -define_args \
  {{-Oos "oos help" AnOos one_of_string {required value_help {values {a b}}}}
   {-Int "int help" AnInt int optional}
   {-Float "float help" AFloat float optional}
   {-Bool "bool help" "" boolean optional}
   {-String "string help" AString string optional}
   {-List "list help" AList list optional}}
  {-IDup int dup AIDup int {optional merge_duplicates}}}
```

Invoking argHandler with the -help option generates the following:

```
prompt> argHandler -help
Usage: argHandler    # argument processor
       -Oos AnOos            (oos help:
                             Values: a, b)
       [-Int AnInt]          (int help)
       [-Float AFloat]       (float help)
       [-Bool]               (bool help)
       [-String AString]     (string help)
       [-List AList]         (list help)
```

Invoking argHandler with an invalid option causes the following output (and a Tcl error):

```
prompt> argHandler -Int z
Error: value 'z' for option '-Int' not of type 'integer' (CMD-009)
Error: Required argument '-Oos' was not found (CMD-007)
```

Invoking argHandler with valid arguments generates the following:

```
prompt> argHandler -Int 6 -Oos a
  -Oos = a
  -Int = 6
```

help(2)
proc(2)

partition_block

Create a partitioned version of the current block based on a physical region.

SYNTAX

int **partition_block**
[-region *region*]
[-halo \fhalo]
object

Data Types

region polyrect
halo distance

ARGUMENTS

-region *region*

A required argument that specifies a rectilinear boundary from which to create a single partition block. Accepts both bbox and bounary coordinate list specifiers.

-halo *halo*

An optional argument that specifies a halo or context buffer around each partition region. When given, each partition region extends by the halo distance on each side.

DESCRIPTION

The **partition_block** command creates a single clipped or partitioned block that captures a given region of the current block. The command saves the resulting partition block into a new library. The library has the name <current_lib>_partition_block, and if a library exists with the same name (from previous calls to **partition_block**) then a numerical suffix is appened to create a unique name. The partitioned block keeps the name of its source block.

The command accepts a rectilinear region, and an optional halo region. The effective partition area is the given region, exteneded on all sides by the halo value if specified. The resulting partition block contains the physical objects that intersect the partition area, along with the corresponding pieces of the netlist. A partition block is always a valid design, though not always a complete sub-circuit. The partition operation makes no additional edits to clean up incomplete states such as dangling nets, missing drivers, etc. Rather the partition block aims to be a most accurate copy of only the data present in the given partition region.

EXAMPLES

The following command creates a partition block using a bbox region

prompt> **partition_block -region {{0 0} {10 10}}**

The following example creates a partition block using a rectilinear region

prompt> **partition_block -region {{5 5} {5 100} {100 100} {100 95} {10 95} {10 5}}**

The following example creates a partition block with a halo

prompt> **partition_block -region {{0 0} {20 20}} -halo 2**

place_eco_cells

Performs coarse placement and legalization on ECO cells in the design.

SYNTAX

status **place_eco_cells**
-cells *cell_objects* | -unplaced_cells | -eco_changed_cells
[-no_legalize]
[-legalize_only]
[-channel_aware]
[-legalize_mode free_site_only | allow_move_other_cells | minimum_physical_impact]
[-displacement_threshold *threshold*]
[-max_displacement_threshold *max_distance*]
[-fixed_connection_net_weight *weight*]
[-honor_user_net_weight]
[-use_virtual_connection]
[-max_fanout *max_fanout*]
[-ignore_pin_connection *pin_name_list*]
[-remove_filler_references *references*]

Data Types

cell_objects collection
threshold float
max_distance float
weight integer
max_fanout integer
pin_name_list list

ARGUMENTS

-cells *cell_objects*

Places the group of specified cells. You must specify one of the *-cells*, *-unplaced_cells* and *-eco_changed_cells* options. These options are mutually exclusive with each other.

-unplaced_cells

Places all unplaced cells. You must specify one of the *-cells*, *-unplaced_cells* and *-eco_changed_cells* options. These options are mutually exclusive with each other.

-eco_changed_cells

Places all the cells with the **eco_change_status** attribute with values **create_cell**, **add_buffer**, **change_link**, **size_cell**, or

add_buffer_on_route. You must specify one of the *-cells*, *-unplaced_cells* and *-eco_changed_cells* options. These options are mutually exclusive with each other.

-no_legalize

Runs placement without legalizing the cells. Use this option when you must run **place_eco_cells** multiple times for different purposes, but legalization needs to be done only one time. By default, this option is off.

-legalize_only

Performs only legalization without placement on the user-provided cells, if you have decided the cell locations. This option is used only with the *-cells* or *-eco_changed_cells* option. The *-legalize_only* and *-no_legalize* options are mutually exclusive.

- If you specify the *-legalize_only -cells* option, the command applies to cells that already have locations, that is, the **is_placed** attribute is TRUE. When the option is specified, you need to supply locations for all input cells. If there is an unplaced cell, the command fails with a EPL-020 error.
- If you specify the *-legalize_only -eco_changed_cells* option, the command applies to cells with the **eco_change_status** attribute that has values **create_cell**, **add_buffer**, **change_link**, **size_cell**, or **add_buffer_on_route**, and the **is_placed** attribute as TRUE. The command skips the cells that are not placed with the warning message EPL-021.

  To perform only legalization without placement for the cells which have **is_placed** attribute set to false, you can change the cell status with the **set_attribute $cells physical_status placed** command before running **place_eco_cells**. Note that you need to make sure to supply locations for these cells, otherwise, you might get unexpected results.

-channel_aware

Uses the channel area between nonabutted macro for ECO placement. For example, buffer chain or pipeline registers can be placed by using those channel areas to produce a better placement result. By default, this option is off.

-legalize_mode free_site_only | allow_move_other_cells | minimum_physical_impact

Specifies the legalization mode. The default is **free_site_only**. This option cannot be used with *-no_legalize*. *-legalize_mode minimum_physical_impact* can only be used with *-legalize_only*.

- **free_site_only**: The ECO cells are legalized on free sites without moving other existing cells.
- **allow_move_other_cells**: The ECO cells are legalized on the nearest legal locations with moving other existing cells.
- **minimum_physical_impact**: Combine ECO cell legalization (free sites only and push non-ECO cell away) into a single, minimum physical impact legalization. Legalize ECO cells on free sites without moving other existing cells, and then do legalization with moving other existing cells for cells with large displacement. This allows non-ECO cells to be pushed away to make space for ECO cells.

-displacement_threshold *threshold*

Specify the displacement threshold value. The units are microns and the value cannot be negative. This option cannot be used together with the *-no_legalize* option. This option cannot be used together with *-legalize_mode allow_move_other_cells*. When this option is used in different legalize mode, the behavior is different. The command will not legalize the cells whose legalization displacement will exceed the specified threshold. That is, the tool keeps the locations of those cells before legalization. And the tool reports the total number of the rejected cells due to the specified threshold and creates a collection *epl_legalizer_rejected_cells* to track these rejected cells. If the collection is already there before **place_eco_cells**, it will be reset. For the cells in the epl_legalizer_rejected_cells collection, you can use *legalize_placement* to push the non-ECO cells to make space for the ECO cells.

- **free_site_only**: The command will not legalize the cells whose legalization displacement will exceed the specified threshold. That is, the tool keeps the locations of those cells before legalization. And the tool reports the total number of the rejected cells due to the specified threshold and creates a collection called *epl_legalizer_rejected_cells* to track these rejected cells. If the collection is already there before running **place_eco_cells**, it will be reset. For the cells in the epl_legalizer_rejected_cells collection, you can use the *place_eco_cells -legalize_mode allow_move_other_cells -*

legalize_only command to push the non-ECO cells to make space for the ECO cells.

- **minimum_physical_impact**: The command first legalizes cells on free sites, but does not legalize the cells whose legalization displacement will exceed the specified threshold. And then collect these cells to do legalization with moving other existing cells again.

-max_displacement_threshold *max_distance*

Specify the maximum displacement threshold value. The units are microns and the value cannot be negative. This option must be used with the *-displacement_threshold* option. The threshold specified by the *-max_displacement_threshold* option should be greater than or equal to the threshold specified by the *-displacement_threshold* option. When this option is used in different legalize mode, the behavior is different. The command creates a collection called *epl_max_displacement_cells* to track the ECO cells which have a legalization displacement that exceeds the threshold specified by the *-max_displacement_threshold* option. If the collection already exists before this command run, it will be reset. The command also does not legalize the cells since the displacement of these cells also exceeds the threshold specified by the *-displacement_threshold* option. The collection *epl_max_displacement_cells* is a subset of the collection *epl_legalizer_rejected_cells*. For the cells in the collection *epl_max_displacement_cells*, you can decide to reject the ECO changes for these larger displacement ECO cells.

- **free_site_only**: The command creates a collection called *epl_max_displacement_cells* to track the ECO cells which have a legalization displacement that exceeds the threshold specified by the *-max_displacement_threshold* option. If the collection already exists before this command run, it will be reset. The command also does not legalize the cells since the displacement of these cells also exceeds the threshold specified by the *-displacement_threshold* option. The collection *epl_max_displacement_cells* is a subset of the collection *epl_legalizer_rejected_cells*. For the cells in the collection *epl_max_displacement_cells*, you can decide to reject the ECO changes for these larger displacement ECO cells.
- **minimum_physical_impact**: The command first legalizes cells on free sites. If cells exist whose legalization displacement will exceed the specified max threshold, the legalization will failed. And the *epl_legalizer_rejected_cells* and *epl_max_displacement_cells* collections will be created to record cells according to their displacement as if the "on free site" legalization happened.

-fixed_connection_net_weight *weight*

Specify the net weight for net connected to fixed point, such as the I/O pad/macro. The value is integer type and should be great than or equal to 2. The option cannot be used with *-legalize_only* and *-use_virtual_connection*.

The weight of net connected to the fixed point is set to the given value, while the weight of other nets is set to default value 1. **place_eco_cells** does coarse placement according to user-specified fixed connection net weight, and places the ECO cell close to the fixed point to which it connects directly. The net weight determines how close the ECO cell is to the fixed point.

The option can support virtual connection-based channel-aware coarse placement when you also specify *-channel_aware*.

-honor_user_net_weight

Performs placement based on user specified net weight setting. The option works together with two commands to create and get the user specified net weight: **set_eco_placement_net_weight** and **report_eco_placement_net_weight**.

The option cannot be used with *-legalize_only* and *-fixed_connection_net_weight*. The option can support channel-aware coarse placement when it used with the *-channel_aware* option.

User needs to set net weight by set_eco_placement_net_weight before place_eco_cells -honor_user_net_weight, otherwise, the command will error out.

-use_virtual_connection

Performs placement based on user-defined virtual connection. The option works together with a set of commands to create, modify and get the virtual connection: **create_virtual_connection**, **add_pins_to_virtual_connection**, **remove_pins_from_virtual_connection**, **remove_virtual_connections**, **"set_attribute -objects virt_conn_list -name name|weight|pins -value $value"**, **"get_attribute -objects virt_conn_list -name name|weight|pins"** and **get_virtual_connections**.

The option cannot be used with *-legalize_only* and *-fixed_connection_net_weight*. The option can support virtual connection-based channel-aware coarse placement when it used with the *-channel_aware* option.

This option must be used with the *-cells* option. The given cell must have at least one virtual driver and one virtual load. Such input cells are considered to be movable cells and placed by the **place_eco_cells** command. The given cell with only input or output virtual connection or without virtual connection will be considered as fixed cells and skipped to do **place_eco_cells** even if the cell exists in cell list of *-cells* option. The command issues a warning for such cells. If all given cells are skipped, the command errors out with no valid cell to be placed.

-max_fanout *max_fanout*

Specify the maximum fanout value to use when ignoring high-fanout net connections of the ECO cells being placed. The command ignores any net connected to the ECO cell if its fanout exceeds the maximum fanout specified. Since the placement of an ECO cell depends on its connectivity, the coarse placement result is affected by this option. However, there is no impact on legalization. If this option is used with the *-legalize_only* option, the command fails with a CMD-001 error message. If you do not specify this option, the tool uses a default of 100 for the maximum fanout.

-ignore_pin_connection *pin_name_list*

Specify the list of pin names, the connections to which should be ignored when placing ECO cells. The pin name must be the reference cell pin name. The pin can be on an ECO cell or on a fixed cell. The command ignores the connection of the specified pins for both eco cells and fixed cells. Since the placement of an ECO cell depends on its connectivity, the coarse placement result is affected by this option. However, there is no impact on legalization. If this option is used with the *-legalize_only* option, the command fails with a CMD-001 error message.

-remove_filler_references *references*

Specify the references of filler cells which can be ignored during Eco legalization. Unfixed filler cells of the specified references will be ignored and Eco cells can be placed in locations that overlap with these filler cells. And at the end of legalization, those filler cells overlapped with other cells will be removed. Other filler cells that not of the specified references are still treated as normal cells and cannot not be ignored during Eco legalization.

Fixed filler cells are always treated as normal cells and cannot be ignored even if their references are specified.

Since some filler cells may be removed, you may need to reinsert smaller filler cells to fill the space.

This option supports all three legalization modes. This option are mutually exclusive with -no_legalize.

DESCRIPTION

This command performs coarse placement and legalization on ECO cells in the design. ECO cells are a small number of cells that are passed into the command as a collection, or a small number of unplaced cells as a result of the **eco_netlist** or Tcl editing command runs. They can also be a small number of cells with the **eco_change_status** attribute that has the values **create_cell**, **add_buffer**, **change_link**, **size_cell**, or **add_buffer_on_route**. The attribute is set by the user or as a result of the **eco_netlist** or Tcl editing command runs.

This command legalizes the cells only on unoccupied sites in the neighborhood of the ECO cell location. The output of this command is a legally placed netlist. This command is designed for connectivity-based incremental ECO placement and provides the following features:

Ease of Use

This command places only the ECO cells and leaves other existing cells untouched to minimize the impact to the existing cell placements. It uses only free sites and does not push other cells away. You do not need to set other cells fixed.

The placement and legalization results from this command are user-controllable. You can select which cells for placement with

the *-cells* option and legalize the cells with user-specified locations using the *-legalize_only* option.

Runtime

The runtime is far less than for full-chip placement.

QoR

The placement result is connectivity-aware, blockage-aware and macro- aware. After obtaining the initial location from the connectivity, the command adjusts the location to avoid the blockage or macro if needed.

In general, the following cells are not considered as ECO cells. If they are specified, the command ignores them and issues an EPL-003 warning message:

- Hierarchical cell
- Fixed cell
- Macro cell
- Filler cell
- I/O pad cell
- Spare cell
- Physical only cell
- Cell without a signal net connection. Cells that connect only to tie nets are more like spare cells.

Using with the eco_change_status Attribute

By default, running the **place_eco_cells** command with or without the *-legalize_only* option resets the **eco_change_status** attribute to **eco_legalized**. However, when you run the command with the *-no_legalize* option, the **eco_change_status** attribute is reset to **eco_placed** for the eco_changed cells. For non eco_changed cells, the **eco_change_status** attribute remains the same. This reset operation is only needed when you legalize the ECO changed cells.

Legalization displacement report

During legalization, the tool reports legalization displacement summary as below.

```
****************************************
  Report : ECO Legalize Displacement
  Design : CORE
****************************************
avg cell displacement:    2.590 um ( 0.60 row height)
max cell displacement:    3.500 um ( 0.81 row height)
std deviation:          0.997 um ( 0.23 row height)
number of cell moved:       2 cells (out of 3 cells)
```

Flow usage about user specified net weight based coarse placement

```
open_block CORE
set_eco_placement_net_weight -nets $nets1 weight 2
set_eco_placement_net_weight -nets $nets2 weight 3

/* $net1 with weight 2, $net2 with weight 3, the others with default weight 1 */
place_eco_cells -cells $cellList -honor_user_net_weight
```

```
report_eco_placement_net_weight -output $file_name

close_block
open_block CORE

/* load net weight setting file to memory */
source $file_name

/* change weight for $nets1 */
set_eco_placement_net_weight -nets $nets1 -weight 3

/* $net1 with weight 3, $net2 with weight 3, the others with default weight 1 */
place_eco_cells -honor_user_net_weight

/* reset all net weight */
set_eco_placement_net_weight -reset
```

Flow usage about virtual connection based coarse placement

- Step 1: Prepare the script to define virtual connection / netlist for target ECO cells. See the man page for **create_virtual_connection**. The target cell must have at least one virtual connection on both input and output pins.
- Step 2: Source the predefined script. The tool loads into memory the virtual connection based on the script.

  (for example, **source my_virtual_connection.tcl**)
- Step 3: Choose the target ECO cells on which to do coarse placement based on the virtual connection. The *num_of_virtual_connection* attribute records number of virtual connections to the ECO cell. The **create_virtual_connection**, **add_pins_to_virtual_connection**, **remove_pins_from_virtual_connection**, **remove_virtual_connections** and **"set_attribute -objects virt_conn_list -name name|weight|pins -value $value"** commands update the attribute value.

  (for example, **set theCells [get_cells -filter num_of_virtual_connection != 0 -hierarchical]**)
- Step 4: The **place_eco_cells** command builds the connection network and does coarse placement based on pure virtual connection. The command also does legalization. The command will not mix the virtual connection with real connection when building connectivity.

  (for example, **place_eco_cells -cells $cells -use_virtual_connection place_eco_cells -cells $cells -use_virtual_connection -no_legalize**)
- Step 5: Manually clean up the in-memory virtual connection data after cells are placed. The tool will clean up the in-memory virtual connection data automatically when the tool quits. When the tool is restarted, you must source the predefined script again to load the virtual connection data before running the **place_eco_cells** command.

  (for example, **remove_virtual_connections -all**)

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following examples show how to run the **place_eco_cells** command with different cell specifications.

```
prompt> place_eco_cells -cells {STACK_BLK/NEW1 STACK_BLK/NEW2}
```

prompt> **place_eco_cells -unplaced_cells**

prompt> **place_eco_cells -eco_changed_cells**

The following examples show how to use the **-no_legalize** option.

prompt> **place_eco_cells -unplaced_cells -no_legalize**

prompt> **place_eco_cells -cells {STACK_BLK/NEW1 STACK_BLK/NEW2} -no_legalize**

prompt> **place_eco_cells -eco_changed_cells -no_legalize**

The following examples show how to use the **-legalize_only** option.

prompt> **place_eco_cells -cells {STACK_BLK/NEW1 STACK_BLK/NEW2} -legalize_only**

prompt> **place_eco_cells -eco_changed_cells -legalize_only**

The following examples show how to use the **-channel_aware** option.

prompt> **place_eco_cells -channel_aware -cells {STACK_BLK/NEW1 STACK_BLK/NEW2}**

The following examples show how to use the **-legalize_mode** option.

prompt> **place_eco_cells -cells {STACK_BLK/NEW1 STACK_BLK/NEW2} -legalize_mode free_site_only**

prompt> **place_eco_cells -cells {STACK_BLK/NEW1 STACK_BLK/NEW2}** \
-legalize_mode allow_move_other_cells

prompt> **place_eco_cells -cells {STACK_BLK/NEW1 STACK_BLK/NEW2}** \
-legalize_mode allow_move_other_cells -legalize_only

prompt> **place_eco_cells -cells {STACK_BLK/NEW1 STACK_BLK/NEW2}** \
-legalize_mode minimum_physical_impact -legalize_only

The following examples show how to use the **-displacement_threshold** option.

The cells for which the legalization displacement exceeds the specified threshold 10 micron are not legalized. The tool keeps the cell location before legalization and the cells are not moved.

prompt> **place_eco_cells -cells $eco_cells -legalize_only -displacement_threshold 10**

Example output:

```
Total 5 cells are not legalized since the legalization displacement exceeds
the specified threshold (e.g. > 10.000 um or 2 row height)
```

The cells for which the legalization displacement exceeds the specified threshold of 8.5 microns are not legalized. The tool keeps the cell location before legalization and the cells are moved to the location after coarse placement by **place_eco_cells**.

prompt> **place_eco_cells -cells $eco_cells -displacement_threshold 8.5**

The following examples show the large displacement report.

prompt> **set legalize_displace_print_count_limit 20**
prompt> **set legalize_print_displacement_threshold 3**
prompt> **place_eco_cells -cells $eco_cells**

Example output:

```
 Large displacement cells:
  Cell: CNTL_BLK/NEW2 (NAND2X1.FRAM)
```

```
    Input location: (0.000 0.000)
    Legal location: (1.680 12.960)
    Displacement: 13.068 um, e.g. 3.03 row height.
  Cell: CNTL_BLK/NEW3 (NAND2X1.FRAM)
    Input location: (0.000 0.000)
    Legal location: (3.360 12.960)
    Displacement: 13.388 um, e.g. 3.10 row height.

  Total 2 cells has large displacement (e.g. > 12.960 um or 3 row height)
```

The following examples uses the **-max_displacement_threshold** option. The cells which legalization displacement exceeds the specified threshold 10 micron are not legalized. The tool creates two collections: epl_legalizer_rejected_cells and epl_max_displacement_cells.

```
prompt> place_eco_cells -cells $eco_cells -legalize_only \
  -displacement_threshold 10 -max_displacement_threshold 20
```

Example output:

```
Total 5 cells are not legalized since the legalization displacement exceeds
the specified threshold (e.g. > 10.000 um or 2 row height)

Total 3 cells are physical-unfriendly ECO cells which displacement exceeds
the user specified threshold distance (e.g. > 20.000 um or 4 row height)
```

The following examples use the **-displacement_threshold** option with **-legalize_mode minimum_physical_impact**.

The cells for which legalization displacement exceeds the specified threshold 10 micron in "on free site" legalization will be legalized again with pushing non-ECO cells.

```
prompt> place_eco_cells -cells $eco_cells -legalize_only \
  -legalize_mode minimum_physical_impact -displacement_threshold 10
```

Example output:

```
****************************************
  Report : ECO Legalize Displacement
  Design : CORE
****************************************
avg cell displacement:    2.590 um ( 0.60 row height)
max cell displacement:    3.500 um ( 0.81 row height)
std deviation:            0.997 um ( 0.23 row height)
number of cell moved:         2 cells (out of 3 cells)
```

The following examples use the **-max_displacement_threshold** option with **-legalize_mode minimum_physical_impact**.

The legalization fails if cells whose legalization displacement exceeds the specified max threshold 10 micron in "on free site" legalization are present.

```
prompt> place_eco_cells -cells $eco_cells -legalize_only \
  -legalize_mode minimum_physical_impact \
  -displacement_threshold 5 -max_displacement_threshold 10
```

Example output:

```
Error: minimum physical impact legalization failed due to physical unfriendly cells
```

The following examples use the **-fixed_connection_net_weight** option.

```
prompt> place_eco_cells -cells $cells -fixed_connection_net_weight 10
prompt> place_eco_cells -cells $cells -fixed_connection_net_weight 10 -no_legalize
```

The following examples use the **-fixed_connection_net_weight** option with **-channel_aware**.

```
prompt> place_eco_cells -cells $cells -fixed_connection_net_weight 5 \
  -channel_aware
prompt> place_eco_cells -cells $cells -fixed_connection_net_weight 5 \
  -no_legalize -channel_aware
```

The following examples show how to use the **-honor_user_net_weight** option.

```
prompt> place_eco_cells -cells $cells -honor_user_net_weight
prompt> place_eco_cells -cells $cells -honor_user_net_weight -no_legalize
```

The following examples use the **-honor_user_net_weight** option with **-channel_aware**.

```
prompt> place_eco_cells -cells $cells -honor_user_net_weight -channel_aware
prompt> place_eco_cells -cells $cells -honor_user_net_weight -no_legalize -channel_aware
```

The following examples show how to use the **-use_virtual_connection** option.

```
prompt> place_eco_cells -cells $cells -use_virtual_connection
prompt> place_eco_cells -cells $cells -use_virtual_connection -no_legalize
```

The following examples use the **-use_virtual_connection** option with **-channel_aware**.

```
prompt> place_eco_cells -cells $cells -use_virtual_connection -channel_aware
prompt> place_eco_cells -cells $cells -use_virtual_connection -no_legalize -channel_aware
```

The following examples show how to use the **-max_fanout** option.

```
prompt> place_eco_cells -unplaced_cells -no_legalize -max_fanout 500

prompt> place_eco_cells -unplaced_cells -max_fanout 500
```

The following examples show how to use the **-ignore_pin_connection** option.

```
prompt> place_eco_cells -unplaced_cells -no_legalize -ignore_pin_connection {CP}

prompt> place_eco_cells -unplaced_cells -ignore_pin_connection {CP A}
```

The following examples show how to use the **-remove_filler_references** option.

```
prompt> set libCells [get_lib_cells {lib1/FILL1 lib1/FILL2}]
prompt> place_eco_cells $ecoCells -remove_filler_references $libCells
```

The following example shows how to use the **-remove_filler_references** option in minimum_physical_impact legalization mode.

```
prompt> place_eco_cells $ecoCells -legalize_mode minimum_physical_impact \
   -remove_filler_references {FILL1 FILL2}
```

place_freeze_silicon

Places new engineering change order (ECO) cells by swapping out the spare cells. This command is typically used in the freeze silicon ECO flow.

SYNTAX

status **place_freeze_silicon**
[-cells *cell_objects*]
[-lib_cells_for_filler_recovery *lib_cells*]
[-no_spare_cell_swapping]
[-map_spare_cells_only]
[-write_map_file *map_file_name*]
[-min_filler_distance distance]

Data Types

cell_objects collection
lib_cells collection
map_file_name string
distance distance

ARGUMENTS

-cells *cell_objects*

Specifies the ECO cells on which to do spare cell mapping. The given cells must have the is_fs_eco_add attribute as true and the eco_change_status attribute as one of the following:

- create_cell
- add_buffer
- add_buffer_on_route
- change_link
- size_cell

If this option is not used, the command does spare cell mapping for cells with the same is_fs_eco_add and eco_change_status attribute settings as the ECO cells.

-lib_cells_for_filler_recovery *lib_cells*

Specifies the programmable spare cell (PSC) filler library cells to recover unused space of fillers. When ECO cells are mapped to PSC fillers, there may be some unused white space between ECO cells, and these space need to be recovered as new PSC fillers. The command will only use the specified library cells to create new PSC fillers. If this option is not specified, the command

will use all available PSC filler library cells in the reference libraries.

-no_spare_cell_swapping

Move eco cells to targeted spare cell locations without swapping spare cell (called trial map). This option is used to preview the mapping result and do analysis and remap eco cells if needed. The tool first runs a fast placement of the eco cells and then places each eco cell at its closest matching spare cell but doesn not do spare cell swapping. For any trial mapped cell pair (eco cell, spare cell), they are placed at the same location and the attribute **fs_mapped_cell_name** is used to record the mapping relationship. For eco cell, the attribute value is the trial mapped spare cell name and vice versa. The option can be used with the option **-cells**, **-map_spare_cells_only** and **-write_map_file**. This option also supports programmable spare cells.

-map_spare_cells_only

Perform spare cell mapping based on existing eco cell locations without fast placement for the eco cells. The tool just places each eco cell at its closest matching spare cell and swaps out spare cells. The option is used when you want to use the spare cells in the neighborhood of the given eco cells to do swapping. The option can be used after you apply -no_spare_cell_swapping and confirm that the eco cell locations are acceptable, or after you manually adjust the eco cell locations. The option can be used with the option **-cells** and **-no_spare_cell_swapping**. The option cannot be used with **-write_map_file** unless **-no_spare_cell_swapping** is also turned on. This option also supports programmable spare cells.

-write_map_file ***map_file_name***

Writes out eco cell and spare cell mapping file, which is used with **map_freeze_silicon** command. This option alone will not trigger eco cell placement or spare cell mapping, and just writes out the mapping pairs (eco cell, spare cell) according to the attribute **fs_mapped_cell_name**. The command writes the mapping pair to the mapping file only when the eco cell and spare cell have the same location. If you manually move the eco cell after **-no_spare_cell_swapping**, the command disables the mapping pair and omits the pair from the mapping file. The option can be used with the option **-cells** and **-no_spare_cell_swapping**. The option cannot be used with **-map_spare_cells_only** unless **-no_spare_cell_swapping** is also turned on. This option also supports programmable spare cells.

-min_filler_distance ***distance***

Specify the minimum distance between eco cells after mapping to PSC fillers. The unit of distance is micron, and this distance will be adjusted internally to be an integral multiple of the unit width of PSC fillers. If not specified, the default value is 0 and means no limitation on the spacing. This option only support eco cells with PSC type.

DESCRIPTION

The **place_freeze_silicon** command automatically places cell instances that were added during an ECO operation. The command does not move cells that are placed previously. Only new cells added by an ECO are placed.

By default, the tool maps new ECO cells with existing spare cells of the same reference library cell or maps them with existing programmable spare cells of the same PSC type.

The tool first runs a fast coarse placement for the ECO cells. Next, the tool finds spare cells nearby the ECO cells and then do matching between ECO cells and spare cells. The matching engine will match each ECO cell to its target spare cell as close as possible. Finally, the tool places each ECO cell to the location of its matched spare cell and swaps out the spare cell, and these cells swapped out will be deleted from database.

You can use an ECO routing command to complete the routing. The freeze silicon capability can be used to implement metal-only ECO changes on an existing layout.

If there are not enough spare cells, the command issues error message.

If there are programmable spare cell mapping rules set by command **set_programmable_spare_cell_mapping_rule**, the **place_freeze_silicon** will also honor these mapping rules and execute the specified mapping between eco cells and

programmable spare cells. User can review the current mapping rules by using command **report_programmable_spare_cell_mapping_rule**. The mapping rules also can be removed by using command **remove_programmable_spare_cell_mapping_rule**. If you want that **place_freeze_silicon** does not honor any mapping rule, please remove all the mapping rules first.

The command behavior is the same, regardless of the design.eco_freeze_silicon_mode application option setting.

The option **-no_spare_cell_swapping** and **-map_spare_cells_only** allow user to analyze QoR before committing the spare cell mapping. And provide flexibility for user to manage spare cell mapping for the desired QoR. The user-driven freeze silicon QoR tuning flow is as follows. Additional iterations might be needed between step 3 and step 4.

1. Apply ECO changes.

2. Analyze eco cells and spare cells by **check_freeze_silicon** command.

3. Trial map eco cells to spare cells.

4. Do analysis and remap eco cells.

5. Map eco cells to spare cells.

6. PG and ECO Route.

For routability, you can mark spare cells in congested area as fs_dont_use before **place_freeze_silicon**, which prevents these spare cells from being used and might avoid a routing detour.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example maps the user-specified ECO cells, specified with the **-cells** option, to the near spare cells of the same reference library cell. Finally, the command swaps out the spare cells.

```
prompt> place_freeze_silicon \
  -cells [get_cells *eco_cell*]
```

The following example automatically maps all the newly added ECO cells to the near spare cells of the same reference library cell or the programmable spare cells (PSC) of the same PSC type. Finally, the tool swaps out the spare cells. The unused space from the PSC cells will be recovered by the same PSC-type library cells specified by **-cells** option.

```
prompt> place_freeze_silicon \
     -lib_cells_for_filler_recovery {FILL1 FILL2}
```

The following 3 examples shows the usage of trial map eco cells to spare cells. You can preview the mapping result with **-no_spare_cell_swapping** and do analysis.

```
prompt> place_freeze_silicon -no_spare_cell_swapping \
  -write_map_file my_map_file -cells $sorted_eco_cells
prompt> place_freeze_silicon -no_spare_cell_swapping \
  -cells $sorted_eco_cells
prompt> place_freeze_silicon -no_spare_cell_swapping
```

The following 2 examples shows the usage of mapping eco cells to spare cells.

Manual spare cell mapping:

```
prompt> place_freeze_silicon -write_map_file my_map_file
prompt> map_freeze_silicon -map_file my_map_file

Batch mode mapping:
prompt> place_freeze_silicon -map_spare_cells_only
```

The following 2 examples shows the usage of **-no_spare_cell_swapping** and **-map_spare_cells_only**. When the option **-map_spare_cells_only** is used with **-no_spare_cell_swapping**, the **place_freeze_silicon** command will not run fast placement and not do spare cell swapping, just place each eco cell at its closest matching spare cell.

```
prompt> place_freeze_silicon -cells $sorted_eco_cells \
  -no_spare_cell_swapping -map_spare_cells_only
prompt> place_freeze_silicon -cells $sorted_eco_cells \
  -no_spare_cell_swapping -map_spare_cells_only -write_map_file my_map_file
```

The following example shows analysis and remap eco cells.

```
prompt> place_freeze_silicon -no_spare_cell_swapping \
  -cells $sorted_eco_cells
```

Overlay congestion map and spare cells on GUI. Mark spare cells in congested area fs_dont_use.

```
prompt> set sC [get_selection]
prompt> set sp [filter_collection $sC "is_spare_cell == true" ]
prompt> set_attribute $sp fs_dont_use true
prompt> place_freeze_silicon -no_spare_cell_swapping -cells $sorted_eco_cells
```

Evaluate the new trial mapping result and swap spare cell if the result is better.

```
prompt> place_freeze_silicon -map_spare_cells_only
```

Another example:

```
prompt> place_freeze_silicon -cells $sorted_eco_cells -no_spare_cell_swapping
```

Move eco cells to more feasible locations based on visual analysis.

```
prompt> place_freeze_silicon -cells $modified_eco_cells -map_spare_cells_only
```

The following example automatically maps the specified ECO cells with PSC type to the near programmable spare cells (PSC) of the same PSC type. And the size of space between the mapped eco cells will be larger than the specified distance 0.5.

```
prompt> place_freeze_silicon -cells $psc_eco_cells -min_filler_distance 0.5
```

place_group_repeaters

Places interconnect repeaters on route.

SYNTAX

status **place_group_repeaters**
-cells *cell_list* |
-repeater_groups *group_id_list*
[-lib_cell_input *pin_name*]
[-lib_cell_output *pin_name*]
[-max_distance_for_incomplete_route *distance*]
[-first_distance *distance*]
[-last_distance *distance*]
[-blockage_aware]
[-horizontal_repeater_spacing *spacing*]
[-vertical_repeater_spacing *spacing*]
[-layer_cutting_distance *layer_scale_list*]

Data Types

cell_list	collection
group_id_list	list
pin_name	string
distance	float
spacing	integer
layer_scale_list	list

ARGUMENTS

-cells *cell_list*

Specifies list of repeaters to be placed in the repeater paths. The two options -cells and -repeater_groups are mutually exclusive, and one of them is required.

-repeater_groups *group_id_list*

Specifies list of repeater group ids. The two options -cells and -repeater_groups are mutually exclusive, and one of them is required.

-lib_cell_input *pin_name*

Specifies pin name when the lib cell has multiple input pins. The default is D.

-lib_cell_output *pin_name*

Specifies pin name when the lib cell has multiple output pins. The default is Q.

-max_distance_for_incomplete_route *distance*

Specifies the maximum gap or distance from driver pin to route, or from load to route. The input value should be greater than 0.

-first_distance *distance*

Specifies the distance between the driver and the first repeater. The default is 0.

-last_distance *distance*

Specifies the distance between the load and the last repeater. The default is 0.

-blockage_aware

Specified with distance-based options. Cells are grouped and assigned cutlines automatically. Computed cell location does not overlap with placement blockages, macros, or lower layer routes.

-horizontal_repeater_spacing *spacing*

Specifies the horizontal spacing between two adjacent repeaters in the horizontal direction in terms of number of site width. For example, if the width of repeater is 9 cell site, then the minimum horizontal spacing is 9. If you specify it to be less than 9, the tool automatically extends the spacing to 9. In this example, to achieve the checkerboard pattern, the horizontal spacing should be 9,13,17,21....

-vertical_repeater_spacing *spacing*

Specifies the vertical spacing between repeaters in the vertical direction in terms of number of site height. When cell is single site height, the minimum vertical spacing is 1 site height. In this example, to achieve a checkerboard pattern, the vertical spacing should be 1,5,9.... When you specify vertical spacing as 4, the tool automatically rounds it to 5. For a double site height library cell, to achieve a checkerboard pattern, you can specify 2,6,10....

-layer_cutting_distance *layer_scale_list*

Specifies the layer cutting distance list. Using this option, you can define input routes and output routes to cell center distances. Specify the option by using the following format: {{layer1 cutting_distance_in_1 cutting_distance_out_1} {layer2 cutting_distance_in_2 cutting_distance_out_2} ...}

DESCRIPTION

This command performs on route placement of interconnect repeaters.

- Support rule-based repeater placement with distance (two pin supernets) and cutline (multiple fanout supernets).
- Smart self-organized (checkerboard) repeater placement based on your intent.
- Cut routes and assign routes to associated repeater output net after repeaters are placed.
- Generic repeater support (not limited to register, buffer, or inverters).

For place_group_repeater -cells, the command applies distance-based repeater placement.

For place_group_repeater -repeater_groups, the command applies cutline-based repeater placement. Before running the place_group_repeater command, define the repeater groups, register path connections (virtual connection) for each set of repeater groups, and cutline for each repeater group by using the set_repeater_group command.

To define register path connections (virtual connection), specify the driver group, path drivers, or path loads for each repeater group, and specify the cells in sequence. The cell connection between groups depends on the cell order within the group.

For example, cell[0] in group 1 and cell[0] in its driver group 2 belong to one register path.

- For the first group, specify -path_drivers;
- For the middle groups, specify -driver_group_id;
- For the last group, specify -driver_group_id and -path_loads;

For -repeater_groups, this command depends on group virtual connection to build cell connectivity, by default. Each input group should have driver group (or path driver) and load group (or path load); otherwise, the command generates an error. If you need to depend on real connection between cells, you need to set the application option, eco.placement.eco_enable_virtual_connection, to false.

EXAMPLES

The following examples show the usages of command.

The following examples show the usages of -cells.

```
prompt> place_group_repeaters -cells $ecoCells -lib_cell_input D
-lib_cell_output Q -max_distance_for_incomplete_route 3.0
prompt> place_group_repeaters -cells $ecoCells -lib_cell_input D -lib_cell_output
Q -first_distance 20 -last_distance 50 -blockage_aware
```

The following examples show the usages of -repeater_groups based on real connection.

```
prompt> set_repeater_group -group_id 1 -cells [get_cells {eco_cell_3 eco_cell_7}]
-cutline {{720 366} {720 386}}
prompt> set_repeater_group -group_id 2 -cells [get_cells {eco_cell_2 eco_cell_6}]
-cutline {{920 366} {920 386}}
prompt> set_repeater_group -group_id 3 -cells [get_cells {eco_cell_1 eco_cell_5}]
-cutline {{1230 330} {1230 350}}
prompt> set_repeater_group -group_id 4 -cells [get_cells {eco_cell_0 eco_cell_4}]
-cutline {{1430 330} {1430 350}}
prompt> set_app_options -name eco.placement.eco_enable_virtual_connection -value false
prompt> place_group_repeaters -repeater_groups {1 2 3 4} -lib_cell_input D
-lib_cell_output Q
```

The following examples show the usages of -repeater_groups based on user-defined virtual connection.

```
prompt> set_repeater_group -group_id 1 -cells $buf_group_1 -cutline {{250  90} {250 105}}
```

```
    -path_drivers $driver_pins
prompt> set_repeater_group -group_id 2 -cells $buf_group_2 -cutline {{190 130} {205 130}}
-driver_group_id 1
prompt> set_repeater_group -group_id 3 -cells $buf_group_3 -cutline {{165 155} {165 175}}
-driver_group_id 2
prompt> set_repeater_group -group_id 4 -cells $buf_group_4 -cutline {{110 155} {110 175}}
-driver_group_id 3 -path_loads $load_pins_group_4
prompt> set_repeater_group -group_id 5 -cells $buf_group_5 -cutline {{135 220} {150 220}}
-driver_group_id 3 -path_loads $load_pins_group_5
prompt> place_group_repeaters -repeater_groups {1 2 3 4 5}
```

SEE ALSO

report_repeater_groups(2)

place_io

Places I/O driver cell instances.

SYNTAX

status **place_io**
[-io_guide *io_guide_list*]
[-rule *rule_name*]
[-matching_types *matching_type_list*]
[-pad_assignment_file *filename*]
[-include_unassigned_pads]
[-incremental]
[-skip_bump_assignment]
[-bump_assignment_only]
[-match_terminals_to_bumps]

Data Types

io_guide_list list
rule_name string
matching_type_list list
filename string

ARGUMENTS

-io_guide *io_guide_list*

Specifies the I/O guides in which to place I/O driver cell instances. Only drivers assigned to the specified I/O guides will be placed. Other drivers will be ignored and remain in their original locations. If no driver cells are assigned to the specified I/O guides, the command will do nothing. If this option is not specified, the command will place I/O drivers in all I/O guides as well as drivers not assigned to any I/O guide.

-rule *rule_name*

Specifies a single routing spacing rule for pathlines. If no rule is specified, the **place_io** command retrieves or creates a rule that satisfies the rules set for all RDL nets. If no rule is set on any RDL nets, the spacing rule is derived from the technology file. This option is used only for flip-chip designs.

-matching_types *matching_type_list*

Specifies the matching types used during I/O placement. If this option is specified, only I/O driver cell instances specified in the matching types will be placed. Other drivers will be ignored and remain in their original locations. If this option is not specified, the command uses all existing matching types and places drivers not part of any matching type as well.

This option is only used for flip-chip designs since matching types describe relationship between bumps and pad pins. There

exist two special types of matching types. The first type contains only bumps. These bumps are excluded from bump assignment and are not connected to any pad pins unless they have been connected to bumps in the original netlist by 2-pin nets. The second type of matching types does not contain any bump. The pads in such type of matching types will excluded from I/O placement. They remain at their current position and are not processed during bump assignment. Their RDL pins will not be connected to any bumps unless they have been connected to bumps in the original netlist by 2-pin nets. If a matching type contains both bumps and pad pins, the **place_io** command assigns bumps to pad pins according to the uniquify number. Excessive bumps or pad pins will remain unassigned.

When this option is selected, logical connectivity of pads that are not part of any specified matching types is not changed unless such pads are connected to bumps contained in the specified matching types. Under such a situation, the pads are disconnected from the bumps.

The creation of matching types enables bump assignment for macros whose design_type attributes are set as macro, not as pad or flip_chip_driver. Normally, because macro cell instances are not considered as I/O cells, no bumps are assigned to their RDL pins. To perform bump assignment for a macro, you must create a matching type that contains the RDL macro pins and bumps to be assigned to these pins. With such a matching type created, the **place_io** command assigns the bumps in the matching type to the pins in the matching type, with the ratio defined by the matching type uniquify number. User can also simply include the macro instance in the matching type. It is equivalent to include all macro RDL pins in the matching type. If user wants the bump to be connected to a specific macro pin terminal, the terminal must be included in the matching type.

When a pin has multiple terminals, only one is connected to the bump assigned. To force the tool to connect all, you must create a matching type with all terminals and the bump. In addition, the uniquify number of the matching type need to be set to the ratio of terminals to bumps.

-pad_assignment_file ***filename***

Specifies allowable I/O guides for one or more I/O pads. Without such constraints, pads not assigned to I/O guides are placed within an I/O guide determined by the **place_io** command. You can limit the I/O guide candidates to a subset of all I/O guides.

The format of the constraint file is as follows. Each line contains one or more pad names followed by a list of I/O guide names. I/O guides not in the list cannot be used to place the pads in the line. If more than one pad is specified, they must be placed in a pair of curly braces. No curly braces are needed for I/O guides. Each line must end with a semicolon.

```
{pad1 pad2} guide1 guide2;
pad3 guide1 guide3 guide0;
```

-include_unassigned_pads

Assigns any unassigned or unconstrained I/O driver cells to an I/O guide and places the cells. If this option is not specified, the command does not place the unassigned or unconstrained drivers, unless you omit both the **-io_guide** and **-matching_types** options.

-incremental

Places I/O driver cells according to their spacing and offset attributes, only for nonflip-chip designs with no I/O constraints. The **place_io** command does not consider I/O guide dimension or bump cell distribution. I/O constraints are ignored with this option.

-skip_bump_assignment

If this option is used, the tool places IO pads only without performing bump assignment. This option and option "-bump_assignment_only" are mutually exclusive.

-bump_assignment_only

If this option is used, the tool does only bump assignment. No pad placement is done and I/O driver cells are not moved. The tool assigns bumps to I/O driver cells based on current locations of I/O driver cells. All the signal I/O constraints and power I/O constraints will be ignored in this mode. This option does not work with **-pad_assignment_file** option. This option and option "-skip_bump_assignment" are mutually exclusive.

-match_terminals_to_bumps

Matches each terminal of a pin to a bump cell. This option only works for pin terminals that fit the following requirements:

a. The label of the pin terminal must be "bump".

b. There is no one-to-one logical connection between the pin and a bump.

If a pin has multiple terminals fitting these requirements, the tool assigns multiple bumps to the pin. For a pin that does not meet these requirements, the tool assigns bumps to the pin in the default way.

By default, the tool picks only one terminal of a pin that has the "bump" label and assigns one bump to the pin during I/O placement.

DESCRIPTION

This command places I/O driver cell instances in I/O guides. By default, I/O driver cell instances that are not assigned to an I/O guide are automatically assigned to available I/O guides and placed. All bumps are considered.

If any pad has a fixed status, it is not moved. In addition, you can also set signal I/O constraints to specify pad orders, pad locations, and space between pads. It is your responsibility not to introduce any constraint conflicts. For example, if the space between two fixed pads is described in a signal I/O constraint, the value must be equal to the actual space between the two fixed pads.

The orientation of a pad is determined by the orientation of its reference cell and the I/O guide which the pad is placed in. Specifically, if the pad is placed in an I/O guide with side set to bottom, its orientation is the same as that of the reference cell. If the pad is placed in I/O guides with different side values, the pad will be rotated in the same way as that of I/O guide with respect to a bottom guide. You can change the reference cell orientation by setting the reference_orientation attribute of the reference cell. Consequently, pad orientations will be changed accordingly. For example, if users set the reference_orientation to MY, a pad placed in a bottom guide will be y-axis flipped. The following command sets the reference_orientation to R270 for all pads whose ref_block attribute is the same as that of **pad1**. As a result, those pads will be rotated by 270 degrees clockwise.

This command ignores non-IO cells. This may cause an overlap between non-IO cells and IO pads. In case, such an overlap needs to be avoided the user can create matching types including all and only such non IO cells. The command will then treat all such non IO cells as regular IO pads and fix their position.

This command will delete all the unfixed fillers in the design.

```
prompt> set_attribute -name reference_orientation \
  [ get_attribute -name ref_block [get_cells pad1]] -value R270
```

You can flip a pad along the direction perpendicular to the I/O guide of the pad. Specifically, you can set the is_flipped attribute as follows. This attribute can only be set on I/O cells placed during I/O placement.

```
prompt> set_attribute -name is_flipped -value true PAD1
```

EXAMPLES

The following example places I/O drivers.

```
prompt> place_io
```

set_signal_io_constraints(2)
write_io_constraints(2)

place_opt

Place and optimize the current design.

SYNTAX

place_opt
[-list_only]
[-from *startStage*]
[-to *endStage*]

Data Types

startStage string
endStage string

ARGUMENTS

-list_only

Prints out the major stages that constitute the default flow for the **place_opt** command.

These stages are: **initial_place**, **initial_drc**, **initial_opto**, **final_place**, and **final_opto**.

This option cannot be used with the **-from** or **-to** options.

-from *startStage*

Specifies the starting stage for the **place_opt** command. Valid values are **initial_place**, **initial_drc**, **initial_opto**, **final_place**, and **final_opto**.

The default is **initial_place**.

If you specify both the **-to** and **-from** options, the *startStage* stage cannot be preceded by the *endStage* stage in the order specified by the **-list_only** option.

-to *endStage*

Specifies the final stage for the **place_opt** command. Valid values are **initial_place**, **initial_drc**, **initial_opto**, **final_place**, and **final_opto**.

The default is **final_opto**.

If you specify both the **-to** and **-from** options, the *startStage* stage cannot be preceded by the *endStage* stage in the order specified by the **-list_only** option.

DESCRIPTION

The default behavior of this command (1) places the current design, (2) optimizes the placed design for timing, electrical DRC violations, area, power, and routability, (3) performs incremental placement to optimize timing and routability, (4) further optimizes the placed design, and (5) legalizes the design placement at the end.

EXAMPLES

The following example places and optimizes the current design and ends up with an optimized design with a legalized placement:

```
prompt> place_opt
```

The following example takes in a placed design as its input and optimizes it for timing, electrical DRC violations, power, area, and routability, without rerunning placement on it, and ends up with an optimized design with a legalized placement:

```
prompt> place_opt -from final_opto
```

SEE ALSO

clock_opt(2)
refine_opt(2)

place_pins

Places pins on blocks within the current design or on the current block.

SYNTAX

status **place_pins**
[-cells *cells*]
[-nets *nets*]
[-pins *pins*]
[-ports *ports*]
[-exclude_nets *nets*]
[-nets_to_exclude_from_routing *nets*]
[-self]
[-legalize]
[-use_existing_routing]

Data Types

cells	collection
nets	collection
pins	collection
ports	collection

ARGUMENTS

-cells *cells*

Specifies the blocks for pin assignment. Only the nets connected to the specified cells are routed during global routing and only pins on selected blocks are placed. By default, the command performs pin assignment on all blocks.

-nets *nets*

Specifies the nets for pin assignment. Only the specified nets are routed during global routing stage and only block pins connected to the selected nets are placed. By default, the command performs pin assignment on all nets.

-pins *pins*

Specifies the pins for pin assignment. Only the specified pins are placed when this option is used. The tool routes the nets that are connected to the specified pins but the tool skips feedthrough creation on those nets. So no feedthrough nets or pins are created or placed. By default, the command performs pin assignment on all block pins.

-ports *ports*

Specifies the top-level ports for pin assignment. The command places only the terminals associated with the specified ports. By default, the tool performs pin assignment on all block pins.

-exclude_nets *nets*

Specifies the nets that are excluded for pin assignment and feedthrough creation. All nets, except the excluded nets, are routed and pins are placed based on the routed nets. All the pins including feedthrough pins are placed except the pins that connected to those specified nets.

-nets_to_exclude_from_routing *nets*

Specifies the nets that are excluded from routing during pin placement. By default, the tool tries to route all the nets that are used for pin placement. This option can be useful if some nets are preferred to skip routing to get quick pin placement results on them. When this option is specified, the **place_pins** command performs pin placement based on net connectivity to minimize wire length. This option cannot be used with the option **-use_existing_routing** , since the routing is skipped when using that particular option.

-self

Performs pin placement on the top-level design. By default, pin placement is performed on blocks within the current top-level design.

-legalize

Performs only pin legalization. The command runs in incremental mode (the value of app option **plan.pins.incremental** is ignored) and legalizes pin overlaps, pin shorts with pre-routes and off-track pins. Routing of nets is skipped, this can be used to quickly legalize existing pin placement. With this option pins that are already legal are not moved and pin shapes are not created for this pins/ports that do not already have shapes associated. That is only existing pins are legalized if needed. Existing pin shapes are considered legal if they are on edge, on track, do not have any overlaps and do not violate any technology related spacing constraints (like layer minimum spacing). Note that the app option to synthesize abutted pins is ignored during the legalize mode of the command.

This option cannot be used with the **-use_existing_routing** or the **-nets_to_exclude_from_routing** options.

-use_existing_routing

Uses existing global routing when placing pins. When this option is specified, the command **place_pins** expects that the nets of the relevant pins are routed by proper global routing commands already, for example, **route_global -virtual_flat** or **route_group -global_planning true**. These routing results will be removed after **place_pins** completes.

When this option is specified and no routing exists for a net, the locations of the relevant pins might not be optimal. The command **place_pins** will not try to route those nets. It will not calculate the flyline based location either.

Note that when running global route before **place_pins -use_existing_routing**, if the block pins already exist in the design, then the global router will route to those pre-existing pins. As a result, if pins are then placed by using these existing routing, their locations might have little or no changes.

Note that this option cannot be used with the **-pins** option.

DESCRIPTION

This command places pins on blocks within the current design, or the top ports of the current design, based on the command line options specified by user. If user does not specify the types of pins to be placed, it places pins for all the editable blocks without fixed physical pins within the current design.

The command first performs global routing, then places pins in legal locations on wire tracks based on the global routing results. The **place_pins** command does not use reserved tracks for pin placement. Depending on the type of pins to be placed, the wire tracks used are:

- For the top ports, **place_pins** uses wire tracks defined at the top.
- For the block pins, **place_pins** uses wire tracks defined inside the corresponding blocks. If the corresponding block does not have any wire tracks defined, then **place_pins** will use the wire tracks defined at the top.

Pin placement also honors pin constraints set by the **create_topological_constraints**, **set_individual_pin_constraints**, **set_bundle_pin_constraints**, and **set_block_pin_constraints** commands. The constraints set by those commands are therefore referred to as topological pin constraints, individual pin constraints, bundle pin constraints, and block pin constraints, respectively. These four types of pin constraints can also be defined in a pin constraints file, which can be read in by command **read_pin_constraints**.

If multiple pin constraints are applied to the same pins, normally the constraints are applied with the following priority:

- topological pin constraints
- individual pin constraints
- bundle pin constraints
- block pin constraints

However, for bundle pin constraints, if the option **-keep_pins_together** is set true, then **place_pins** will try to honor it whenever possible. In some cases, it might have to relax the individual pin constraints requested layer or spacing.

Certain types of pin constraints, e.g. spacing, location, layer, or pin length, can be specified as hard constraints by command **set_block_pin_constraints**. When these constraints are hard, **place_pins** honors the applicable value and skip all DRC rule checks, even if it means possible DRC violations. For example, if location is hard and one pin is constrained at a location inside pin blockage, or will be shorted to another pin, this pin will be placed at the location regardless. Or if length is hard and one pin is constrained by a pin length that is shorter than minimum length, or this value violates min area rule, the pin will still be of the specified length regardless these violations.

A pin guide or a routing corridor can be created to refrain certain pins within the defined region. Alternatively, a pin blockage can be created to forbid certain pins with in the defined region.

If pin constraints are so restrictive that **place_pins** cannot honor all of them, one or more constraints might be relaxed to place the constrained pins, provided they are not hard constraints. Depending on the type of constraint a pin has, the sequence of constraints relaxation can be slightly different.

If the pin has the side and offset constraints, the constraints relaxation sequence is the following:

- If the pin has a non-zero range constraint such as offset range, pin guide, routing corridor, etc, then relax the spacing. Otherwise, relax the offset.
- Relax both offset and spacing.
- Ignore the edge abutment.

If the pin does not have the side and offset constraints, the constraint relaxation sequence is the following:

- Relax spacing.
- Ignore edge abutment but honor spacing.

If the preceding constraints relax sequence cannot find a solution to place the pin, the command tries additional relaxation sequence as follows:

- Relax offset but honor others.
- Relax layer but honor others.
- Relax spacing but honor others.

- Relax offset, layer and spacing.

During constraint relaxation, if any of the constraints are hard constraints, the corresponding relaxation is skipped.

The pin width, length and spacing can be affected by other factors in addition to the pin, bundle or block pin constraints, if they are not specified as hard constraints.

In particular, the pin width is decided by the applicable pin constraints applied to them according to the priority sequence above, with the following exceptions:

- if the pin is placed on a wire track with non-zero track width, then the pin width is the same as the track width. If the track width is less than the default width of the layer, the width is then promoted to the default width. All other width related pin constraints are ignored.
- if the pin has no width-related pin constraints, but its net has a non-default routing rule requiring a width on the layer, then the pin width is same as the non-default rule specified width
- if the pin has no width-related pin constraints and no non-default routing rule, then the pin width is the same as the maximum of the default width and min-width rule defined by the technology file

The pin length is decided as the maximum of the pin length constraints (if applicable/present) and the following:

- the pin width
- the min-length rule defined in the technology file on the layer if it is applicable
- the pin-length required to satisfy the min-area rule if there is a min-area rule defined in the technology file on the layer. Note that width based min-area rules are also supported, the maximum of the min-area rule and width-based min area rule will be applied if both are present.
- lastly, if the layer has the mask constraints defined, the pin length is promoted to 10X routing pitches

Note that the length of the pins after being determined as the maximum of the above mentioned constraints/values, is rounded up to the nearest multiple of the grid size (if grid is present). This is to ensure that pins are created on the manufacturing grid. The depth is rounded to nearest multiple of grid size that is greater than constrained depth.

If there is no individual or bundle pin spacing constraints, then the pin spacing is decided by the following:

- if its net has a non-default routing rule requiring a spacing distance on the layer, then the pin spacing to the nearest pin honors the specified distance
- if its net does not have a non-default routing rule or the non-default routing rule does not have a spacing distance requirement on the layer, then the pin spacing is decided by the command **set_block_pin_constraints**

The **set_editability** command can enable or disable this command for blocks or levels of physical hierarchy. The **place_pins** command has no effect on the blocks that are disabled by **set_editability**.

If feedthrough creation is allowed, this command might create feedthrough nets and ports, depending on the global routing results. If feedthroughs are created, the design netlist is modified. The newly-created feedthroughs are automatically updated with multivoltage (MV) constraints if the design uses UPF.

If feedthroughs pins/nets are created, by default, newly created feedthrough ports and nets are named "net_name__FEEDTHRU_#" in **place_pins**, where net_name is the name of the original net that connected this feedthrough port or feedthrough net, and "#" is an index number. The names of newly-created feedthroughs pins/nets can be controlled by following application options:

plan.pins.new_port_name_tag
plan.pins.new_port_name_tag_style

Use the following application option to control the split-net naming convention:

set_app_options -name plan.pins.new_split_nets_use_block_names -value true

When this application option is true, the tool inserts the feedthrough master block names into the feedthrough net name. The inserted string starts with master name of the driving block, then a sequence of all the load blocks master names separated by double underscore characters. By default, this application option is false by default and block names are not inserted into the feedthrough net name.

For example, if you are using suffix name tag style (default), the feedthrough net name is:

BaseNetName + "__" + BlockBasedSubString + "__" + NameTag + __ IndexNumber

For prefix name tag style:

NameTag + "_" + IndexNumber + "__" + BaseNetName + "__" + BlockBasedSubString

Note that this only applies to split nets that connect one block to one or more other blocks. It DOES NOT apply to any split net that has a top port connection in the block in which the split net belongs.

You can disable pin placement on an a previously-placed pin by setting the physical_status to "fixed" for the terminal of this pin. The following command sets this "fixed" status on terminal of pin block/A and pin placement skips placing this pin.

prompt> **set_attribute [get_terminals -of_objects [get_pins block/A]] physical_status fixed**

By default, pin placement tries to generate the global route and place pins so that block pins can be aligned for nets connecting two pins. To direct the tool to apply more effort to achieve better pin placement, use the **plan.pins.reserved_channel_threshold** application option.

By default, clock nets are excluded from feedthrough creation. To enable feedthrough creation on clock nets, set the **plan.pins.exclude_clocks_from_feedthroughs** application option to false.

When **-self** option is specified, the tool still places pins for the ports that are not marked as power/ground type but connected to power/ground net. When **-self** option is not specified and block pins are connected to top level power/ground net but the block port type are not power/ground, the tool still places pins for those block ports.

Users can use app options to control pin placement behavior. Specifically, pin placement related app options start with plan.pins. The following are current app options related to place_pins. For more details, use report_app_options plan.pins* to list those app options and their current settings.

plan.pins.allow_pins_in_narrow_macro_channels
plan.pins.exclude_clocks_from_feedthroughs
plan.pins.exclude_inout_nets_from_feedthroughs
plan.pins.incremental
plan.pins.layer_range
plan.pins.new_port_name_tag
plan.pins.new_port_name_tag_style
plan.pins.new_split_nets_use_block_names
plan.pins.pin_range
plan.pins.reserved_channel_threshold
plan.pins.retain_bus_name
plan.pins.synthesize_abutted_pins
plan.pins.ignore_pin_spacing_constraint_to_pg
plan.pins.treat_pg_as_shield
plan.pins.enable_span_rules

If there are mask constraints defined on the tracks and if **place_pins** creates any pins on the mask constraints defined tracks, the mask constraints will also be set on the pins as the following:

- The mask constraint set on the pin is from one of the values set on the tracks. **place_pins** will not use any other values not seen on the current tracks.
- **place_pins** first checks the pins nearest usable tracks. A usable track is the track that is not occupied by this pin, and if there is a layer shape on this track with minimum width, it does not trigger the minimum spacing or any mask constraint spacing

violation. The nearest usable tracks are those usable tracks on this pins left and right (or top and bottom) that are nearest.

- Then **place_pins** negates the mask constraints values on those nearest usable tracks. If there are common values between the negated mask constraints values on the left (or bottom) nearest usable track and the right (or top) nearest usable track, **place_pins** picks one value and applied it to this pin.
- If there are no common values between the negated mask constraints on the left (or bottom) nearest usable track and the right (or top) nearest usable track, **place_pins** chooses the mask constraint on the center track that this pin occupies and apply it to this pin. And a warning message shall be issued to the user that no applicable mask constraints values could be found.

This command returns 1 on success, 0 otherwise.

EXAMPLES

The following command places pins on all blocks within the current design.

```
prompt> place_pins
```

The following commands enable four cores for pin placement and perform pin placement on all blocks within the current design.

```
prompt> set_host_options -max_cores 4
prompt> place_pins
```

pop_up_objects

Transfers physical objects from the block level to the top level.

SYNTAX

string **pop_up_objects**
[-cells *block_instance_collection*]
[-blocks *block_instance_collection*] (OBSOLETED)
object_collection

Data Types

block_instance_collection collection
object_collection collection

ARGUMENTS

-cells *block_instance_collection*

Specifies which block instances from which to pop up objects. By default, all block instances are processed.

object_collection

Specifies the block-level objects to pop up. The objects include nets, routing objects (paths, wires, vias and terminals), routing guides, placement blockages, pin guides, pin blockages and cell instances, or the owner hardmacro cells of the marker layer shapes (see **set_pop_up_object_options** command). For example, if *net_collection* is included with *object_collection*, the *pop_up_objects* command pops up routing objects associated with the specified nets. Note that via matrix is always popped up with its owner net. So if and only if user specify the owner net in the *net_collection*, the via matrix can be popped up.

The *object_collection* option is required for the *pop_up_objects* command.

DESCRIPTION

This command transfers objects from block level to the top level.

If the **-pins_as_terminals** option has been set with the **set_pop_up_object_options** command, and routing for a block net which has a terminal is being popped up, a terminal is created in the top block if the net in the top block has a logical connection to a top-level port. A terminal will be created if the child net has been specified for pop-up, or if the block terminal has been specified for pop-up. If a specific object of a child net has been specified in the collection, but not the entire net, and not the specific block terminal, then no terminal will be created.

If a block-level net is specified for pop-up, then all routing objects will be popped up, unless no paths or vias exist in the block for

that net. If only select shapes of a net are specified for pop-up, then only those shapes will be popped up.

In other words, to pop-up an entire net and remove it from the logical netlist for its current block, you must specify the net and not the shapes of the net. If you specify only the shapes for pop-up, the net itself is not popped up.

If the specified net for pop-up is part of a block that has multiple instances (MIB), then if any of the instances are have not net connection for the port related to the net, then no routing is popped up for that instance.

If routing blockages or placement blockages in a block are the result of pushing down cells or routing as blockages, then these blockages cannot be popped back to the top. The will have the "copied-down" shadow status, and no objects with this shadow status may be popped back to the top.

Attributes are copied from the corresponding block-level object for all objects created at the parent level.

EXAMPLES

The following example pops up the power and ground net routing objects.

```
prompt> set pg_nets [get_nets {blockA/VDD blockA/VSS}]
prompt> pop_up_objects $pg_nets
```

The following example pops up cell instances from block block_1.

```
prompt> set pop_cells [get_cells {blockA/U1 blockA/U2}]
prompt> pop_up_objects $pop_cells
```

The following example pops up signal routing objects (using an alternate way of specifying block-level objects for pop-u->p):

```
prompt> set pop_nets [get_nets blockA/netA]
prompt> pop_up_objects $pop_nets
```

The following example pops up a specific block-level via:

```
prompt> set pop_vias [get_vias blockA/VIA_C_0]
prompt> pop_up_objects $pop_vias
```

preview

Evaluates its arg list without actually executing it, but option values are "stored through" if option value-tracking is enabled.

SYNTAX

preview *arg* ...

ARGUMENTS

arg

The arg list will be evaluated without being executed.

DESCRIPTION

The preview command (like the built-in Tcl command eval) takes one or more arguments, which together comprise a Tcl script containing one or more commands. The preview command concatenates all its arguments together (like eval), and passes the concatenated string to the CCI/Tcl interpreter recursively.

The preview command passes its concatenated command string to the CCI/Tcl command evaluator as usual, but the special feature of the preview command is that the command will not actually be executed by preview. Instead only the early stages of CCI argument/option checking will happen for the command string. Specifically, standard CCI checking of option arguments is performed, as is "store through" of new current option values for options with current-value-tracking enabled (if option checking succeeded). The preview command thus provides a way to update current values of a command's options (which have current-value-tracking enabled) without actually executing the command.

Conceptually, the CCI preview command is in the same "family" as the Tcl built-in command eval - the difference is that eval executes its concatenated command string, while preview does not, but preview does implement CCI option checking and "store through" for current values of options (which have current-value-tracking enabled).

The advantage of the preview command (compared with a command for turning on and off preview mode) is that a preview command is guaranteed to finish/exit (thus guaranteeing that the preview behavior in the CCI command evaluator will get turned off as soon as the preview command exits). If instead it was necessary to have matching commands for turning on and off "preview mode", bugs in Tcl script code might cause the "turn off preview mode" call to be skipped - then the interpreter would be stuck in "preview mode" indefinitely (and we do not want to take the risk of such a serious bug happening). By having preview as a command, we greatly reduce the risk that the interpreter could get "stuck in preview mode".

Note that the preview command itself does not implement any additional echoing to output of its concatenated command.

About preview and mutually exclusive options: preview performs all option checking for the previewed command as if it was to be executed (even though the command will not be executed). Thus the simultaneous presence of multiple mutually exclusive options

will generate an error under preview (and "store through" of current option values will be aborted). This can be regarded as both a feature (it's consistent with normal command execution) and a limitation (it makes it impossible to set current values for mutually exclusive options of a command from a single run of preview). To workaround this limitation, we also provide the set_command_option_value command (which does not do checks such as the mutual exclusion check) - see the man page for set_command_option_value.

A possible power user application: power users could put preview commands in their home directory Tcl startup files for their favorite dialogs/commands to "seed" initial current values for these dialogs. This may lower the need for automatically saving replay scripts (of preview commands for each command/dialog) on exit from the application. Note: the set_command_option_value command may be easier to use than preview for this purpose.

EXAMPLES

Consider a command named foo with two integer options, -bar1 and -bar2, that have current-value-tracking enabled. In the following example, the "current values" being tracked for the -bar1 and -bar2 options are updated to 10 and 20 respectively:

```
prompt> preview foo  -bar1 10  -bar2 20
prompt> get_command_option_values -current -command foo
-bar1 10  -bar2 20
```

Note that foo command is not actually executed in this example.

print_message_info

Prints information about diagnostic messages that have occurred or have been limited.

SYNTAX

string **print_message_info**
  [-ids *id_list*]
  [-summary]

Data Types

id_list list

ARGUMENTS

-ids *id_list*

Specifies a list of message identifiers to report. Each entry can be a specific message or a glob-style pattern that matches one or more messages. If this option is omitted and no other options are given, then all messages that have occurred or have been limited are reported.

-summary

Generates a summary of error, warning, and informational messages that have occurred so far.

DESCRIPTION

The **print_message_info** command enables you to print summary information about error, warning, and informational messages that have occurred or have been limited with the **set_message_info** command. For example, if the following message is generated, information about it is recorded:

Error: unknown command 'wrong_command' (CMD-005)

It is useful to be able to summarize all recorded information about generated diagnostic messages. Much of this can be done using the **get_message_info** command, but you need to know a specific message ID. By default, **print_message_info** summarizes all of the information. It provides a single line for each message that has occurred or has been limited, and one summary line that shows the total number of errors, warnings, and informational messages that have occurred so far. If an *id_list* is given, then only messages matching those patterns are displayed. If **-summary** is given, then a summary is displayed.

Using a pattern in the *id_list* is intended to show a specific message prefix, for example, "CMD*". Note that this does not show all messages with that prefix. It shows only the messages that have occurred or have been limited.

EXAMPLES

The following example uses **print_message_info** to show a few specific messages:

```
prompt> print_message_info -ids [list "CMD*" APP-99]

Id          Limit   Occurrences   Suppressed
-------------------------------------------------------------
CMD-005       0          7          2
APP-99        1          0          0
```

At the end of the session, you might want to generate some information about a set of interesting messages, such as how many times each occurred (which includes suppressions), how many times each was suppressed, and whether a limit was set for any of them. The following example uses **print_message_info** to get this information:

```
prompt> print_message_info

Id          Limit   Occurrences   Suppressed
-------------------------------------------------------------
CMD-005       0          12         0
APP-027     100          150        50
APP-99        0          1          0

Diagnostics summary: 12 errors, 150 warnings, 1 informational
```

Note that the suppressed count is not necessarily the difference between the limit and the occurrences, since the limit can be dynamically changed with the **set_message_info** command.

set_message_info(2)
suppress_message(2)

print_proc_new_vars

Checks for new variables created within a Tcl procedure.

SYNTAX

string **print_proc_new_vars**

ARGUMENTS

The **print_proc_new_vars** command has no arguments.

DESCRIPTION

The **print_proc_new_vars** command is used in a Tcl procedure to show new variables created up to that point in the procedure. If the **sh_new_variable_message_in_proc** and **sh_new_variable_message** variables are both set to **true**, this command is enabled. If either variable is **false**, the command does nothing. The result of the command is always an empty string.

When enabled, the command issues a CMD-041 message for each variable created in the scope of the procedure so far. Arguments to the procedure are excluded.

For procedures that are in a namespace (that is, not in the global scope), **print_proc_new_vars** also requires that you have defined some aspect of the procedure using the **define_proc_attributes** command.

Important: This feature has a significant negative impact on CPU performance. This should be used only when developing scripts or in interactive use. When you turn on the feature, the application issues a message (CMD-042) to warn you about the usage of this feature.

EXAMPLES

Assuming that the appropriate control variables are set to **true**, the following commands show new variables created within procedures:

```
prompt> proc new_proc {a} {
        set x $a
        set y $x
        unset x
        print_proc_new_vars
```

```
        }

prompt> new_proc 67
=New variable report for new_proc:
Information: Defining new variable 'y'. (CMD-041)
=END=

prompt>

prompt> proc ns::p2 {a} {
          set x $a
          print_proc_new_vars
        }

prompt> define_proc_attributes ns::p2

prompt> ns::p2 67
=New variable report for ns::p2:
Information: Defining new variable 'x'. (CMD-041)
=END=
```

SEE ALSO

define_proc_attributes(2)
sh_new_variable_message(3)
sh_new_variable_message_in_proc(3)

print_suppressed_messages

Displays an alphabetical list of message IDs that are currently suppressed.

SYNTAX

string **print_suppressed_messages**

ARGUMENTS

The **print_suppressed_messages** command has no arguments.

DESCRIPTION

The **print_suppressed_messages** command displays all messages that you suppressed using the **suppress_message** command. The messages are listed in alphabetical order. You only can suppress informational and warning messages. The result of **print_suppressed_messages** is always the empty string.

EXAMPLES

The following example shows the output from the **print_suppressed_messages** command:

```
prompt> print_suppressed_messages
No messages are suppressed

prompt> suppress_message {XYZ-001 CMD-029 UI-1}

prompt> print_suppressed_messages
The following 3 messages are suppressed:
    CMD-029, UI-1, XYZ-001
```

SEE ALSO

suppress_message(2)
unsuppress_message(2)

printenv

Prints the value of environment variables.

SYNTAX

string **printenv**
  [*variable_name*]

Data Types

variable_name string

ARGUMENTS

variable_name

Specifies the name of a single environment variable to print.

DESCRIPTION

The **printenv** command prints the values of the environment variables inherited from the parent process or set from within the application with the **setenv** command. When no arguments are specified, all environment variables are listed. When a single *variable_name* is specified, if that variable exists, its value is printed. There is no useful return value from **printenv**.

To retrieve the value of a single environment variable, use the **getenv** command.

EXAMPLES

The following examples show the output from the **printenv** command:

```
prompt> printenv SHELL
/bin/csh

prompt> printenv EDITOR
emacs
```

SEE ALSO

getenv(2)
setenv(2)

printvar

Prints the values of one or more variables.

SYNTAX

string **printvar**
[*pattern*]
[-user_defined | -application]

Data Types

pattern string

ARGUMENTS

pattern

Prints variable names that match *pattern*. The optional *pattern* argument can include the wildcard characters * (asterisk) and ? (question mark). If not specified, all variables are printed.

-user_defined

Shows only user-defined variables. This option is mutually exclusive with the **-application** option.

-application

Shows only application variables. This option is mutually exclusive with the **-user_defined** option.

DESCRIPTION

The **printvar** command prints the values of one or more variables. If the *pattern* argument is not specified, the command prints out the values of application and user-defined variables. The **-user_defined** option limits the variables to those that you have defined. The **-application** option limits the variables to those created by the application. The two options are mutually exclusive and cannot be used together.

Some variables are suppressed from the output of **printvar**. For example, the Tcl environment variable array *env* is not shown. To see the environment variables, use the **printenv** command. Also, the Tcl variable **errorInfo** is not shown. To see the error stack, use the **error_info** command.

EXAMPLES

The following command prints the values of all of the variables:

```
prompt> printvar
```

The following command prints the values of all application variables that match the pattern *sh*a**:

```
prompt> printvar -application sh*a*
sh_arch              = "sparcOS5"
sh_command_abbrev_mode  = "Anywhere"
sh_enable_page_mode     = "false"
sh_new_variable_message = "false"
sh_new_variable_message_in_proc = "false"
sh_source_uses_search_path = "false"
```

The following command prints the value of the **search_path** variable:

```
prompt> printvar search_path
search_path          = ".  /designs/newcpu/v1.6  /lib/cmos"
```

The following command prints the values of the user-defined variables:

```
prompt> printvar -user_defined
a                = "6"
designDir        = "/u/designs"
```

SEE ALSO

error_info(2)

setenv(2)

proc_args

Displays the formal parameters of a procedure.

SYNTAX

string **proc_args**
proc_name

Data Types

proc_name string

ARGUMENTS

proc_name

Specifies the name of the procedure.

DESCRIPTION

The **proc_args** command is used to display the names of the formal parameters of a user-defined procedure. This command is essentially a synonym for the Tcl builtin command **info** with the *args* argument.

EXAMPLES

This example shows the output of **proc_args** for a simple procedure:

```
prompt> proc plus {a b} { return [expr $a + $b] }

prompt> proc_args plus
a b

prompt> info args plus
a b

prompt>
```

SEE ALSO

info(2)
proc(2)
proc_body(2)

proc_body

Displays the body of a procedure.

SYNTAX

string **proc_body**
proc_name

Data Types

proc_name string

ARGUMENTS

proc_name

Specifies the name of the procedure.

DESCRIPTION

The **proc_body** command is used to display the body (contents) of a user-defined procedure. This command is essentially a synonym for the Tcl builtin command **info** with the *body* argument.

EXAMPLES

This example shows the output of **proc_body** for a simple procedure:

```
prompt> proc plus {a b} { return [expr $a + $b] }

prompt> proc_body plus
 return [expr $a  + $ b]

prompt> info body plus
 return [expr $a  + $ b]

prompt>
```

SEE ALSO

info(2)
proc(2)
proc_args(2)

promote_clock_data

Loads specific clock data from a lower-level of hierarchy at the top level.

SYNTAX

int **promote_clock_data**
[-cells *block_instance_names*]
[-auto_clock connected | local | all]
[-balance_points]
[-mesh_annotations]
[-port_latency]
[-latency_offset]

Data Types

block_instance_names list

ARGUMENTS

-cells *block_instance_names*

Specifies a list of names of the block instances from which to load specific clock data.

If this option is not specified, the data will be promoted from all block instances in bottom-up order of their respective physical hierarchy level.

-balance_points

When this option is specified, balance points set by the **set_clock_balance_points** command are promoted.

This option is mutually exclusive with **-mesh_annotations**, **-port_latency** and **-latency_offset** options.

-auto_clock connected | local | all

Associates clocks at the block level with clocks at the top level. Before promoting balance points, it is necessary to associate clocks at the block level with clocks at the top level. For example, your top- level clock might be called "SYS_CLK", and the same clock in the block might be called "CLK". You can set the association between block clock and top clock by using the **set_block_to_top_map** command, or by using **promote_clock_data -auto_clock** and specifying the same rule. See the **set_block_to_top_map** man page for more details.

You can select one of three rules for auto-clock mapping:

- **connected** - The "connected" rule associates block-level clocks with top-level clocks under the following conditions: If a block clock has its source at a block port (a boundary clock), it can be associated to a top-level clock that propagates to that port. If a block clock has its source on an internal pin sources (a local clock), the top-level clock source must be declared at the same pin.

- **local** - The "local" rule maps connected clocks. In addition, if a block clock has its source on an internal pin sources (a local clock) and has no associated top-level clock, a new top-level clock will be created with the same waveform as the block-level clock. The new top-level clock will be associated with the local block-level clock.
- **all** - The "all" rule maps clocks as in the "local" rule. In addition, if a block clock has its source at a block port (a boundary clock) and no top-level clock propagates to that port, a new top-level clock will be created with the same waveform as the block-level clock. The new top-level clock will be associated with the local block-level clock. The top-level boundary clock will allow timing analysis to be done, but it is not necessarily correct for signoff. You should consider removing or replacing this clock before signoff.

Note that if two block-level clocks are declared at the same boundary port, the "all" rule cannot resolve both of them. This is because it will not automatically declare two conflicting clocks in the top-level block. You must manually declare two top-level clocks, with the appropriate waveforms. After the top clocks exist, **-auto_clock** mapping can associate them with the block clocks.

-mesh_annotations

When this option is specified, annotations set by the **set_annotated_delay** command and **set_annotated_transition** command are promoted.

This option is mutually exclusive with **-balance_points**, **-port_latency** and **-latency_offset** options.

-port_latency

When this option is specified, latency inside the blocks are promoted and set as balance points on the clock input pins of the block.

This option is mutually exclusive with **-balance_points**, **-mesh_annotations** and **-latency_offset** options.

-latency_offset

When this option is specified, offset latency at clock network sink and clock pins of ICG cells will be promoted.

This option is mutually exclusive with **-balance_points**, **-mesh_annotations** and **-port_latency** options.

DESCRIPTION

The **promote_clock_data** command causes specific clock data from lower levels of physical hierarchy to be applied to the top level. The data include mesh annotations set using **set_annotated_delay** and **set_annotated_transition** commands, CTS balance points set using **set_clock_balance_points** command, latency inside the blocks at the clock input pins and offset latency at clock network sink and clock pins of ICG cells. These promoted data are added to any data that are already applied to the top-level design.

You should consider using this command when:

- The annotations and balance points of a lower level block have changed locally and you want to see these data during top-level analysis.
- You have changed the design view of your lower-level block from "abstract" to "design", and your current data only cover the abstract part of the block.
- You need the latency inside the CCD done blocks to be visible to the top-level.

  The **promote_clock_data** command includes analysis of your block's current configuration, where a configuration is defined by the view type ("design" or "abstract") that you have linked for your block's subblocks. It is possible that your current block configuration is bigger than the configuration of your block at the time balance points and annotations were saved on disk. That is, the balance points and annotations on disk may only cover a portion of the instances and nets in your current block. This will happen when your balance points and annotations on disk cover only an "abstract" view and your current design contains a full "design" view. In this case, **promote_clock_data** detects the problem and prints an error message.

When multiple instances from different levels of physical hierarchy are specified using **-cells** option, the data will be promoted from the block instances in bottom-up order of their respective physical hierarchy level.

This command returns 1 on success, 0 otherwise.

EXAMPLES

The following example promotes mesh annotations from block instance "block1".

```
prompt> promote_clock_data -cells block1 -mesh_annotations
```

The following promotes balance points from all physical hierarchies.

```
prompt> promote_clock_data -balance_points
```

propagate_3d_connections

Derives logical connections for bumps in a 3DIC design.

SYNTAX

status **propagate_3d_connections**
[-nets *net_list*]
[-check_only]

Data Types

net_list list

ARGUMENTS

-nets *net_list*

Specifies the nets for logical connection propagation. By default, all top-level nets in the design are propagated.

-check_only

Check only physical and logical connectivity, do not perform propagation. By default, the command propagates logical connections.

DESCRIPTION

This command creates logical connection based on bump-pair physical alignment information with top level nets.

EXAMPLES

The following example derives the logical connection of bumps on the net VDD with I/O port.

prompt> **propagate_3d_connections -nets VDD**

SEE ALSO

create_3d_mirror_bumps(2)
set_cell_location(2)

propagate_3d_matching_types

Propagates matching types of bumps, pins and tsv by tracing nets and bump contacts.

SYNTAX

status **propagate_3d_matching_types**
[-from *source_chip_list*]
[-to *target_chip_list*]
[-matching_types *matching_type_list*]
[-check_only]
[-force]

Data Types

source_chip_list list
target_chip_list list
matching_type_list list

ARGUMENTS

-from *source_chip_list*

Specifies the source chips whose matching types are to be propagated. By default, all chip's matching types will be propagated.

-to *target_chip_list*

Specifies the target chips that the specified matching types will be propagated to. By default, all chips will be propagated to.

-matching_types *matching_type_list*

Specifies the matching types in the source chip to be propagated. By default, all matching types will be propagated.

-check_only

Performs a check for matching type propagation, but do not modify the design. By default, the command propagates the matching types and modifies the design.

-force

Assigns new matching types for all related objects. Related objects are objects in the target chip that have connections to the specified matching types in the source chip.

The **-force** option treats all related objects in the target chip as if they don't have matching types.

DESCRIPTION

This command propagates matching types for bumps, pins and tsv by tracing nets and bump contacts. The matching type specifies which bump cells are to be connected to which I/O driver pins. The **create_matching_type** command defines a matching type constraint, and the **assign_3d_interchip_nets** command uses matching types of cells and terminals to do net assignment. This command propagates matching types of cells, pins and terminals to other pins by tracing nets and contacted bumps. Normally, two bumps that are center-aligned, are treated as "contacted" bumps. Moreover, if you set the application option **plan.3dic.bump_alignment_threshold**, two bumps with centers that are less than this value are considered to be "contacted". Note that the new matching types are assigned to the pins of objects.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

In the following example, "P1" in chip1 and "SOC/BUMP7" in chip2 have been set matching types "PG" and "SIGNAL". The **-force** option lets "PG" override the "SIGNAL" matching type.

```
prompt> propagate_3d_matching_types -from chip1 -to chip2 -matching_types {PG} -force
Information: propagate matching type { 'PG' } from chip chip1 to target chip chip2.
```

In the following example, matching types "SIGNAL" and "PG" have been set to "SIIP/P1" and "i_bump_1" in chip1, these two matching types will propagate to the pins of "SIIP/P2" and "i_bump_2" in chip2. "default" means no matching type has not been set. Because **-matching_types** is not used, both "PG" and "SIGNAL" matching types will be propagated.

```
prompt> propagate_3d_matching_types -from chip1 -to chip2
Information: propagate matching type { 'SIGNAL' } from chip chip1 to target chip chip2.
Information: propagate matching type { 'PG' } from chip chip1 to target chip chip2.
```

propagate_pin_mask_constraint

Propagates the multiple-patterning mask constraint from one pin to its abutted pin on the same layer that does not have the multiple-patterning mask constraint.

SYNTAX

status **propagate_pin_mask_constraint**

ARGUMENTS

This command has no arguments.

DESCRIPTION

This command propagates the multiple-patterning mask constraint from one pin to its abutted pin on the same layer that does not have multiple-patterning mask constraint.

The abutted pins can be either two block pins or a block pin and a hard macro pin. If one of the pins is a hard macro pin, it must be the pin that has the multiple-patterning mask constraint.

If neither abutted pin has a multiple-patterning mask constraint, this command does not try to set the constraint on either pin.

The **set_editability** can enable/disable this command for blocks or levels of physical hierarchy. This command has no effect on the blocks that are disabled by **set_editability**.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example propagates the multiple-patterning mask constraint on abutted pins.

```
prompt> propagate_pin_mask_constraint
1
```

SEE ALSO

propagate_pin_mask_to_via_metal

SYNTAX

status propagate_pin_mask_to_via_metal
[-block *block*]

Data Types

block	string or collection

ARGUMENTS

-block *block*

Specify the name of the block to be processed.

DESCRIPTION

A via consists of three layers: upper-metal enclosure, via cut, and lower-metal enclosure. When the router drops a via on a pin, the lower-metal enclosure layer of the via is the same as the pin layer.

In a double-patterning technology, each pin-shape instance has an attribute mask_constraint, which identifies the mask to which the shape belongs, such as mask_one or mask_two. Each via instance also has attributes to identify the mask to which each of its three layers belongs.

For stream-out of design data in GDSII format, if a via's lower-metal mask attribute (lower_mask_constraint) is set to no_mask, the tool can automatically propagate the mask identity from an M1 pin-shape to the M1 layer of the via above the pin, overriding the no_mask attribute setting. To do this, use the '-propagate_pin_mask_to_via_metal' option of the write_gds command.

Some applications need the mask identity propagated to the via M1 layers to be reflected in the database. This command can be used for that purpose.

By default, this command operates on the current design. After the command is run, the M1 layer of each via instance is annotated to indicate the same mask information as the M1 pin-shape object under the via. To preserve the modified design data, save the design with the save_block command.

To operate on a design other than the current design, use the -block option.

EXAMPLES

The following command modifies the vias in the current block by updating the lower_mask_constraint with the mask_constraint attribute of the pin-shape on which the via is incident:

```
prompt> propagate_pin_mask_to_via_metal
1
```

The following command modifies the vias in the block 'blockB' by updating the lower_mask_constraint with the mask_constraint attribute of the pin-shape on which the via is incident:

```
prompt> propagate_pin_mask_to_via_metal -block blockB
1
```

save_block(2)
write_gds(2)

propagate_switching_activity

Forces the propagation of power-switching activity information.

SYNTAX

status **propagate_switching_activity**
[-scenarios *scenario_list*]
[-modes *mode_list*]
[-corners *corner_list*]

Data Types

scenario_list	list
mode_list	list
corner_list	list

ARGUMENTS

-scenarios *scenario_list*

Specifies the scenarios to be considered. If this option is not specified, then only those scenarios are considered which contain the modes and corners specified through **-modes** and **-corners** options. Activity propagation is done separately for each scenario. If none of the **-modes**, **-corners**, or **-scenarios** options are specified, propagation is done for the current scenario in the design.

-modes *mode_list*

Specifies the mode filter on the set of scenarios to be considered. A scenario is considered if its mode is present in *mode_list*. If this option is not specified, no filtering on modes will occur.

-corners *corner_list*

Specifies the corner filter on the set of scenarios to be considered. A scenario is considered if its corner is present in *corner_list*. If this option is not specified, no filtering on corners will occur.

DESCRIPTION

Use this command to force propagation of the power switching activity information.

During the propagation of the switching activity, the information annotated using the read_saif, set_switching_activity commands is used to estimate the activity on unannotated nets. All commands that need switching activity information on all design objects use the switching activity propagation mechanism automatically.

The mechanism to propagate switching activity uses the static probability and toggle rate information you annotate to estimate the static probability and toggle rate information on unannotated design objects. The mechanism used by the tool is based on a stochastic simulation method, which is that random activity based on the annotated switching activity is generated on the annotated design objects, and this activity is propagated across the design using a zero-delay simulator. This is repeated a few thousand times, depending on the effort level specified through power.propagation_effort app option.

Once propagated, activity is retained until a design changes causes the activity to be invalidated. If you wish to be informed of this, you can un-suppress the messages POW-001 and POW-051 with the **unsuppress_message** command. These messages are suppressed by default.

push_down_clock_trunks

Pushes down top-level clock trunk cells. The cells are pushed into blocks which have been enabled for feedthrough creation. This command is needed only in CTP-Pushdown flavor.

SYNTAX

status **push_down_clock_trunks**
[-clock *clocks*]

Data Types

clocks collection

ARGUMENTS

-clock *clocks*

Specifies a list of clocks for which the clock trunk cells must be pushed down. By default, all top-level clock cells are pushed down.

DESCRIPTION

During clock trunk planning, feedthroughs can be planned by creating clock buffers and physically placing them on the top of a block. Initially, clock buffers created in this way belong to the top level. When planning is complete, the top-level clock buffers must be pushed down into blocks, and feedthroughs must be created. After push down, any remaining unplaced block ports, in particular the newly created ports from the feedthroughs, must be placed.

This command pushes down the clock buffers, creates feedthroughs, and places the newly created block ports. This command is typically used at the end of an automatic or manual clock trunk planning session.

Cells are only pushed down into blocks which have been enabled for feedthrough creation with the **set_block_pin_constraints -allow_feedthroughs** command.

This command is needed only in CTP-Pushdown flavor where blocks are in readonly mode.

EXAMPLES

The following example pushes down clock cells on top of blocks for all clocks.

```
prompt> push_down_clock_trunks
```

SEE ALSO

gui_load_clock_trunk_planning(2)
set_block_pin_constraints(2)

push_down_objects

Pushes top-level objects into blocks.

SYNTAX

string **push_down_objects**
[-cells *block_instance_collection*]
object_collection

Data Types

block_instance_collection collection
object_collection collection

ARGUMENTS

-cells *block_instance_collection*

Specifies which block instances to push down objects into. By default, all blocks are processed.

object_collection

Specifies the object collection to be pushed down. The objects include nets, routing objects (paths, vias and terminals), routing guides, routing corridors, blockages (placement, shaping, routing), cell rows (wire tracks indirectly when rows are specified), and charging stations (non-primary voltage areas and their associated single-rail repeater cells). Note that the **get_shapes** command only returns a collection of paths; the command does not return vias. To include vias, use the **get_vias** command.

For example, if *net_collection* is included with object_collection, this command pushes down routing objects associated with the specified nets. Note that via matrix is always pushed down with its owner net. So if and only if user specify the owner net in the *net_collection*, the via matrix can be pushed down.

The *object_collection* is required for this command.

The following descriptions describe actions that the command performs on the object at the top level and block level. The actions for each object are specified by using the **set_push_down_object_options** command.

The supported objects that can be pushed down into blocks are **pg_routing**, **signal_routing**, **routing_guide**, **routing_corridor**, **blockage** (placement, shaping, routing), **pin_guide**, **pin_blockage**, **site_rows**, and **cells** and **charging_station**. Each object is described below.

- **pg_routing**
  The **pg_routing** objects include paths, vias and terminals that connect to power and ground nets. If a net connects to these objects at the top level, but does not exist in the block, the command creates a child net in the block. If a top-level terminal overlaps with the block and connects to a top-level power and ground net, this command copies the terminal into the block as a block pin with the same shape as the terminal. When terminals are pushed down into blocks as block terminals, they remain in the top cell. They are never removed, regardless of the top_action.

If the net that is being pushed into a block has a connection to a block, then that port determines what net in the block that the created routing is assigned to in the block. For instance, if the net being pushed is VDD0 and connects to block A/VDD, then the routing in the block is created for net VDD in the block.

If the net that is being pushed into a block has a nondefault routing rule (NDR), then that NDR will be created for the new net in the child block.

If the design has MIB instances and PG straps crossing MIB instances, the MIB instances are checked for correct horizontal and vertical alignment of the MIB instances. If misalignment is detected, all PG routing into blocks is suppressed. This can be overriden using the **set_push_down_object_options -object_type pg_routing -ignore_misalignment true**.

The valid top actions for routing objects are *keep* and *remove*, and the valid block actions for routing objects are *copy*, *create_pin_shape*, or both options at the same time. The default top action for *pg_routing* is *remove* and the default block action for *pg_routing* is *create_pin_shape*.

For the routing object type,

If you specify **set_push_down_object_options -top_action keep**, the top-level routing object is untouched after running **push_down_objects**.

If you specify **set_push_down_object_options -top_action remove**, the **push_down_objects** command removes the overlapping section of the top-level route object that overlapped with the block boundary. If paths are collinear with the block boundaries, the paths are not removed from the top.

If you specify **set_push_down_object_options -block_action copy**, (mutually exclusive with **create_blockage**), the **push_down_objects** command copies into the block the overlapping section of the top-level object that overlapped with the block. The newly created block-level routing object is connected to its corresponding block net. A block port and net is created if necessary.

If you specify **set_push_down_object_options -block_action create_blockage**, (mutually exclusive with **copy**), the **push_down_objects** command copies into the block as a routing blockage the overlapping section of the top-level object that overlapped with the block boundary. The newly created block-level routing blockage is not associated with any net, and the netlist is unaffected in both the top and block. The original top-level routing object is retained in the top block without regard to the **-top_action** option setting.

If you specify **set_push_down_object_options -block_action create_pin_shape**, the **push_down_objects** command creates pin shapes where the routing object touches the block boundary. However, if the *object_collection* contains only vias and nothing else, then by specifying **set_push_down_object_options -block_action create_pin_shape**, pins will be created for all vias that touches and within the block boundary. A port is created if necessary. If paths are collinear with the block boundaries, the pin shapes are created collinear for the length of the collinear path. All terminals created in blocks are created with fixed status.

Note that pins are created based only upon either top-level terminal overlap with a block or wire overlap with a block (normally at block boundary crossings). Pins are not created from other net-connected shapes such as rectangles (with or without "macro_pin_connect" attributes). Such shapes do get pushed down into the block, but pins are not created derived from these shapes. Also, such shapes that do get pushed into a block are cut by the amount of overlap with the block, and whatever is left in the top is replaced with rectangles with the overlapped part removed.

In the unusual case where the source of the pin creation from collinear overlap is a wire that looks like it is a horizontal wire with its end overlapping perpendicularly over a block edge, but in fact the wire is technically the other type (horizontal-looking but x endpoint are the same x value, or vertical-looking by y endpoints are the same y value), then the pins that result from this scenario will be created as if the wires really are as they appear, overlapping perpendicularly. The wire is still a collinear wire and will not be modified in the top, but the pins will be cut inside the block like a normal perpendicular overlap produces, and any wires created inside the block from the overlap will be created like normal perpendicular overlap as well.

If you specify **set_push_down_object_options -block_action {copy create_pin_shape}**, the **push_down_objects** command creates a copy of the routing object in the block and creates pin shapes where the routing objects touch the block boundaries.

If you specify **set_push_down_object_options -block_action center_pin_from_wire**, the **push_down_objects** command creates a center pin from the wire shapes (paths) passed into the command using [get_shapes]. This block action must be used with great caution, as it will create a center pin for EVERY path shape passed into the command. You must be sure you use this block_action ONLY with a limited number of explicitly specified path shapes.

If you specify **set_push_down_object_options -routing_overlap_check**, the **push_down_objects** command performs additional checks. If you combine the routing overlap check with **set_push_down_object_options -top_action remove** and **set_push_down_object_options -block_action copy** or **set_push_down_object_options -block_action {copy create_pin_shape}**, the **push_down_objects** command checks for overlaps between objects of the same types (wires against wires, vias against vias). If an overlap exists in the design, the command errors out without pushing down the overlapped object. Since command **push_down_objects** does limited overlap checking, you must use more specific DRC checks to prevent DRC violations and shorts. This checking is only done against existing real physical metal objects like wires and vias. It does not check for routing blockages. This applies to both PG routing and signal routing.

By default, when pins (terminals in blocks) are created after push-down of a signal or of PG routing, they are created as squares. The length of the created pin (the distance from the edge that touches a boundary to the opposite pin edge) is the same as the wire width (for the wire that was used to create the pin). However, the pin length can be extended to a length that is longer than the wire width under either of these two conditions: 1) A minLength rule exists for the layer of the pin (where the minLength is larger than the wire width) or 2) a length determined by the minArea rule, where the calculated length is larger than the wire width or the minLength rule.

If the minLength pin length results in the pin extending further into the block than the routing extends, this introduces the possibility of spacing/short violations with objects in the child block. For this reason, the command attempts to only create the pin from PG strap overlap by starting at the end of the strap where it extends into the block, and measuring outward enough to meet minLength/minArea requirements. This can result in the PG pin extending outside the block a small amount. But the amount that it extends should not exceed the top-level PG routing, so that should not result in pin are that is not already covered by top-level PG routing. The best way to avoid this scenario is to try to make sure that all PG straps overlap a block enough to meet minLength/minArea pin rules. And try to avoid placing objects in the block close enough to the block boundary to have spacing/short violations with the pushed-down PG pin.

For pg_routing, the **set_push_down_object_options** command supports two options to help avoid DRC violations in the block: **-collinear_margin** and **-pin_meet_fatwire_rule**. You must also include the **-object_type pg_routing** option.

The **-collinear_margin** option specifies a distance within which the closest edge of a PG route parallel to (but not overlapping) the block boundary is considered a collinear PG route. A normal collinear PG strap is one that runs parallel to an edge, but overlaps it so that one edge is inside the boundary and the other edge is outside the boundary. Normally, PG straps which run parallel, but do not overlap the boundary, are not treated as collinear straps. Collinear straps are only created in the child block as copies of the original top-level strap, and the original strap is left untouched in the top. With this option, the command will include non-overlapping PG straps and include them as copies in the child block so that their DRC effect can be observed in the block. These will appear outside of the block boundary in the child reference block.

By default, this option is -1, and the command only considers overlapping parallel PG straps as collinear straps.

If the value of the **-collinear_margin** option is 0 (as in microns), only non-overlapping parallel straps that exactly abut a boundary edge will be pushed into the block as a collinear strap. If the value is greater than zero, any PG strap parallel to a block edge will be copied into the block as a collinear strap if the closest edge of the strap is within the distance specified in the option.

Note that this expanded margin for collinear routing only captures wires and vias that fall inside the expanded instance margin. It does not capture non-routing shapes such as rectangles and polygons, because such shapes are not considered collinear.

The **-pin_meet_fatwire_rule** Boolean option is false by default. If this option is true, the command ensures that the size of the PG pin is big enough to trigger fat-wire spacing rules within the block. To do this, the command creates a pin that is as long (in the direction perpendicular to the edge) as it is wide. This length is created inside the boundary if it can safely be done. But if the strap which was the basis for the pin only overlapped the block less than that length, then the pin can protrude outside the boundary.

- **signal_routing**

The **signal_routing** objects include paths, vias and terminals that connect to signal nets. Signal nets specified can be in any physical level of the physical hierarchy. If a net connects to these objects in the block in which the net resides, but does not exist in a block instance that the net overlaps, the command creates a child net in the overlapped block.

If the net that is being pushed into a block does have a connection to a block, then that port will determine what net in the block that the created routing is assigned to in the block. For instance, if the net being pushed is FOO and connects to block A/FOO, then the routing in the block is created for net FOO in the block.

If the net that is being pushed into a block has a nondefault routing rule (NDR), then that NDR will be created for the new net in the child block.

The valid top actions for signal routing objects are *keep* and *remove*, and the valid block actions for routing objects are *copy*, *create_pin_shape*, or both options at the same time. The default top action for *signal_routing* is *remove* and the default block action for *signal_routing* is *create_pin_shape*.

If you specify **set_push_down_object_options -routing_overlap_check**, the **push_down_objects** command performs additional checks. If you combine the routing overlap check with **set_push_down_object_options -top_action remove** and **set_push_down_object_options -block_action copy** or **set_push_down_object_options -block_action {copy create_pin_shape}**, the **push_down_objects** command checks for overlaps between objects of the same types (wires against wires, vias against vias). If an overlap exists in the design, the command errors out without pushing down the overlapped object. Since command **push_down_objects** does limited overlap checking, you must use more specific DRC checks to prevent DRC violations and shorts. This checking is only done against existing real physical metal objects like wires and vias. It does not check for routing blockages. This applies to both PG routing and signal routing.

For the signal routing object type, if you specify **set_push_down_object_options -top_action keep**, the top-level signal routing object is untouched after running **push_down_objects**. No ports are created for the blocks into which the routing is pushed, and the routing objects in the blocks are created without connection to any net. Because no ports are created, no pins are created at the boundary if the *top_action* is *keep*. **set_push_down_object_options -block_action create_pin_shapes** should not be used in combination with **set_push_down_object_options -top_action keep**. Note that multiple push-downs of routing objects with *top_action keep* results in multiple copies of the routing created within the blocks.

If you specify **set_push_down_object_options -top_action remove**, the **push_down_objects** command removes the overlapping section of the top-level signal routing object that overlapped the block boundary. If the paths are collinear with the block boundaries, the net is skipped.

If you specify **set_push_down_object_options -block_action copy**, (mutually exclusive with **create_blockage**), the **push_down_objects** command creates a copy of the part that original top-level object overlapped with the block boundary. In addition, the newly created block-level routing object is connected to its corresponding block net. A block port and net are created if necessary.

If you specify **set_push_down_object_options -block_action create_blockage**, (mutually exclusive with **copy**), the **push_down_objects** command copies into the block as a routing blockage the overlapping section of the top-level object that overlapped with the block boundary. The newly created block-level routing blockage is not associated with any net, and the netlist is unaffected in both the top and block. The original top-level routing object is retained in the top block without regard to the **-top_action** option setting.

If you specify **set_push_down_object_options -block_action create_pin_shape**, the **push_down_objects** command creates pin shapes where the routing object touches the block boundary. A port is created if necessary. If you specify **set_push_down_object_options -block_action {copy create_pin_shape}**, the **push_down_objects** command creates a copy of the routing object in the block and creates pin shapes where the routing objects touch the block boundaries.

The command assesses the routing and determines whether feedthrough ports are a potential necessity. By default, feedthroughs are not created unless the command detects pin constraints for the net that indicate that the command is free to allow feedthroughs on the net. If so, and the routing requires a feedthrough port on the block, the feedthrough ports are created automatically. These feedthrough ports are automatically updated for multi-voltage (MV) boundary conditions if the design has UPF constraints.

In the default configuration for allowing feedthroughs for signal nets (false by default), the command creates an extra

terminal on the block for each secondary and more crossings of the block boundary. These are essentially EEQ (electrically equivalent) pins.

If feedthroughs are allowed, and feedthrough pins are created which result from a terminal overlap with a block, the pin which is derived from that terminal will not have user attributes copied from that terminal, as it normally would if the pin were not a feedthrough pin (a pre-existing logical connection).

To control whether feedthroughs are allowed on a net, set a pin constraint by using the **set_individual_pin_constraints -net netname -allow_feedthroughs true** command. This is absolutely necessary if you intend to push down routing into a block and to create feedthroughs. If you don't allow feedthroughs by using the **set_individual_pin_constraints** command, only one port will be created for a net that crosses a block multiple times for nets with no preexisting logical connections. That port direction will be INOUT, and multiple EQ pins will be created in the block for that port. In the top level, the one port will be assigned to original top-level net that crossed the block. Such a behavior is almost always NOT intended. Ensure that you use the **set_individual_pin_constraints -net netname -allow_feedthroughs true** command if you are pushing down routing into a block that the net is not connected to logically, and you expect a feedthrough (multiple ports) to be created.

By default, if feedthroughs are created and new "split" nets are generated as a result of the original net being broken into pieces, the command composes split net names based on the top-level net name. These split net names can be customized using the **plan.pins.new_port_name_tag** and **plan.pins.new_port_name_tag_style** application options. The plan.pins.new_split_nets_use_block_names application option also controls the naming convention.

Note that if a signal is being pushed down for feedthrough creation, and some routing terminates with connections to leaf cells that are on top of blocks that part of the routing can be pushed into, the command will refuse such a net, because the command requires that such leaf cells be included for push-down in such a scenario.

set_app_options -name plan.pins.new_split_nets_use_block_names -value true

If the **plan.pins.new_split_nets_use_block_names** application option is set to true, the command embeds information about the blocks that are involved in the generated split net into these split net names. The master names of these blocks is embedded into a substring of the new net name. This substring starts with the master name of the driving block, followed by a sequence of all the load blocks master names, separated by double underscore characters. This option is false by default.

The names are composed as follows:

If Suffix name tag style (default):

BaseNetName + "__" + BlockBasedSubString + "__" + NameTag + __ IndexNumber

If Prefix name tag style:

NameTag + "_" + IndexNumber + "__" + BaseNetName + "__" + BlockBasedSubString

Note that this only applies to split nets that connect one block to one or more other blocks. It WILL NOT apply to any split net that has a top port connection in the block in which the split net belongs.

Routing objects which have no net associated with them are pushed down into the block with no net association in the block. Because there is no net association, there is no need to create new ports on the block. Any remaining top-level segments of the routing object continue to have no net association.

The command creates block pins for terminals which overlap a block, even if the net has no routing. All terminals created in blocks are created with fixed status. When terminals are pushed down into blocks as block terminals, they remain in the top cell. They are never removed, regardless of the top_action. If a net has preexisting connections to a block and those preexisting connections have preexisting physical pins, but the routing does not touch those pins, such pins will be deleted unless they have a fixed status.

Attributes are copied from the corresponding top-cell object for all objects created in child blocks.

Wire-stubs are supported in signal routing push-down, but only supports scenarios where the routing crosses a given block instance one time. If it crosses a block, exits, and then recrosses the block (either by looping back or if the block is rectilinear

in such a way that the block gets crossed more than one time), then the tool issues an error message and the net is rejected for push-down. This is because such a routing might require multiple child block nets, but for wire-stubs the tool assumes that all routing in a block belongs to one child net.

By default, when pins (terminals in blocks) are created as a result of push-down of a signal or PG routing, they are created as squares. The length of the created pin (the distance from the edge that touches a boundary to the opposite pin edge) is the same as the wire width for the wire that was used to create the pin. However, the pin length might be extended to a length that is longer than the wire width under either of these two conditions: 1) a minLength rule exists for the layer of the pin (where the minLength is larger than the wire width) or 2) a length determined by the minArea rule where the calculated length is larger than the wire width or the minLength rule.

Abutted Pin Synthesis Support

The command supports an option for validating designs with routing pushed into abutting multiply instantiated blocks (MIBs). After the command pushes down all routing and terminals, the command determines if any newly-created MIB pins abut another block edge. If the MIB pins abut a block edit, the tool examines the relationship of the abutting pin with the adjacent block and creates a corresponding pin on the adjacent block. If there is a previously existing logical connection between the new pin (which is a single pin with no abutted pin initially), the tool creates an abutting physical pin to abut the previously single pin. If no logical connection exists with the adjacent block, then either a new pin with a dangling net will be created in the adjacent block (in the event that the single pin is an output pin), or if the single pin is an input pin, then a tie-low net will be used in the adjacent block and an abutting pin will be created.

If the new pin resulting from the **push_down_objects** command on an MIB block is a feedthrough pin, and it abuts with another newly-created MIB feedthrough pin, then a new net will be created to stitch the two MIB feedthrough pins together.

This feature can be activated by setting the **plan.pins.synthesize_abutted_pins** application option to true.

Note that abutted pin synthesis only supports pin propagation for connections created as a result of feedthrough push-down, which will result in a single physical pin per logical connection. Multiple physical pins for the particular block port are not supported in abutted pin synthesis. Such pins are referred to as EEQ (Electrically Equivalent) pins, and these normally result from pushing down PG routing which cross the block boundary at multiple locations, but which only uses one block port for all the crossings.

- **routing_guide** and **blockage**
  If the **routing_guide** or **blockage** (placement, shaping, routing) objects are included in *object_collection*, and the routing guides or blockages overlap the block boundaries, the overlapping section of the top-level object is pushed down into the block. New routing guides or blockages are created based on the nonoverlapping sections and the tool removes the original top routing guides or blockages.

  The valid actions for routing guides and blockages (placement, shaping, routing) are:

  set_push_down_object_options -top_action keep
  set_push_down_object_options -top_action remove
  set_push_down_object_options -block_action copy

  The default actions for the routing guide and blockage objects are:

  set_push_down_object_options -top_action remove
  set_push_down_object_options -block_action copy

  If **set_push_down_object_options -top_action remove** and **set_push_down_object_options -block_action copy** are specified, the tool pushes the overlapping section of the routing guides or blockages down into the block. The top original routing guides and blockages are removed and new routing guides and blockages are created based on the nonoverlapping sections.

  If **set_push_down_object_options -top_action keep** and **set_push_down_object_options -block_action copy** are specified, the overlapping sections are copied into the block and the original top-level physical objects are untouched.

- **pin_guide** and **pin_blockage**
  If the **pin_guide** or **pin_blockage** objects are included in *object_collection*, and the pin guides or pin blockages overlap the

block boundaries, and the associated pin guide or pin blockages objects have connections to the block, and the block is the parent of the pin guide, the whole pin guide or pin blockage is pushed down into the block. New pin guides or pin blockages are created based on the boundaries of the original top pin guides or pin blockages.

For pin blockages specifically, the blockage will be pushed into the overlapped block if the blockage has NO associations at all. If, the blockage does have associations, but not to the current overlapped block, then it is not pushed into the block. So in effect, NO ASSOCIATIONS is equivalent to association with all blocks.

The valid actions for pin guides and pin blockages are:

set_push_down_object_options -top_action keep
set_push_down_object_options -top_action remove
set_push_down_object_options -block_action copy

The default actions for the pin guide and pin blockage are:

set_push_down_object_options -top_action keep
set_push_down_object_options -block_action copy

If **set_push_down_object_options -top_action remove** and **set_push_down_object_options -block_action copy** are specified, the pin guides or pin blockages are pushed down into the block and the top original pin guide and pin blockage are removed.

If **set_push_down_object_options -top_action keep** and **set_push_down_object_options -block_action copy** are specified, the pin guides or pin blockages are copied into the block and the original top-level physical objects are untouched.

- **site_rows**
  If standalone **site rows** (those not part of a site array) are included in the *object_collection*, those standalone site rows that overlap block boundaries are copied into the block. Along with the site rows, wire tracks are automatically pushed down when site rows are pushed down. All wire tracks over the blocks are pushed down. If there are standalone site rows being pushed into the block, the preexisting site rows are erased and site rows are created.

  If there are wire tracks being pushed into the block, all preexisting wire tracks with the "copied_down" shadow status in the block are erased and new wire tracks are created. Wire tracks are not removed from the top block during this site row and wire track push-down.

  Note that if MIB block instances are present and are misaligned, then this will be detected by the command. If all block instances are considered for push-down (the default... meaning the -cells option is not used) then site rows will not be pushed into any blocks. This can be worked around by either setting the **-ignore_misalignment** option in **set_push_down_object_options** to true:

  Or, you can push down into specific non-MIB instances using the **-cells** option. For non-MIB instances, the use of **-cells** will disregard any MIB misalignment.

  Or just fix the MIB misalignment issue and run site row push-down again.

  The are no top or block actions for site rows.

- **site_arrays**
  If **site arrays** are included in the *object_collection*, site arrays that overlap block boundaries are copied into the block. Along with the site arrays, wire tracks which are non-derived (they don't belong to any site array in the parent block) are automatically pushed down when site arrays are pushed down. All non-derived wire tracks over the blocks are pushed down. If there are preexisting wire tracks in the block, the preexisting non-derived wire tracks with the copied-down shadow status or site arrays of the same name are erased and new wire tracks and site arrays are created. Wire tracks are not removed from the top site during this site array and wire track push-down. The exception to this rule is that if wire tracks exist in the top block that belong to a site array that is pushed down, then some, or all of such site-array-owned tracks will be removed from the top. If a default site array is specified for push-down into a block, any existing default site array (along with any preexisting non-site-array standalone site rows) in the block is deleted before push-down, and replaced with the new pushed-down default site array. Default site arrays are never removed from the top after push-down. Nondefault site arrays

are removed automatically from the top block if the site array boundary is completely enclosed within the block instance boundary, but kept otherwise.

Note that if user-created wire tracks exist in a block that a site array is pushed into, these will not automatically be deleted during wire track push-down associated with site-array push-down. The command will ONLY pre-delete wire tracks which have the "copied_down" shadow status.

There are no top or block actions for site arrays.

- **cells**
  If **cells** are included in the *object_collection*, cell instances that overlap block boundaries are copied into the block that is overlapped. Cells specified for push-down can reside in any physical level of the top-design's physical hierarchy. When multiple cells are pushed down, any nets that connect to only these cells are automatically pushed down into the block also. Any routing associated with these internal nets is automatically pushed down also. The same is true for any cells that have a preexisting connection to the block, and that net does not connect to any other cell besides one (or more) being pushed down. This is a mandatory action because the top-level net is removed from the top-level cell. This action is not controlled by any option which can be set with the **set_push_down_object_options** command.

  If the cells being pushed into the specified block are connected to PG nets, then the command will connect the cells in the block to the child-level PG nets that are connected to the block in the top. If, for some reason, these PG nets are not connected to the block in the top, the command will create new PG ports and nets and connect the cells in the block to these new ports/nets. The ports and nets will have a name appendage added to the name of the PG nets in the top. For example, VSS in the top will be created in the block as VSS__PUSHDOWN.

  By default, a block port becomes obsolete if all cells connected to the that port have been pushed into the block. The command deletes the obsolete port and issues an informational message (limited to 10 by default) when removing the port. To force the tool to retain obsolete ports, specify the block_action retain_obsolete_ports, by using the **set_push_down_object_options** command. If this option is specified, the command will retain these ports as floating ports on the block.

  If multiply instantiated block (MIB) instances exist and cells are specified for push-down into more than one of these instances, the command will push down cells into each instance separately, if the cells are at different locations over the block relative to the block's origin.

  The command has special support for cells which identically overlap different MIB instances. This means that each instance has the same pattern of cell overlap, (such as a chain of repeaters where each chain is overlapping each instance identically and each cell in the chain is the exact same type as a counterpart cell in a chain overlapping another MIB instance). When this is detected by the command, the command pushes the chain into one of the instances, and then essentially reuses that chain for the other instances, and just connects the new port instances for the other MIB instances.

  If a cell being pushed down overlaps more than one block (if the **-blocks** option is used, then if more than one of the specified blocks), then the command reports the partial overlap with all of the blocks that the cell overlaps, and it chooses a block to push down into based upon which block has the most area overlap with the push-down cell. If the area of overlap with multiple blocks is equal for multiple blocks, then the command chooses the block whose boundary contains the push-down cell's origin (assuming the origin lies on top of a pushable block). If the push-down cell's origin is not within the boundary of a pushable block instance, then the command chooses the block whose origin is closest to the cell's origin.

  The valid actions for cells are **set_push_down_object_options -top_action remove** and **set_push_down_object_options -top_action keep** (for physical-only cell pushdown ONLY) and **set_push_down_object_options -block_action copy | create_blockage**.

  If you specify **set_push_down_object_options -block_action copy**, (mutually exclusive with **create_blockage**), the command **push_down_objects** creates a copy of the top-level cell instance in the block. Block ports and nets are created if necessary.

  If you specify **set_push_down_object_options -block_action create_blockage**, (mutually exclusive with **copy**), the **push_down_objects** creates a placement blockage in the block. The netlist is unaffected in both the top and block. The original top-level cell instance is retained in the top block without regard to the -top_action option setting.

If you specify **set_push_down_object_options -object_type cells -allow_multi_rail_cells true**, (only allowed in combination with the **cells** object type), the **push_down_objects** will allow the push-down of MV type cells with multi-rails and no UPF strategy. Without this object-type-specific option, the command will issue an error message and prevent the push-down of cells of this type.

If you specify **set_push_down_object_options -object_type cells -top_action keep**, the command will ONLY push-down physical-only cells, and disregard all other cell type during that push-down session. The physical-only cells created in the blocks will be created with the "copied-down" shadow status, and no nets or ports will be created in the block. The physical-only cells in the top will be untouched.

- **routing_corridor**
  If **routing corridors** are included in the *object_collection*, routing corridors that overlap block boundaries are copied into the block. All nets which are associated with the top-block routing corridor being pushed down are searched for in the block and if a block-level net is found to be connected to the top-level net, then the block-level counterpart gets associated with the new routing corridor in the block. If no block-level nets can be found in the block which map to those in the parent block (by port connection), then the routing corridor in the block will still be created, but with no net associations. If a routing corridor exists in the block with the same name as the one being copied down, and it possesses the copied-down shadow status, it is removed and replaced with the one being copied down.

- **charging_station**
  If **charging_stations** (also referred to as gas stations, which are non-primary voltage areas in MV designs which have associated single-rail repeater cells) are included in the *object_collection*, the command examines the regions of the top-level charging station, and the cells it owns, and determines if the command can legally propagate the voltage area and its cells to the deepest block (in terms of physical hierarchy depth) that the voltage area overlaps. The voltage area must completely fit into that block, and that block must already have UPF supply nets that are equivalent to those associated with the charging station in the top. If the command concludes that it can successfully accommodate the UPF requirements, and the cells are found to be only single-rail repeater buffers or inverters, then the command will create a new charging station in the target block (the deepest overlapped block) and then push the repeater cells down a physical level at a time, propagating all signal ports and nets as it pushes the repeater cells down to the destination target block. It then associates the new cells with the new voltage area and applies all necessary UPF connections and constraints to the new cells and all new ports created on the way down.

  The new charging station will receive all user attributes that existed on the top-level charging station (Voltage Area) and the new repeater cells will also receive copies of user attributes from the top-level repeater cells.

  The charging station is removed from the top if all of its regions were pushed down into the destination block. If only some of the charging station's regions were pushed down, then only those regions are removed from the top block.

  All new charging stations and associated repeater cells are given the appropriate shadow status (pushed-down or copied-down).

  The only valid top action for charging_station objects is *remove*, and the only valid block action for charging_station objects is *copy*. These are also the default top and block actions for *charging_station* objects.

DESCRIPTION

This command transfers objects from the top level to the block level. It will continue pushing down objects to the deepest physical depth as controlled by the command **set_editability** .

The **set_editability** command can enable or disable the **push_down_objects** command for blocks or levels of physical hierarchy. The **push_down_objects** command has no effect on the blocks that are disabled by **set_editability**. It will refrain from pushing further into a block if that block has been marked disabled.

By default, the name marker suffix "__PUSHDOWN" is appended to new cells, ports, and nets created by this command after push-down of routing and cells. You can override this name marker by using the **plan.pins.new_port_name_tag** and/or

plan.pins.new_cell_name_tag application options as follows:

set_app_options -name plan.pins.new_cell_name_tag -value "MYLABEL"
set_app_options -name plan.pins.new_port_name_tag -value "MYTAG"

By default, the tool appends the name marker at the end port or net name. Use the **plan.pins.new_port_name_tag_style** application option to put the name marker at the front of the port name as a prefix.

set_app_options -name plan.pins.new_port_name_tag_style -value "prefix"

Note that this command invokes some setup commands, such as linking blocks and initializing UPF, before it begins to push down objects. For large designs, this can take from a second to minutes. For this reason, it is advisable to run this command on multiple nets instead of one net at a time.

Note that if buses are to be pushed down into blocks as feedthroughs, it is important that all nets of the bus are pushed down in the same call to the **push_down_objects** command, so that the feedthrough ports can be correctly defined as bus ports on the blocks that the bus feeds through. If a net of a bus is pushed down on bit at a time, bus port creation will not be correctly defined for the feedthroughs resulting from bus net push-down.

EXAMPLES

The following example pushes down the routing objects of power and ground nets.

```
prompt> push_down_objects [get_nets {VDD VSS}]
```

The following example pushes down the routing all paths.

```
prompt> push_down_objects [get_shapes]
```

The following example pushes down the routing all paths and vias.

```
prompt> change_selection [get_shapes]
prompt> change_selection [add_to_collection [get_selection] [get_vias]]
prompt> push_down_objects [get_selection]
```

The following example pushes down all placement blockages.

```
prompt> push_down_objects [get_placement_blockages]
```

The following example pushes down all routing blockages.

```
prompt> push_down_objects [get_routing_blockages]
```

The following example pushes down all routing guides into block A.

```
prompt> push_down_objects [get_routing_guides] -blocks [get_cells A]
```

The following example pushes down the buffer BUF1 into block A

```
prompt> push_down_objects [get_cells BUF1] -blocks [get_cells A]
```

The following example pushes down all standalone site rows.

```
prompt> push_down_objects [get_site_rows -filter "is_derived==false"]
```

The following example pushes down all site arrays.

```
prompt> push_down_objects [get_site_arrays]
```

The following example pushes down all site routing corridors.

```
prompt> push_down_objects [get_routing_corridors]
```

The following example pushes down a charging station (or gas station), and all repeater cells belonging to that voltage area that overlap blocks.

```
prompt> push_down_objects [get_voltage_areas cs_00]
```

push_rdl_routes

Moves routed redistribution layer (RDL) wires either in a specified direction or away from the specified nets.

SYNTAX

status **push_rdl_routes**
[-nets *collection_of_nets* | -nets_in_file *nets_file*]
[-objects *collection_of_objects*]
-layer *tech_layer_name*
[-mode net | neighbor]
[-direction up | down | left | right]
[-sweep_range *sweep_range*]
[-bounding_box *{ {llx lly} {urx ury} }*]

Data Types

collection_of_nets collection
nets_file string
tech_layer_name string
sweep_range integer
llx float
lly float
urx float
ury float
collection_of_objects collection

ARGUMENTS

-nets *collection_of_nets*

Specifies the RDL nets to be pushed when using the **-mode net** option. For the **-mode neighbor** option, the **-nets** option specifies the net to push routed wires away from.

-nets_in_file *file_name*

Specifies the name of the file that contains the RDL nets to be pushed when using the **-mode net** option.

The **-nets_in_file** and **-mode neighbor** options are mutually exclusive.

-nets has higher priority than **-nets_in_file**.

-objects *collection_of_objects*

Specifies the RDL nets (see **-nets**) by cells or pins. Only the sub-nets which involve the cells or pins are affected.

If the app option **flip_chip.route.routing_style** is **spanning_tree**, the whole nets of the cells or pins are regarded as involved.

You must specify one of these options: **-nets**, **-nets_in_file**, or **-objects**.

-layer *tech_layer_name*

Specifies the metal layer on which to push the specified RDL wires. You can specify only one metal layer. Specify the metal layer by using its technology file layer name.

This option is required.

-mode net | neighbor

Specify the mode used to move RDL nets. If you do not specify this option the command uses **-mode net** by default.

In the net push mode, the command pushes the RDL nets in the direction specified by the **-direction** option. A wire is pushed until it is totally blocked by a routing obstruction (a metal blockage or wire) or it meets the bounding box of the target routed net. When a wire is blocked, the tool splits the wire and tries to push parts of the wire. For example, assume that a vertical wire A is being pushed to the right, as shown in Figure 1, but blockage B partially blocks the path. When the tool finishes pushing the wire, wire A is split into 3 parts: vertical segment A1, horizontal segment C, and vertical segment A2, as shown in Figure 2.

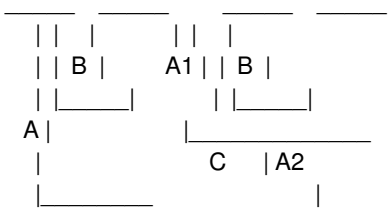

Figure 1 Figure 2

When pushing wires, the tool respects the spacing requirements defined by the **set_app_options {flip_chip.route.layer_bump_spacings list}** command.

In the neighbor push mode, the command pushes the nearest 2xN nets away from a specific net, where N is specified by the **-sweep_range N** option. You can specify only one net at a time.

-direction up | down | left | right

Specifies the direction in which to push the RDL nets.

This option must always be used with the **-mode net** option but never with the **-mode neighbor** option. If you do not specify the direction together with the **-mode net** option, the tool does not push any wires.

-sweep_range *sweep_range*

Specifies the sweep range value used together with the **-mode neighbor** option. The range should be from 1 to 40. Values outside the expected range result in an error. The default is 10.

-bounding_box *{ {llx lly} {urx ury} }*

Specifies a window within which to limit the push operation. For example, assume that you push net A up and you specify a window W as shown in Figure 3. After the push operation, net A is pushed but is kept within window W, as shown in Figure 4.

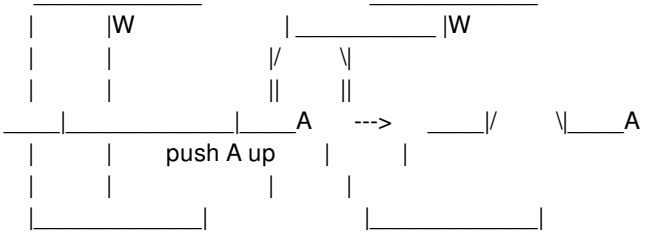

Figure 3 Figure 4

You must also specify the **-mode net** option when you specify the **-bounding_box** option.

The unit for this option is microns.

DESCRIPTION

This command moves routed RDL wires and supports several types of push operations.

When you push an RDL wire by using the **push_rdl_routes** command, the tool moves the wire in the specified direction until the wire is blocked by an obstacle. The command respects the spacing requirements defined by the **create_routing_rule -spacings** command. The RDL wires remain on their original metal layer and the connectivity is not changed.

RDL nets are nets in flip-chip designs or 3DIC designs which are routed on the redistribution layer. In a flip-chip design, RDL nets connect a bump cell to driver I/O cells. In a 3DIC or interposer design, RDL nets can connect the following elements:

- A micro-bump cell and a micro-bump cell
- A micro-bump cell and a TSV (through silicon via) cell
- A micro-bump cell and driver I/O cell

Micro-bump cells are also called flip-chip pads.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following command pushes the NET1 and NET2 rdl nets on the METAL7 metal layer in the upward direction.

```
prompt> push_rdl_routes -layer METAL7 -mode net \
  -nets {NET1 NET2} -direction up
```

The following command pushes 40 neighboring nets (20 on each side) away from the NET3 RDL net on the METAL9 layer.

```
prompt> push_rdl_routes -layer METAL9 -mode neighbor \
  -nets NET3 -sweep_range 20
```

query_objects

Searches for and displays objects in the database.

SYNTAX

string **query_objects**
[-verbose]
[-truncate *elem_count*]
[-class *class_name*]
object_spec

Data Types

class_name	string
elem_count	int
object_spec	list

ARGUMENTS

-verbose

Displays the class of each object found.

By default, the command lists only the name of each object. When you use this option, the command lists prefixes the name of each object with its class, as shown in the EXAMPLES section.

-truncate *elem_count*

Truncates the display to *elem_count* elements.

By default, the command displays up to 100 elements. To change the number of elements displayed by the command, use this option. To see all elements, set the *elem_count* value to 0.

-class *class_name*

Specifies the class used to search for objects when an element in the *object_spec* argument is not a collection. Valid classes are application-specific.

If you do not specify this option, the command displays only those elements in the *object_spec* argument that are collections and displays an error message for any other elements, as shown in the EXAMPLES section.

object_spec

Specifies the objects to find and display. Each element in the list is either a collection or a pattern.

- When you specify a collection, the command displays the contents of the collection.

- When you specify a pattern, the command searches the database for objects of the class specified in the **-class** option. If you do not specify the **-class** option, the command issues an error message for the pattern.

DESCRIPTION

The **query_objects** command finds and displays objects in the application's runtime database. The command does not have a meaningful return value; it displays the objects found and returns an empty string.

To control the number of elements displayed, use the **-truncate** option. If the display is truncated, the command prints an ellipsis (...) as the last element. If the default truncation occurs, the command displays a message that shows the total number of elements that would have displayed, as shown in the EXAMPLES section.

Although the output from the **query_objects** command looks similar to the output from any command that creates a collection, the **query_objects** command always returns an empty string.

The **query_objects** command displays the output in either a Legacy format or in a Tcl compatible format. The default output format varies by tool but you can control the format yourself by setting the **query_objects_format** variable. For example, to force Tcl-compatible output use this command:

```
prompt> set_app_var query_objects_format Tcl
Tcl
```

The EXAMPLES section shows output in both the Legacy and Tcl formats.

EXAMPLES

These following examples show the basic usage of the **query_objects** command in both Legacy and Tcl format.

```
prompt> set_app_var query_objects_format Legacy
Legacy
prompt> query_objects [get_cells o*]
{"or1", "or2", "or3"}
prompt> query_objects -class cell U*
{"U1", "U2"}
prompt> query_objects -verbose -class cell \
?   [list U* [get_nets n1]]
{"cell:U1", "cell:U2", "net:n1"}
prompt> set_app_var query_objects_format Tcl
Tcl
prompt> query_objects [get_cells o*]
{or1 or2 or3}
pt_shell> query_objects -class cell U*
{U1 U2}
pt_shell> query_objects -verbose -class cell \
?   [list U* [get_nets n1]]
{{cell U1} {cell U2} {net n1}}
```

When you omit the **-class** option, only those elements of the *object_spec* argument that are collections generate output. The other elements generate error messages.

```
prompt> query_objects [list U* [get_nets n1] n*]
```

```
Error: No such collection 'U*' (SEL-001)
Error: No such collection 'n*' (SEL-001)
{"n1"}
```

When the output is truncated, the command prints an the ellipsis at the end of the display. For the following example, assume the default truncation is 5 (it is actually 100).

```
prompt> query_objects [get_cells o*] -truncate 2
{"or1", "or2", ...}
prompt> query_objects [get_cells *]
{"or1", "or2", "or3", "U1", "U2", ...}
Output truncated (total objects 126)
```

query_pg_extension

Check PG wire shapes meet the requirement that wire shape has desired extension against siterow.

SYNTAX

status **query_pg_extension**
[-net *netname_list*]
[-layer *layer_name*]
[-extension_value *value*]

Data Types

netname_list list
layer_name string
value float

ARGUMENTS

-net *netname_list*

Specifies the name of power or ground nets for wire shape checking. This option combines with **layer** to filter desired shapes. This is a required option.

-layer *layer_name*

Specifies the name of layer for wire shape checking. This option combines with **net** to filter desired shapes. This is a required option.

-extension_value *value*

Specifies a specific value for checking the distance between wire end and siterow

DESCRIPTION

This command checks the distance between wire ends and siterow. If the distance doesn't equal to **extension_value**, it will return the name of the shape.

EXAMPLES

The following example performs checking PG wire extension to siterow.

```
prompt> query_pg_extension \
   -net VDD
   -layer M1
   -extension_value 0.2
```

query_qor_snapshot

Analyzes timing report files from existing QoR snapshots, applies any specified filters, and displays the results in an appropriate format.

SYNTAX

status **query_qor_snapshot**
-name *snapshot_name*
[-directory *directory_name*]
[-type min | max]
[-output_file *file_name*]
[-display]
[-sort_by *column*]
[-group_by *column*]
[-columns *column_list*]
[-and *column_list*]
[-filters *filter_list*]

Data Types

snapshot_name string
directory_name string
column string
column_list list of strings
filter_list string

ARGUMENTS

-name *snapshot_name*

Specifies the name of the Query QoR snapshot result to be analyzed. This is a required option.

-directory *directory_name*

Specifies the name of the directory to search for the Query QoR snapshot specified by the **-name** option.

If you do not specify this option, the tool searches for the QoR snapshot in the directory specified by the application option **time.snapshot_storage_location**.

-type min | max

Loads the appropriate snapshot setup report if you specify **max** and hold report if you specify **min**. This option can only be specified together with the **-name** option.

The default is **max** for loading setup.

/\" .IP "-incremental" /\" Queries the previous queried result instead of querying from scratch. /\" This option and the **-name** option are mutually exclusive. You must /\" specify one of them. /\" /\"

-output_file *file_name*

Specifies the name of the generated output html file.

-sort_by *column_list*

Specifies the column used to sort the results. The default is wns.

To sort a column in descending order, specify "*column_name*" or "+*column_name*". To sort a column in ascending order, specify "-*column_name*". Two exceptions: *wns* and *zero_path* columns have their default sorting order reversed (*+wns* results in an ascending sort). This is so that the default sort order for a column produces the most meaningful sorting order (descending for most numeric columns).

Valid sort columns are: path_group, startpoint, endpoint, scenario, wns, transition_degradation, slew_degradation, zero_path, logic_levels, path_delay, input_delay, output_delay, clock_uncertainty, incremental, transition_time, capacitance, fanout, clock_skew, launch_clock, launch_clock_latency, capture_clock, capture_clock_latency, bufinvcount, io_path, and cross_clock.

-group_by *column_list*

Specifies the column used to group the results. This option groups the results based on the unique values found for this column to create a summary that links to details for that value of the column.

Valid group columns are: path_group, startpoint, endpoint, scenario, launch_clock, capture_clock, bufinvcount, logic_levels, cross_clock and io_path.

-columns *column_list*

Specifies the list of columns to include in the output. The columns are displayed in the specified order. The columns should be separated with spaces. If you specify a column multiple times, its location is determined by the last instance.

Valid columns are: path_group, startpoint, endpoint, scenario, wns, transition_degradation, slew_degradation, derate, zero_path, logic_levels, path_delay, input_delay, output_delay, clock_uncertainty, incremental, transition_time, capacitance, fanout, clock_skew, launch_clock, launch_clock_latency, capture_clock, capture_clock_latency, bufinvcount, cross_clock, io_path, instance_mcnt, libcell_mcnt.

To show all available columns in a predetermined order, specify the **-columns all** option.

Note: You can specify the column names as minimally-distinct strings. That is, instead of using capacitance, you can use "capa" or even "paci", since no other column name contains that sequence of letters.

-filters *filter_list*

Specifies a list of filters to apply to the paths analyzed from the timing report. The specified filters are applied with OR logic; all paths matching any specified filter are selected.

Each filter consists of a filter option and its argument. Most filters accept a range of either floating point or integer numbers as an argument. The argument range consists of two numbers separated by a comma. The first number is the lower bound and the second number is the upper bound. You can also specify just one number. In this case, it is interpreted as the lower bound, unless it is preceded by a comma. If the number is preceded by a comma, it is interpreted as the upper bound.

You can specify one or more of the following filters:

- -wns *lower_bound*,*upper_bound*
  Includes all paths that have a worst negative slack (WNS) within the specified floating point range.
- -transition_degradation *lower_bound*,*upper_bound*

Includes all paths that have their transition degradation ratio (output pin transition time / input pin transition time) within the specified floating point range.

- -slew_degradation *lower_bound*,*upper_bound*
  Includes all paths that have a slew degradation (input pin transition / last stage output pin transition) within the specified floating point range.
- -logic_level *lower_bound*,*upper_bound*
  Includes all paths that have their number of logic levels within the specified integer range.
- -fanout *lower_bound*,*upper_bound*
  Includes all paths that have their worst fanout within the specified integer range.
- -input_delay *lower_bound*,*upper_bound*
  Includes all paths that have an external input delay within the specified floating point range.
- -output_delay *lower_bound*,*upper_bound*
  Includes all paths that have an external output delay within the specified floating point range.
- -clock_uncertainty *lower_bound*,*upper_bound*
  Includes all paths that have clock uncertainty within the specified floating point range.
- -zero_path *lower_bound*,*upper_bound*
  Includes all paths with a zero-path margin within the specified floating point range.
- -clock_skew *lower_bound*,*upper_bound*
  Includes all paths that have clock skew within the specified floating point range.
- -path_delay *lower_bound*,*upper_bound*
  Includes all paths that have a path delay within the specified floating point range.
- -transition_time *lower_bound*,*upper_bound*
  Includes all paths that have a transition time within the specified floating point range.
- -capacitance *lower_bound*,*upper_bound*
  Includes all paths that have their worst capacitance within the specified floating point range.
- -derate *lower_bound*,*upper_bound*
  Includes all paths that have their timing derate within the specified floating point range.
- -incremental *lower_bound*,*upper_bound*
  Includes all paths that have an incremental value within the specified floating point range.
- -bufinvcount *lower_bound*,*upper_bound*
  Includes all paths that have their buffer+inverter count within the specified integer range.
- -io_path *lower_bound*,*upper_bound*
  Include all paths that contain an input or output element in their path. Input/Output elements are: (in), (inout) or (out).
- -cross_clock *lower_bound*,*upper_bound*
  Includes all paths that have different values for the launch and capture clocks. Paths with the same launch and capture clocks will have a value of 0 for this attribute, and paths with different launch and capture clocks will have an attribute of 1.
- -launch_clock *pattern*
  Includes all paths whose launch clock name matches the pattern. You can specify multiple patterns by using the OR operator, "|". Wildcards are supported in the pattern at the beginning or end.
- -capture_clock *pattern*
  Includes all paths whose capture clock name matches the pattern. You can specify multiple patterns by using the OR operator, "|". Wildcards are supported in the pattern at the beginning or end.

- -path_group *pattern*
  Includes all paths whose path group matches the pattern. You can specify multiple patterns by using the OR operator, "|". Wildcards are supported in the pattern at the beginning or end.

- -startpoint *pattern*
  Includes all paths whose startpoint matches the pattern. You can specify multiple patterns by using the OR operator, "|". Wildcards are supported in the pattern at the beginning or end.

- -endpoint *pattern*
  Includes all paths whose endpoint matches the pattern. You can specify multiple patterns by using the OR operator, "|". Wildcards are supported in the pattern at the beginning or end.

- -scenario *pattern*
  Includes all paths whose scenario matches the pattern. You can specify multiple patterns by using the OR operator, "|". Wildcards are supported in the pattern at the beginning or end.

- -instance *pattern*
  Includes all paths that contain an instance matching the pattern. You can specify multiple patterns by using the OR operator, "|". Wildcards are supported in the pattern.

- -file_instance *file_name*
  Includes all paths that contain an instance that matches any of the patterns listed in the specified file (patterns can be separated by space or a newline). Patterns take the same form as those for -instance.

- -libcell *pattern*
  Includes all paths that contain a library cell matching the pattern. You can specify multiple patterns by using the OR operator, "|". Wildcards are supported in the pattern.

- -instance_mcnt *lower_bound*,*upper_bound*
  Includes all paths for which the total count of matches of any of -instance or -file_instance patterns is within the specified range.

- -libcell_mcnt *lower_bound*,*upper_bound*
  Includes all paths for which the total count of matches of any -libcell pattern is within the specified range.

  If you do not specify this option, the following filters are applied:

  -filters "-wns ,0 -zero_path ,0 -fanout 40 -transition_degradation 2.0
  -slew_degradation 2.0 -logic_levels 50"

-and *column_list*

Specifies a list of filters to apply with AND logic. These filters are applied to the paths that pass the filters specified in the **-filters** option. Paths that match one or more OR filters and all AND filters are included in the result.

For example, if you specify **-filters "-wns ,-3.0 -cross_clock 1"**, the command reports the paths with timing violations where WNS is worse than -3.0 OR -cross_clock is true. If you specify **-filters "-wns ,-3.0 -cross_clock 1" -and wns**, the command reports the paths with timing violations where WNS is worse than -3.0 and -cross_clock is true.

DESCRIPTION

The **query_qor_snapshot** command analyzes timing report files from existing QoR snapshots, applies any specified filters, and displays the results in an appropriate format. You can specify which columns to output with the **-columns** option, and which filters to apply as AND filters with the **-and** option.

Multicorner-Multimode Support

This command has no dependency on scenario-specific, mode-specific, or corner-specific information.

EXAMPLES

Before running the **query_qor_snapshot** command, you must run the **create_qor_snapshot** command to generate the snapshot data, as shown in the following example:

```
prompt> create_qor_snapshot -name place_opt
```

In the following example, the **query_qor_snapshot** command analyzes a QoR snapshot named preroute, which is saved under the snapshot directory and reports the values with WNS between -2.0 and -1.0.

```
prompt> query_qor_snapshot -name preroute -filters "-wns -2.0,-1.0"
```

In the following example, the **query_qor_snapshot** command analyzes QoR snapshot named placeopt, which is saved under the snapshot directory and reports the values with WNS less than -1.0 or fanout over 40.

```
prompt> query_qor_snapshot -name placeopt -filters "-wns ,-1.0 -fanout 40"
```

The following example shows all paths that have WNS less than zero.

```
prompt> query_qor_snapshot -name timing_report -filters "-wns ,0"
```

The following example shows all paths that have cells with output or input transition time over 2 ns.

```
prompt> query_qor_snapshot -name timing_report \
  -filters "-transition_degradation 2"
```

The following example shows all paths that have path stages with slew degradation over 3 ns.

```
prompt> query_qor_snapshot -name timing_report \
  -filters "-slew_degradation 3"
```

The following example shows all paths that have over 50 logic levels:

```
prompt> query_qor_snapshot -name timing_report \
  -filters "-logic_level 50"
```

The following example shows all paths that have cells with a fanout over 40.

```
prompt> query_qor_snapshot -name timing_report -filters "-fanout 40"
```

The following example looks at all timing paths that match the worst negative slack (WNS) filter or zero-path filter. If the WNS violation is more than -10 ns or the path violates zero-path delay.

```
prompt> query_qor_snapshot -name timing_report \
  -filter "-wns ,-10.0 -zero_path ,0"
```

time.snapshot_storage_location(3)

quit!

quits the application without posting an application exit dialog

SYNTAX

quit!

ARGUMENTS

None.

DESCRIPTION

This command is an alternative to the **quit** command. When called with the GUI up, the **quit** command posts an application exit dialog. To avoid having to "deal with" the exit dialog, the user can instead call the **quit!** command which is guaranteed to exit the application without posting a GUI exit dialog.

EXAMPLES

icc_shell> **quit!**

SEE ALSO

quit(2)

quit

Exits the shell.

SYNTAX

string **quit**

ARGUMENTS

The **quit** command has no arguments.

DESCRIPTION

The **quit** command exits from the application. It is basically a synonym for the **exit** command with no arguments. If there are pending jobs from **redirect -bg, then quit will wait for the jobs to complete before exiting.**

EXAMPLES

The following example exits the current session:

```
prompt> quit
```

SEE ALSO

exit(2)

read_aif

Reads in one AIF (Advanced Input Format) file.

SYNTAX

status **read_aif**
[-use_port_name]
[-ignore_assign_nets]
[-hierarchy]
[-pad_to_ref_list { {*pad_type ref_name orientation*} ... }]
aif_file_name

Data Types

pad_type string
ref_name string
orientation string
aif_file_name string

ARGUMENTS

-use_port_name

Specifies the connection name read from AIF file to be treated as port name. If not specified then the connection name read from AIF file is treated as net name.

-ignore_assign_nets

Specifies the connection names present in AIF file to be ignored. No net connection is made for the bump instances in the AIF file. If not specified then connections are made for the bump instances in AIF file.

-hierarchy

Specifies the IO/BUMPs are read in across all physically hierarchy levels instead of only in top level.

-pad_to_ref_list { {*pad_type ref_name orientation*} ... }

Allows the reference pad type present in AIF file of bump instances to be remapped to a different reference library bump cell. *pad_type* is the reference pad type present in AIF file and *ref_name* is the different reference library bump cell to which remapping needs to be done. The orientation of bump instance can also be changed than what is present in AIF file by using *orientation*. Valid values of *orientation* are N, W, S, E, FN, FW, FS and FE. *orientation* defaults to N if not specified.

aif_file_name

Specifies name of one AIF file to be read.

DESCRIPTION

Reads bump instances from the AIF file and creates them in the current design, if not already present. Net connections of the bump instances are made according to the connections given in AIF file and the bump instances are placed at coordinates as given in AIF file.

The coordinates given in AIF file are relative and are adjusted with die width and height (also present in AIF file) and reference library bump cell coordinates to calculate actual placement coordinate.

If the connection column in AIF file for a bump instance is "-", then the connection of the bump instance is removed.

The reference library bump cell and orientation as given in AIF file can be overridden by using -pad_to_ref_list option to read_aif.

If input AIF file was created with -hierarchy option then AIF file is not read in and a warning message is issued.

EXAMPLES

In the following example, the file my.aif is read and bump instances are created or updated with net connections as given in my.aif

```
prompt> read_aif my.aif
1
```

In the following example, the file my.aif is read and bump instances with reference pad type as BUMPCELL are changed to BUMP2 and the orientation is also changed to south.

```
prompt> read_aif my.aif -pad_to_ref_list { {BUMPCELL BUMP2 S} }
1
```

SEE ALSO

write_aif(2)

read_block_connection_file

Reads in a text file containing information on the connectivity between different blocks, and generates a new top-level design based on that.

SYNTAX

string **read_block_connection_file**
-connections *file_name*
[-design_name *design_name*]
[-map_file *file_name*]
[-ignore_blocks *cell_names*]

Data Types

design_name string
file_name string
cell_names list

ARGUMENTS

-connections *file_name*

Specifies the name of the input text file containing the block connection information in a standard format. This file should be in CSV format and must contain the connection data in the form of columns. The supported standard column names are as follows:

- Module Instance
- Module Reference
- Module Port
- Module Port Direction
- Connected Module Instance
- Connected Module Reference
- Connected Module Port
- Connected Module Port Direction

The first row of the file should contain all these column names. Some of these columns are optional and can be omitted, and some default values will be assumed in this case. For example, "Module Port Direction" and "Connected Module Port Direction" columns are not required and a value of "inout" will be assumed for them if they are missing.

If any of the required columns are missing, the tool will error out. Unsupported columns will be ignored without any error. To use

your own column names, you can provide a map file through **-map_file** option. The columns could be in any order.

-design_name ***design_name***

Specifies the name of the top-level design created from the connection info. If design name is not specified, it defaults to "TOP". The design must not already exist in the current library.

-map_file ***file_name***

Specifies an optional CSV file which maps custom column names in the connections file to standard Synopsys column names in the form <custom_name>,<standard_name> per line.

For example, the map file contents could be as follows:

```
Main_Ref,Module Reference
Other_Port,Connected Module Port
```

In this example, "Main_Ref" and "Other_Port" are custom column names which can be used in the connections file. The custom column names should not be the same as the standard column names. Also, they must not contain any wildcard or special characters.

-ignore_blocks ***cell_names***

Specifies a list of instances to exclude while creating the top-level netlist. Any line in the input file containing one of these block names will be ignored. Therefore, these blocks will not be instantiated in the final created design.

DESCRIPTION

The **read_block_connection_file** command reads in a text file containing information on the connectivity between different blocks and creates a top-level design based on the information. The input file can describe any kind of connectivity between multiple modules and from modules to the top-level ports. For example, Module1 <-> Module2, Module2 <-> Module3, Module3 <-> TOP, and so on. In other words, there is no restriction on how many instances are specified at the top level, how many connections are there between all the instances, or how and which instances are connected to the top-level ports. If some particular instance needs to be skipped from the top-level design, it can be specified via the **-ignore_blocks** option.

Each line in the input file represents one connection, whether it is between modules, from a module to the top-level, or even between two top-level ports. The connection from a module to the top-level port (i.e. the "outside world") can be specified by using special keyword "_TOP_" as the Instance as well as the Reference name. If data for a column is missing, the default will be assumed wherever possible. For example, "inout" will be assumed if the "Module Port Direction" column entry is blank. However, some fields might not have default values, these lines will emit warnings and be ignored if the field is blank or incorrect. The order of the rows is not important as there is no dependency of one connection on another.

The top-level design will be created in the current library. If the current library is not set, the command creates a library using the input file name. The top-level design will be named "TOP", unless another name is provided with the **-design_name** option. The name should not be same as any pre-existing design name. The command saves the design into the current library and sets it as the current design. This can be verified with the **list_blocks** and **current_block** commands. If required, you can write out a Verilog netlist by using the **write_verilog** command or do further analysis on this design.

Data consistency checks

The **read_block_connection_file** utility will do multiple checks on the input data in order to generate a correct and meaningful top-level netlist. Some of these checks are as follows:

1. There should not be any missing or extra column entries in each row, unless a default value can be assumed for that column

2. No column should be repeated.

3. The map file, if provided, must have exactly two columns delimited by comma. The first column should contain custom (non-standard) column names and the second should be one of the standard column names.

4. The entries should not contain any special characters like ? or *.

5. The number of columns should be uniform across all the rows.

6. The directions specified for a multiply-occurring port or pin should be consistent across the file.

7. Instances of two different modules should not have the same name.

8. For a connection to a top-level port, both the Module name and Instance name should be the special keyword "_TOP_".

Any line with incorrect data format in any file will be ignored and a corresponding Warning message will be issued. If the data provided in the input text files is not consistent and clean, the tool will fail to generate the top-level netlist and error out with appropriate Error message.

EXAMPLES

The following example reads in a CSV file with standard columns and generates a top-level design named "TOP".

```
prompt> read_block_connection_file -connections ./test1.csv
Information: Created top-level design 'TOP'. (TLNL-002)
1
```

The following example reads in a CSV file with custom column names, specifies a map file for the column names, specifies the output design name and creates a design in the current library.

```
prompt> read_block_connection_file -connections test2.csv -map_file map.csv -design_name MY_TOP
Information: Setting 'My_Ref' as a custom name for column name 'Module Reference'. (TLNL-017)
Information: Created top-level design 'MY_TOP'. (TLNL-002)
1
prompt> current_lib
{test2}
prompt> list_blocks
Lib test2 /u/user1/test2 current
  *>  0 MY_TOP.design Sep-07-01:51
1
```

SEE ALSO

current_block(2)
current_lib(2)
list_blocks(2)
write_verilog(2)

read_cell_expansion

Reads the cell expansion data from a file to support ASCII flow.

SYNTAX

int **read_cell_expansion**
[-input *input_file_name*]
[-scale_factor *unit_scale*]

Data Types

input_file_name string
unit_scale float

ARGUMENTS

-input *input_file_name*

Specifies the name of the input expansion data file. This is a required argument.

-scale_factor *unit_scale*

Specifies the scale factor between tools. This is optional.

DESCRIPTION

The **read_cell_expansion** command reads the cell expansion data from a file.

EXAMPLES

The following example reads a cell expansion file and applies it to the current design.

prompt> **read_cell_expansion -input in.exp**

SEE ALSO

write_cell_expansion(2)

read_def

Reads in one or more DEF (Design Exchange Format) files.

SYNTAX

status **read_def**
[-design *block*]
[-syntax_only]
[-no_incremental]
[-convert_sites *conversion_spec*]
[-add_def_only_objects all | cells | nets | ports | none]
[-skip_pg_net_connections]
[-traverse_physical_hierarchy]
file_names
[-include *include_list*]
[-exclude *exclude_list*]

Data Types

block string
conversion_spec list
file_names list
include_list list
exclude_list list

ARGUMENTS

-design *block*

Specifies the block into which to read the DEF files.

When you specify this option, the tool does not link the block before reading the DEF files. You must ensure that the block is linked before you run the **read_def** command.

By default, the command reads the DEF files into the current block. If the current block is not linked, the tool automatically links it before reading the DEF files.

-syntax_only

Indicates that the DEF files are processed only to check the syntax and semantics of the files.

-no_incremental

Removes all existing physical annotations from the current block before reading the DEF files. Currently, this option does not support hierarchical designs.

-convert_sites *conversion_spec*

Specifies the mapping of DEF site names using the following syntax:

{ {*from_site to_site*} ...}

The command converts all DEF rows of site *from_site* to rows of site *to_site*.

-add_def_only_objects all | **cells** | **nets** | **ports** | **none**

Specifies the types of objects that are created by the **read_def** command if they exist in the DEF file but not in the current block. You can specify one or more of the following values, except for **none**, which must be used alone:

- **none** (the default)
  The command does not create cells, nets, or ports if they are not in the current block.
- **cells**
  If a cell exists in the DEF file, but not in the current block, the command creates the cell and connects it to the netlist as specified in the DEF file. The command always creates power and ground net connections; The command creates signal/clock net connections if and only if the pins and the net within the same hierarchy. Otherwise, it ignores signal/clock net connections. If the component name contains hierarchy, the hierarchy must already exist in the design; the command does not create new hierarchical cells.
- **nets**
  If a non-PG net exists in the DEF file, but not in the current block, the command creates the net and connects it to the port specified in the DEF PINS section. If the net name contains hierarchy, the hierarchy must already exist in the design; the command does not create new hierarchical cells.
- **ports**
  If a non-PG port exists in the DEF file, but not in the current block, the command creates the port and connects it to the net specified in the DEF PINS section.
- **all**
  This value is equivalent to specifying **cells**, **nets**, and **ports** at the same time.

-skip_pg_net_connections

Indicates that the **read_def** command skips the PG net connections in the DEF files.

-traverse_physical_hierarchy

Indicates reading design information from the DEF files into a hierarchy design.

cells Only physical-only cells can be created in top or sub block when the option "*-add_def_only_objects cells*", is specified at the same time. Other cells only can be placed at the specified location.

nets Only PG nets can be created in top or sub blocks unless the option "*-add_def_only_objects nets*" is specified at the same time. Only unconnected pins can be connected to the net specified in the DEF netlist. All the wiring shapes can be created in the block that is associated with the net.

pins Only top-block pins can be read in the hierarchy design.

via definitions, routing rules and bounds
They are read into sub block only when they are used by wiring or cells in sub block, otherwise, they are read

into top block.

rows, blockages and tracks
They only can be read into top block.

file_names

Specifies one or more DEF files to read.

-include *include_list*

Specifies which optional constructs and object types to include when reading the DEF file. When you use this option, only the listed optional constructs and object types are read. These are the optional constructs and object types:

blockages
bounds
cells
fills
nets
ports
routing_rules
rows_tracks
scanchains
specialnets
vias
diearea

-exclude *exclude_list*

Specifies which optional constructs and object types to exclude when reading the DEF file. When you use this option, only the listed optional constructs and object types are excluded from being read. The valid values for this option are the same as for the "*-include*" option.

-include and *-exclude* are mutually exclusive options.

DESCRIPTION

Reads design information from the DEF files into the specified block or the current block, based on the **-design** option.

If you use relative path names to specify the DEF files, the command uses the **search_path** variable to locate the files. If you use absolute path names to specify the DEF files, the command does not use the **search_path** variable. To determine the file that the **read_def** command reads, use the **which** command.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example reads the DEF file named my.def into the current block. The command uses the **search_path** variable to locate the DEF file.

```
prompt> read_def my.def
1
```

SEE ALSO

current_block(2)

report_design(2)
remove_blocks(2)
search_path(3)

read_design_io

Reads in a delimited text file that contains location, reference cell, and other information for I/O cells. The command creates or updates the specified I/O elements in the design.

SYNTAX

string **read_design_io**
-file_name_list *file_name_list*
[-map_file *file_name*]
[-delimiter_char *char*]
[-comment_char *char*]
[-c4_ref_name *ref_cell_name*]
[-tsv_ref_name *ref_cell_name*]
[-ubump_ref_name *ref_cell_name*]
[-overlap_check *check_type*]
[-create_ports]
[-power *name_list*]
[-ground *name_list*]
[-die_origin *coordinates*]
[-die_orientation *orientation*]
[-cell_origin_type *string*]
[-units *units_per_micron*]
[-verbose]

Data Types

file_name_list list
file_name string
char string of one character
ref_cell_name string
check_type string
name_list list
units_per_micron integer

ARGUMENTS

-file_name_list *file_name_list*

Specifies the names of one or more input I/O design data files. The files must be ASCII files that contain character delimited values. By default, command is uses as the field separator. A different field separator can be defined via the **-delimiter_char** option. Each row should have exactly same number of fields within a file, however, some fields can be empty in some rows.

-map_file *file_name*

Specifies a CSV file that maps custom column names in the input file to standard Synopsys column names. Custom column names are specified in the first field, and standard Synopsys column names are specified in the second field, separated by a comma.

For example, the following map file maps four custom column names to their corresponding Synopsys column names.

```
IO_driver name,C4_inst
Ref_Cell,Reference_name
X_COORD,X_origin
Y_COORD,Y_origin
```

-delimiter_char ***char***

Specifies a single character to be used as the field delimiter in the output files. If not specified, comma is the field delimiter.

-comment_char ***char***

Specifies a single character to be used as a comment character. When the comment character appears as the first character in a field, that field is ignored.

-c4_ref_name ***ref_cell_name***

Specifies the name of default C4 bump library cell reference to use if the Reference_name field is empty.

-tsv_ref_name ***ref_cell_name***

Specifies the name of default through-silicon via library cell reference to use if the Reference_name field is empty.

-ubump_ref_name ***ref_cell_name***

Specifies the name of micro-bump library cell reference to use if the Reference_name field is empty.

-overlap_check ***check_type***

Specifies the type of check to be done for physical overlap with existing objects while creating new objects. Possible values are **none**, **nominal** and **strict**. Value of **none** means that no checking will be done and a new object will be created even if any other object or cell exists at that location. With value of **nominal**, following rules will apply:

- Two cells of same type cannot overlap with each other.

- C4 bump can overlap with an existing uBump, TSV or a standard cell.

- uBump can overlap with an existing C4 bump, TSV or a standard cell.

- TSV can overlap with an existing C4 bump or a uBump.

Value of **strict** means that no overlap with any existing cell of any type is allowed. This is an optional option and if it is not specified, the default value of **nominal** is assumed.

-create_ports

Create the ports specified in the CSV file if they do not exist at the time of reading the file.

-power ***name_list***

When ports or nets are specified in the input CSV file, if they match the names in the given list, their port_type or net_type attribute respecitively will be set to *power*. If the port or net does not exist in the design, it will be created with type *power*. If the port or net already exists, the port_type or net_type attribute will be updated to *power*.

-ground ***name_list***

When ports or nets are specified in the input CSV file, if they match the names in the given list, their port_type or net_type attribute

respecitively will be set to *ground*. If the port or net does not exist in the design, it will be created with type *ground*. If the port or net already exists, the port_type or net_type attribute will be updated to *ground*.

-die_origin *coordinates*

Specifies the coordinates with respect to which the cells (bumps and TSVs) should be placed. In other words, the specified coordinates will be considered as the die origin. This option is optional. If not specified, the lower left corner of the die (interposer) will be considered.

-die_orientation *orientation*

Specifies the orientation of the Interposer die. If specified, the die is assumed to be rotated accordingly, and hence the coordinates of the newly placed bumps and TSVs will be adjusted appropriately. The allowed values are R0, R90, R180, R270, MX, MXR90, MY, and MYR90. This option is optional. If not specified, the die orientation will be assumed to be R0 (no rotation).

-cell_origin_type *string*

Specifies what point of the cell should be considered as its origin in order to do its placement. The allowed values are *lower_left* or *center*. The bounding box of the cell will be used to calculate its center. This option is optional. If not specified, the lower left corner of the cell will be considered.

-units *units_per_micron*

If the length unit used in the CSV file is different from that of the design library, this option can be used to specify the custom unit for length. When specified, the distance values, i.e. X/Y coordinates specified in the CSV will be divided by this number to derive the distance value in microns. The value must be an integer >=1. This is an optional option. If not specified, the distance values will be assumed to be in the same unit as the current library.

-verbose

Outputs detailed information

DESCRIPTION

The **read_design_io** command reads one or more input files in character delimited format and modifies the current design based on the I/O design data in those files. This command requires an existing NDM library and design to be created and opened, and it will not create a new NDM design. The existing design may or may not already contain design objects, floorplan, etc. Based on the field map and provided I/O object data in the input file, the command can create, place, and connect the following design objects:

- C4 bump cells

- Microbump cells

- Through-Silicon Vias (TSVs)

If a specified I/O object does not exist, it will be created. Otherwise, its placement and connection will be updated based on the file data. The input file is in as ASCII file that is character delimited. The default character delimiter is a comma. A different field separator can be specified with the **-delimiter_char** option. Each row should have exactly the same number of fields within a file, however, some fields can be empty in some rows.

The Following standard columns can be specified in the input file:

- Reference_name

- C4_inst

- Ubump_inst

- TSV_inst

- X_origin

- Y_origin

- Orientation

- Port_name

- Net_name

- Comments

Any additional columns are ignored and the tool issues a warning message. The first row of the input file must be a header row that contains the column names. Each row contains information for one I/O design object. If there are multiple rows for the same object, the later rows will overwrite the previous connection. If the column names in the CSV files are not same as the standard column names specified above, a mapping from the custom column names to these standard names can be provided with the **-map_file** option.

If the reference name for the C4, ubump, or TSV objects are not provided, the default values will be used when creating the objects as defined with the **-c4_ref_name**, **-ubump_ref_name**, and **-tsv_ref_name** options. A specified object reference in the input file will override the default or placement information for that object.

If a cell is already in the design, it will be placed to the location specified by the X_origin and Y_origin fields. If the location data is incomplete (for example, X-origin exists but Y-origin is missing), both columns are skipped. If a cell does not exist, it will be created at the specified location or by default at (0,0). The command will skip the cell and issue a warning if the following are true:

- A reference is not available or cannot be found
- The specified xy coordinates are outside the die bounds
- The specified object overlaps with an existing object

If connectivity is different from the current netlist, the tool will skip the connection information. If connectivity is impossible due to a missing port or some other problem, then no connection will be made.

Any missing, invalid or inconsistent data on a row will cause an error and the I/O object will not be created. If the command encounters an error while parsing the input file, but the "sh_continue_on_error" application variable is "true", the command ignores the row and continues parsing the remaining lines. The supplied data does not have to produce a complete design.

The contents of "Comments" column have no affect on the command. However, ensure that the comment string does not contain a delimiter character (for example, a comma). If a comment character has been specified with the **-comment_char** option, data fields can be defined as comments which will be ignored by the command.

If multiple input files are provided, the subsequent files will overwrite the design information of objects that were specified in previous files. So the order in which the files are specified is important and affects the final result. Different input files can have different number of columns and different order.

Field Map File Details

If the input file contains custom names for fields instead of the Synopsys standard names, a mapping file can be provided via the **-map_file** option. Use the mapping file to create a map between the custom field names and the corresponding Synopsys standard name for the field.

Each line in the map file contains exactly two strings separated by a comma. The first string is a user-defined field string and the second string is a Synopsys keyword. The order of lines does not matter. If the second string is not recognized, the line is ignored with a warning message.

The following map file maps the standard C4_inst field name to "IO_driver", and maps the standard Reference_name field name to "Ref_Cell".

IO_driver,C4_inst
Ref_Cell,Reference_name

The custom field names should not be same as the standard field names. Also, they must not contain any wildcard or special characters.

EXAMPLES

The following example reads in a CSV file with standard column names and creates or updates I/O design objects at the top level.

```
prompt> read_design_io -file_name_list ./test1.csv
Information: 6 lines processed from 1 files.
Information: 0 C4 bumps created. 0 C4 bumps placed.
Information: Location of 1 existing C4 bumps updated.
Information: 0 ubumps created. 0 ubumps placed.
Information: Location of 1 existing ubumps updated.
Information: 0 TSVs created. 0 TSVs placed.
Information: Location of 0 existing TSVs updated.
Information: 0 nets created. 0 net connections made.
Information: 1 C4 bump errors found.
Information: 1 Ubump errors found.
Information: 2 TSV errors found.
Information: 0 syntax errors found apart from the above errors.
1
```

The following example reads in a colon-separated file with custom column names, specifies a map file for the column names, and specifies a default C4 reference lib cell.

```
prompt> read_design_io -delimiter_char ":" -map_file custToSnps.txt \
  -c4_ref_name io.nlib:c4bump.design
Warning: Ignoring entry as number of columns in map file should be exactly 2.
 (custToSnps.txt line 3) (TLNL-014)
Warning: Unrecognized column name 'DUMMY' in map file, ignoring it.
 (custToSnps.txt line 4) (TLNL-018)

Information: 6 lines processed from 1 files.
Information: 0 C4 bumps created. 0 C4 bumps placed.
Information: Location of 1 existing C4 bumps updated.
Information: 0 ubumps created. 0 ubumps placed.
Information: Location of 1 existing ubumps updated.
Information: 0 TSVs created. 0 TSVs placed.
Information: Location of 0 existing TSVs updated.
Information: 0 nets created. 0 net connections made.
Information: 1 C4 bump errors found.
Information: 1 Ubump errors found.
Information: 2 TSV errors found.
Information: 0 syntax errors found apart from the above errors.

read_drc_error_file

Creates an error data from the given DRC error file.

Please note that, with this command, the error cell is created but not saved. Thus, the error cell has unsaved data. To post-process or overwrite the error cell, use the following commands:

save_block (To save the error cell)

close_drc_error_data -force (To close the error cell)

remove_drc_error_data -force (To remove the error cell)

SYNTAX

status **read_drc_error_file**
[-drc_type *type*]
[-error_data *error_data_name*]
-file *drc_file*

Data Types

type string
error_data_name string
drc_file string

ARGUMENTS

-drc_type *type*

Type of the drc_file. Valid values are: calibre. If this option is not specified, the default type is "calibre".

-error_data *error_data_name*

Name to assign to the error data.

For calibre drc report, if this option is not specified, <cell_name>.err is used by default, where <cell_name> is found inside the drc report file.

If this option is not specified and <cell_name> is not found, this command will abort.

-file *drc_file*

The DRC error report to read in. This is a required option.

DESCRIPTION

The **read_drc_error_file** command takes a DRC error report as input and creates error data. The error data can then be loaded with the error browser.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following is an example of how to run the **read_drc_error_file** command.

```
prompt> read_drc_error_file -file drc_report
```

SEE ALSO

signoff_check_drc(2)

read_ivm

Reads via variation file(.ivm) for current desgin.

SYNTAX

status **read_ivm**
file_name
[-corners *corners*]

Data Types

file_name string
corners list

ARGUMENTS

file_name

Specifies the via variation file name to read.

-corners *corners*

Specifies the list of corners for which to apply the extraction options. If corners are not specified then the ivm file will be applied to all corners.

DESCRIPTION

This command reads .ivm file for via variation analysis for the current design.

EXAMPLES

The following example reads new.ivm file for specified two corners.

prompt> **read_ivm new.ivm -corners {FuncMode_max.SS.081v.125c_FuncCmax.corner FuncMode_min.FF.099v.125c_FuncC**

SEE ALSO

report_ivm(2)
remove_ivm(2)
write_ivm(2)
write_parasitics(2)

read_lib_package

Restores the libraries and application option settings from a library package file previously created by the **write_lib_package** command.

SYNTAX

status **read_lib_package**
[-destination *directory_name*]
[-overwrite]
packed_lib_file_name

Data Types

directory_name string
packed_lib_file_name string

ARGUMENTS

-destination *directory_name*

Name of the destination directory where the library will be unpacked. The default is the current directory.

-overwrite

Overwrites any identically named library in the destination directory. By default, an identically named library in the destination directory causes an error, which prevents the library from being restored from the package file.

packed_lib_file_name

The name of the library package file.

DESCRIPTION

This command restores the design library and reference libraries from a library package file previously created by the **write_lib_package** command. After unpacking the library, the command opens the library and sets the current design to match the library that was packed. It also sets the application options and Tcl variables to match the state of the library at the time of packing.

After read_lib_package, please ensure that you have saved all the libraries and blocks onto disk by running "save_lib -all" so all the data from the package persists on disk.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example unpacks the library package file mylib.pack. It restores the design library to the current directory and the reference libraries to a directory called reflibs under the directory of the restored design library.

```
prompt> read_lib_package mylib.pack
1
```

The following example unpacks the library package file mylib.pack and restores the design library to the directory one level above the current directory. If a design library of the same name already exists at the destination, the command overwrites the existing library.

```
prompt> read_lib_package -destination .. -overwrite mylib.pack
1
```

SEE ALSO

write_lib_package(2)

read_name_map

Reads a name map file for the current design.

SYNTAX

string **read_name_map**
name_map_file

Data Types

name_map_file string

ARGUMENTS

name_map_file

Specifies the name of the input name map file.

DESCRIPTION

This command reads the name map data from the specified name map file for the current block.

The name mapping file is a Tcl script containing Tcl built-in commands and two Synopsys commands: **set_query_rules**, which defines renaming rules for rule-based query, and **define_name_maps**, which defines the name mapping for specific objects. The file is provided information only; you should not edit or modify it.

The following is an example of a name mapping file:

```
# Query Rules
set_query_rules hierarchical_separator {/ _} bus_notation {[] __}

# Tcl built-in: local variables
set hier_1  A/B/C/D
set hier_2  A_B/B2/this/is/a/long/path

# Explicit name maps
define_name_maps \
    -application golden_upf \
    -design_name design \
    -columns {class pattern options names} \
    [list cell $hier_1/A_reg [list leaf]       [list $hier_2/ger_A]       ] \
```

```
    [list cell A/B/X*_reg    [list nocase leaf] [list A_B/zar_reg A_B/Y_reg3]]

# cleanup
unset hier_1
unset hier_2
```

EXAMPLES

The following example reads a name map file:

```
prompt> read_name_map top.nmf
```

SEE ALSO

write_name_map(2)
load_upf(2)
set_query_rules(2)
define_name_maps(2)

read_net_estimation_rules

Reads an XML document that contains net estimation rules. This command can be used to re-create the net estimation rules previously saved with the **write_net_estimation_rules** command.

SYNTAX

int **read_net_estimation_rules**
-filename *xml_filename*
[-cell *cell*]

Data Types

xml_filename string
cell collection

ARGUMENTS

-filename *xml_filename*

Specifies the name of the XML document to read that contains net estimation rule data. This command attempts to apply any valid rules and parameters found in the document to the current net estimation rules. The command reports any errors detected while reading the XML document.

-cell *cell*

Specifies the physical cell into which to read the net estimation rule.

By default, rules are read back into the cell in which they were created (the cell attribute in the XML file). If the save file does not specify a cell, they are read into the current block. -cell overrides any saved cell in the XML file.

DESCRIPTION

This command reads an XML document containing net estimation rule data. The XML document can be written by the **write_net_estimation_rules** command or created manually.

NET ESTIMATION RULES AND HIERARCHY

Net estimation rules can be created in any physical block at any level of the hierarchy and multiple blocks can have different rules with the same name. However, rules are often stored/retrieved by name, and doing this can cause confusion as to which rule is being used by a given command. Generally, the "current" (top) block's list of rules is searched by commands such as

estimate_timing. This means that if you define rule R1 in "top" and rule R1 in block "B1", if you make block B1 the current block, commands will use B1's R1. When you go back to top, top's R1 is used. To avoid confusion, use globally unique rule names and define them at the top - they will be propagated to child blocks during distributed commands as necessary. Rules in child blocks that have the same name as rules in top may also be overwritten during distributed commands.

EXAMPLES

The following example creates one non-default rule, writes out the rule as an XML document, and saves the file to rules.xml.

```
prompt> set_net_estimation_rule -parameter register_spacing -value 20 myrule
prompt> write_net_estimation_rules -script rules.xml -format xml
1
```

The following example reads an existing net estimation rule document called rules.xml written out in the previous example.

```
prompt> read_net_estimation_rules -filename rules.xml
1
```

SEE ALSO

report_net_estimation_rules(2)
set_net_estimation_rule(2)
write_net_estimation_rules(2)

read_ocvm

Reads AOCV/POCV derating factor tables.

SYNTAX

int **read_ocvm**
[-corners <list_of_corners>]
ocvm_file

Data Types

ocvm_file string

ARGUMENTS

-corners

Indicates the list of corners for which the AOCV/POCV derate factors are to be applied. If this option is not provided, the corner associated with the current scenario is used.

ocvm_file

Specifies the name of the AOCV/POCV file.

DESCRIPTION

The **read_ocvm** command reads AOCV/POCV derate factor tables from a disk file. The tables are annotated onto one or more design objects. Allowed design object types are hierarchical cells, library cells and designs. The AOCV/POCV data is used to reduce pessimism and improve the accuracy of results. Set the app option **time.aocvm_enable_analysis** to enable AOCV analysis, and set the app option **time.pocvm_enable_analysis** to enable POCV analysis.

Note that a net inherits the AOCV/POCV derate set of a hierarchical cell (design) that fully contains the net. For example, for nets that cross the boundary between the top level and a block (with an associated AOCV/POCV table set), the lowest level hierarchical cell that fully contains the net is not the block. Therefore, the net derating comes from an AOCV/POCV table set that contains the block and fully encloses the net.

When applying AOCV/POCV tables on multiple object types that apply to an arc, the following priority, in decreasing order of precedence, is used to determine the table that applies to the arc:

1. Library cell table
2. Hierarchical cell table

3. Design table

Tables are processed in the order that they appear in the AOCV/POCV file. The last table of a specific type {object_type, rf_type, delay_type, derate_type} to be defined for an object in the file overwrites previous tables defined for the same object of the same type.

The **read_ocvm** command can read binary and compressed binary AOCV/POCV files created using the **write_binary_aocvm** command. No additional arguments are required to read binary or compressed binary AOCV/POCV files.

Multicorner-Multimode Support

By default, this command works on the current corner. To specify a different corner, use the **-corners** option.

EXAMPLES

The following example shows an AOCV derate file, test.aocvm, with a single table annotated on the design.

```
prompt> sh cat test.aocvm

version:       1.0

object_type:    design
rf_type:       rise
delay_type:     cell
derate_type:    late
object_spec:
voltage:       1.02
depth:         1 2 3
distance:      100 1000
table:         1.20 1.10 1.08
               1.22 1.15 1.11

prompt> read_ocvm test.aocvm
```

SEE ALSO

read_optimization_history

Read design optimization history from saved file.

SYNTAX

status **read_optimization_history**
[-file *file_name*]

DESCRIPTION

This command restores the history of the optimization steps applied to the design.

SEE ALSO

read_compile_history(2)
write_compile_history(2)
report_optimization_history(2)

read_parasitic_tech

Reads in one or more parasitic model files in TLUPlus format or common nxtgrd file format.

SYNTAX

string **read_parasitic_tech**
-tlup *tlup_files*
[-layermap *layer_map_file*]
[-name *name*]
[-sanity_check none | basic | advanced]
[-fill_emulation true | false]

Data Types

tlup_files string
layer_map_file string
name string

ARGUMENTS

-tlup *tlup_files*

Specifies the names of one or more TLUPlus files or common nxtgrd file to read. This argument is required and you must provide at least one TLUPlus file name.

-layermap *layer_map_file*

Specifies the names of the layer map file between the technology file and the ITF file.

-name *name*

Specifies the name which identifies this model. If not specified, the base file name is used as the parasitic tech model name.

-sanity_check none | **basic** | **advanced**

Disables or enables certain level of sanity check on TLUPlus file and layer mapping file. Default value is basic. Set value "none" to disable all sanity checks. Set value "advanced" to enable strict layer mapping file checks.

-fill_emulation true | **false**

Read TLUPlus file with or without fill emulation. Default value is false. Use this option for the common tech file only. Set value "false" to read TLUPlus file without fill emulation. Set value "true" to read TLUPlus file with fill emulation.

RC parasitic extraction recognizes the parasitic tech by model name. A different name implies a different parasitic tech.

DESCRIPTION

This command reads in parasitic model data files. After the data is read in, it is stored in current library and the TLUPlus files or common tech file are no longer referenced. The data and TLUPlus files name are saved to disk along with other library data when the **save_lib** command is issued. The parasitic data is used in RC parasitic extraction, delay calculation, net estimations, and other applications.

The layer map file maps the technology file layer name to Interconnect Technology Format (ITF) layer name. The "conducting_layers" and "via_layers" keywords are used to identify the layer properties. Lines starting with * or # are comments in the layer mapping file. If there is no layer map file specified, the ITF layer name is treated the same as the technology layer name.

The following is an example of the layer map file.

```
*****Technology_maskName VS ITF_layerName*****
conducting_layers
poly     fpoly
metal1   metal1
metal2   metal2
metal3   metal3
metal4   metal4
metal5   metal5
metal6   metal6
metal7   metal7
via_layers
polyCont  polyCont
via1     via1
via2     via2
via3     via3
via4     via4
via5     via5
via6     via6
```

Multicorner-Multimode Support

This command has no dependency on scenario-specific, mode-specific, or corner-specific information.

EXAMPLES

The following example reads in the file.tlup TLUPlus file.

```
prompt> read_parasitic_tech -tlup file.tlup -layermap file.layermap \
  -name critical_worst_param_1
```

The following example reads in the file.nxtgrd nxtgrd file.

```
prompt> read_parasitic_tech -tlup file.nxtgrd -layermap file.layermap \
  -name critical_worst_param_1
```

read_parasitics

Reads parasitics from SPEF files or GPD path, GPD attachment in ndm design for current design and sub designs.

SYNTAX

status **read_parasitics**
[-corner_spef {*corners spef_file* [*corner_type*]}\
[-gpd gdp_path]
[-gpd_attach]
[-block *block_name*]
[-validate]

Data Types

corners list
spef_file string
corner_type string
block_name string
gpd_path string

ARGUMENTS

-corner_spef {*corners spef_file corner_type*}

Specifies the SPEF files associated with the constraint corners.

You can specify this option multiple times. If corners share the same SPEF file, you can specify them in the same **-corner_spef** option by listing the corner names. Otherwise, you must specify the files in different **-corner_spef** options. See the first example in the EXAMPLES section.

The valid values for the *corner_type* argument are **early** and **late**. If you do not specify the *corner_type* argument, the SPEF file is for both early and late.

The .spef_scenario file generated by the **write_parasitics** command has the association of corner scenarios with the SPEF files.

-gpd *gpd_path*

Specifies the gpd path for RC annotation. Users need to make sure the input GPD which have the matched corners with corners defined in the working block. Otherwise, read parasitics from GPD would be failed with error message.

-gpd_attach

read RC from gpd attached in the working ndm design. If ndm design does not have gpd attached, read parasitics from GPD attachment would be failed with error message.

-block *block_name*

Specifies the block name associated with the specified SPEF files. Use this option if the SPEF files are for a subblock.

If the SPEF files are for a subblock, the corners specified in the **-corner_spef** options should be corners defined for the top-level block.

By default, the SPEF files are for the top-level block.

-validate

Execute validation.

DESCRIPTION

This command reads parasitics for the current design and sub designs from the SPEF files, or GPD path, GPD attachent. **read_parasitics** is the block level command. You need to specify one **read_parasitics** command for each block for hierarchical design. The **read_parasitics** command would annotate RC for the nets reading from SPEF files,or GPD path, GPD attachment. The nets in the design not annotated would be estimated when executing the **report_timing** command after running **read_parasitics**.

EXAMPLES

The following example reads SPEF files for the current block, which has multiple constraint corners. Two constraint corners of the total eight corners share one SPEF file.

```
prompt> read_parasitics \
  -corner_spef {{FuncMode_max.SS.081v.125c_FuncCmax.corner \
    FuncMode_min.FF.099v.125c_FuncCmax.corner} dr_cc_max_125.spef} \
  -corner_spef {{FuncMode_min.FF.099v.m40c_FuncCmax.corner \
    FuncMode_max.FF.081v.m40c_FuncCmax.corner} dr_cc_max_m40.spef} \
  -corner_spef {{FuncMode_max.SS.081v.125c_FuncCmin.corner \
    FuncMode_min.FF.099v.125c_FuncCmin.corner} dr_cc_min_125.spef}
  -corner_spef {{FuncMode_min.FF.099v.m40c_FuncCmin.corner \
    FuncMode_min.FF.081v.m40c_FuncCmin.corner} dr_cc_min_m40.spef}
```

The following example reads SPEF files for a hierarchical design that has one subblock. The first **read_parasitics** command is for the top-level block. The second **read_parasitics** command is for the subblock.

```
prompt> read_parasitics -corner_spef {s1.corner input/top.spef}
prompt> read_parasitics -block {rm2000_l2data_spr4096x288_bistw} \
  -corner_spef {s1.corner input/block.spef}
```

The following example reads GPD path for a current block

```
prompt> read_parasitics -gpd input/top.gpd fP
```

The following example reads GPD attached in current ndm block for a current block

```
prompt> read_parasitics -gpd_attach fP
```

read_physical_rules

Imports library/cell level abstract physical rules and attributes through PRF file to target library and its cells.

SYNTAX

int **read_physical_rules**
file_name
[-include *include_list*]
[-library *lib*]

Data Types

file_name string
lib string
include_list list of string

ARGUMENTS

***file_name*:**

Specifies the file name to be read in. This is required option.

-include *include_list*

Specifies which rules to be imported from the input file.

- **library**: Imports library level rules.
- **cell**: Imports cell/pin level rules and attributes.
- **instructions**: Imports stream in instructions as corresponding app-options. This option is avaiable only in library manager.
- **site**: Imports site and row_pattern and track_pattern under these two groups.
- **layer**: Imports layer definition under library level.
- **pin_attr**: Imports pin level attributes such as "direction","port_type", "pg_type" and "is_secondary_pg". This option can only work together with "cell".
- **routing_blockage**: Imports routing_blockage definition. This option can only work together with "cell".
- **all**: Imports all rules and attributes.

  The default value in library manager is *{library cell}*, in ICC2 is *{library}*.

-library *lib*

Specifies the target library to import the rules and attributes. This option is only avaiable in ICC2. If not specified, the target library will be found by the library name in PRF file, or current library if not found.

In library manager, it's always the current worksapce library.

DESCRIPTION

This command reads in abstract physical rules and attributes from input file to target library and all its cells. In library manager, the file must be read in before **check_workspace**, as cell data will be saved only at that time. In ICC2, the file can be read to runtime ref-libs by specifying -library.

EXAMPLES

The following example reads in all rules from in.prf to current library and all its cells.

```
prompt> read_physical_rules in.prf -include all
2
```

The following example reads in instructions an cell attributes/rules from in.prf to current library.

```
prompt> read_physical_rules in.prf -include {cell instructions}
2
```

The following example reads in cell level rules from in.prf to libA.

```
prompt> read_physical_rules in.prf -include cell -library libA
2
```

SEE ALSO

write_physical_rules(2)
remove_physical_rules(2)

read_pin_constraints

Reads pin constraints from the specified file and applies them to the current design.

SYNTAX

status **read_pin_constraints**
[-file_name *file_name*]

Data Types

file_name string

ARGUMENTS

-file_name *name*

Specifies the file name that contains the pin constraints. The constraints are used by the router and pin placer.

DESCRIPTION

This command reads a file which contains pin and feedthrough constraints. The pin constraint file contains multiple sections that contain different types of constraints for the router and pin placer. Four sections are supported: topological map, physical pin constraints, pin spacing control, block pin constraints. Pin-based physical pin constraints supports multi-level physical hierarchy (MPH).

This command stores the pin constraints in the database. The constraints are treated the same as constraints that are set with other Tcl commands. You can use the **report_individual_pin_constraints** and **remove_individual_pin_constraints** commands to report and remove pin constraints.

The **set_editability** command can enable or disable this command for blocks or levels of physical hierarchy. This command has no effect on the blocks that are disabled with the **set_editability** command.

Each section begins with a section header. Supported section headers are "start topological map", "start feedthrough control", "start physical pin constraints", "start pin spacing control", "start block pin constraints;". Each section ends with a section footer and a semicolon (;). The section footer corresponds to the section header and begins with the "end" keyword, for example "end topological map;". The constraint file specifies how nets should be routed through blocks in routing stage and how pin should be placed during pin placement.

Empty lines or lines with only white spaces are ignored. Leading or trailing white spaces are ignored. Lines that begin with comment character (#) are comments and are ignored.

Curly brackets ({}) are used to separate different constraints and objects. A semicolon (;) separates different records. If there is more

than one object following a constraint keyword, you must use curly brackets. In the following example, the first layer constraint is incorrect because the layer names are not surrounded by curly brackets. The second constraint shows the correct syntax.

```
{{cell A} {layers M2 M4}}  # incorrect
{{cell A} {layers {M2 M4}} # correct
```

Topological Map

The topological map section contains routing topologies for different nets in the design. Add constraints to this section to specify how nets should be routed through blocks during pin placement.

Each record contains one or more net or bundle names, followed by pairs of linked objects. Use curly brackets to specify more than one net name. The objects can be block cell, top-level port or any cell instance pin. The pin can be a macro pin or standard cell pin, but cannot be the pin on physical block. Note that ports and pins cannot be specified for bundles. In following example, a net connects to cell_A, Cell_C, and Cell_E, you can force the routing to go through Cell_B to connect Cell_A and Cell_C as follows:

```
start topological map;
{Nets Net_A}
  {{{Cell Cell_A} {Cell Cell_B}}
   {{Cell Cell_B} {Cell Cell_C}}
   {{Cell Cell_A} {Cell Cell_E}}};
end topological map;
```

The following example forces routing to pass through Cell_B to connect top-level port A with a macro or standard cell pin C/a if Net_A does not connect to Cell_B:

```
start topological map;
{Nets Net_A}
  {{{Port A} {Cell Cell_B}}
   {{Cell Cell_B} {Pins C/a}}};
end topological map;
```

When you have a set of nets with the same routing patterns, you can describe them as a group of nets within curly brackets separated by spaces. In addition, you can use "*" as a wildcard to specify a set of nets, such as a bus. Note that when a set of nets are specified, you cannot use top-level ports or pins to describe the connectivity.

```
start topological map;
{Nets {Net_A Net_B DataIn*}}
  {{{Cell Cell_A} {Cell Cell_B}}
   {{Cell Cell_B} {Cell Cell_C}}};
end topological map;
```

For block objects, you can specify side, offset, and layer constraints for the block pins. The side specifies the side number for a block instance where the pins are inserted. The side number is a positive integer that starts from 1. Given any block instance with a rectangular or rectilinear shape, the leftmost edge is side number

1. If there are multiple leftmost edges, then edge 1 is the lowest leftmost edge. The sides are numbered in consecutive order proceeded clockwise around the shape. The shape here referring to block instance's shape, not the reference block's shape.

The offset specifies the distance in microns from the starting point of a specific edge to the routing cross-point (or the block pin's center location) on that edge in clockwise direction. The starting point is also following the clockwise fashion. For instance, for a bottom horizontal edge, the starting point is the right vertex of the edge as it is counted in clockwise and bottom edge's starting point is right point vertex. Since the offset is specific on an edge, you must specify the side information with your offset. The edge here is referring to the edge on block instance, not the reference block. The topological constraints not support negative offset value.

The layer constraint specifies the metal layers to use for the pins.

The following example shows one net record in the topological map section that contains side, offset, and layers of the pins. The routing connects Cell_A through side 1 at offset 20.18 on layer M2 to Cell_B through side 3 at offset 40.28 on layer M4. The routing also connects Cell_B through side 1 at offset 30.28 on layer M4 to Cell_C through side 3 at offset 15.88 on layer M2.

```
start topological map;
{Nets Net_A}
  {{{Cell Cell_A} {sides 1}
    {offset 20.18} {layers M2}}
   {{Cell Cell_B} {sides 3}
    {offset 40.28} {layers M4}}}

  {{{Cell Cell_B} {sides 1}
    {offset 30.28} {layers M4}}
   {{Cell Cell_C} {sides 3}
    {offset 15.88} {layers M2}}};
end topological map;
```

In addition, for block objects, you can specify routing cross-point's location range (or block pin's location range) on a side. The location range is specified with a pair of numbers within {}. In following example, the routing will route from Cell_A through side 2 with location range between 10 micron offset and 20 micron offset when connecting to Cell_B, and routing will route through Cell_B's side 4 with location range between 10 micron offset and 20 micron offset.

```
start topological map;
{Nets Net_A}
  {{Cell Cell_A} {sides 2}
    {offset {10 20}}}
  {{Cell Cell_B} {sides 4}
    {offset {10 20}}};
end topological map;
```

For bundle-based topological constraints, the wildcard character (*) is not supported. For instance, you cannot specify a wildcard character for bundles, ports or pins as the bundle is a group of nets. In this context, the wildcard character for bundles, ports or pins can be confusing.

For a very complicated routing topology which involves multiple enters/exits on same block instance, the tool might not be able to generate routing topology that user intends to. In this case, it is recommended to start from the driver to define the routing topology. In the following example, a routing topology started from driver block A and goes to block B with side 1/offset 20, and then goes from block B to load block C. On the separated routing path on same net, the routings branch out from driver block A and goes to block B again and then goes to load block D. With different offset (40) on the same side(1) of block B, the topological constraints can be specified in following ways:

```
start topological map;
{Nets Net_E}
  {{Cell A} {{Cell B} {sides 1}{offset 20}}}
  {{{Cell B} {sides 3}{offset 40}} {Cell C}}
  {{Cell A} {{Cell B} {sides 1}{offset 40}}}
  {{{Cell B} {sides 3}{offset 20}} {Cell D}}
end topological map;
```

When there are multiple enters/exits on block B, in order to avoid ambiguity, it is recommended to define the topology starting from driver. Also the physical constraints (side/offset or offset range} can be used to help resolve the ambiguity.

Feedthrough Control

The feedthrough control section enables or disables feedthroughs for specific nets and blocks. Each record begins with the Nets keyword and contains one or more net names within curly brackets. The net names are followed by "Feedthrough" or "NoFeedthrough" keywords, followed by block cells within curly brackets.

The following rules are used when applying the feedthrough control:

- Later statements override earlier statements for the same nets.
- The Feedthrough and NoFeedthrough keywords specify whether feedthroughs are allowed or not by default, for either specified block cells or for the entire design. If block cells are specified, all other blocks cells assume the opposite feedthrough constraint value. Therefore, only one Feedthrough or NoFeedthrough constraint line is required per specification, there is no need to specify both the Feedthrough and NoFeedthrough keywords in a single feedthrough specification.
- Topological map constraints can overrule feedthrough control statements. For example, the following topological map constraint forces a feedthrough on block B, regardless of whether feedthroughs are allowed on B.

  {{{cell A} {cell B}} {{cell B} {cell C}}}

The following example enables feedthroughs for net Xecutng_Instrn[0] on blocks I_ALU, I_REG_FILE and I_STACK_TOP.

```
start feedthrough control;
{Nets Xecutng_Instrn[0]}
  {Feedthrough {I_ALU I_REG_FILE I_STACK_TOP}};
end feedthrough control;
```

The following example prevents feedthroughs for net Xecutng_Instrn[0] on blocks I_ALU, I_REG_FILE and I_STACK_TOP.

```
start feedthrough control;
{Nets Xecutng_Instrn[0]}
  {NoFeedthrough I_ALU I_REG_FILE I_STACK_TOP};
end feedthrough control;
```

A single Feedthrough or NoFeedthrough statement completely specifies the allowed feedthrough modules for the net. Feedthrough statements are not cumulative. If multiple feedthrough statements exist for the same net, the latest feedthrough statement take over the previous statement. This rule simplifies the organization of the feedthrough file and prevents complex interactions between feedthrough statements.

Feedthrough and NoFeedthrough statements override the default feedthrough permission set by the **set_block_pin_constraints -allow_feedthroughs true|false** command for the specified nets. However, feedthrough allow/disallow set by **set_individual_pin_constraints -allow_feedthroughs true|false** command for individual net will overrule the Feedthrough/NoFeedthrough statements.

The statement "{ Feedthrough A B }" does not force the creation of feedthroughs on A and B. Instead, the statement allows feedthroughs on blocks A and B, while restricting feedthroughs on all other blocks. To force a specific feedthrough path you must use the pairwise statements described later.

If there are feedthrough constraint conflicts between topological map constraint and previous feedthrough constraints, the feedthrough constraints from constraint file take priority. If there are conflicts between feedthrough constraints and topological map constraints, topological map constraints take priority.

Physical Pin Constraints

The physical pin constraints section specifies physical pin constraints for individual nets, pins or ports. Supported keywords are: net, pins, reference, sides, layers, offset, order, start, end, off_edge, location, width and length.

The syntax for most supported constraint keywords (sides, layers, width, length, etc) is the same as in the command **set_individual_pin_constraints**. See the related man pages for more details. For offset, **read_pin_constraints** can take a number as well as a range, which includes a start point and an end point.

Each record in the physical pin constraints section is a set of key words with values enclosed by curly brackets and ended by a semicolon. The first element in the record can be a top-level net or a port for a reference block. If the record is a port object, the block is expected to follow with reference block's name associated with the port.

The physical pin constraints section also supports order for a collection of pins or ports, which is not very convenient by using command **set_individual_pin_constraints**. To set the order for a collection of pins or ports, it must specify the desired edge. And it is also a good practice to specify the range by using **start** and **end**. Otherwise, it means the whole edge. In the most simple case as shown in the following example, the distance between the adjacent order constrained pins or ports is roughly equal to the range divided by the number of order constrained pins or ports. Therefore, if there is a big blockage taking away a large chunk of edge, the range should reflect the existence of such a blockage. Generally, the order constraints are intended for a collection of pins or ports on a region with continuous available empty wire tracks for pin placement.

If a specific order plus an exact spacing are desired for a set of pins, the recommended approach is to define a bundle and constrain the pin order and spacing with **set_bundle_pin_constraints**. Please refer to manpages of **create_bundle** and **set_bundle_pin_constraints**.

The following example applies constraints on a design with two block instances **Inst1** and **Inst2**, whose reference block names are **BlockA** and **BlockB**, respectively.

The first two records constrain pins on net **E** connecting block instances **Inst1** and **Inst2**. The next three records constrain the pins **C**, **D** and **F** on reference block **BlockA**. The last record set the order of pins **in[1]**, **in[2]** and **in[3]** on reference block **BlockB**.

```
start physical pin constraints;
{Net E} {cell Inst1} {layers METAL2} {sides 2};
{Net E} {cell Inst2} {layers METAL4} {sides 4};
{Pins C} {reference BlockA} {layers METAL2} {sides 1} {offset {40 50}};
{Pins D} {reference BlockA} {layers METAL2} {width 0.8} {length 0.8};
{Pins F} {reference BlockA} {off_edge} {location {10 10}};
{reference BlockB} {sides 2} {start 10} {end 80} {order {in[1] in[2] in[3]}};
end physical pin constraints;
```

The side constraint specifies the side number on which the pin should be inserted for the specified reference block. The side number is a positive integer that starts from one. Given any rectangular or rectilinear shape, the leftmost edge is side number one. If there are multiple leftmost edges, then edge one is the lowest leftmost edge. The sides are numbered in consecutive order proceeded clockwise around the shape. The shape is referring to the reference block's boundary shape.

The offset constraint specifies the distance in microns from the starting point(positive value) or ending point (negative value) of a specific edge to the routing cross-point on thate dge in the clockwise direction. The starting point is also followingt he clockwise fashion. For instance, for a bottom horizontal edge, the starting point is the right vertex of the edge as it is counted in clockwise and bottom edge's starting point is right point vertex, vice versa, for ending point is the left vertex of the edge. Since the offset is specific on an edge, you must specify the side information with your offset. The edge here is referring to the reference block's boundary edge.

The location constraints value are referred to the reference cell in the pin constraint entry and therefore, the coordinates will translated to top-level view.

A more complicated order constraint is shown in the following example. The pin order **A** and **B** is specified as to be 2 wire tracks in between with **A** first and **B** second. **B** also must use layer M4. Pins **A**, **B**, **C** and **D** must be placed within the region between 20 to 40 microns on side 3 of block **RISC_CORE**. Because pin **C** and **D** are not specified within the {order...} constraint, they can be anywhere within the 20 to 40 micron region on side 3.

```
start physical pin constraints;
{reference RISC_CORE}
  {sides 3} {start 20}
  {end 40} {{order {A {spacing 2} {layers METAL4} B}} {pins {C D}}};
end physical pin constraints;
```

If there are multiple records constraining the same object with conflict settings, the last record overwrites the previous ones.

Finally, pin constraints can be applied by either one of the commands **set_individual_pin_constraints**, **set_bundle_pin_constraints**, or **read_pin_constraints**. But try to use the same method to apply the constraints if possible so as to avoid unwanted conflict between different methods. If unclear whether or not the database was applied constraints before, or the type of the constraints applied, use **remove_individual_pin_constraints** or **remove_bundle_pin_constraints** to clear them.

Pin Spacing Control

The pin spacing control section specifies pin spacing constraints for individual edges on each block cell.

Each record specifies the pin spacing constraints for one or more edges on one or more layers for a particular block cell. The constraint contains the reference, side, and layer keywords. Keywords are case insensitive.

In addition, for those edges specified in the pin spacing control section, those layers that are NOT listed are NOT allowed for pin placement. Furthermore, if those listed layers are NOT allowed in the corresponding reference blocks, they are NOT allowed for pin placement either.

```
start pin spacing control;
{reference ref_cell_name} {sides {side_a side_b}}
{layer_a spacing_a} {layer_b spacing_b};
end pin spacing control;
```

The reference keyword specifies the block reference that this constraint applies to. For a block cell, this constraint refers to the reference cell name, not the cell instance name, if it is to constrain the top level.

The sides keyword specifies one or more sides of the block. If there is more than one side, specify the side number within curly brackets separated by white space. You can use a wildcard character (*) to specify that all sides are allowed.

After the side constraint, layer and spacing constraints are specified as pairs. You can specify multiple layer-spacing pairs. The layer value is the layer name. The spacing value is the minimum number of wire tracks between adjacent pins for the specified layer.

In the following example, the CPU block cell is constrained to minimum pin spacing of 2 wire tracks on layer M2, a minimum pin spacing of 3 wire tracks on layer M4, and minimum pin spacing of 3 wire tracks on layer M6 for sides 2 and 4 of the block:

```
start pin spacing control;
{reference CPU} {sides 2 4} {METAL2 2} {METAL4 3} {METAL6 3};
end pin spacing control;
```

Keywords are case insensitive. The reference name and the layer name are case-sensitive.

If a line contains a syntax error, the line is ignored. The command issues warnings or errors that report any lines that are ignored.

If the pin spacing control section contains conflicting constraints for the same edge, same layer and the same block, the last constraint takes priority.

Block Pin Constraints

The block pin constraints section specifies pin constraints that apply to all the pins of the specified block cell.

You can specify block-related pin constraints for feedthroughs, layers, spacing, corner keepouts, hard pin constraints, sides and exclude sides. The same constraint can be set with the **set_block_pin_constraints** Tcl command. Supported keywords are: reference, sides, exclude_sides, layers, feedthrough, spacing, spacing_distance, corner_keepout_distance, corner_keepout_num_tracks and hard_constraints.

The following example sets pin constraints:

```
start block pin constraints;
{reference DATA_PATH}
 {layers {METAL3 METAL4 METAL5}}
 {feedthrough true}
 {corner_keepout_num_tracks 1}
 {spacing 5}
 {exclude_sides {2 3}};

{reference ALU}
```

```
 {layers {METAL3 METAL4 METAL5}}
 {feedthrough true}
 {hard_constraints {spacing location layer}}
 {sides {2 3}};
end block pin constraints;
```

You can use the **write_pin_constraints** command to write out block cell pin constraints to a file, and use the **read_pin_constraints** command to read the file.

Bundle Pin Constraints

The bundle pin constraints section specifies bundle pin-related constraints. This section is now included in physical pin constraints section.

You can specify whether bundle pin constraints are honored or not during pin placement. The same constraints can be set with the **set_bundle_pin_constraints -keep_pins_together true|false** command. The following example sets bundle pin constraints:

```
start physical pin constraints;
{bundle bundle_0} {keep_bundle_pins_together true};
end physical pin constraints;
```

You can use the **write_pin_constraints** command to write out the bundle pin constraints to a file, and use the **read_pin_constraints** command to read the file.

Conflicts

When there is a conflict between a topological map constraint and a physical pin constraint, topological map constraints takes priority over physical pin constraints for global routing and pin placement.

The constraint file can have multiple topological map sections or multiple physical pin constraints sections. If same object is listed multiple times with the same constraint, the last record takes priority. If the same object is listed multiple times with different constraints, the constraints are combined.

EXAMPLES

The following example reads the pin_cstr pin constraint file.

```
prompt> read_pin_constraints -file_name pin_cstr
```

A complete pin constraints file example is shown below.

```
start topological map;
{nets net_B}
{{{cell Cell_A} {sides 1}
  {offset 20.18} {layers M2}}
 {{cell  Cell_B} {sides 3}
  {offset 40.28} {layers M4}}
 {{cell  Cell_C} {sides 1}
  {offset 30.28} {layers M4}}
 {{cell  Cell_D} {sides 3}
  {offset 15.88} {layers M2}}};
end topological map;

start feedthrough control;
{nets Xecutng_Instrn[0]}
```

```
  {NoFeedthrough {I_ALU I_REG_FILE I_STACK_TOP}};
end feedthrough control;

start physical pin constraints;
  {pins C} {reference B} {layers METAL2 METAL4} {sides 2};
  {pins D} {reference B} {sides 2};
  {net C/A} {layer METAL4};
  {bundle bundle_0} {keep_bundle_pins_together true}
end physical pin constraints;

read_rde

Reads RDE model from a encrypted file for current design.

SYNTAX

status **read_rde**
file_name
[-help]

Data Types

file_name string

ARGUMENTS

file_name

Specifies the name of the input file from which a RDE model for the current design are read.

-help

Specifies the usage of read_rde

DESCRIPTION

This command reads the RDE model for the current design from a file. The file is an encrypted format generated by the "write_rde" command. For very large designs, the runtime of the RDE capture step can be reduced by dumping the RDE model from a prior run with "write_rde" and reading it back into a successive run with "read_rde". Once the RDE model information is read in, before either the place_opt or clock_opt flow stages, the subsequent RDE capture step(s) will be skipped subject to the following use model. A RDE model dumped after place_opt (final_opto) may be reused only by the place_opt call of the successive run. An RDE model dumped after clock_opt may be used in both the place_opt and clock_opt stages of the new run (the model need only be read in one time, before either place_opt or clock_opt). The "read_rde" command includes some checking as to whether there have been floorplan changes and, if so, may not allow the RDE model to be read in. In this case, the user should run the default flow and regenerate new RDE model information after the RDE capture stages if desired.

USAGE

run 1 : place_opt -from final_opto write_rde place_opt_RDE ... clock_opt -from final_opto write_rde clock_opt_RDE

run 2 : read_rde place_opt_RDE OR read_rde clock_opt_RDE place_opt -from final_opto ... read_rde clock_opt_RDE clock_opt

-from final_opto

EXAMPLES

The following example reads a RDE model for the current design.

```
prompt> read_rde -help
Usage: read_rde    # a RDE stream in command
      [file_name]          (filename to read in)
prompt> read_rde my.rde
```

SEE ALSO

write_rde(2)

read_saif

Reads a Switching Activity Interchange Format (SAIF) file and annotates switching activity information on nets, pins and ports in the current design.

SYNTAX

status **read_saif**
file_list
[-strip_path *source_name*]
[-path *target_name*]
[-scenarios *scenario_list*]
[-modes *mode_list*]
[-corners *corner_list*]
[-exclude_sdpd]
[-normalize true | false]
[-nocase]
[-report]
[-use_highest_toggle_rate]
[-ignore_name_mapping]

Data Types

file_list list
source_name string
target_name string
scenario_list list
mode_list list
corner_list list

ARGUMENTS

file_list

Specifies a list of SAIF files to be read. Each list item consists of the SAIF file name and optionally the weight, scaling ratio, strip path and the path. The syntax for each list item is

file_name
[-weight *weight_value*]
[-scaling_ratio *scaling_ratio_value*]
[-strip_path *source_name*]
[-path *target_name*]

The default for the **-weight** and **-scaling_ratio** options is 1.0 and when specified should be larger than 0.0. The **-strip_path** and **-path** options can be specified either individually for each file or, if multiple files have the same strip path or path, once for all files.

-strip_path *source_name*

Specifies the name of the instance of the current design as it appears in the SAIF file. The current design appears as an instance in the SAIF file. The read_saif command annotates all subinstances in the hierarchy of the specified instance, and annotates the instance itself. Each instance name that is specified must be complete, but without any trailing hierarchy separator (/).

-path *target_name*

Specifies the target instance on which the switching activity, in the SAIF file, is to be annotated. If this option not specified, the current instance is assumed to be the target instance.

-scenarios *scenario_list*

Specifies the scenarios to be considered. If this option is not specified, then only those scenarios are considered which contain the modes and corners specified through **-modes** and **-corners** options. Activity annotation is done separately for each scenario. If none of the **-modes**, **-corners**, or **-scenarios** options are specified, annotation is done for the current scenario in the design.

-modes *mode_list*

Specifies the mode filter on the set of scenarios to be considered. A scenario is considered if its mode is present in *mode_list*. If this option is not specified, no filtering occurs on modes.

-corners *corner_list*

Specifies the corner filter on the set of scenarios to be considered. A scenario is considered if its corner is present in *corner_list*. If this option is not specified, no filtering occurs on corners.

-exclude_sdpd

When specified, the state-dependent and path-dependent (SDPD) switching activities are ignored while reading saif file(s). By default, the SDPD activities are read from saif file(s).

-normalize true | false

Controls whether the weight associated with each SAIF file is normalized, which means that the sum of the weighted activity values is divided by the sum of the weights.

By default (**true**), the command normalizes the weights.

If **false**, the command uses the weights as specified.

-nocase

When specified, the SAIF file is matched without considering the name case of the objects specified. The object matching is done in name-case insensitive manner.

-report

When specified, the command generates a summary which indicates number of objects present in saif file which were found in the design and also number of objects present in design which were found in the saif file. If this option is not specified, command summary is not generated.

-use_highest_toggle_rate

When this option is used, the nonSDPD activity with the highest toggle rate is selected from the list of specified SAIF files. When this option is specified, SDPD activities are ignored. This option cannot be used with the option *normalize* and *weight*.

-ignore_name_mapping

This option should be used when reading a SAIF generated from the current design where no name mapping needs to be performed, for example when reading a gate level SAIF file generated from the same netlist. This allows the existing name mapping database to be preserved but not used for the read_saif command.

DESCRIPTION

The **read_saif** command reads a list of SAIF files and annotates the switching activity attributes *rise_toggle_rate*, *fall_toggle_rate* and *static_probability* for nets, ports, and pins of the current design. If a particular object in the SAIF file cannot be found in the current design, the object is ignored and a warning message is provided. The read_saif command returns 1 if at least one of the objects in the file is successfully annotated. Otherwise, it returns 0. This command resets the switching activity for the design before reading the specified SAIF files. For the merging of SAIF files, one can read multiple SAIF files. The probabilities are multiplied with the weight factor and accumulated overall SAIF files. The toggle rates are multiplied with the weight factor and the scaling factor and accumulated over all SAIF files. The resulting probability and toggle rate is normalized (divided by the sum of weights), except when option -normalize false is used.

Whenever the '-nocase' option is used, the SAIF file is interpreted ignoring the name cases of the objects specified in SAIF file. An object with name 'ABC' in SAIF can be matched to object 'abc' in the netlist and vice-versa.

Saif information is saved with a block unless app option 'power.enable_activity_persistency' is set to 'off'.

Multicorner-Multimode Support

EXAMPLES

The following example annotates switching activity for the current block.

```
prompt> read_saif test.saif
```

The following example annotates switching activity for the current block that has been annotated as Test/U1 in simulation testbench.

```
prompt> read_saif test.saif -strip_path Test/U1
```

The following example annotates switching activity from the SAIF file for the instance Mult/U12 in the current block.

```
prompt> read_saif test.saif -path Mult/U12
```

The following example annotates the switching activity from a SAIF file and then reports it using the **get_switching_activity** command. The toggle rate values and static probability are derived from the SAIF file and the activity type is set to 'simulated'.

```
prompt> read_saif test1.saif
prompt> get_switching_activity [get_pins GPRs/iso]
(mode = default, corner = default, probability = 0.504926,
rise_toggle_rate = 9.61391e+06, fall_toggle_rate = 9.61391e+06,
type = simulated)
```

The following example merges two SAIF files test1.saif and test2.saif. The probabilities for the annotated cells will be (1 * probability(test1.saif) + 2 * probability(test2.saif)) / 3, and the toggle rates will be ((1 * 4 * toggle_rate(test1.saif) + 2 * 3 toggle_rate(test2.saif)) / 3. Since individual strip paths have not been specified per file, strip path for both will be ChipTop. Path for test1.saif will be InstDecode, and for test2.saif it will be GPRs.

```
prompt> read_saif {{test1.saif -scaling_ratio 4 -path InstDecode} \
  {test2.saif -weight 2.0 -scaling_ratio 3.0}} \
  -strip_path ChipTop -path GPRs
```

The following example merges two SAIF files test1.saif and test2.saif under the option use_highest_toggle_rate. The non-SDPD toggle rate and probabilities for the annotated cells will be chosen to be those of the one with highest toggle rate amongst test1.saif

and test2.saif . When this option is specified, SDPD activities are ignored.

prompt> **read_saif -use_highest_toggle_rate {{test1.saif} {test2.saif}}**

read_sdc

Reads in a script in Synopsys Design Constraints (SDC) format.

SYNTAX

status **read_sdc**
file_name
[-echo]
[-syntax_only]
[-version *sdc_version*]

Data Types

file_name string
sdc_version string

ARGUMENTS

file_name

Specifies the name of the file that contains the SDC script to read.

-echo

Echoes each constraint as it is executed.

-syntax_only

Checks only the syntax and semantics of the SDC script.

-version *sdc_version*

Specifies the version of SDC to which the file conforms.

Allowed values are 1.0, 1.1, 1.2, 1.3, 1.4, 1.5, 1.6, 1.7, 1.8, 1.9, 2.0, 2.1, and **latest** (the default).

DESCRIPTION

The **read_sdc** command reads in a script file in Synopsys Design Constraints (SDC) format. SDC is also licensed by external vendors through the Tap-in program.

By default, the **read_sdc** command executes the constraints as they are read. If there are errors in the script, it is possible that some constraints are applied, and some are not. You can use the **-syntax_only** option to check the script without applying any constraints. This also verifies conformance to the specified SDC version. If there are any errors during the checking phase, the result of the **read_sdc** command is 0.

Like the **source** command, the **read_sdc** command is sensitive to variables that control script execution, such as **sh_continue_on_error** and **sh_script_stop_severity**. The **read_sdc** command uses the **sh_source_uses_search_path** variable to determine if the **search_path** variable is used to find the script.

The **read_sdc** command supports several file formats. The file can be a simple ASCII script file, an ASCII script file compressed with gzip, or a Tcl bytecode script, created by TclPro Compiler.

Note that SDC does not allow command abbreviation. Also, the **exit** and **quit** commands do not cause the application to exit, but they do cause the reading of the SDC file to stop.

The latest SDC version supports the following commands. Those added for versions 1.3 and later are noted. Th list does not include some constraints that are ignored by the tool.

General Purpose Commands:

expr
list
set

Object Access Functions:

all_clocks
all_inputs
all_outputs
all_registers (1.7)
current_design
current_instance
get_cells
get_clocks
get_libs
get_lib_cells
get_lib_pins
get_nets
get_pins
get_ports
set_hierarchy_separator

Basic Timing Assertions:

create_clock
create_generated_clock (1.3)
group_path (1.7)
set_clock_gating_check
set_clock_groups (1.7)
set_clock_latency
set_clock_sense (1.7)

set_wire_load_selection_group

For a complete guide to using SDC with Synopsys tools, see the *Using the Synopsys Design Constraints Format Application Note*, which is available in SolvNet at https://solvnet.synopsys.com.

The usage of some of the supported commands is restricted when reading SDC. In some cases, some options are not allowed. In some tools, some of the commands, such as the **set_logic*** commands, are not supported. If the SDC file contains a command that is not supported by the tool, the **read_sdc** command ignores the command and issues a warning message (for an example, see the EXAMPLES section). If the SDC file contains a command or option that is not supported by the SDC format, the **read_sdc** command issues an error message.

Multicorner-Multimode Support

This command works only on the current scenario.

EXAMPLES

The following example reads the SDC script named top.sdc.

```
prompt> read_sdc top.sdc -version 1.2

Reading SDC version 1.2...
1
```

The following example reads the SDC script named top2.sdc. The script contains commands not supported by SDC, so the **read_sdc** command issues CMD-005 messages for those commands.

```
prompt> read_sdc -syntax_only top2.sdc -version 1.2

Checking syntax/semantics using SDC version 1.2...

Error: Unknown command 'link_design' (CMD-005)

** Completed syntax/semantic check with 1 error(s) **
0
```

The following example shows the result when the SDC file contains a command that is not supported by the tool. One SDC message is generated per instance of an unsupported command. At the end of the read, the command generates a summary of all unsupported commands in the file. The SDC file is read into the tool.

```
prompt> read_sdc t2.sdc -version 1.2

Reading SDC version 1.2...
Warning: Constraint 'set_logic_zero' is not supported by the tool. (SDC-3)
Warning: Constraint 'set_logic_zero' is not supported by the tool. (SDC-3)
Warning: Constraint 'set_logic_one' is not supported by the tool. (SDC-3)

Summary of unsupported constraints:
Information: Ignored 1 unsupported 'set_logic_one' constraint. (SDC-4)
Information: Ignored 2 unsupported 'set_logic_zero' constraints. (SDC-4)
1
```

The following example shows the output generated by the **read_sdc** command when reading an SDC file with unsupported options. In an SDC file, the **current_design** can be used only to get the current design; no arguments are allowed.

```
prompt> read_sdc t3.tcl -echo -version 1.2
Reading SDC version 1.2...
current_design TOP
Error: extra positional option 'TOP' (CMD-012)
0
```

read_signal_em_constraints

Reads the signal electromigration rules.

SYNTAX

status **read_signal_em_constraints**
[-encrypted]
[-format ITF | ALF]
file_name

Data Types

file_name string

ARGUMENTS

-encrypted

Indicates that the electromigration file is encrypted. This option is exclusive with the option *-format*.

-format ITF | ALF

Specifies the electromigration file format. The supported formats are **ITF** and **ALF**, and if this option is not specified, the data will be read as **ITF** format by default. This option is exclusive with the option *-encrypted*.

file_name

Specifies the ITF file from which to import signal electromigration data into the current design library. The specified ITF file should contain only signal electromigration information.

DESCRIPTION

The **read_signal_em_constraints** command reads signal electromigration data into the current design library. If the design library already contains signal electromigration information, it is replaced by the data in the new ITF file.

The command returns 1 if the file is successfully read in; otherwise, it returns 0.

Multicorner-Multimode Support

This command has no dependency on scenario-specific, mode-specific, or corner-specific information.

EXAMPLES

The first example reads a signal electromigration file named test.itf into the current design library. The second example reads a encrypted signal electromigration file named test.itf.enc into the current design library. The third example reads a signal electromigration file named test.alf into the current design library.

```
prompt> read_signal_em_constraints test.itf
prompt> read_signal_em_constraints -encrypted test.itf.enc
prompt> read_signal_em_constraints -format ALF test.alf
```

SEE ALSO

current_lib(2)
read_tech_file(2)
search_path(3)

read_tech_file

Reads a technology file into the current library.

SYNTAX

int **read_tech_file**
[-convert_sites *convert_sites*]
file_name

Data Types

file_name Technology file to read
convert_sites List of technology file sites to convert

ARGUMENTS

-convert_sites *convert_sites*

A list of technology file sites to convert. This option can be used only with the **-technology** option.

file_name

The technology file you want to read.

RETURN VALUE

Returns 1 if the technology file is successfully read in, and 0 if it is not.

DESCRIPTION

The **read_tech_file** command reads a technology section into the current library. If sites are defined in the technology file, the -convert_sites option can be used to map them from one name to another. The same option exists in the read_def command to make the site names match among all the input data.

If the new technology file is missing layers defined in the existing technology data, or if some layers have different names/numbers, the **read_tech_file** command will allow the replacement. In these cases, the tool issues information messages and existing objects on the missing layers become unbound objects. When layers are re-created or read in through another technology file replacement, these objects are rebound to the layers.

EXAMPLES

The following example read in a technology file "tcb90g.tf" into the current library.

```
prompt> read_tech_file tcbn90g.tf
Information: technology file '/user/joe/work/tcbn90g.tf' is loaded
{"r4000"}
```

SEE ALSO

create_lib(2)
write_tech_file(2)
report_unbound(2)
search_path(3)

read_tech_lef

Reads one or more LEF (Library Exchange Format) technology data files.

SYNTAX

string **read_tech_lef**
[-design *design*]
[-merge_action add | ignore | overwrite | update]
[-syntax_only]
file_names

Data Types

design	collection
file_names	list

ARGUMENTS

-design *design*

Specifies the block in which to create the LEF technology data. If this is not specified, LEF technology data will be created in the current block.

-merge_action add | ignore | overwrite | update

Specifies the strategy for merging LEF data into an existing block. The strategy is used only when there has a matched object found in existing block. The definition for each option value is:

- **add** (the default) : Adds a new object to existing block by making name unique
- **ignore** : Skips the new object
- **overwrite** : Deletes the existing object in block, and then create the new object.
- **update** : Combines the new object with the existing object in block, retaining both data sets. For objects that do not have components, this will be same as overwrite. For objects that have components, the merge depends on the components. For components that should be unique or already exists, the command overwrites them. For components that do not have name or do not exist yet, the command adds them.

-syntax_only

Specifies that the LEF files are processed only to check the syntax and semantics of the files.

file_names

Specifies names of one or more LEF files to be read.

DESCRIPTION

The command reads LEF technology data into an existing block.

To locate files that have relative path names, the command uses the **search_path** variable and searches for each file in each directory listed in the **search_path**. Files that have absolute path names are loaded as though there were no **search_path**. To determine the file that **read_tech_lef** loads, use the **which** command.

The **-merge_action** option customize how LEF technology data is merged into the existing block.

This command is only available in **icc2_shell**.

EXAMPLES

The following example reads the file via_rule.lef file.

```
prompt> read_tech_lef via_rule.lef
1
```

The following example reads via_rule.lef into an existing block called my_block and ignores an object if it already exists in the block.

```
prompt> read_tech_lef via_rule.lef -design my_block -merge_action ignore
```

SEE ALSO

read_lef(2)
search_path(3)

read_test_model

Reads a test model file.

SYNTAX

status **read_test_model**
[-format ctl | icl | pdl | ict | wks | hdl]
[-design *design_name*]
filename

Data Types

design_name string
filename string

ARGUMENTS

-format ctl | **icl** | **pdl** | **ict** | **wks** | **hdl**

Specifies the format of the test model.

By default, the model is assumed to be in .ctl format.

-design *design_name*

Specifies the name of the design to which to attach the test model. This is meaningful only for CTL test models. By default, the model is attached to the current design.

model_files

Specifies the names of the test model files to read. This argument is required. When you specify the format as **ctl**, you can specify only one file.

DESCRIPTION

The **read_test_model** command reads test model files.

The test model files represent the test behavior of designs. The attributes that are represented include all DFT signals and their purpose, the test timing, and the sequence of events needed to shift test vectors in and out of the design. The /fBread_test_model/fP command reads in only the test model and the interface definition of a design, and ignores any other information. Since the gate-level implementation of a design is not needed, significant memory and runtime savings can be achieved.

A successful read of a model overwrites any test model information in memory.

Note that for standard IEEE1838, TAP port specifications inside Internal statment of testmode should adhere the following points.

- **Primary Tap:** User data should contain both "IEEE1149.1" and "IEEE1838" standards to define the port as Primary TAP. Last user data is to define the name of the tap set, it is optional for PTAP ports.

  For example, "tdo" { DataType ScanDataOut User "IEEE1149.1" User "IEEE1838" User "TAP set name" { ScanDataType Internal; } }

- **Secondary Tap:** User data should contain only "IEEE1838" standard to define the port as secondary TAP. Last user data is to define the name of the die to which the port belongs, if there are multibple STAP die's available, it is mandatory to provide the state name.

  For example, "myStapTdo" { DataType ScanDataOut User "IEEE1838" User "STAP set name" { ScanDataType Internal; } }

Test models are stored on disk using the **write_test_model** command.

EXAMPLES

```
prompt> current_design
{des_unit.nlib:des_unit.design}

prompt> read_test_model myModel.ctl

File name: myModel.ctl

Warning: CTL Model read for design des_unit (DFT-2000)
```

SEE ALSO

write_test_model(2)

read_test_protocol

Reads a STIL test protocol file into memory.

SYNTAX

status **read_test_protocol**
-section *section_name*
[-test_mode *test_mode_name*]
file_name

Data Types

section_name string
test_mode_name string
file_name string

ARGUMENTS

-test_mode *test_mode_name*

Specifies a test mode name to read and store a test protocol. If not specified, the current test mode is used by default. This option is only supported when updating the post-DFT test protocol.

-section *section_name*

Specifies a section name of the protocol. With this option, the **read_test_protocol** command reads only the specified section and ignores others. The only valid parameter value is **test_setup**, which describes the initialization sequence.

input_file_name

Specifies the name of the test protocol file in STIL format to read.

DESCRIPTION

This command reads a test protocol file into memory. Reading a test protocol file defines the scan test protocol for the current design.

The scan test protocol provides a means to formally define the process by which a design is tested, such as the sequence of scan-in vectors, parallel vectors, and scan-out vectors performed for each test pattern. The protocol defined for a design is used to drive scan-test design rule checking.

The format of the test protocol file is STIL. See the TestMAX DFT and TestMAX ATPG user guides for details of the protocol file

format.

The **read_test_protocol** command enables you to define an arbitrary test protocol for a design by reading in a text file describing the protocol. Use **write_test_protocol** to write out an existing protocol for a design in the same text format.

Normally, this command removes any protocol that may be present in memory through the previous use of the **read_test_protocol** or **create_test_protocol** commands.

When the **read_test_protocol -section test_setup** command is executed before pre-DFT DRC has been performed, the **test_setup** section from the specified protocol file is read in and used in place of the default setup protocol created by the tool. The provided **test_setup** section must include all preconditioned signals defined by the **set_dft_signal** command, such as clock, set, reset, and constant signals. Any STIL **Loop** constructs are retained as-is.

To modify the default setup protocol used by pre-DFT DRC, you can write out the default test protocol, modify the **test_setup** section, then read it back in; see the EXAMPLES section for more information.

When the **read_test_protocol -section test_setup** command is executed after DFT insertion has been performed, the **test_setup** section of the in-memory test protocol created by DFT Compiler is merged with the **test_setup** section from the specified protocol file. This merged in-memory protocol is used for any subsequent DRC. Any STIL **Loop** constructs are unrolled during this merging process. If multiple test modes were created by DFT Compiler, you can update each one using the **-test_mode** option of this command, or the **current_test_mode** command.

With the STIL protocol format, you cannot distinguish between a clock signal and an asynchronous signal. You must define asynchronous signals with the **set_dft_signal** command before reading your custom STIL protocol.

EXAMPLES

The following example reads a test protocol from the **newUPC1.spf** file:

```
prompt> read_test_protocol newUPC1.spf
Reading test protocol file 'newUPC1.spf'...
```

The following example reads a test protocol for the **UPC1** design from the **UPC1.spf** default file:

```
prompt> read_test_protocol
Reading test protocol file 'UPC1.spf'...
```

The following example defines the asynchronous signal **rstn** for design UPC1 and reads a test protocol from the file UPC1.spf:

```
prompt> set_dft_signal -type Reset -active_state 0 -port rstn

prompt> read_test_protocol UPC1.spf
```

The following example reads a **test_setup** section of the protocol. For example, assume that the **init_sequence.spf** file has the following **test_setup** vector sequence:

```
MacroDefs {
  "test_setup" {
    W "_default_WFT_";
    V { "A" = 0; "B" = 0; "CP" = 0; }
    V { "A" = 1; "B" = 1; "CP" = P; }
    V { "A" = 0; "B" = 0; "CP" = 1; "AA" = 1; "BB" = 1; }
  }
}
```

The following command reads in the initialization sequence and ignores the rest of the protocol file:

```
prompt> read_test_protocol -section test_setup init_sequence.spf
```

The following example creates a default test protocol, modifies it, and reads the modified **test_setup** back in:

```
prompt> create_test_protocol

prompt> write_test_protocol -output test_setup_mod.spf

  (manually modify test_setup in file,
  keeping pre-conditioned signals as needed)

prompt> read_test_protocol -section test_setup test_setup_mod.spf
```

The following example updates the post-DFT test setup protocol for two test modes:

```
prompt> insert_dft

prompt> read_test_protocol -section test_setup \
        -test_mode Internal_scan postDFT.spf

prompt> read_test_protocol -section test_setup \
        -test_mode ScanCompression_mode postDFT.spf

prompt> current_test_mode Internal_scan

prompt> dft_drc

prompt> current_test_mode ScanCompression_mode

prompt> dft_drc
```

write_test_protocol(2)

read_verilog

Reads in one or more Verilog files.

SYNTAX

string **read_verilog**
[-library *library_name*]
[-design *design_name*]
[-top *module_name*]
file_names

Data Types

library_name string
design_name string
module_name string
file_names string

ARGUMENTS

-library *library_name*

Specifies the name of the library to contain the design. If the current library is not set, the command creates a library using the first input file name. By default, the command saves the design into the current library. If the reference library list is not set, then issues a warning.

-design *design_name*

Specifies the name of the design and label to read in, in designName[/labelName] format. If design name is not specified, the top module is used as the design name. If label name is not specified, the default label, specified with the file.verilog.default_user_label app_option, will be used. Reading into an opened design is not allowed. The design must not already exist or be closed.

-top *module_name*

Specifies the name of the top module in the design hierarchy. By default, the top module is the module that is not instantiated by any other modules.

-as_block

Specifies that a new block should be created to store the read modules.

file_names

Specifies the names of one or more input Verilog netlist files.

DESCRIPTION

Reads one or more structural, gate-level Verilog netlists into the tool. To locate Verilog files that have relative pathnames, the command uses the **search_path** variable and searches for each file in each directory listed in the **search_path**. Files with absolute pathnames are loaded independent of the **search_path** variable. Use the **which** command to determine the file that **read_verilog** loads. After reading the Verilog files with the **read_verilog** command, use the **list_blocks** command to view the design objects. To remove designs, use the **remove_block** command.

The command saves the read modules into the current block if there is an open current block defined, and the block is not yet linked. This behavior can be disabled so a new block is created with the -as_block argument, or if -design is used.

When targeting an existing block a redefinition of a module will overwrite an existing definition.

The Verilog netlists must contain fully-mapped, structural designs. The tool cannot link or perform timing analysis with netlists that are not fully mapped at the gate level. There must be no high-level Verilog constructs in the netlist.

The Verilog file can be a simple ASCII file or a compressed gzip file. Each gzip file is uncompressed to a temporary file in the directory defined by the **icc2_tmp_dir** variable.

Generally, the Verilog reader does not create unconnected nets and discards unconnected instances. To keep unconnected nets in your design, set the **file.verilog.keep_unconnected_nets** app option to **true**. Also, if a module has one or more references to a reference name, but no instances have connections, those instances are omitted if the **file.verilog.keep_unconnected_cells** app option is set to "false" (the default). Discarding unconnected instances saves memory for instances of filler cells and other cells with no pins.

Additionally, **read_verilog** command prints summary at the end of run. The following describes each field:

- Number of modules read: <no. of modules read from verilog file>
- Top level ports: <no. of ports in top module including PG ports>
- Total ports in all modules: <total no. of ports in all the modules including PG ports>
- Total nets in all modules: <total no. of nets in all the modules including PG nets>
- Total instances in all modules : <total no. of instances in all the modules>
- Elapsed = <clock time>, CPU = <cpu time>

Limitations of the Verilog Reader

The Verilog reader has the following limitations:

- No non-structural constructs are supported. For details, see the "Supported Language Subset for the Verilog Reader".
- Parameters are not supported. Parameter and defparam statements are read and ignored.
- Gate instantiations are not supported.

Supported Language Subset for the Verilog Reader

The Verilog reader supports a small structural subset of the Verilog language. Additional constructs are recognized and ignored. Supported constructs are as follows:

- module/endmodule
- input, inout, and output

- wire
- tri, wor, and wand: These constructs are supported and are treated the same as the wire construct. That is, there is no special significance to these constructs.
- supply0 and supply1: These constructs create wires that are logic 0 and 1, respectively.
- assign
- tran: An exception from the gate instantiation subset, tran is supported to the extent that it relates one wire to another, as with assign. Beyond that, tran has no special significance.
- The preprocessor directives `define, `undef, `include, `ifdef, `else, and `endif are not supported by default. The **read_verilog** command targets structural, machine-generated Verilog, which rarely contains these constructs. Set the **file.verilog.enable_vpp** app option to true to enable a preprocessor phase that expands these constructs and outputs a temporary file to the directory defined by the **icc2_tmp_dir** variable.
- All simulation directives (for example, `timescale) are recognized and ignored.
- The specify/endspecify construct and its contents are recognized and ignored.
- Like HDL Compiler, the comment directives *translate_off* and *translate_on* are used to bypass Verilog features not supported by the reader. The following example shows how to bypass an unsupported feature:

```
// synopsys translate_off
nand (n2, a1, s2);
/* synopsys translate_on */
```

EXAMPLES

The following example defines a search path and reads the newcpu.v Verilog file.

```
prompt> set search_path "/designs/newcpu/v1.6 /libs/cmos"
/designs/newcpu/v1.6 /libs/cmos

prompt> read_verilog newcpu.v
Loading verilog file '/designs/newcpu/v1.6/newcpu.v'
Number of modules read: 6
Top level ports: 124
Total ports in all modules: 514
Total nets in all modules: 598
Total instances in all modules: 18
Elapsed = 00:00:00.00, CPU = 00:00:00.00
1
```

[-port_modules *port_module_names*]
[-sparse_modules *sparse_module_names*]

[-leaf_cells *leaf_cell_names*]
[-buffer_cells *buffer_cell_names*]
[-macro_cells *macro_cell_names*]

file_names

Data Types

library_name string
design_name string
module_name string
target_block_size integer
glue_cell_count integer
target_cell_count integer
cell_count_threshold integer
hierarchy_depth integer
port_depth integer
dense_module_names list
port_module_names list
sparse_module_names list
leaf_cell_names list
buffer_cell_names list
macro_cell_names list
file_names list

ARGUMENTS

-library *library_name*

Specifies the name of the library to contain the design. If the current library is not set, the command creates a library using the first input file name. By default, the command saves the design into the current library. If the reference library list is not set, then issues a warning.

-design *design_name*

Specifies the name of the design and label to read in, in designName[/labelName] format. If design name is not specified, the top module is used as the design name. If label name is not specified, the default label, specified with the file.verilog.default_user_label app option, is used. Reading into an opened design is not allowed. The design must not already exist or be closed.

-top *module_name*

Specifies the name of the top module in the design hierarchy. By default, the top module is the module that is not instantiated by any other modules.

-partition

Use the partition method to select dense modules.

-allocation

Use the allocation method to select dense modules.

-target_block_size *target_block_size*

Specifies the target for the number of cells in each partition block.

-glue_cell_count *glue_cell_count*

Specifies the target for the number of leaf cells to allocate for glue modules of the partition blocks.

-target_cell_count *target_cell_count*

Specifies the target for the total number of leaf cells to create.

-large_threshold *cell_count_threshold*

Specifies the number of leaf cells that a module can contain before it is considered to be a large module.

-depth *hierarchy_depth*

Specifies the number of top levels of module hierarchy to make dense.

-keep_port_depth *port_depth*

Specifies the number of levels of module hierarchy to preserve port interfaces.

-dense_modules *dense_module_names*

Specifies a list of module names to have dense representations.

-port_modules *port_module_names*

Specifies a list of module names to have port interfaces preserved.

-sparse_modules *sparse_module_names*

Specifies a list of module names to have sparse representations.

-leaf_cells *leaf_cell_names*

Specifies a list of cell reference names to be treated as leaf cells.

-buffer_cells *buffer_cell_names*

Specifies a list of cell reference names to be treated as buffer cells.

-macro_cells *macro_cell_names*

Specifies a list of cell reference names to be treated as macro cells.

file_names

The names of one or more Verilog files to be read.

DESCRIPTION

Reads one or more structural, gate-level Verilog netlists into the tool as an outline design. An outline design is used for high capacity design planning. The outline design contains hierarchy, but no leaf cells or nets. An outline design cannot be used for optimization or timing.

After committing the design block hierarchy with the **commit_block** command, use the **expand_outline** command to expand each outline representation into a full design based on the original Verilog. It is important to keep the original Verilog files untouched in their original locations before you run the **expand_outline** command.

To enable Data Flow Analysis, top-level outline modules should contain dense netlist connectivity. Lower-level outline modules that don't need that information should contain sparse netlist connectivity. Use the **read_verilog_outline** command options to specify which modules should have a dense or sparse representation.

One of two methods are used to determine which modules are marked as dense or sparse. Use the partition method to create individual blocks of a specified hierarchical size. Use the allocation method to explore as much of the design hierarchy as possible within a memory budget of a maximum number of leaf cell instances. The default is the partition method. This can be changed with the *plan.outline.partition* app option.

For the partition method, top-level modules in the module hierarchy are marked as dense until the hierarchical cell count beneath a module is less than a target block size. Buffers and inverters are included in the hierarchical cell count. This maintains connectivity in the top levels of hierarchy which enables Data Flow Analysis. The target block size is specified by the *plan.outline.target_block_size* app option, which defaults to 1,000,000 leaf cells. Use the **-target_block_size** option to override the default setting.

In the partition method, after the partition blocks are designated, small module hierarchies within each partition are made dense. This maintains connectivity between the partition blocks for better Data Flow Analysis. The target number of leaf cells to allocate to these module hierarchies is specified by the *plan.outline.glue_cell_count* app option, which defaults to 100,000 leaf cells. A value of -1 skips marking any glue modules as dense. Buffers and inverters are not represented in the outline design and are not included in the target glue cell count. Use the **-glue_cell_count** option to override the default setting.

For the allocation method, top-level modules in the module hierarchy are marked as dense until the target leaf cell count is reached. This count allows a rough trade-off between memory used for the outline design and the level of detail represented in the design. Buffers and inverters are not represented in the outline design and are not included in the target leaf cell count. The target leaf cell count is specified by the *plan.outline.target_cell_count* app option, which defaults to 1,000,000 leaf cells. Use the **-target_cell_count** option to override the default setting.

In the allocation method, modules that meet a leaf cell count threshold are considered large modules that should be represented as sparse modules in an outline design. Buffers and inverters are not represented in the outline design and are not included in the leaf cell count. The leaf cell count threshold is specified by the *plan.outline.large_threshold* app option, which defaults to 10,000 leaf cells. Use the **-large_threshold** option to override the default setting.

For Data Flow Analysis, dense connectivity is needed in top-level modules. The module hierarchy depth that should be marked as dense is specified by the *plan.outline.dense_module_depth* app option, which defaults to 1. Use the **-depth** option to override the default setting. A depth value of 1 forces the top module to be dense, a depth value of 2 forces the top module and its immediate children in the module hierarchy to be dense, and so on. A value of 0 has no effect. A value of -1 marks all non-sparse modules as dense. The hierarchy depth overrides the target cell count specified by the **-target_cell_count** option.

Modules and their parent modules in the module hierarchy up to the top module can be treated as dense modules by specifying their module names in the **-dense_modules** option list. The dense modules list overrides the target cell count specified by the **-target_cell_count** option.

Modules can be treated as sparse modules by specifying their module names in the **-sparse_modules** option list. Modules specified as sparse override all other options.

Dense modules have complete port interfaces, sparse modules do not. Use the *plan.outline.keep_port_depth* app option to specify the module hierarchy depth that should retain complete port interfaces. The default is 1. That value can be overridden with the **-keep_port_depth** option. A value of 0 or 1 retains the port interface of the top module. A value of 2 retains the port interface of the top module and its immediate children, and so on. A value of -1 retains the port interfaces for all modules.

Modules can be explicitly marked to retain their port interfaces by specifying their module names in the **-port_modules** option list.

The library's reference library list is examined to determine what cells are leaf cells. These cells are not instantiated into sparse modules, but they are counted so the area of each module can be computed. Buffer and inverter cells are not instantiated into sparse or dense modules, they are always counted so the area of each module can be computed. Large macro cells are important for design planning, so they are always instantiated.

The **-leaf_cells** option can be used to specify the reference names of additional cells that should be treated as leaf cells and not instantiated into the sparse modules.

The **-macro_cells** option can be used to specify the reference names of additional cells that should be treated as macro cells and are always instantiated into the outline design.

In dense modules, netlist connectivity is mostly preserved. Inverters and buffer cells from the reference library are treated as wires so connections through those cells can still be seen, minus the buffers and inverters themselves.

The **-buffer_cells** option can be used to specify the names of additional cells that should be treated as wires connecting nets.

Nets and leaf cells are not represented in sparse modules. Leaf cells are counted so the area of each module can be computed. Sparse modules contain port interfaces only if a parent of the module is a dense module. Since a module must have a port interface to be committed as a block, make sure that modules which are block candidates have their port interfaces preserved.

Nets are still represented for flip_chip_driver cells even in sparse modules. When the flip_chip_driver cell is sparse, the module and the modules that contain them (up to the top) will be marked to retain their port interfaces, so there are nets to make the connections up to the top-level ports.

All port interfaces and nets are restored in the full design by the **expand_outline** command. Otherwise the **read_verilog_outline** command is similar to the **read_verilog** command. See the **read_verilog** command documentation for more information on options and variable settings.

EXAMPLES

In the following example, the r4000.v.gz compressed Verilog file is read into an outline design. The alu is committed as a separate

block, and the top design is expanded.

```
prompt> set_ref_libs -ref_libs {"tcbn90ghvt" "tcbn90glvt"}
tcbn90ghvt tcbn90glvt
prompt> read_verilog_outline -top r4000 r4000.v.gz
Loading verilog file '/usr/.../r4000.v.gz'
1
prompt> current_design r4000
{"r4000"}
prompt> link
Information: units loaded from library 'tcbn90ghvt' (LNK-040)
Design 'r4000' was successfully linked.
1
prompt> commit_block alu
1
prompt> expand_outline
Loading verilog file './r4000.hcvr.v.gz'
1
prompt>
```

read_virtual_pad_file

Creates virtual pads from a file.

SYNTAX

status **read_virtual_pad_file**
file_name *file_name*

Data Types

file_name string

ARGUMENTS

file_name *file_name*

Specifies the file that contains virtual pad net names and locations.

DESCRIPTION

This command reads a file that contains net and coordinate information for virtual pads, and instantiates the virtual pads into the design.

The virtual pad file uses the following format, where the power net name is followed by lines containing x-coordinate, y-coordinate, and layer name for each pad location. You can also specify "auto" as the layer name.

```
power_net_name_a
x1 y1 layer_name1
x2 y2 layer_name2

power_net_name_b
x3 y3 layer_name3
x4 y4 layer_name4
```

The following example assigns virtual pads for nets VDD and VSS.

```
VDD
1632.565  1183.195  auto
576.565   987.625   auto
1566.565  589.105   auto
675.565   1201.645  auto
```

```
1401.565  758.845   auto
VSS
1071.565  1365.565  auto
840.565   943.345   auto
708.565   1068.805  auto
1566.565  762.535   auto
```

Multicorner-Multimode Support

This command is not supported in a multi-scenario design flow.

EXAMPLES

The following example creates virtual pads from a file named test.vpad

```
prompt> read_virtual_pad_file test.vpad
```

SEE ALSO

report_virtual_pads(2)
set_virtual_pad(2)
write_virtual_pad_file(2)

rebind_block

Rebind references in a block.

This command is deprecated, please use link_block command.

SYNTAX

int **rebind_block** [-verbose] [*block*]

string *block*

ARGUMENTS

-verbose

The display verbose messages.

block

The block to be rebound; the default is the current block.

DESCRIPTION

Rebinds block references for the specified *block* or the current block using the library's ref_lib list.

Libraries specified in the ref_lib list are searched in order for references to physically hierarchical blocks and lib cells. The ref_lib list uses the *search_path* to locate libraries. The ref_lib list is usually set when the library is created with the **create_lib** command, but can be updated with the **set_ref_libs** command.

Unresolved Verilog references from **link_block** will be bound using the view switch list if the referenced block is now available in the ref_lib list.

The **rebind_block** command does not change the bound block view for each cell. To change the view referenced by a cell, use the **change_view** command.

Pins on each cell that reference the block are updated to match the ports on the referenced block. Pins can be added or deleted as needed. If a pin that is a candidate to be deleted has a net connection, the rebind fails for that cell. That block reference is left unbound and the cell is unchanged.

The operation of the **rebind_block** command is similar to the **link_design -rebind** command. The **rebind_block** command only rebinds one block, while the **link_design -rebind** command rebinds all blocks in the block hierarchy.

Unresolved References

Cells which fail to be rebound are left as unbound references. These references appear as leaf cells in the block. To resolve an unbound reference, update the library's ref_lib list or the *search_path* to include the library containing the desired referenced block, and rebind the block.

The number of unresolved references to have detailed error messages can be selected using the *link.reference_limit* app option. After this limit has been reached, a summary of the number of unresolved references is given. You can change this limit with the **set_app_options** command. Information on **rebind_block** app options is found on the *link_options* manual page.

Rebind Errors

Missing block references or incompatible port references will cause **rebind_block** to fail. To correct these failures, update the ref_lib list or *search_path* and rebind the block.

EXAMPLES

In the following example, block TOP in library blockLib is linked to physically hierarchical blocks MID and BOT, and the lib cell library leafCellLib.

```
prompt> rebind_block -verbose TOP
Using libraries: designLib leafCellLib
Rebind: Collapsing hierarchy for cell 'u2/uMID'.
Rebind: Collapsing hierarchy for cell 'u1/u2/uMID'.
Rebind: Collapsing hierarchy for cell 'u1/uBOT'.
Rebind: Remapping pins on reference MID
Block 'TOP' was successfully rebound.
1
prompt> link_block -verbose
Using libraries: designLib leafCellLib
Visiting block tiny:TOP.design
Visiting block tiny:BOT.design
Visiting block tiny:MID.design
Expanding block tiny:TOP.design
Block 'TOP' was successfully linked.
1
prompt>
```

reconnect_fishbone_style_power_switch

Performs blockage-aware fishbone style power switch reconnection.

SYNTAX

collection **reconnect_fishbone_style_power_switch**
-sw_cells *list_of_power_switch_names*
-ctrl_pin_name *library_control_pin_name*
-ack_pin_name *library_acknowledge_pin_name*

Data Types

list_of_power_switch_names list
library_control_pin_name string
library_acknowledge_pin_name string

ARGUMENTS

-sw_cells *list_of_power_switch_names*

Specifies power switch cell names which will be reconnected. The specified power switch cells must be connected by the **connect_power_switch -mode fishbone** command. This option is required.

-ctrl_pin_name *library_control_pin_name*

Specifies the control pin name for the power switch library cell. This option is required.

-ack_pin_name *library_acknowledge_pin_name*

Specifies the acknowledge pin name for the power switch library cell. This option is required.

DESCRIPTION

This command performs blockage-aware fishbone style reconnection for power switches which were connected by the **connect_power_switch -mode fishbone** command. This command detects long connections between power switches and reconnects the power switches to the nearest neighbors. This command will not reconnect the main trunk cells. It cannot handle multiple groups of power switches simultaneously and it cannot be called multiple times for the same group of power switches after **connect_power_switch -mode fishbone**.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following is an example reconnects the power switches. The control pin is SLEEP, the acknowledge pin is SLEEPOUT.

```
prompt> reconnect_fishbone_style_power_switch -sw_cells $sw_names \
  -ctrl_pin_name SLEEP -ack_pin_name SLEEPOUT
```

SEE ALSO

connect_power_switch(2)

record_layout_editing

This command records changes to the layout change for a restricted set of objects and writes the changes to a Tcl script file.

SYNTAX

status **record_layout_editing**
-start | -stop
[-output *file_name*]

Data Types

file_name string

ARGUMENTS

-start

Begins recording changes to the layout for the current design. Layout changes are recorded until you perform **record_layout_editing -stop** or close the design.

-stop

Stops recording of changes to the layout writes out the changes to the output file specified by the **-output** option. This option must be used together with the **-output** option.

-output *file_name*

Specifies the output Tcl file name into which to write the layout changes. The file contains changes from the point when **record_layout_editing -start** is run to current point. This option must be used together with the **-stop** option.

DESCRIPTION

This command records the layout changes and writes out the changes to a Tcl script file. You can source the Tcl script file to re-create the changes. It could help to realize the parallel layout editing of the design.

Run **record_layout_editing -start** to begin recording layout changes. When you run **record_layout_editing -stop -output**, layout changes since you ran **record_layout_editing -start** are written out as Tcl commands to the specified file. If you run **record_layout_editing -start** and the tool is already recording layout changes, the tool issues a warning message, discards the previous recording, and begins a new recording. If you close design while recording layout changes, the tool issues a warning message and discards the recording.

Parallel Layout Editing using record_layout_editing

You can use the **record_layout_editing** command to record layout changes on individual design blocks, then reapply the combined changes to a master design copy. The basic flow of the technique is as follows:

1. Design the partition.
2. Deploy each layout partition to separated designers
3. Record the layout changes for each design with the following steps:
   1) record_layout_editing **-start**
   2) Edit the layout
   3) record_layout_editing **-stop** -output change.tcl
4. Collect each designer's record of changes and source the changes to the original design one by one. Using this technique, the final design will contain all the layout changes.

Supported Object Types

Only changes for objects in the top block will be saved. The supported object types are as the following:

- Shape
- Via
- Terminal
- Via_def

Supported Editing Operations for Recording

The supported layout editing operation includes only the following:

- Tcl commands for creating layout objects
- Tcl commands for removing layout objects
- Set attributes by using **set_attribute**
- GUI move and resize

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example records a layout editing session to remove shape RECT_32_0.

```
prompt> record_layout_editing -start
prompt> remove_shapes RECT_32_0
prompt> record_layout_editing -stop -output change.tcl
```

SEE ALSO

set_attribute(2)
remove_shapes(2)

record_signoff_eco_changes

Records ECO changes for the incremental signoff ECO flow.

SYNTAX

int **record_signoff_eco_changes**
-start [-input *file_name*]

int **record_signoff_eco_changes**
-stop
[-def]
[-compress]

int **record_signoff_eco_changes**
-init
[-def]
[-compress]

Data Types

file_name PrimeTime ECO Tcl file

ARGUMENTS

-start

Start to record ECO changes if the recording is not started yet, or else it will error out. This option is mutually exclusive with the **-stop** and **-init** options.

-input *file_name*

Specify a Tcl file for signature check. This option works together with the **-start** option. The tool checks signoff ECO signature consistency between the Tcl file and the current block. If the signatures are inconsistent, or there is no signature inside design or Tcl file, the check fails and the command issues an error message and exits. If the check passed, this command will automatically source the Tcl file.
The Tcl file input is the PT-ECO Tcl file generated by PrimeTime ECO flow. The signature check provide one extra layer protection to make sure the PT-ECO Tcl file applied to the right block.

-stop

Terminate the recording if recording mode is on and save necessary data to disk. This option is mutually exclusive with the **-start** and **-init** options.

-init

Terminate the recording if recording mode is on, and save the full design data to disk as an initial point for the incremental signoff ECO flow. This option is mutually exclusive with the **-start** and **-stop** options.

-def

Save the DEF file. This option is used with the **-stop** or **-init** option.

-compress

Save the DEF and Verilog files in compressed format if available. This option works with the **-stop** or **-init** option.

DESCRIPTION

The **record_signoff_eco_changes** command records and saves the design ECO changes for the incremental signoff ECO flow. The command can record cell, netlist and physical geometry changes, and save the ECO changes to disk for the current block.

Inside the tool session for incremental signoff ECO flow, the timing ECO commands are not limited to PT-ECO Tcl. You can provide timing ECO commands manually to update the design. However, the logical recording will be terminated automatically if functional ECO commands are issued in the flow.

The saved ECO changes are used to benefit StarRC and PrimeTime runtime for the multiple iterations of incremental signoff ECO flow. It will always save an information file and full NDM db. Full DEF file will be saved if the *-def* option is available. If the logical recording is terminated, or option *-init* is used, full Verilog file will be saved. Depending on the recording status, other design change files may be saved also. These files will be used by StarRC and PrimeTime internally inside the incremental signoff ECO flow and are not be user-readable. If the current block is closed before the recording is stopped, all recorded information is discarded.

EXAMPLES

The following example is to create an initial point for incremental signoff ECO flow:

```
prompt> record_signoff_eco_changes -init
```

The following example starts to record the design ECO changes.

```
prompt> record_signoff_eco_changes -start -input pt_eco.tcl
```

The following example saves the recorded ECO changes.

```
prompt> record_signoff_eco_changes -stop
```

The following example is a simple incremental signoff ECO flow.

```
prompt> open_block LIB.ndm:BLOCK
prompt> record_signoff_eco_changes -start -input pt_eco.tcl
prompt> place_eco_cells
prompt> route_eco
prompt> record_signoff_eco_changes -stop
```

SEE ALSO

place_eco_cells(2)
route_eco(2)

recover_auto_save

Opens the auto-saved library of the current library.

SYNTAX

status **recover_auto_save**

DESCRIPTION

This command recovers and opens the auto-saved library of the current library. You can also recover and open the latest auto-saved library through the command option -recover of open_lib. The auto-saved library is recovered, opened and merged into the current or original library.

EXAMPLES

The following example recovers the auto-saved library to the current library.

```
prompt> report_auto_save
*********************************************************
Original Library : r4000

Auto-saved library path              : /slowfs/ndmdisk003/r4000_19142
Auto-saved library timestamp         : Wed Aug 14 01:56:21 2019
Auto-saved library size              : 2933585 bytes
Auto-saved library is_recovery_save  : false
Auto-saved library context           : creste_net

prompt> recover_auto_save
Information: Loading library file '/slowfs/ndmdisk003/r4000_19142' (FILE-007)
```

recover_rp_placement

Recover placement information for placed relative placement groups.

SYNTAX

int **recover_rp_placement**
rp_group_list | -all
-blockage

Data Types

rp_group_list list or collection

ARGUMENTS

rp_group_list

Specifies a list of relative placement groups. The list may contain relative placement group names, patterns, or collections. A collection may be specified using the **get_rp_groups** command. This option is mutually exclusive with *-all*.

-all

Recovers placement information for all relative placement groups from the current block. This option is mutually exclusive with *rp_group_list*.

-blockage

Specifies that consider relative placement blockages too. Please note that the bounding box of the placement blockages is not recovered. The size of the relative placement blockage is used in recovering placement information of the relative placement groups.

DESCRIPTION

This command recovers placement information for the specified relative placement groups. The placement information includes the bounding box and placement status of the relative placement groups. Note that placement information cannot be recovered if the relative placement group is not placed or placement failed.

EXAMPLES

The following example recovers placement information for relative placement group named "top_rp1" and "top_rp2".

```
prompt> recover_rp_placement { top_rp1 top_rp2 }
2
```

SEE ALSO

recycle_programmable_spare_cells

Recycles the removed ECO cells and converts them back to programmable spare cells (PSC). These PSC cells can be used to do PSC mapping afterward. This command is typically used in the freeze silicon ECO flow.

SYNTAX

status **recycle_programmable_spare_cells**
[-cells *cell_objects*]
[-lib_cells_for_filler_recovery *lib_cells*]

Data Types

cell_objects collection
lib_cells collection

ARGUMENTS

-cells *cell_objects*

Specifies that the spare cells come from removed ECO cells for recycling. The specified cells must have the psc_filler_is_used attribute set to true. If this option is not specified, the command recycles cells by collecting all available spare cells with the psc_filler_is_used attribute set to true from the set of removed ECO cells in the current design.

-lib_cells_for_filler_recovery *lib_cells*

Specifies the programmable spare cell (PSC) filler library cells, The command uses only these library cells to fill and recover the unused space of the PSC cells after PSC recycling. If the option is disabled, the command uses all available PSC filler library cells in the reference libraries.

DESCRIPTION

The **recycle_programmable_spare_cells** command recycles the removed ECO cells and converts them back to PSC cells. These PSC cells can be used to do PSC mapping afterward.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example recycles the cells specified by the **-cells** option and converts them back to PSC cells.

```
prompt> recycle_programmable_spare_cells \
    -cells [get_cells *_Spare]
```

SEE ALSO

place_freeze_silicon(2)

redirect

Redirects the output of a command to a file.

SYNTAX

string **redirect**
[-append] [-tee] [-file | -variable | -channel] [-compress]
[-bg]
[-max_cores *number_of_cores*]
target
{*command_string*}

Data Types

number_of_cores integer
target string
command_string string

ARGUMENTS

-append

Appends the output to *target*.

-tee

Like the Linux command of the same name, sends output to the current output channel as well as to the *target*.

-file

Indicates that *target* is a file name, and redirection is to that file. This is the default.

This option is mutually exclusive with the **-variable** and **-channel** options.

-variable

Indicates that *target* is a variable name, and redirection is to that Tcl variable.

This option is mutually exclusive with the **-file** and **-channel** options.

-channel

Indicates that *target* is a Tcl channel, and redirection is to that channel.

This option is mutually exclusive with the **-file** and **-variable** options.

-compress

Compress when writing to file.

If redirecting to a file, this option specifies that the output should be compressed as it is written. The output file is in a format recognizable by the Linux **gzip -d** command.

You cannot specify this option with the **-append** option.

-bg

Indicates that the redirected command or script executes in the background and in parallel with other foreground commands downstream.

When you run this command, the tool returns the process ID (PID) of the background process and then displays the shell prompt immediately to execute the next command.

The **redirect -bg** command supports only a limited set of commands; the tool issues an error message if you specify an unsupported command. To list the supported commands, use the **list_commands -bg** command. If the command or script includes a **redirect -bg** command, the **-bg** option is ignored.

You can run at most two commands in the background. If there are already two **redirect -bg** commands running, additional **redirect -bg** commands are queued.

If you run the **exit** or **quit** command while background commands are running, the tool waits for all background commands to complete before exiting.

The **-bg** option must be used with the **-file** and **-max_cores** options. No other options are allowed.

-max_cores ***number_of_cores***

Specifies the maximum number of CPU cores that can be used by multicore commands run within the **redirect -bg** command.

target

Indicates the target of the output redirection. This is either a file name, Tcl variable, or Tcl channel depending on the command arguments.

command_string

Specifies the command to execute. Intermediate output from this command, as well as the result of the command, are redirected to *target*. The *command_string* must be rigidly quoted with curly braces.

DESCRIPTION

The **redirect** command performs the same function as the traditional Linux-style redirection operators > and >>. However, it is more flexible because you can redirect multiple commands or an entire script.

By default, the redirected commands are run in the foreground. To run the redirected commands in the background, use the **-bg** option. In both cases, the *command_string* must be rigidly quoted (that is, enclosed in curly braces) for the operation to succeed.

Note that the builtin Tcl command **puts** does not respond to output redirection of any kind. Use the builtin **echo** command instead.

Behavior Without the -bg Option

When you use the **redirect** command without the **-bg** option,

- The **redirect** command returns an empty string.

Screen output occurs only if errors occurred during execution of the *command_string* (other than opening the redirect file). When errors occur, a summary message is printed. See the examples.

Although the result of a successful **redirect** command is the empty string, you can still get and use the result of the redirected command. Construct a **set** command in which you set a variable to the result of your command. Then, redirect the **set** command. The variable holds the result of your command. See the examples.

- By default, output is redirected to a file.

  You can redirect the output to a Tcl variable by using the **-variable** option or to a Tcl channel by using the **-channel** option.

  You can send the output to the current output device as well as the redirect target by using the **-tee** option. See the EXAMPLES section for an example.

Behavior With the -bg Option

The **-bg** option enables parallel processing on multicore hardware for performance reasons. This command is targeted for post-update reporting, analysis, and design export commands.

When you use the **redirect** command with the **-bg** option,

- The command returns the PID of the background job instead of an empty string.
- You must redirect the output to a file; the **-bg** option cannot be used with other redirect targets.
- The maximum number of cores for the main session is reduced by the maximum number of cores used by the background jobs.
- You can use the **parallel_execute** command with the **redirect -bg** command to run jobs in parallel in the background.
- Changes made to the netlist or other data by commands executed in the background job are not brought back to the foreground job.

  Also, using commands in the background job that modify the netlist or other data can cause memory blow up in the child process.
- The background job cannot pass variables back to the foreground job.

  To pass variables from a background job to the foreground job, you must write the contents of the variables to a file in the background job, and then read that file in the foreground job.
- If you use the **change_names** command in the background, you must stop recording Formality setup information before running the **redirect -bg** command and use a new SVF file within the background job. Both the SVF files must be provided for formal verification.

EXAMPLES

In the following example, the output of the plus procedure is redirected. The echoed string and the result of the plus operation are in the output file. Notice that the result is not echoed to the screen.

```
prompt> proc plus {a b} {echo "In plus" ; return [expr $a + $b]}
prompt> redirect p.out {plus 12 13}
prompt> exec cat p.out
In plus
25
```

In this example, a typo in the command creates an error condition. The error message indicates that you can use **error_info** to trace

the error, but you should first check the output file.

```
prompt> redirect p.out {plus2 12 13}
Error: Errors detected during redirect
       Use error_info for more info. (CMD-013)
prompt> exec cat p.out
Error: unknown command 'plus2' (CMD-005)
```

This example shows how to use of the results from redirected commands. Because the result of the **redirect** command for a command that does not generate a Tcl error is the empty string, use the **set** command to trap the result of the command. For example, assume that there is a command to read a file that has a result of "1" if it succeeds, and "0" if it fails. If you redirect only the command, there is no way to know if it succeeded.

```
prompt> redirect p.out { read_a_file "a.txt" }
# Now what? How can I redirect and use the result?
```

If you set a variable to the result, you can use that result in the foreground process.

```
prompt> redirect p.out { set rres [read_a_file "a.txt"] }
if { $rres == 1 } {
  echo "Read ok!"
}
```

The **redirect** command is not limited to redirection of a single command. You can redirect entire blocks of a script with a single **redirect** command. This simple example with the **echo** command demonstrates this feature:

```
prompt> redirect p.out {
?       echo -n "Hello "
?       echo "world"
?     }
prompt> exec cat p.out
Hello world
prompt>
```

The **redirect** command allows you to tee output to the previous output device and also to redirect output to a variable. This simple example with the **echo** command demonstrates this feature:

```
prompt> set y "This is "
This is
prompt> redirect -tee x.out {
        echo XXX
        redirect -variable y -append {
          echo YYY
          redirect -tee -variable z {
            echo ZZZ
          }
        }
      }
XXX
prompt> exec cat x.out
XXX
prompt> echo $y
This is YYY
ZZZ

prompt> echo $z
ZZZ
```

The following example demonstrates how to run a Tcl procedure and a Tcl script in the background by using the **redirect** command

with the **-bg** option. The Tcl procedure and Tcl script can contain any of the commands supported by the **-bg** option.

```
prompt> set_host_options -max_cores 4
prompt> redirect -bg -max_cores 1 -file x.out {MyTclProc}
prompt> redirect -bg -max_cores 1 -file y.out {source y.tcl}
prompt> echo $z
ZZZ
```

The following example demonstrates how the **set_svf** command can be used within the **redirect -bg** command. If the reference design is from foo.v, to verify the netlist after the **redirect -bg** command, use both the compile.svf and redirect.svf SVF files. To verify the netlist after the **compile -incremental** command, use the compile.svf and compile_incr.svf SVF files.

```
prompt> set_host_options -max_cores 4
prompt> set_svf compile.svf
prompt> read_verilog foo.v
prompt> read_sdc foo.sdc
prompt> compile
prompt> set_svf -off
prompt> redirect -bg -max_cores 1 -file x.out \
  {set_svf redirect.svf; change_names -rules verilog -hierarchy; ...}
prompt> set_svf compile_incr.svf
prompt> compile -incremental
ZZZ
```

redo

Redo the effects of one or more commands.

SYNTAX

int **redo**
[-levels *num_levels* | -marker *marker_name* | -all]
[-check_only]
[-silent]

Data Types

num_levels int
marker_name string

ARGUMENTS

-levels *num_levels*

Redoes the effects of the specified number of command levels.

-marker *marker_name*

Restores the system state to the point of creation of the marker with the specified name.

-all

Restores the system to the most recent available state in the command history.

-check_only

Causes the command to return the same status and messages it would otherwise return without actually performing the redo or changing anything.

-silent

Surpresses messages and a TCL error in the event of an error.

DESCRIPTION

This command redoes the effects of one or more previous database-changing commands, or "command levels". If the *-levels* option is used, then the specified number of command levels will be redone. It is an error to specify more levels than there are in the command history that are more recent than the current point.

If the *-marker* option is used, then the system state will be restored to that of when the specified marker was created. *marker_name* may be the user assigned or system generated name of the marker. This option would typically be used to restore the system to a user marker, which would have been created using the *create_undo_marker* command. It is an error to specify a marker that was created previous to the current point in the command history - for that case use the *undo* command instead.

If the *-all* option is used, then the system state will be restored to the latest available state in the command history. Note that this may not be the latest state that was originally undone from, as the execution of a new state-changing command earlier in the history will cause the subsequent redo history to be truncated.

If neither the *-levels*, *-marker*, or *-all* option is used, then this command will redo one command level.

The command returns the actual number of command levels redone or, if the *-check_only* option was used, that would have been redone without the *-check_only* option.

EXAMPLES

The following redoes one command level:

```
prompt> get_attribute $inst origin
0.0000 0.0000
prompt> set_attribute $inst origin {100 300}
{U368}
prompt> get_attribute $inst origin
100.0000 300.0000
prompt> undo
1
prompt> get_attribute $inst origin
0.0000 0.0000
prompt> redo
1
prompt> get_attribute $inst origin
100.0000 300.0000
```

The following returns the system to the most recent state:

```
prompt> create_undo_marker my_mrk
my_mrk
prompt> get_attribute $inst origin
0.0000 0.0000
prompt> set_attribute $inst origin {200 400}
{U368}
prompt> set_attribute $inst origin {300 600}
{U368}
prompt> get_attribute $inst origin
300.0000 600.0000
prompt> undo -marker my_mrk
2
prompt> get_attribute $inst origin
0.0000 0.0000
prompt> redo -all
```

```
2
prompt> get_attribute $inst origin
300.0000 600.0000
```

get_undo_info(2)

refine_placement

Performs incremental placement with congestion optimization.

SYNTAX

status **refine_placement**
[-effort very_low | medium | high]
[-congestion_effort low | medium | high]
[-perturbation_level low | medium | high]
[-coordinates *bbox*]

Data Types

bbox rectangle

ARGUMENTS

-effort very_low | low | medium | high

Specifies the CPU effort level for coarse placement. If running very low effort it is advised to set the -congestion_effort to low. The default effort level is medium.

-congestion_effort low | medium | high

Specifies the effort level of congestion removal. The higher effort, the less attention is paid to other objects: timing, density and total wire-length. The default effort level is **medium**.

-perturbation_level low | medium | high

Specifies the perturbation level for the placement to optimize congestion. Specifying **low** produces the least amount of movement from the placement. The higher the level specified, the more movement you might expect from the placement. So, specifying **high** produces the most movement from the placement. The default effort level is **medium**.

-coordinates *bbox*

Specifies one rectangle that defines the region from which to run incremental congestion removal.

The "bbox" is lower-left and upper-right coordinates of a rectangle.

The default (without this option) is to run incremental placement for the entire design, which is the recommended way to use this command. If you want to specify one localized region on which incremental placement should be done, you can use this option to prevent any disturbance of the rest of the converged design. The region based refinement may cause timing/congestion degradation if regions are not properly specified.

The units of the **-coordinates** are in microns.

No runtime improvement is expected when this option is used; it is primarily used to restrict the placer from making changes outside the specified rectangles.

DESCRIPTION

The **refine_placement** command performs incremental congestion optimization for the current design. This command does not touch netlist.

Multicorner-Multimode Support

This command operates a scenario selected based on timing QoR.

EXAMPLES

The following example runs the **refine_placement** command in low-effort congestion mode:

```
prompt> refine_placement -congestion_effort low
```

The following example runs the **refine_placement** command in single region:

```
prompt> refine_placement -coordinates { {$llx1 $lly1} { $urx1 $ury1 } }
```

SEE ALSO

create_placement(2)

refine_topology_plans

Refine a topology plan to create additional nodes and edges.

SYNTAX

int **refine_topology_plans**
[*topology_plan_list*]

Data Types

topology_plan_list collection

ARGUMENTS

topology_plan_list

Specifies the list of topology plans to refine. If not specified then it means all the topology plans within the current design.

DESCRIPTION

The **refine_topology_plans** command refines a topology plan by creating additional nodes and edges.

If a topology edge has layer-shapes attribute defined with Manhattan style edge segments, then new topology nodes are created where the edge segments cut at a block boundaries. The original topology edge is also cut at the position where the new topology nodes are created, and new topology edges are created between new and existing topology nodes, and then connect them together.

If the topology edge does not have the layer-shapes attribute defined, or the layer-shapes are not Manhattan style, then there will be no new nodes or edges created for this topology edge.

Upon success, the command returns 1. Otherwise, 0.

EXAMPLES

The following example refines all the topology plans of the design.

```
prompt> refine_topology_plans
```

SEE ALSO

create_topology_plans(2)

refresh_performance_via_ladder_constraints

Refreshes via ladder constraints in a design to ensure compliance with via ladder candidates.

SYNTAX

status **refresh_performance_via_ladder_constraints**

DESCRIPTION

The **refresh_performance_via_ladder_constraints** command refreshes via ladder constraints in a design to ensure compliance with via ladder candidates.

EXAMPLES

The following example verifies all via ladder constraints in the design and updates via ladder constraints which comply with via ladder candidates.

```
prompt> refresh_performance_via_ladder_constraints
```

SEE ALSO

insert_via_ladders(2)
refresh_via_ladders(2)
remove_via_ladder_constraints(2)
remove_via_ladders(2)
set_via_ladder_constraints(2)
verify_via_ladders(2)

refresh_via_ladders

Refreshes via ladders to ensure compliance with via ladder constraints. This command runs the **verify_via_ladders** command, removes any via ladders that would cause "Misplaced via ladder" DRCs, and runs the **insert_via_ladders** command to insert via ladders where needed. The command is further controlled with the route.auto_via_ladder.* application options.

SYNTAX

status **refresh_via_ladders**
[-nets {*collection_of_nets*}]

Data Types

collection_of_nets collection

ARGUMENTS

-nets {*collection_of_nets*}

Specifies the nets on which to update via ladders. A via ladder will be updated only on pins with via ladder constraints when the pin is also on one of the specified nets.

If you do not specify this option, via ladders are updated on any pin with a via ladder constraint.

DESCRIPTION

The **refresh_via_ladders** command refreshes via ladders in a design to ensure compliance with via ladder constraints. This command runs the **verify_via_ladders** command, removes any via ladders that would cause "Misplaced via ladder" DRCs, and runs the **insert_via_ladders** command to insert via ladders where needed.

The **route.auto_via_ladder.update_during_route** application option, when true, activates an automatic via ladder update at the start of all routing commands that run global routing, track assignment, and detail routing. This includes the **route_auto**, **route_group**, and **route_eco** commands.

The **refresh_via_ladders** command executes the same internal flow as automatic via ladder updating in routing commands, but does so as a standalone command. The **refresh_via_ladders** command performs the via ladder update and terminates immediately without performing any other routing tasks.

EXAMPLES

The following example verifies all via ladders in the design, removes any via ladders that cause "Misplaced via ladder DRCs," and performs via ladder insertion. Vias ladders are inserted on any pin with a via ladder constraint but no corresponding via ladder in the layout.

```
prompt> refresh_via_ladders
```

remove_3d_virtual_blocks

Removes virtual interface blocks.

SYNTAX

integer **remove_3d_virtual_blocks**
-all | *vib* | *vib_cell* | {*die1 die2*}

Data Types

vib collection
vib_cell collection
die1 collection
die2 collection

ARGUMENTS

-all

Removes all virtual interface blocks in the design.

vib

Specifies the virtual interface block to remove.

vib_cell

Specifies the virtual interface block by cell instance to remove.

{ *die1 die2* }

Specifies the dies between which to remove the virtual interface block.

DESCRIPTION

This command removes virtual interface blocks from the design. If the virtual interface block was connected to the top netlist during creation, the die ports at the interface are reconnected back together.

EXAMPLES

The following example removes all virtual interface blocks from the design.

```
prompt> remove_3d_virtual_blocks -all
```

The following example removes the virtual interface block between two dies.

```
prompt> remove_3d_virtual_blocks {die1 die2}
```

The following example removes the specified virtual interface block.

```
prompt> remove_3d_virtual_blocks die1__die2
```

SEE ALSO

create_3d_virtual_blocks(2)

remove_abstract

Removes the abstract associated with the given design from memory and disk

SYNTAX

return_val **remove_abstract**
[*design_name*]

Data Types

return_val 0 (or 1) if command failed (or succeeded).
design_name Name in form [libName:]designName/label

ARGUMENTS

design_name

The source design name with optional library specifications. If the option is not given, the **current_design** is used. If the library specification is not given, the **current_lib** is used. The library of the specified block should already be opened in edit mode.

RETURN VALUE

Returns 1 if the design is saved and 0 if not. If an illegal name(with a slash) is given for the design, a TCL error is raised.

DESCRIPTION

The command removes the abstract view associated with the given (or current) design. If the abstract is editable, the open blocks on which the abstract depends will automatically be upgraded to "edit" mode.

EXAMPLES

Remove the abstract view associated with the current design.

```
prompt> remove_abstract
1
```

Following example removes the abstract associated with the design "mid", in library "midlib".

```
prompt> list_blocks
Lib toplib
  +>  0 top.design current
Lib midlib
  ->  0 mid.abstract
  -   0 mid.design
3
prompt> remove_abstract midlib:mid
1
prompt> list_blocks
Lib toplib
  +>  0 top.design current
Lib midlib
  ->   0 mid.design
2
```

SEE ALSO

create_abstract(2)
merge_abstract(2)

remove_annotated_check

Removes annotated timing-check information.

SYNTAX

status **remove_annotated_check**
[-modes *mode_list*]
[-corners *corner_list*]
[-scenarios *scenario_list*]
-all | -from *from_list* | -to *to_list*
[-rise | -fall]
[-clock rise | fall]
[-setup]
[-hold]
[-recovery]
[-removal]
[-nochange_low]
[-nochange_high]
[-width]
[-period]

Data Types

from_list list
to_list list

ARGUMENTS

-modes *mode_list*

Specifies the modes for which to remove the annotated value. Each active scenario of the modes specified by the **-modes** option and the corners specified by the **-corners** option is de-annotated separately. If this option is not given, the command removes annotation for every scenario that is active with the specified corner(s). It is an error to give this option with the **-scenarios** option.

-corners *corner_list*

Specifies the corners for which to remove the annotated value. Each active scenario of the modes specified by the **-modes** option and the corners specified by the **-corners** option is de-annotated separately. If this option is not given, the command removes annotation for every scenario that is active with the specified mode(s). It is an error to give this option with the **-scenarios** option.

-scenarios *scenario_list*

Specifies the scenarios for which to remove the annotated value. Each of the specified scenarios is de-annotated separately. It is an error to give this option with the **-modes** or the **-corners** options. If none of the **-modes**, **-corners**, or **-scenarios** options are specified, the command applies to the current scenario only.

-all

Removes all annotated checks in the current design. This includes rise and fall values for setup, hold, recovery, removal, and nochange pin-to-pin timing checks. You must specify either **-all**, **-from**, or **-to**; if you specify **-all**, you cannot specify any other arguments or options.

-from ***from_list***

Specifies a list of leaf cell clock pins that are the startpoints of the timing arcs from which annotated checks are to be removed. You must specify either **-all**, **-from**, or **-to**; if you specify **-all**, you cannot specify any other arguments or options.

-to ***to_list***

Specifies a list of leaf cell data pins that are the endpoints of the timing arcs from which annotated checks are to be removed. You must specify either **-all**, **-from**, or **-to**; if you specify **-all**, you cannot specify any other arguments or options.

-rise | **-fall**

Specifies whether the check to be removed is for data rise or fall transition. If you do not specify either **-rise** or **-fall**, both values are removed.

-clock rise | **fall**

Specifies whether the check to remove is for clock rising or falling. By default, checks for both clock rise and fall are removed.

-setup

Removes only setup timing-check information.

-hold

Removes only hold timing-check information.

-recovery

Removes only recovery timing-check information.

-removal

Removes only removal timing-check information.

-nochange_low

Removes only the nochange timing check against data low information.

-nochange_high

Removes only the nochange timing check against data high information.

-width

Removes only minimum pulsewidth timing check information.

-period

Removes only period timing check information.

DESCRIPTION

This command removes annotated timing checks between the specified pins. Data rise and fall and clock rise and fall annotated checks are removed by default.

You can use the **remove_annotated_check** command for pins at lower levels of the design hierarchy. These pins are specified as "INSTANCE1/INSTANCE2/PIN_NAME."

If the design is not already linked, **remove_annotated_check** links it automatically.

The **remove_annotated_check** command removes annotated timing checks set by the **set_annotated_check** command, and also removes setup, hold, recovery, removal, or nochange annotated timing checks set by the **read_sdf** command. The **reset_design** command removes annotated timing checks in addition to other information.

Multicorner-Multimode Support

By default, this command works on the current scenario. To specify a different scenario, use the **-scenarios** option or the **-corners** and **-modes** options.

EXAMPLES

The following example removes an annotated setup check between pins u1/u2/CP and u1/u2/D:

```
prompt> remove_annotated_check -setup -from u1/u2/CP -to u1/u2/D
```

The following example removes all annotated timing checks on the current design:

```
prompt> remove_annotated_check -all
```

SEE ALSO

current_design(2)
link(2)
read_sdf(2)
report_annotated_check(2)
reset_design(2)
set_annotated_check(2)

remove_annotated_delay

Removes the annotated delay between two pins.

SYNTAX

status **remove_annotated_delay**
[-modes *mode_list*]
[-corners *corner_list*]
[-scenarios *scenario_list*]
-all | -from *from_list* | -to *to_list*

Data Types

from_list list
to_list list

ARGUMENTS

-modes *mode_list*

Specifies the modes for which to remove the annotated value. Each active scenario of the modes specified by the **-modes** option and the corners specified by the **-corners** option is de-annotated separately. If this option is not given, the command removes annotation for every scenario that is active with the specified corner(s). It is an error to give this option with the **-scenarios** option.

-corners *corner_list*

Specifies the corners for which to remove the annotated value. Each active scenario of the modes specified by the **-modes** option and the corners specified by the **-corners** option is de-annotated separately. If this option is not given, the command removes annotation for every scenario that is active with the specified mode(s). It is an error to give this option with the **-scenarios** option.

-scenarios *scenario_list*

Specifies the scenarios for which to remove the annotated value. Each of the specified scenarios is de-annotated separately. It is an error to give this option with the **-modes** or the **-corners** options. If none of the **-modes**, **-corners**, or **-scenarios** options are specified, the command applies to the current scenario only.

-all

Removes all net- and cell-annotated delays in the current design. If you specify **-all**, you cannot specify any other arguments.

-from *from_list*

Specifies a list of leaf-cell pins or top-level ports that are the startpoints of the timing arcs from which to remove annotated delays. You must specify either **-all**, or both **-from** and **-to**.

-to *to_list*

Specifies a list of leaf-cell pins or top-level ports that are the endpoints of the timing arcs from which to remove annotated delays. You must specify either **-all**, or both **-from** and **-to**.

DESCRIPTION

This command removes annotated delays between the specified pins, which must be on the same net or on the same cell. Both rise and fall annotated delays are removed. There must be a timing arc between the pins in *from_list* and the pins in *to_list* or no annotated delay is removed.

You can use **remove_annotated_delay** for pins at lower levels of the design hierarchy. These pins are specified as "INSTANCE1/INSTANCE2/PIN_NAME."

To annotate net delay values between pins in a design, use **set_annotated_delay -net** command. To annotate cell delay values between pins in a design, use the **set_annotated_delay -cell** command. You must use **-from** and **-to** in the same manner you used them to set annotated values.

Multicorner-Multimode Support

By default, this command works on the current scenario. To specify a different scenario, use the **-scenarios** option or the **-corners** and **-modes** options.

EXAMPLES

The following example first shows the annotation of the delay to remove. The second command removes the annotated net delay between output pin Z of cell instance U1/U2/U3 and input pin A of cell instance U6:

```
prompt> set_annotated_delay -net <value> -from U1/U2/U3/Z -to U6/A
prompt> remove_annotated_delay -from U1/U2/U3/Z -to U6/A
```

The following example removes all annotated net and cell delays from the current design:

```
prompt> remove_annotated_delay -all
```

SEE ALSO

current_design(2)
report_timing(2)
reset_design(2)
set_annotated_delay(2)

remove_annotated_power

Removes annotated cell power dissipation values that were set by **set_annotated_power**.

SYNTAX

status **remove_annotated_power**
-scenarios *scenario_list*
-all
[cell_list]

Data Types

scenario_list list
cell_list list

ARGUMENTS

-scenarios

Specifies the set of scenarios for which the annotated values should be removed. The default is the value returned by the **current_scenario** command.

-all

Specifies that the power annotations of all cells should be removed.

cell_list

Specifies the cells for which the annotated power values should be removed. When option *-all* is given, no cell_list is allowed.

DESCRIPTION

This command removes annotated power values on cells. These annotations were previously applied using the *set_annotated_power* command. The command removes all annotations of a cell, so both leakage and internal power annotations for all supply nets are removed.

Multicorner-Multimode Support

EXAMPLES

The following example removes the power annotations for cell U1/U2/U3 in the current scenario.

```
prompt> remove_annotated_power U1/U2/U3
```

The following example removes the power annotations of all cells in the scen1 scenario.

```
prompt> remove_annotated_power -all -scenarios scen1 \
```

SEE ALSO

report_annotated_power(2)
set_annotated_power(2)

remove_annotated_transition

Removes the annotated transition at a pin.

SYNTAX

status **remove_annotated_transition**
[-modes *mode_list*]
[-corners *corner_list*]
[-scenarios *scenario_list*]
-all | *pins*

Data Types

pins collection

ARGUMENTS

-modes *mode_list*

Specifies the modes for which to remove the annotated value. Each active scenario of the modes specified by the **-modes** option and the corners specified by the **-corners** option is de-annotated separately. If this option is not given, the command removes annotation for every scenario that is active with the specified corner(s). It is an error to give this option with the **-scenarios** option.

-corners *corner_list*

Specifies the corners for which to remove the annotated value. Each active scenario of the modes specified by the **-modes** option and the corners specified by the **-corners** option is de-annotated separately. If this option is not given, the command removes annotation for every scenario that is active with the specified mode(s). It is an error to give this option with the **-scenarios** option.

-scenarios *scenario_list*

Specifies the scenarios for which to remove the annotated value. Each of the specified scenarios is de-annotated separately. It is an error to give this option with the **-modes** or the **-corners** options. If none of the **-modes**, **-corners**, or **-scenarios** options are specified, the command applies to the current scenario only.

-all

Removes the annotated transition time from every pin in the current design. If you specify **-all**, you cannot specify any other arguments.

pins

Removes the annotated transition time from the specified pins. If you specify **-all**, you cannot specify any other arguments.

DESCRIPTION

This command removes annotated transitions at the specified pins. Both rise and fall annotated transitions are removed.

To annotate net-transition values at pins in a design, use the **set_annotated_transition** command.

Multicorner-Multimode Support

By default, this command works on the current scenario. To specify a different scenario, use the **-scenarios** option or the **-corners** and **-modes** options.

EXAMPLES

The following example removes the annotated transition at every pin in the design:

```
prompt> remove_annotated_transition -all
```

The following example first shows the annotation of the transition to be removed. The second command removes the annotated transition at the output pin Z of cell instance U1/U2/U3:

```
prompt> set_annotated_transition value U1/U2/U3/Z
prompt> remove_annotated_transition U1/U2/U3/Z
```

SEE ALSO

remove_antenna_rules

Name

remove_antenna_rules

Removes the antenna rules in the library.

SYNTAX

integer **remove_antenna_rules**
[-mode *antenna_mode*]
[-name *rule_name*]
[-library *library*]

Data Types

antenna_mode integer
rule_name string
library collection

ARGUMENTS

-mode *antenna_mode*

An integer value between 1 and 6, that represents the way the antenna areas are computed. When this option is specified, only the antenna rules that use the given mode for antenna area calculation, are updated to remove the specified mode. This is an optional option and mutually exclusive to *-name*.

-name *rule_name*

The name of the antenna rule to be deleted from the given library. The command aborts if an antenna rule with the given name does not exist. This is an optional option and mutually exclusive to *-mode*.

-library *library*

The library from which the given antenna rules are to be deleted. This is an optional option. When not specified, the antenna-rules from the current library are deleted.

DESCRIPTION

This command removes the antenna rules from the given library. The default behavior is to remove all the antenna rules from the current library.

The command returns the number of antenna rules removed from the given library when all rules are removed. It returns 1 when a rule is removed based on a specified name or when a mode is removed from corresponding rules.

EXAMPLES

The following example removes the antenna rule 'r1' from the current library.

```
prompt>remove_antenna_rules -name r1
1
```

The following example removes all the antenna rules from the library 'lib1'

```
prompt>remove_antenna_rules -library lib1
16
```

SEE ALSO

define_antenna_rule(2)
define_antenna_layer_rule(2)

remove_array_from_macro_group

Remove macro array to macro group.

SYNTAX

status **remove_array_from_macro_group**
-array macro_array

ARGUMENTS

-macro_array macro_array

Specifies macro array.

DESCRIPTION

This command remove specified macro array from the macro group it belongs to. All macros of the macro array will be removed from the macro group.

EXAMPLES

The following command remove macro array array1 from its macro group.

prompt> **remove_array_from_macro_group** -array array1

SEE ALSO

create_macro_group(2)
add_array_from_macro_group(2)
add_macro_to_group(2)
remove_macros_from_group(2)
clone_macro_group_packing(2)
create_macro_array(2)

remove_attachments

Removes the given attachments from the specified owner object.

SYNTAX

status **remove_attachments**
names
[-of_object *objects*]

Data Types

names list
objects collection

ARGUMENTS

names

List of attachment names to be removed. This argument supports glob style patterns.

-of_object *objects*

Specifies the object whose attachments will be removed. By default, the current block and current library will be considered in that order as owner object.

DESCRIPTION

This command removes the attachments with the names in the given list from the objects provided through the **-of_object** option. If **-of_object** is not used, then the current block is used as the owner object. If current block is not set, current library is used as the owner object For the attachment names, glob style pattern is supported.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example removes the attachment test_attachment from the current block.

```
prompt> remove_attachments -of_object [current_block] test_attachment
1
```

SEE ALSO

add_attachment(2)
open_attachment(2)
report_attachments(2)

remove_attributes

Removes an attribute from the specified objects.

SYNTAX

collection **remove_attributes**
[-quiet]
-objects *object_list*
-name *attribute_name*
pos_object_list
pos_attribute_name

object_list list
attribute_name string
pos_object_list list
pos_attribute_name string

ARGUMENTS

-quiet

Turns off the warning messages that would otherwise be issued if the attribute or objects are not found.

-objects *object_list*

Specifies a list of objects from which the attribute is to be removed. Each element in the list is a collection of objects. This option is mutually exclusive with *pos_object_list*. Either one (and only one) of *-objects* or *pos_object_list* must be specified.

-name *attribute_name*

Specifies the name of the attribute to be removed. This option is mutually exclusive with *pos_attribute_name*. Either one (and only one) of *-name* or *pos_attribute_name* must be specified.

pos_object_list

Specifies a list of objects from which the attribute is to be removed. Each element in the list is a collection of objects. This positional option is provided for compatibility with other tools.

pos_attribute_name

Specifies the name of the attribute to be removed. This positional option is provided for compatibility with other tools.

DESCRIPTION

This command removes the specified attribute from the specified objects. This command returns a collection of objects that have the specified attribute removed.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information if there is no scenario dependency for the attributes. However, for attributes such as **max_leakage_power**, which are scenario dependent, this command uses information from the current scenario only.

EXAMPLES

The following command defines a new attribute named *X* on the net:

```
prompt> define_user_attribute -type int -classes net -name X
1
```

The following command sets the *X* attribute to 30 on all the nets in the current hierarchy:

```
prompt> set_attribute -objects [get_nets *] -name X -value 30
{"out", "in", "VDD", "VSS"}
```

This command removes the *X* attribute from the nets named *VSS* and *VDD*:

```
prompt> remove_attributes -objects [get_nets V*] -name X
{"VDD", "VSS"}
```

This command retrieves the *X* attribute from the net named *VDD*:

```
prompt> get_attribute -objects [get_nets VDD] -name X
Warning: Attribute 'X' does not exist on net 'VDD' (ATTR-3)
```

The following command retrieves the *X* attribute from a net named *in*;

```
prompt> get_attribute -objects [get_nets in] -name X
30
```

This command removes the *output_not_used* attribute on a port:

```
prompt> remove_attributes -objects [get_ports OUT1] -name output_not_used
{"OUT1"}
```

In the following example, a warning message is issued because the cell named *U9* cannot be found:

```
prompt> remove_attributes -objects [get_cells {U1 U9}] -name dont_touch
Warning: No cell objects matched 'U9' (SEL-004)
{"U1"}
```

In the following example, the specified attribute cannot be found:

```
prompt> remove_attributes -objects [get_cells *] -name arrival
Warning: Attribute 'arrival' has not been defined for cells (ATTR-1)
```

shell.dc_compatibility.remove_libcell_attribute(3)

remove_auto_save

Removes the auto-saved library of the specified library.

SYNTAX

status **remove_auto_save**
[-library library_name | library_path]

Data Types

library_name string
library_path string
auto_saved_library_name string

ARGUMENTS

-library

Specifies the library name or path whose auto-saved library needs to be removed.

DESCRIPTION

This command removes the specified auto-saved library of the specified library. By default, this command removes the auto-saved library of the current library.

EXAMPLES

The following example removes the auto-saved library of the current library.

prompt> **remove_auto_save**

SEE ALSO

stop_auto_save(2)

recover_auto_save(2)
start_auto_save(2)
report_auto_save(2)

remove_blackbox_timing

Removes black box timing data and updates the abstract view for the current block.

SYNTAX

status **remove_blackbox_timing**

ARGUMENTS

This command has no arguments.

DESCRIPTION

This command removes the black box timing information on the current block. The abstract view of the current block is updated or re-created to reflect the change.

EXAMPLES

The following example creates an abstract view with black box timing information for the current design, and then updates the abstract view to remove BBT data.

```
prompt> create_clock -period 10 -name main_clock [get_ports Clk]
prompt> set_blackbox_clock_port Clk
prompt> create_blackbox_load_type -lib_cell buf0 loadType1
prompt> create_blackbox_drive_type -lib_cell buf8 driveType1
prompt> set_blackbox_port_load -type loadType1 [all_inputs]
prompt> set_blackbox_port_drive -type driveType1 [all_outputs]
prompt> create_blackbox_delay -rise_from Clk -to [all_outputs] -clock main_clock -value 0.3
prompt> create_blackbox_constraint -from Clk -edge rise -to [all_inputs] \
    -clock main_clock -value 0.3
prompt> commit_blackbox_timing
prompt> remove_blackbox_timing
```

SEE ALSO

commit_blackbox_timing(2)

remove_block_pin_constraints

Removes the existing block pin constraints.

SYNTAX

string **remove_block_pin_constraints**
[-cells *cell_collection*]
[-self]
[-pin_spacing_control]

Data Types

cell_collection collection

ARGUMENTS

-cells *cell_collection*

Specifies the blocks from which to remove block pin constraints. If you specify this option, the command only removes the block pin constraints for the specified blocks.

If you do not specify this option and "-self" option, the command removes block pin constraints for all blocks inside current design.

-self

If this option is specified, the command removes the block pin constraints that are associated with current top design.

-pin_spacing_control

If this option is specified, the command removes the block pin spacing constraints that are set by read_pin_constraints and associated with reference blocks.

DESCRIPTION

This command removes block pin constraints from blocks. If you do not specify any arguments, this command removes pin constraints for all blocks.

The **set_editability** command can enable or disable the **remove_block_pin_constraints** command for specified blocks or levels of physical hierarchy. This command has no effect on the blocks that are disabled with the **set_editability** command.

EXAMPLES

The following example removes the physical constraints for all pins, nets and blocks.

```
prompt> remove_block_pin_constraints
```

SEE ALSO

report_block_pin_constraints(2)
set_block_pin_constraints(2)
set_editability(2)

remove_blocks

Removes one or more open blocks from memory, its library, and the disk.

SYNTAX

return_val **remove_blocks**
[-force]
blocks

Data Types

return_val 0 (or 1) if command failed (or succeeded)
blocks A single block name in [libName:]blockName[/labelName][.viewName] format or a collection of blocks

ARGUMENTS

-force

This option is used when the destination is (or may be) open and modified but not yet saved.

blocks

A block name with optional library, label, and view specifications, or a collection of blocks. If the library specification is not present, the **current_lib** is used. If the label specification is not present, the default un-named label is used. If the view specification is not present, then *design view* is used. If the option is not given, the **current_block** is used. When no view is explicitly specified then all available views are considered.

RETURN VALUE

Returns the number of blocks removed and 0 if not. If an illegal name(with a slash) is given for the block, a Tcl error is raised.

DESCRIPTION

This command removes an open block and all of its contents. After it is executed the block is purged from memory and its disk contents are removed. USE THIS COMMAND WITH EXTREME CAUTION! It is intended for use primarily in scripts that (re)construct blocks at the beginning to reinitialize a block completely from scratch. The command will fail if the block has been modified but not yet saved unless the **-force** option is given. Note that this command works if a block exists whether it is in memory or not.

When no view is explicitly specified for **blocks** then all available views of source block are removed.

EXAMPLES

This example forcibly removes the block Top from both memory and from disk.

```
prompt> remove_blocks -force Top
1
```

remove_bound_shapes

Removes bound shapes from the current design.

SYNTAX

int **remove_bound_shapes**
[-verbose]
[-all]
[-force]
[*bound_shape_list*]

Data Types

bound_shape_list list

ARGUMENTS

-verbose

Displays verbose deletion information.

-all

Removes all bound shapes and their owning move bounds from the current design.

-force

Ignore locked status of the objects. If this option is not provided and any of the affected objects has locked status, command will fail generating tcl error.

bound_shape_list

Specifies a list of bound shapes to remove. The list may contain bound shape collections, specified using the **get_bound_shapes** command.

DESCRIPTION

This command removes bound shapes from the current design except macro group move bound's bound shapes. If all bound shapes of a particular move bound is removed, the move bound is removed as well.

Macro group move bound's shapes cannot be removed using this command. To remove bound shapes from macro group move

bound use remove_bound to completely remove the bound followed by create bound to create the macro_group move bound with desired bound shapes.

The number of removed bound shapes are returned.

EXAMPLES

The following example removes bound shapes of bound "movebound1".

```
prompt> remove_bound_shapes [get_bound_shapes -of_objects movebound1]
2
```

The following example removes all bound shapes in the design.

```
prompt> remove_bound_shapes -all
5
```

[-mirror_left_outside_corner_cell]
[-mirror_right_outside_corner_cell]
[-mirror_left_inside_corner_cell]
[-mirror_right_inside_corner_cell]
[-mirror_left_boundary_cell]
[-mirror_right_boundary_cell]
[-mirror_left_inside_horizontal_abutment_cell]
[-mirror_right_inside_horizontal_abutment_cell]
[-tap_distance]
[-top_tap_cell]
[-bottom_tap_cell]
[-prefix]
[-separator]
[-insert_into_blocks]
[-at_va_boundary]
[-no_1x]
[-min_row_width]
[-min_horizontal_jog]
[-min_vertical_jog]
[-min_horizontal_separation]
[-min_vertical_separation]
[-do_not_swap_top_and_bottom_inside_corner_cell]

ARGUMENTS

-all

Specifies whether to remove all the existed boundary cell rules.

-left_boundary_cell

Specifies whether to remove the existed left boundary cell rule.

-right_boundary_cell

Specifies whether to remove the existed right boundary cell rule.

-bottom_boundary_cells

Specifies whether to remove the existed bottom boundary cells rule.

-top_boundary_cells

Specifies whether to remove the existed top boundary cells rule.

-bottom_left_outside_corner_cell

Specifies whether to remove the existed bottom left outside corner cell rule.

-bottom_right_outside_corner_cell

Specifies whether to remove the existed bottom right outside corner cell rule.

-top_left_outside_corner_cell

Specifies whether to remove the existed top left outside corner cell rule.

-top_right_outside_corner_cell

Specifies whether to remove the existed top right outside corner cell rule.

-bottom_left_inside_corner_cells

Specifies whether to remove the existed bottom left inside corner cells rule.

-bottom_right_inside_corner_cells

Specifies whether to remove the existed bottom right inside corner cells rule.

-top_left_inside_corner_cells

Specifies whether to remove the existed top left inside corner cells rule.

-top_right_inside_corner_cells

Specifies whether to remove the existed top right inside corner cells rule.

-mirror_left_outside_corner_cell

Specifies whether to remove the existed mirror left outside corner cell rule.

-mirror_right_outside_corner_cell

Specifies whether to remove the existed mirror right outside corner cell rule.

-mirror_left_inside_corner_cell

Specifies whether to remove the existed mirror left inside corner cell rule.

-mirror_right_inside_corner_cell

Specifies whether to remove the existed mirror right inside corner cell rule.

-mirror_left_boundary_cell

Specifies whether to remove the existed mirror left boundary cell rule.

-mirror_right_boundary_cell

Specifies whether to remove the existed mirror right boundary cell rule.

-mirror_left_inside_horizontal_abutment_cell

Specifies whether to remove the existed mirror left inside horizontal abutment cell rule.

-mirror_right_inside_horizontal_abutment_cell

Specifies whether to remove the existed mirror right inside horizontal abutment cell rule.

-tap_distance

Specifies whether to remove the existed tap distance rule. If the tap distance rule is to be removed, the top tap cell and bottom tap cell are also removed.

-top_tap_cell

Specifies whether to remove the existed top tap cell rule. If the top tap cell rule is to be removed, the bottom tap cell rule is also to be removed or is not existed in current design, then the tap distance rule is also to be removed.

-bottom_tap_cell

Specifies whether to remove the existed bottom tap cell rule. If the bottom tap cell rule is to be removed, the top tap cell rule is also to be removed or is not existed in current design, then the tap distance rule is also to be removed.

-prefix

Specifies whether to remove the existed prefix rule.

-separator

Specifies whether to remove the user specified separator. If yes, the default value "!" will be used.

-insert_into_blocks

Specifies whether to remove the insert into blocks rule.

-at_va_boundary

Specifies whether to remove the existed at va boundary rule.

-no_1x

Specifies whether to remove the existed no 1x rule. If any of top right outside corner cell rule, bottom right outside corner cell rule, top left outside corner cell rule and bottom left outside corner cell rule is to be removed, then no 1x rule is also to be removed.

-min_row_width

Specifies whether to remove the existed min row width rule.

-min_horizontal_jog

Specifies whether to remove the existed min horizontal jog rule.

-min_vertical_jog

Specifies whether to remove the existed min vertical jog rule.

-min_horizontal_separation

Specifies whether to remove the existed min horizontal separation rule.

-min_vertical_separation

Specifies whether to remove the existed min vertical separation rule.

-do_not_swap_top_and_bottom_inside_corner_cell

Specifies whether to remove the existed do no swap top and bottom inside corner cell rule.

DESCRIPTION

This command is used to remove the existed boundary cell insertion and checking rules. If user specifies one option whose corresponding boundary cell rule is not stored in design, then the option will be automatically ignored.

EXAMPLES

The following example removes all the existed boundary cell rules.

prompt> **remove_boundary_cell_rules -all**

SEE ALSO

set_boundary_cell_rules(2)
report_boundary_cell_rules(2)
compile_boundary_cells(2)
check_boundary_cells(2)
compile_targeted_boundary_cells(2)
check_targeted_boundary_cells(2)

remove_boundary_optimization

Removes the boundary_optimization restriction on specified pins, cells or modules.

SYNTAX

int **remove_boundary_optimization**
object_list

Data Types

object_list list

ARGUMENTS

object_list

Specifies a list of pins, cells or modules where to remove boundary optimization restrictions. Cell or reference names in object_list must be from the current design. If more than one object is specified, they must be enclosed in quotation marks ("") or braces ({}).

DESCRIPTION

This command removes the boundary_optimization restriction on objects in object_list, which were previously set using set_boundary_optimization command. The command has no effect on objects specified in the object_list, which were not restrictred earlier.

EXAMPLES

The following example shows how to remove previously set boundary optimization restriction on the cells named U0, U1 and U2.

prompt> remove_boundary_optimization { U0 U1 }

prompt> remove_boundary_optimization U2

SEE ALSO

compile(2)
set_boundary_optimization(2)
report_boundary_optimization(2)

remove_bounds

Removes bounds from the current design.

SYNTAX

int **remove_bounds**
[-force]
[-verbose]
[-all]
[*bound_list*]

Data Types

bound_list list

ARGUMENTS

-force

Ignore locked status of the objects. If this option is not provided and any of the affected objects has locked status, command will fail generating tcl error.

-verbose

Displays verbose deletion information.

-all

Removes all bounds from the current design.

bound_list

Specifies a list of bounds to remove. The list may contain bound names, patterns, or collections. A collection may be specified by using the **get_bounds** command.

DESCRIPTION

This command removes bound constraints from the current design. The number of removed bounds are returned.

EXAMPLES

The following example removes bounds named "movebound1" and "movebound2".

```
prompt> remove_bounds { movebound1 movebound2 }
2
```

The following example removes bounds that match the pattern "movebound*".

```
prompt> remove_bounds movebound*
3
```

The following example removes all bounds in the design.

```
prompt> remove_bounds -all
5
```

SEE ALSO

create_bound(2)
get_bounds(2)
add_to_bound(2)
remove_from_bound(2)
report_bounds(2)

remove_buffer

Removes the buffer cells at a specified driver pin or net on a mapped design.

SYNTAX

status **remove_buffer**
-from *start_point*
-net *net_list*
cell_list
[-allow_tie_connection]

Data Types

start_point	list
net_list	list
cell_list	list
allow_tie_connection	boolean

ARGUMENTS

-from *start_point*

Specifies the starting pin or port of the fanout tree from which the buffers or inverter pairs need to be removed. Only driver pins or driver ports can be specified for this option.

This option is mutually exclusive with the **-net** and **cell_list** options.

-net *net_list*

Specifies the starting net of the fanout tree from which the buffers or inverter pairs need to be removed. Only one net can be specified for this option and the driver pin of this net would be considered as the start for fanout traversal. This means that all of the load cells connected to the net are considered in the buffer tree.

This option is mutually exclusive with the **-from** and **cell_list** options.

cell_list

Specifies the buffer or inverter cells to be removed. Each buffer is a cell name or a collection of netlist cells. When inverter cells are specified, they must be specified in pairs.

This option is mutually exclusive with **-from** options.

-allow_tie_connection

Specifies whether the buffers connected with the tie/PG net can be removed.

DESCRIPTION

This command removes buffer cells when you specify a *cell_list* and a buffer or a pair of inverters at the specified pins, or the net on a mapped design. When a driver pin or a net is given, a buffer or a pair of buffers is removed with this driver as the root.

This command does not remove buffer/inverter-pair across the logical hierarchy.

This command support transparent interface optimization(TIO) flow, which can remove buffer cells in sub blocks of abstract view from top block.

This command can remove inverters only as pairs. You must specify both of the pairing inverters if you use the *cell_list* argument.

This command accepts the final implementation of buffer or inverters removal, even if it negatively impacts the timing or Design Rule Checking (DRC) violations in the design.

This command support editing a verilog module in the module aspect, through **edit_module**.

This command will check the editability of the block before removing buffer cells.

This command honors design.eco_freeze_silicon_mode. When this app option is true, buffers to remove will be marked as spare cell and renamed by adding _Spare post-fix, instead of being removed from database.

This command is exactly equivalent to **remove_buffers**.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example removes a buffer cell:

```
prompt> remove_buffer -from [get_pins cell1/O]
1

prompt> remove_buffer -net [get_nets net1]
1

prompt> remove_buffer cell2
1
```

Editing a verilog module in the module aspect:

```
prompt> edit_module h1m {remove_buffer {u2 u3 u4 u5 u6}}
```

SEE ALSO

remove_buffers(2)
all_fanout(2)

add_buffer(2)
report_cell(2)
edit_module(2)

remove_buffer_trees

Remove all buffer trees or buffer trees between specified drivers / loads

SYNTAX

status **remove_buffer_trees**
[-from *pin_or_net_list*]
[-source_of *pin_list*]
[-all]
[-verbose]

Data Types

pin_or_net_list N/A
pin_list N/A

ARGUMENTS

-from *pin_or_net_list*

Specifies a list of driver pins or nets from which buffer trees are to be removed. The command removes all buffers and inverters from these specified pins or nets until encountering the next non-repeaters loads. This option is mutually exclusive with the **-all** option. If this option is specified with **-source_of**, then buffer trees between the **-from** driver pins and **-source_of** load pins are removed.

-source_of *pin_list*

Specifies a list of load pins. The command removes all buffers and inverters between the load pin and the previous non-repeater driver pin, tracing upstream from the load. Only the buffers and inverters directly between that driver and the specified load pins are removed. There might be repeaters in the tree going only to other loads, and they will not be removed. If the cell of a specified pin is a repeater, the cell itself is also removed. This option is mutually exclusive with the **-all** option.

-all

Removes all buffer trees in the design. This option is mutually exclusive with the **-from** and **-source_of** option.

-verbose

Prints detailed info during buffer tree removal, such as buffer instance names whose removal introduce logical feedthroughs in the netlist.

DESCRIPTION

This command removes data path buffer trees in the design.

There are three options for removing buffer trees. It is required to specify one of these options:

- **-all**: Removes all buffer trees
- **-from**: Removes buffer trees from the specified drivers pins or nets
- **-source_of**: Removes the partial buffer trees in the fan-in to the specified load pins

Buffer tree removal is not performed on ideal nets, clock nets, tri-state nets, and multi-driven nets. Some buffers and inverters cannot be removed, including dont_touch cells, size_only cells, and unpaired inverters.

If a buffer removal would introduce a logical feedthrough in the netlist, and the app option **opt.port.eliminate_verilog_assign** is set to *true*, then that buffer will not be removed.

Use **remove_clock_trees** to remove clock trees.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example removes a buffer tree driven by pin a/O

```
prompt> remove_buffer_trees -from [get_pins a/O]
```

The following example removes the fan-in buffer tree driving pin b/I

```
prompt> remove_buffer_trees -source_of [get_pins b/I]
```

The following example removes all buffer trees

```
prompt> remove_buffer_trees -all
```

SEE ALSO

create_buffer_trees(2)
remove_clock_trees(2)
report_buffer_trees(2)
opt.port.eliminate_verilog_assign(3)

remove_buffers

Removes the buffer cells at a specified driver pin or net on a mapped design.

SYNTAX

status **remove_buffers**
-from *start_point*
-net *net_list*
cell_list
[-allow_tie_connection]

Data Types

start_point	list
net_list	list
cell_list	list
allow_tie_connection	boolean

ARGUMENTS

-from *start_point*

Specifies the starting pin or port of the fanout tree from which the buffers or inverter pairs need to be removed. Only driver pins or driver ports can be specified for this option.

This option is mutually exclusive with the **-net** and **cell_list** options.

-net *net_list*

Specifies the starting net of the fanout tree from which the buffers or inverter pairs need to be removed. Only one net can be specified for this option and the driver pin of this net would be considered as the start for fanout traversal. This means that all of the load cells connected to the net are considered in the buffer tree.

This option is mutually exclusive with the **-from** and **cell_list** options.

cell_list

Specifies the buffer or inverter cells to be removed. Each buffer is a cell name or a collection of netlist cells. When inverter cells are specified, they must be specified in pairs.

This option is mutually exclusive with **-from** options.

-allow_tie_connection

Specifies whether the buffers connected with the tie/PG net can be removed.

DESCRIPTION

This command removes buffer cells when you specify a *cell_list* and a buffer or a pair of inverters at the specified pins, or the net on a mapped design. When a driver pin or a net is given, a buffer or a pair of buffers is removed with this driver as the root.

This command does not remove buffer/inverter-pair across the logical hierarchy.

This command support transparent interface optimization(TIO) flow, which can remove buffer cells in sub blocks of abstract view from top block.

This command can remove inverters only as pairs. You must specify both of the pairing inverters if you use the *cell_list* argument.

This command accepts the final implementation of buffer or inverters removal, even if it negatively impacts the timing or Design Rule Checking (DRC) violations in the design.

This command support editing a verilog module in the module aspect, through **edit_module**.

This command will check the editability of the block before removing buffer cells.

This command honors design.eco_freeze_silicon_mode. When this app option is true, buffers to remove will be marked as spare cell and renamed by adding _Spare post-fix, instead of being removed from database.

This command is exactly equivalent to **remove_buffer**.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example removes a buffer cell:

```
prompt> remove_buffers -from [get_pins cell1/O]
1

prompt> remove_buffers -net [get_nets net1]
1

prompt> remove_buffers cell2
1
```

Editing a verilog module in the module aspect:

```
prompt> edit_module h1m {remove_buffers {u2 u3 u4 u5 u6}}
```

edit_module(2)

remove_bundle_pin_constraints

Removes all bundle pin constraints from the bundles. If no options are given, all bundle pin constraints in the design are removed.

SYNTAX

int **remove_bundle_pin_constraints**
[-bundles *bundle_collection*]
[-cells *cell_collection*]
[-self]

Data Types

bundle_collection collection
cell_collection collection

ARGUMENTS

-bundles *bundle_collection*

Specifies the net bundles from which the constraints are removed. If not specified, it applies to all bundles. The bundles must be in the top level of the current design.

-cells *cell_collection*

Specifies the block cells from which the constraints are removed. If not specified, and **-self** is also not specified, the command processes all block cells. The cells must be in the top level of the current design.

-self

Specifies that the constraints applied to the top-level block are removed. If not specified, and **-cells** is also not specified, it applies to all block cells. It is legal to use **-cells** and **-self** together.

DESCRIPTION

This command removes all existing bundle pin constraints from nets, pins and ports. If you do not specify any arguments, this command removes *all* bundle pin constraints from the design. Note that you can specify both a set of bundles with **-bundles** and a set of block cells with **-cells** (or *-self*). In this case, only constraints which apply to both a specified bundle and a specified cell will be removed.

The **set_editability** command can enable or disable the **remove_bundle_pin_constraints** command for specified blocks or levels of physical hierarchy. This command has no effect on the blocks that are disabled with the **set_editability** command.

There are four type of bundle pin constraints, ordered from less specific to more specific:

- Global constraints: Constraint applies to all bundles and all block instances.
- Per-bundle constraints: Constraint applies to a specific bundle and all block instances.
- Per-cell constraints: Constraint applies to all bundles and a specific block instance.
- Per-bundle-cell-pair constraints: Constraint applies to a specific bundle and a specific block instance.

In general, this command removes the specified constraint and any other related, more specific constraint. For example, the command **remove_bundle_pin_constraints -bundles B** removes the per-bundle constraint specific to bundle B, but also removes the per-bundle-cell-pair constraints which are specific to bundle B and any cell related to bundle B. Constraints specific to only to a cell but not to bundle B are not removed. In addition, global constraints and are not removed in this example.

This command returns 1 if some constraints could be removed, 0 otherwise.

EXAMPLES

The following example removes all bundle pin constraints from the design, including global constraints, per-bundle constraints, per-cell constraints, and per-bundle-cell-pair constraints.

```
prompt> remove_bundle_pin_constraints
```

The following example removes all bundle pin constraints specific to BUNDLE0. Per-bundle and per-bundle-cell-pair constraints which are specific to BUNDLE0 are removed.

```
prompt> remove_bundle_pin_constraints -bundles [get_bundles BUNDLE0]
```

The following example removes all bundle pin constraints specific to cmem0. Per-cell and per-bundle-cell-pair constraints which are specific to cmem0 are removed.

```
prompt> remove_bundle_pin_constraints -cells [get_cells cmem0]
```

The following example removes all bundle pin constraints specific to the top-level block. Per-cell and per-bundle-cell-pair constraints which are specific to the top-level block are removed.

```
prompt> remove_bundle_pin_constraints -self
```

The following example removes all bundle pin constraints specific to the combination of BUNDLE0 and cmem0. Only matching per-bundle-cell-pair constraints are removed.

```
prompt> remove_bundle_pin_constraints -bundles [get_bundles BUNDLE0] \
  -cells [get_cells cmem0]
`.in -0.25in
```

remove_busplans

Remove entire busplans or specified bits of busplans from design.

SYNTAX

int **remove_busplans**
[-from *pins_or_ports*]
[buses]

Data Types

pins_or_ports collection of pin or port objects
buses string

ARGUMENTS

-from *pins_or_ports*

Specify the busplans to be removed based on where the busplan begins. This allows you to remove a subset of the bits of a busplan. This is mutually exclusive with *buses*.

buses

Specify the busplans to remove based on the busplan names. The busplans must have been previously created by the **create_busplans** command. This is mutually exclusive with *-from*.

DESCRIPTION

Remove busplans that were previously defined by the **create_busplans** command.

EXAMPLES

Create a 8 bit busplan named bus1 and then remove one bit from that busplan.

prompt> **create_busplans -name bus1 -from B1/OUT1[*] -start_end_cells {B1 B2 B3 B4}**
prompt> **report_busplans bus1**

****

```
Report : report_busplans
 ...

****************************************
Start/end at instances: B1 B2 B3 B4
bus1: 8 bits start=B1/OUT1[7] clock=-unknown-
  pin              group1     (  8) B1/OUT1[7]
    register         group2     (  8) r1/r7
      register       group3     (  8) r2/r7
        pin          group4     (  8) B2/IN1[7]
1
prompt> remove_busplans -from B1/OUT1[7]
1
prompt> report_busplans bus1

****************************************
Report : report_busplans
 ...

****************************************
Start/end at instances: B1 B2 B3 B4
bus1: 7 bits start=B1/OUT1[6] clock=-unknown-
  pin              group1     (  7) B1/OUT1[6]
    register         group2     (  7) r1/r6
      register       group3     (  7) r2/r6
        pin          group4     (  7) B2/IN1[6]
1
```

SEE ALSO

remove_case_analysis

Removes the case analysis value on the specified input.

SYNTAX

status **remove_case_analysis**
port_or_pin_list

Data Types

port_or_pin_list list

ARGUMENTS

port_or_pin_list

Lists ports or pins for which to remove the case analysis entry.

-all

Specifies to remove all case analysis in the current design.

DESCRIPTION

This command removes previously specified case analysis entries on ports or pins. Case analysis is specified using the **set_case_analysis** command. The command specifies that a pin or port is at a constant logic value (0 or 1), or that only one of the rising or falling transition is valid.

Multicorner-Multimode Support

This command works only on the current mode.

EXAMPLES

The following example specifies that ports in0 and in2 are set to the constant logic value 0.

```
prompt> set_case_analysis 0 {in0 in2}
prompt> report_case_analysis
```

```
****************************************
Report : case_analysis
 ...

****************************************

Pin name     Case analysis value
---------------------------------
in2          0
in0          0
```

The following example removes the case analysis entry on port in2.

```
prompt> remove_case_analysis {in2}
prompt> report_case_analysis

****************************************
Report : case_analysis
Design : middle
Version:
Date   :
****************************************

Pin name     Case analysis value
---------------------------------
in0          0
```

The following example removes all specified mode that has been set from the current design.

```
prompt> remove_case_analysis -all
```

SEE ALSO

set_case_analysis(2)
report_case_analysis(2)

remove_cell

Removes the specified cell instances.

SYNTAX

integer **remove_cells**
[-design *design*]
[-force]
[*cells*]
[-all]

Data Types

design collection
cells collection

ARGUMENTS

-design *design*

Specifies the block from which to remove the cells.

By default, the cells are removed from the current block.

-force

Removes the specified cell instances even if their **physical_status** attribute is set to **locked**.

By default, the command raises a Tcl error if the **physical_status** attribute of any of the specified cells has a value of **locked**.

cells

Specifies the cell instances to remove.

This argument and the **-all** option are mutually exclusive; you must specify one.

-all

Removes all cell instances from the specified block.

This option and the *cells* argument are mutually exclusive; you must specify one.

DESCRIPTION

Removes the specified cell instances from the current block unless otherwise specified by the **-design** option.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example removes all cells whose instance names start with "or2t".

```
prompt> get_cells or2t*
{or2t_1 or2t_2}

prompt> remove_cells or2t*
2
```

SEE ALSO

create_cell(2)
get_cells(2)
replace_cell(2)

remove_cell_array_patterns

Removes cell array patterns.

SYNTAX

int **remove_cell_array_patterns**
[-all]
[-verbose]
[*cell_array_pattern_list*]

Data Types

cell_array_pattern_list list

ARGUMENTS

-all

Removes all cell_array_patterns from the current block.

-verbose

Displays verbose deletion information.

cell_array_pattern_list

Specifies a list of cell array patterns to remove. The list may contain cell array pattern names, patterns, or collections. A collection may be specified by using the **get_cell_array_patterns** command.

RETURN VALUE

The number of removed cell array patterns.

DESCRIPTION

This command removes cell_array_patterns from the current block.

EXAMPLES

The following example removes cell_array_patterns that match the pattern "CELL_ARRAY_PATTERN*".

```
prompt> remove_cell_array_patterns CELL_ARRAY_PATTERN*
3
```

The following example removes all cell_array_patterns in the block.

```
prompt> remove_cell_array_patterns -all
5
```

SEE ALSO

get_cell_array_patterns(2)
create_cell_array_pattern(2)
report_cell_array_patterns(2)

remove_cell_buses

Removes cell buses from the current design.

SYNTAX

collection **remove_cell_buses**
[-design *design*]
[-force]
[-block *block*]
[-cell *cell*]
-all | *cell_bus_list*

Data Types

block string or collection
cell string or collection
cell_bus_list string or collection

ARGUMENTS

-design *design*

Specifies the design in which to remove the cell buses. If no design is specified, the cell buses are removed from the current design.

-block *block*

Specifies the block where the cell bus is to be removed. If specified, **remove_cell_buses** has the same effect as **edit_module** in which the module is changed and changes will be on all module occurrences.

-cell *cell*

Specifies the cell where the cell bus is to be removed. The cell bus is removed on the cell's reference module. **remove_cell_buses** will first uniquify the reference if needed, then remove the cell bus. When not specified, the cell bus is removed on the current module.

-force

Ignores the locked status of cells of the bus cell. If this option is not specified and any of the affected objects has locked status, the command issues a Tcl error and exits.

-all

Removes all cell buses.

cell_bus_list

Specifies a list of cell buses to remove.

RETURN VALUE

This command returns the removed cell bus count, an empty string if it fails, or a TCL_ERROR if there is a command syntax error.

DESCRIPTION

This command removes a list of cell buses from the current design (unless otherwise specified by -design). Individual members of buses remain.

EXAMPLES

The following example removes cell bus named *bus1*

```
prompt> remove_cell_buses bus1
1
```

SEE ALSO

create_cell_bus(2)
get_cell_buses(2)
report_cell_buses(2)

remove_cells

Removes the specified cell instances.

SYNTAX

integer **remove_cells**
[-design *design*]
[-force]
[*cells*]
[-all]

Data Types

design collection
cells collection

ARGUMENTS

-design *design*

Specifies the block from which to remove the cells.

By default, the cells are removed from the current block.

-force

Removes the specified cell instances even if their **physical_status** attribute is set to **locked**.

By default, the command raises a Tcl error if the **physical_status** attribute of any of the specified cells has a value of **locked**.

cells

Specifies the cell instances to remove.

This argument and the **-all** option are mutually exclusive; you must specify one.

-all

Removes all cell instances from the specified block.

This option and the *cells* argument are mutually exclusive; you must specify one.

DESCRIPTION

Removes the specified cell instances from the current block unless otherwise specified by the **-design** option.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example removes all cells whose instance names start with "or2t".

```
prompt> get_cells or2t*
{or2t_1 or2t_2}

prompt> remove_cells or2t*
2
```

SEE ALSO

create_cell(2)

remove_checkpoint_actions

Removes the specified action's definitions, associations, and history from the checkpoint system.

SYNTAX

integer **remove_checkpoint_actions**
action_names *action_names*

Data Types

action_names list

ARGUMENTS

-action_names *action_names*

Specifies the names of the action or flow change for the checkpoint system that will be removed.

DESCRIPTION

This command removes the specified actions from the checkpoint system. Removal includes the action definition created by create_checkpoint_action, the associations to checkpoints defined by associate_checkpoint_action, and any history of that action having run at previous checkpoints reported by get_checkpoint_data.

EXAMPLES

The following example removes a checkpoint action or flow change for the checkpoint system.

This example removes the high_congestion_effort action.

```
prompt> remove_checkpoint_actions high_congestion_effort
```

This example removes the power_mode_total and power_mode_leakage actions.

```
prompt> remove_checkpoint_actions "power_mode_total power_mode leakage"
```

remove_checkpoint_reports

Removes the specified report's definitions, associations, and history from the checkpoint system.

SYNTAX

integer **remove_checkpoint_reports**
  report_names *report_names*

Data Types

report_names list

ARGUMENTS

-report_names *report_names*

Specifies the names of the report for the checkpoint system that will be removed.

DESCRIPTION

This command removes the specified reports from the checkpoint system. Removal includes the report definition created by create_checkpoint_report, the associations to checkpoints defined by associate_checkpoint_report, and any history of that report having run at previous checkpoints reported by get_checkpoint_data.

EXAMPLES

This example removes the timing report.

```
prompt> remove_checkpoint_actions timing
```

This example removes the area and power reports.

```
prompt> remove_checkpoint_actions "area power"
```

remove_clock

Removes one or more clocks from the current design.

SYNTAX

string **remove_clocks** -all | *clock_list*

list *clock_list*

ARGUMENTS

-all

Specifies to remove all clocks in the current design.

clock_list

Specifies a list of collections containing clocks or patterns matching the clock names.

DESCRIPTION

Removes the specified clock objects from the current design. You must specify either *clock_list* or **-all**. The command returns the number of clocks removed.

If a removed clock is the only member of a path group, the path group is also removed. For information about path groups, refer to the **group_path** man page. To list all clock sources in the design, use **report_clock**.

All arrival and required times specified by commands **set_input_delay** and **set_output_delay** relatively to the clock that is being removed are also removed.

Multicorner-Multimode Support

This command works only on the current mode.

EXAMPLES

The following example removes clock CLK1.

prompt> **remove_clocks CLK1**

The following example removes all clocks from the current design.

prompt> **remove_clocks -all**

SEE ALSO

create_clock(2)

remove_clock_balance_groups

Remove clock balance groups.

SYNTAX

string **remove_clock_balance_groups**
clock_balance_group_list | -all

Data Types

clock_balance_group_list collection

ARGUMENTS

clock_balance_group_list

Specifies a list of clock balance groups to remove. This option and **-all** option are mutually exclusive.

-all

Remove all clock balance groups in the current design. This option and *clock_balance_group_list* are mutually exclusive. Either the **-all** option or *clock_balance_group_list* has to be specified.

DESCRIPTION

This command will remove clock balance groups from constraints.

Multicorner-Multimode Support

EXAMPLES

The following example removes the specified clock_balance_group.

prompt> **remove_clock_balance_groups grp1**

SEE ALSO

create_clock_balance_group(2)
report_clock_balance_groups(2)
get_clock_balance_groups(2)
balance_clock_groups(2)

remove_clock_balance_points

Removes user-specified constraints set with a previous **set_clock_balance_points** command.

SYNTAX

string **remove_clock_balance_points**
[-clock *clock_list*]
[-corners *corner_list*]
[-balance_points *port_pin_list*]

Data Types

clock_list list
corner_list list
port_pin_list list

ARGUMENTS

-clock *clock_list*

Specifies the clocks from which to remove the constraints.

By default, the command removes the constraints from all clocks of the current mode.

-corners *corner_list*

Specifies the corners from which to remove the constraints.

By default, the command removes the constraints from all corners of the current mode.

-balance_points *port_pin_list*

Specifies the ports or pins from which to remove the constraints.

By default, the command removes all constraints from the specified clocks.

DESCRIPTION

This command removes user-specified constraints set with a previous **set_clock_balance_points** command.

If the command does not find any constraints to remove, it issues an information message.

EXAMPLES

The following example removes the constraint set on the gck/CP pin for all clocks in the current mode.

```
prompt> remove_clock_balance_points -balance_points gck/CP
```

SEE ALSO

set_clock_balance_points(2)
report_clock_balance_points(2)

remove_clock_cell_spacings

Removes spacing rules for the specified or all cells in the clock tree.

SYNTAX

status **remove_clock_cell_spacings**
[-clocks *clock_list*]
[-lib_cells *libcell_name_list*]

Data Types

clock_list collection
libcell_name_list list

ARGUMENTS

-clocks *clock_list*

Specifies the clock trees for which the cell spacing settings will be removed.

-lib_cells *libcell_name_list*

Specifies a list of library cell names, so that only instances on the clock tree of such type would be affected.

DESCRIPTION

This command serves as an instruction to mark relevant existing clock cell spacing rules, previously defined by **set_clock_cell_spacing_rule** command for the removal. In order for the rules to be removed from the relevant instances on the clock network, **synthesize_clock_trees** command needs to be executed. If **-lib_cells** switch is not specified all spacing rules previously defined would be marked for the removal. If it (**-lib_cells** switch) is defined - only spacing rules, that are applied to specified libcells would be marked for the removal. If **-clocks** option is used then it will remove cell spacing settings for specified clock networks.

EXAMPLES

The following example marks clock cell spacing rules for the removal for all clock buffers that are of the cell type BUFFD2BWP

prompt> **remove_clock_cell_spacings -lib_cells mylib/BUFFD2BWP**

The following example marks all clock cell spacing rules for the removal.

```
prompt> remove_clock_cell_spacings
```

SEE ALSO

report_clock_cell_spacings(2)
set_clock_cell_spacing(2)
cts.placement.cell_spacing_rule_style(3)

remove_clock_drivers

Removes cells added with command *create_clock_drivers*.

SYNTAX

status **remove_clock_drivers**
[-prefix *name*]

Data Types

name string

ARGUMENTS

-prefix *name*

Only those cells are deleted which have a name starting exactly with the specified prefix. The passed name should not contain a wildcard.

DESCRIPTION

The *remove_clock_drivers* command will delete cells inserted by previous calls of command *create_clock_drivers*. It will remove all repeaters and merge template clones into the originally given template cell. Merging of template clones will only be done if every equivalent input is driven by the same pin as the equivalent original template cell input pin. With the option *-prefix* the set of removed cells can be limited to those which start exactly with the specified prefix.

Multicorner-Multimode Support

This command has no dependency on scenario-specific, mode-specific, or corner-specific information.

EXAMPLES

The following example removes all cells inserted with calls to *create_clock_drivers* having a name starting with foo.

prompt> **remove_clock_drivers -prefix foo**

SEE ALSO

create_clock_drivers(2)
synthesize_multisource_global_clock_trees(2)
remove_multisource_global_clock_trees(2)

remove_clock_exclusivity

Removes clock exclusivity setting on a cell output set by set_clock_exclusivity command.

SYNTAX

Boolean **remove_clock_exclusivity**
-output output_pins

output_pins *list*

ARGUMENTS

-output output_pins

Specifies the output pin of a cell that has been previously set as exclusive by the set_clock_exclusivity command.

DESCRIPTION

This command removes the exclusivity previously set on an output pin of a cell by the set_clock_exclusivity command. In that case, the tool will no longer infer exclusivity of clocks that pass through the cell and reach that output pin.

Multicorner-Multimode Support

This command works only on the current mode.

EXAMPLES

The following example removes two exclusivity points previously set by set_clock_exclusivity command.

prompt> **remove_clock_exclusivity -output {AND02/Z MUX02/Z}**

SEE ALSO

set_clock_exclusivity(2)

report_clock(2)
set_disable_auto_mux_clock_exclusivity(2)
time.enable_auto_mux_clock_exclusivity(3)

remove_clock_gating_check

Removes clock gating checks for design objects.

SYNTAX

status **remove_clock_gating_check**
[-setup]
[-hold]
[-rise]
[-fall]
[-high | -low]
[*object_list*]

Data Types

object_list list

ARGUMENTS

-setup

Removes the clock-gating constraint on the setup time only. If you do not specify either the **-setup** or **-hold** option, both setup and hold constraints are removed.

-hold

Removes the clock-gating constraint on the hold time only. If you do not specify either the **-setup** or **-hold** option, both setup and hold constraints are removed.

-rise

Removes the clock-gating constraint only on the rising delays. If you do not specify either the **-rise** or **-fall** option, constraints on both rising and falling delays are removed.

-fall

Removes the clock-gating constraint only on the falling delays. If you do not specify either the **-rise** nor **-fall** option, constraints on both rising and falling delays are removed.

-high

Removes the high specification from the object list, previously set by the **set_clock_gating_check** command. You must specify either **-high** or **-low**.

-low

Removes the low specification from the object list, previously set up by **set_clock_gating_check** command. This option has to be either high or low.

object_list

Specifies a list of objects in the current design for which to remove the clock gating check. The objects can be clocks, ports, pins, or cells. If you specify a cell, all input pins of that cell are affected. If you do not specify any objects, the clock-gating check is removed from the current design.

DESCRIPTION

The **remove_clock_gating_check** command is used to remove any clock-gating check properties applied with the **set_clock_gating_check** command. This command does not remove the clock-gating check itself.

Multicorner-Multimode Support

EXAMPLES

The following example removes the setup requirement (for rising and falling delays) on all gates in the clock network involved with clock CK1 path.

```
prompt> remove_clock_gating_check -setup [get_clocks CK1]
```

The following example removes the hold requirement on the rising delay of gate and1.

```
prompt> remove_clock_gating_check -hold -rise [get_cells and1]
```

You can also use the **reset_design** command to remove information set by the **set_clock_gating_check** command.

SEE ALSO

current_design(2)

reset_design(2)
set_clock_gating_check(2)
set_disable_clock_gating_check(2)
time.disable_clock_gating_checks(3)
time.clock_gating_user_setting_only(3)

remove_clock_groups

Removes specific exclusive or asynchronous clock groups from the current design.

SYNTAX

Boolean **remove_clock_groups**
-physically_exclusive | -logically_exclusive | -asynchronous
-name *name_list* | -all

list *name_list*

ARGUMENTS

-physically_exclusive

Specifies that groups set for physically exclusive clocks are to be removed. The **-physically_exclusive**, **-logically_exclusive** and **-asynchronous** options are mutually exclusive; you must choose only one.

-logically_exclusive

Specifies that groups set for logically exclusive clocks are to be removed. The **-physically_exclusive**, **-logically_exclusive** and **-asynchronous** options are mutually exclusive; you must choose only one.

-asynchronous

Specifies that groups set for asynchronous clocks are to be removed. The **-physically_exclusive**, **-logically_exclusive** and **-asynchronous** options are mutually exclusive; you must choose only one.

-name *name_list*

Specifies a list of clock groups to be removed, which matches the groups in the given names. You should use the **set_clock_groups** command to predefine these names. Substitute the list you want for *name_list*. The **-name** and **-all** options are mutually exclusive.

-all

Specifies to remove all groups set for exclusive or asynchronous clocks in the current design. The **-name** and **-all** options are mutually exclusive.

DESCRIPTION

Removes specific exclusive or asynchronous clock groups from the current design. These clock groups are specified by the

name_list from the current design. You must specify either **-exclusive** or **-asynchronous**. You must specify either *name_list* or **-all**.

To find the names for existing groups, use the **report_clock** command with the **-groups** option.

Multicorner-Multimode Support

This command works only on the current mode.

EXAMPLES

The following example removes exclusive clock groups named *mux*.

```
prompt> remove_clock -exclusive -name mux
```

The following example removes all asynchronous clock groups from the current design.

```
prompt> remove_clock -asynchronous -all
```

SEE ALSO

report_clock(2)
set_clock_groups(2)

remove_clock_jitter

Removes clock jitter information previously set by the **set_clock_jitter** command.

SYNTAX

status **remove_clock_jitter**
-clock *clock_list*
[-modes *mode_list*]
[-corners *corner_list*]
[-scenarios *scenario_list*]

Data Types

clock_list list

ARGUMENTS

-clock *clock_list*

Specifies a list of clocks from which to remove the clock jitter.

-modes *mode_list*

Specifies the scenarios to remove the clock jitter. If this option is given, all scenarios of the given modes are used. The **-scenarios** option must not be specified with this option. If both **-modes** and **-corners** are specified, all scenarios whose mode is specified by **-modes** and whose corner is specified by **-corners** are used.

-corners *corner_list*

Specifies the scenarios to remove the clock jitter. If this option is given, all scenarios of the given corners and the current mode is used. The **-scenarios** option must not be specified with this option. If both **-modes** and **-corners** are specified, all scenarios whose mode is specified by **-modes** and whose corner is specified by **-corners** are used.

-scenarios *scenario_list*

Specifies the scenarios to remove the clock jitter. The **-modes** or **-corners** option must not be given with this option.

Multicorner-Multimode Support

By default, this command works on the current scenario. To specify a different scenario, use the **-scenarios** option or the **-corners** and **-modes** options.

DESCRIPTION

This command removes the cycle-to-cycle jitter or the duty-cycle jitter of the clock that was previously set by the **set_clock_jitter** command.

EXAMPLES

The following example removes the cycle-to-cycle jitter of 0.5 and duty-cycle jitter of 0.7 specified on the clock mclk

```
prompt> set_clock_jitter -clock [get_clocks mclk] -cycle 0.5 -duty_cycle 0.7
prompt> remove_clock_jitter -clock [get_clocks mclk]
```

SEE ALSO

report_clock_jitter(2)
set_clock_jitter(2)

remove_clock_latency

Removes clock latency information from specified objects.

SYNTAX

string **remove_clock_latency**
[-source]
[-offset]
[-clock *clock_list*]
[-modes *mode_list*]
[-corners *corner_list*]
[-scenarios *scenario_list*]
object_list

Data Types

clock_list list
mode_list list
corner_list list
scenario_list list
object_list list

ARGUMENTS

-source

Specifies that clock source latency should be removed.

-offset

Specifies that clock offset latency should be removed.

-clock *clock_list*

Removes from the design any network latency defined on the pin or port objects in *object_list* which refers the clocks in *clock_list*. If the **-clock** option is supplied when *object_list* refers to clock objects, a warning is issued that the option is not relevant in this case and execution of the command proceeds as if **-clock** was not specified. This option does not remove a more general latency setting without any specific clock.

-modes *mode_list*

Specifies the scenarios from which to remove the clock latency. If this option is given, all scenarios of the specified modes will be used. The **-scenarios** option must not be specified with this option. If both **-modes** and **-corners** are specified, all scenarios whose mode is specified by **-modes** and whose corner is specified by **-corners** will be used.

-corners *corner_list*

Specifies the scenarios from which to remove the clock latency. If this option is given, all scenarios of the specified corners and the current mode will be used. The **-scenarios** option must not be specified with this option. If both **-modes** and **-corners** are specified, all scenarios whose mode is specified by **-modes** and whose corner is specified by **-corners** will be used.

-scenarios ***scenario_list***

Specifies the scenarios from which to remove the clock latency. The **-modes** or **-corners** option must not be specified with this option.

object_list

Provides a list of clocks, ports, or pins.

DESCRIPTION

This command removes clock latency information from the specified objects. It removes the user-specified clock network or source latency information from the specified objects. If a dynamic component of clock source latency has been specified, this will also be removed. If separate latency values for corners exist (specified using **-corners** in the **set_clock_latency** command) then all those corner values are also removed. Clock network latency is the time required for a clock signal on the design to propagate from the clock definition point to a register clock pin. Clock source latency (also called insertion delay) is the time it takes for a clock signal to propagate from its actual ideal waveform origin point to the clock definition point in the design.

Clock latency is managed on a per-scenario basis. For designs with multiple scenarios, you can specify scenarios by using the **-modes**, **-corners**, and **-scenarios** options.

By default, if none of these options are specified, the command applies to the current scenario. The tool issues an error if there is no current scenario. If the **-scenarios** option is specified, the command applies to all of the specified scenarios.

If the **-modes** option is specified, the command applies to all scenarios of the specified modes. The tool issues an error if none of the specified modes have any scenarios.

If the **-corners** option is specified, the command applies to all scenarios of the specified corners and the current mode. The tool issues an error if none of the specified corners have any scenarios with the current mode. If both the **-modes** and **-corners** options are specified, the command applies to all scenarios of the specified corners and the specified modes. The tool issues an error if there are no such scenarios. It is an error to specify **-scenarios** with **-modes** or **-corners**.

Clock network and source latency information is set on objects by using the **set_clock_latency** command. See the **set_clock_latency** man page for more details.

To report clock network and source latency information, use the **report_clocks** command with the **-skew** option.

Multicorner-Multimode Support

By default, this command works on the current scenario. To specify a different scenario, use the **-scenarios** option or the **-corners** and **-modes** options.

EXAMPLES

The following example removes clock latency information from the clock named **CLK1**.

```
prompt> remove_clock_latency [get_clocks CLK1]
```

The following example removes clock source latency information from the clock named **CLK1**.

```
prompt> remove_clock_latency -source \
[get_clocks CLK1]
```

The following example removes clock source latency information from the clock source port, CLK, with relative clock, **CLK1**. Dynamic component with the source latency is also removed.

```
prompt> remove_clock_latency -source \
-clock [get_clocks CLK1] [get_ports CLK]
```

remove_clock_routing_rules

Removes routing rules in clock tree synthesis.

SYNTAX

status **remove_clock_routing_rules**
[-clocks *clock_list* | -nets *net_list*]
[-net_type sink | internal | root]
[-rule *ndr_rule* | -default_rule]

Data Types

clock_list collection
net_list collection
ndr_rule string

ARGUMENTS

-clocks *clock_list*

Specifies the clock trees of the rules . This option and the **-nets** option are mutually exclusive.

-nets *net_list*

Specifies the nets on which the routing rules are removed. This option and the **-clocks** option are mutually exclusive.

-net_type sink | internal | root

Specifies the net type of the routing rules. This option cannot work together with the **-nets** option. There are three net types: **sink**, **internal** and **root**.

-rule *ndr_rule*

Specifies the non-default routing rule to be removed.

-default_rule

Removes the default routing rule.

DESCRIPTION

This command removes the routing rules used in clock tree synthesis.

EXAMPLES

The following example assigns a non-default rule named *dblespacing* to the sink level nets of clock clk1 in clock tree. Then it removes this rule and reports the routing rules to confirm the settings.

```
prompt> set_clock_routing_rules -clocks clk1 -net_type sink -rule dblespacing
1
prompt> report_clock_routing_rules

****************************************
 Report : clock routing rules
 Design : Decoder
 Date   : Thu Nov 29 08:44:45 2012
****************************************
   Clock: clk1 (mode default); Net Type: sink;     Rules: dblespacing

prompt> remove_clock_routing_rules -clocks clk1 -net_type sink
1
prompt> report_clock_routing_rules

****************************************
 Report : clock routing rules
 Design : Decoder
 Date   : Thru Nov 29 08:45:12 2012
****************************************

 No clock routing rule is found.
```

SEE ALSO

set_clock_routing_rules(2)
report_clock_routing_rules(2)

remove_clock_sense

The remove_clock_sense command is deprecated. Use the remove_sense command instead.

Multicorner-Multimode Support

This command works only on the current mode.

SEE ALSO

remove_sense(2)
set_sense(2)

remove_clock_skew_groups

Removes the user-defined skew group.

SYNTAX

remove_clock_skew_groups
skew_group_list

Data Types

skew_group_list collection

ARGUMENTS

skew_group_list

List of skew group names/collections.

DESCRIPTION

This command removes the specified skew group from the design.

Multicorner-Multimode Support

EXAMPLES

The following example removes the skew group named grp1.

```
prompt> remove_clock_skew_groups [get_clock_skew_groups grp1]
in -0.25i
```

SEE ALSO

create_clock_skew_group(2)

get_clock_skew_group(2)
report_clock_skew_groups(2)

remove_clock_transition

Removes clock transition time information.

SYNTAX

string **remove_clock_transition** *clock_list*

clock_list
[-modes *mode_list*]
[-corners *corner_list*]
[-scenarios *scenario_list*]

clock_list list
mode_list list
corner_list list
scenario_list list

ARGUMENTS

clock_list

Specifies a list of clocks for which to remove clock transition time.

-modes ***mode_list***

Specifies the scenarios that clock transitions will be removed from. If this option is given, all scenarios of the given modes will be used. The **-scenarios** option may not be given with this option. If both **-modes** and **-corners** are given, all scenarios whose mode is specified by **-modes** and whose corner is specified by **-corners** will be used.

-corners ***corner_list***

Specifies the scenarios that clock transitions will be removed from. If this option is given, all scenarios of the given corners and the current mode will be used. The **-scenarios** option may not be given with this option. If both **-modes** and **-corners** are given, all scenarios whose mode is specified by **-modes** and whose corner is specified by **-corners** will be used.

-scenarios ***scenario_list***

Specifies the scenarios that clock transitions will be removed from. The **-modes** or **-corners** option may not be given with this option.

DESCRIPTION

Removes clock transition information specified by the **set_clock_transition** command. To list all the set clock transition values, use the **report_clock** command with the **-skew** option.

Clock transition is managed on a per-scenario basis. For designs with multiple scenarios, you can specify scenarios by using **-modes**, **-corners**, and **-scenarios** options.

By default, if none of these options are specified, the command is applied to the current scenario. (It will be an error if there is no current scenario). If the **-scenarios** option is given, the command will be applied to all of the specified scenarios. If the **-modes** option is given, the command will be applied to all scenarios of the specified modes. (It will be an error if none of the specified modes have any scenarios.) If the **-corners** option is given, the command will be applied to all scenarios of the specified corners and the current mode. (It will be an error if none of the specified corners have any scenarios with the current mode.) If both the **-modes** and **-corners** options are given, the command will be applied to all scenarios of the specified corners and the specified modes. (It will be an error there are no such scenarios.) It is an error to give **-scenarios** with **-modes** or **-corners**.

Multicorner-Multimode Support

By default, this command works on the current scenario. To specify a different scenario, use the **-scenarios** option or the **-corners** and **-modes** options.

EXAMPLES

The following example removes clock transition information from all clocks in the current scenario.

```
prompt> remove_clock_transition [all_clocks]
```

SEE ALSO

all_clocks(2)
create_clock(2)
report_clocks(2)
set_clock_latency(2)
set_clock_transition(2)
set_clock_uncertainty(2)

remove_clock_tree_options

Remove existing target skew or latency constraints.

SYNTAX

status **remove_clock_tree_options**
[-clocks *clock_list*]
[-corners *corner_list*]
[-all]
[-target_skew]
[-target_latency]
[-copy_exceptions_across_modes]
[-root_ndr_fanout_limit]
[-max_incr_repeater_levels]

Data Types

clock_list list *corner_list* list

ARGUMENTS

-clocks *clock_list*

Removes target skew or latency on specified clock trees. If not specified, target skew or latency that is previously defined by **set_clock_tree_options** without -clocks option will be removed.

-corners *corner_list*

Removes target skew or latency in specified corners. If not specified, target skew or latency that is set to current corner will be removed.

-all

Removes all target skew or latency constraints.

-target_skew

Specifies that the constraints to be removed are target skew constraints.

-target_latency

Specifies that the constraints to be removed are target latency constraints.

-copy_exceptions_across_modes

Specifies that all the "-copy_exceptions_across_modes" settings will be removed. It can only be used by itself and cannot be

combined with other options.

-root_ndr_fanout_limit

Specifies that "-root_ndr_fanout_limit" (fanout-based ndr) settings will be removed. It can be combined with all other options except the "copy_exceptions_across_modes" option.

-max_incr_repeater_levels

Specifies that "-max_incr_repeater_levels" settings will be removed.

DESCRIPTION

Remove target skew or latency constraints or fanout-based ndr settings that are previously defined by **set_clock_tree_options**.

EXAMPLES

The following example removes the target skew constraint on clock clk1.

prompt> **remove_clock_tree_options -target_skew -clock clk1**

The following example removes all target latency constraint on all clocks.

prompt> **remove_clock_tree_options -target_latency -all**

SEE ALSO

set_clock_tree_options(2)
report_clock_tree_options(2)

remove_clock_tree_reference_subset

Removes previously defined references from a clock tree.

SYNTAX

status **remove_clock_tree_reference_subset**
[-clocks *clock_list*]

Data Types

clock_list collection

ARGUMENTS

-clocks *clock_list*

Removes references settings for the specified list of clocks.

DESCRIPTION

Use this command to remove the specified references settings from clock trees. If the **-clocks** option is used, reference lists of the specified clocks are removed. If the **-clocks** option is not used, all clock tree reference settings will be removed.

EXAMPLES

The following example removes reference cell settings for clock tree clk1.

prompt> **remove_clock_tree_references_subset -clocks clk1**

SEE ALSO

report_clock_tree_reference_subset(2)
set_clock_tree_reference_subset(2)

remove_clock_trees

Removes buffers and inverters in the clock trees.

SYNTAX

status **remove_clock_trees**
[-clocks *clock_list*]
[-clock_repeaters_only]
[-keep_ideal_clock_attributes]
[-keep_struct]

Data Types

clock_list collection

ARGUMENTS

-clocks *clock_list*

Runs only the clock trees specified in *clock_list*. By default, the command is applied for all currently defined clock trees in all active modes.

-clock_repeaters_only

Removes buffers/inverters inserted by clock tree synthesis tools only. This option is off by default.

-keep_ideal_clock_attributes

Keeps the ideal clock attributes, such as clock latencies, clock transitions, and clock uncertainties. Those cells with ideal clock attributes will not be removed in this situation.

-keep_struct

This option will skip reparenting gates, so the clock tree's structure will not change.

DESCRIPTION

This command removes buffers and inverters in clock trees.

EXAMPLES

The following example removes all buffers in clock tree named CLK1.

```
prompt> remove_clock_trees -clocks CLK1
```

SEE ALSO

synthesize_clock_trees(2)

remove_clock_trunk_endpoints

Removes the status of clock trunk endpoint from pins or ports.

SYNTAX

status **remove_clock_trunk_endpoints**
[-clock *clock_list*]
[-corners *corner_list*]
[-auto_clock connected | local | all]
[*pins_or_ports*]

Data Types

clock_list list or collection
corner_list list or collection
pins_or_ports collection

ARGUMENTS

-clock *clock_list*

Removes clock trunk endpoints for the specified clocks. By default, clock trunk endpoints are removed for all clocks.

-corners *corner_list*

Removes corner trunk endpoints for the specified corners. By default, clock trunk endpoints are removed for all corners.

pins_or_ports

Removes clock trunk endpoints for the specified pins or ports. By default, clock trunk endpoints are removed for all pins and ports.

-auto_clock connected | local | all

Associates clocks at the block level with clocks at the top level. For example, your top-level clock might be called "SYS_CLK", and the same clock in the block might be called "CLK". You can set the association between block clock and top clock by using the **set_block_to_top_map** command, or by using **remove_clock_trunk_endpoints -auto_clock** and specifying the same rule. See the **set_block_to_top_map** man page for more details. Note that the **-clocks** and **-auto_clock** options are mutually exclusive. You can select one of three rules for auto-clock mapping:

- **connected** - The "connected" rule associates block-level clocks with top-level clocks under the following conditions: If a block clock has its source at a block port (a boundary clock), it can be associated to a top-level clock that propagates to that port. If a block clock has its source on an internal pin sources (a local clock), the top-level clock source must be declared at the same pin.
- **local** - The "local" rule maps connected clocks. In addition, if a block clock has its source on an internal pin sources (a local clock) and has no associated top-level clock, a new top-level clock will be created with the same waveform as the block-

level clock. The new top-level clock will be associated with the local block-level clock.

- **all** - The "all" rule maps clocks as in the "local" rule. In addition, if a block clock has its source at a block port (a boundary clock) and no top-level clock propagates to that port, a new top-level clock will be created with the same waveform as the block-level clock. The new top-level clock will be associated with the local block-level clock. The top-level boundary clock will allow timing analysis to be done, but it is not necessarily correct for signoff. You should consider removing or replacing this clock before signoff.

Note that if two block-level clocks are declared at the same boundary port, the "all" rule cannot resolve both of them. This is because it will not automatically declare two conflicting clocks in the top-level block. You must manually declare two top-level clocks, with the appropriate waveforms. After the top clocks exist, **-auto_clock** mapping can associate them with the block clocks.

DESCRIPTION

This command removes clock trunk endpoints during clock trunk planning. Use options to remove clock trunk endpoints only for specified clocks, corners, pins, or ports.

EXAMPLES

The following example removes all clock trunk endpoints.

```
prompt> remove_clock_trunk_endpoints
1
```

The following example removes clock trunk endpoints for the block1/CLK pin.

```
prompt> remove_clock_trunk_endpoints block1/CLK
1
```

SEE ALSO

gui_load_clock_trunk_planning(2)
report_clock_trunk_endpoints(2)
set_clock_trunk_endpoints(2)

remove_clock_uncertainty

Removes clock uncertainty information previously set by the **set_clock_uncertainty** command.

SYNTAX

string **remove_clock_uncertainty**
[*object_list* |
-from *from_clock*
| -rise_from *rise_from_clock*
| -fall_from *fall_from_clock*
-to *to_clock*
| -rise_to *rise_to_clock*
| -fall_to *fall_to_clock*]
[-rise]
[-fall]
[-setup]
[-hold]
[-modes *mode_list*]
[-corners *corner_list*]
[-scenarios *scenario_list*]
[*object_list*]

Data Types

object_list list
from_clock list
rise_from_clock list
fall_from_clock list
to_clock list
rise_to_clock list
fall_to_clock list
mode_list list
corner_list list
scenario_list list

ARGUMENTS

-from *from_clock*

Specifies the source clock for interclock uncertainty. You must specify either the pair of **-from**/**-rise_from**/**-fall_from** and **-to**/**-rise_to**/**-fall_to**, or *object_list*; you cannot specify both.

-rise_from *rise_from_clock*

Same as the **-from** option, but indicates that *uncertainty* applies only to rising edge of the source clock. You can use only one of the **-from**, **-rise_from**, or **-fall_from** options. Use **-rise_from** instead of the obsolete option **-from_edge rise**.

-fall_from ***fall_from_clock***

Same as the **-from** option, but indicates that *uncertainty* applies only to the falling edge of the source clock. You can use only one of the **-from**, **-rise_from**, or **-fall_from** options. Use **-fall_from** instead of the obsolete option **-from_edge fall**.

-to ***to_clock***

Specifies the destination clock for interclock uncertainty. You must specify either the pair of **-from**/**-rise_from**/**-fall_from** and **-to**/**-rise_to**/**-fall_to**, or *object_list*; you cannot specify both.

-rise_to ***rise_to_clock***

Same as the **-to** option, but indicates that *uncertainty* applies only to rising edge of the destination clock. You can use only one of the **-to**, **-rise_to**, or **-fall_to** options. Use **-rise_to** instead of the obsolete option **-to_edge rise**.

-fall_to ***fall_to_clock***

Same as the **-to** option, but indicates that *uncertainty* applies only to falling edge of the destination clock. You can use only one of the **-to**, **-rise_to**, or **-fall_to** options. Use **-fall_to** instead of the obsolete option **-to_edge fall**.

-modes ***mode_list***

Specifies the scenarios that uncertainty will be set on. If this option is given, all scenarios of the given modes are used. The **-scenarios** option must not be given with this option. If both **-modes** and **-corners** are given, all scenarios whose mode is specified by **-modes** and whose corner is specified by **-corners** are used.

-corners ***corner_list***

Specifies the scenarios that uncertainty will be set on. If this option is given, all scenarios of the given corners and the current mode are used. The **-scenarios** option may not be given with this option. If both **-modes** and **-corners** are given, all scenarios whose mode is specified by **-modes** and whose corner is specified by **-corners** will be used.

-scenarios ***scenario_list***

Specifies the scenarios that uncertainty will be set on. The **-modes** or **-corners** option must not be given with this option.

object_list

Specifies a list of clocks, ports or pins from which uncertainty information is to be removed. You can use either the pair of **-from**/**-rise_from**/**-fall_from** and **-to**/**-rise_to**/**-fall_to** options or the *object_list* option, but you cannot specify both; they are mutually exclusive.

-rise

Specifies that uncertainty is to be removed for only the rising clock edge. By default, uncertainty is removed for both rising and falling clock edges. This option is valid only for interclock uncertainty, and is now obsolete. Unless you need this option for backward-compatibility, use **-rise_to** instead.

-fall

Specifies that uncertainty is to be removed for only the falling clock edge. By default, uncertainty is removed for both rising and falling clock edges. This option is valid only for interclock uncertainty, and is now obsolete. Unless you need this option for backward-compatibility, use **-fall_to** instead.

-setup

Specifies that only setup check uncertainty is to be removed. By default, both setup and hold check uncertainties are removed.

-hold

Specifies that only hold check uncertainty is to be removed. By default, both setup and hold check uncertainties are removed.

DESCRIPTION

Removes clock uncertainty information previously set by the **set_clock_uncertainty** command from clocks, ports, pins, or between specified clocks. To display clock uncertainty information, use the **report_clocks** command with the **-skew** option.

Clock uncertainty is managed on a per-scenario basis. For designs with multiple scenarios, you can specify scenarios by using **-modes**, **-corners**, and **-scenarios** options.

By default, if none of these options are specified, the command is applied to the current scenario, and it is an error if there is no current scenario. If the **-scenarios** option is given, the command is applied to all of the specified scenarios. If the **-modes** option is given, the command is applied to all scenarios of the specified modes, and it is an error if none of the specified modes have any scenarios. If the **-corners** option is given, the command is applied to all scenarios of the specified corners and the current mode, and it is an error if none of the specified corners have any scenarios with the current mode. If both the **-modes** and **-corners** options are given, the command is applied to all scenarios of the specified corners and the specified modes, and it is an error if there are no such scenarios. It is an error to give **-scenarios** with **-modes** or **-corners**.

Multicorner-Multimode Support

By default, this command works on the current scenario. To specify a different scenario, use the **-scenarios** option or the **-corners** and **-modes** options.

EXAMPLES

The following example removes uncertainty information from a clock named *CLK* and a pin named *clk_buf/Z*.

```
prompt> remove_clock_uncertainty [get_clocks CLK]
prompt> remove_clock_uncertainty [get_pins clk_buf/Z]
```

The following example removes interclock uncertainties between the *PHI1* and *PHI2* clock domains.

```
prompt> remove_clock_uncertainty -from PHI1 -to PHI1
prompt> remove_clock_uncertainty -from PHI2 -to PHI2
prompt> remove_clock_uncertainty -from PHI1 -to PHI2
prompt> remove_clock_uncertainty -from PHI2 -to PHI1
```

set_clock_uncertainty(2)

remove_clocks

Removes one or more clocks from the current design.

SYNTAX

string **remove_clocks** -all | *clock_list*

list *clock_list*

ARGUMENTS

-all

Specifies to remove all clocks in the current design.

clock_list

Specifies a list of collections containing clocks or patterns matching the clock names.

DESCRIPTION

Removes the specified clock objects from the current design. You must specify either *clock_list* or **-all**. The command returns the number of clocks removed.

If a removed clock is the only member of a path group, the path group is also removed. For information about path groups, refer to the **group_path** man page. To list all clock sources in the design, use **report_clock**.

All arrival and required times specified by commands **set_input_delay** and **set_output_delay** relatively to the clock that is being removed are also removed.

Multicorner-Multimode Support

This command works only on the current mode.

EXAMPLES

The following example removes clock CLK1.

prompt> **remove_clocks CLK1**

The following example removes all clocks from the current design.

prompt> **remove_clocks -all**

SEE ALSO

create_clock(2)

remove_colors

Clears user specified colors from given objects and associated cells.

SYNTAX

status **remove_colors**
[*object_list*]

Data Types

object_list collection

ARGUMENTS

object_list

For cells in the object_list collection, user specified colors of all cells in the collection, and all cells descended from hierarchical cells in the collection will be removed.

For voltage areas in the object_list collection, user specified colors of all voltage areas in the collection, and all cells associated with the voltage areas will be removed.

If omitted, colors are removed from all cells in the current top design.

DESCRIPTION

If *objects* is specified and contains cells, this command removes user specified colors from the cells in the collection and all cells descended from hierarchical cells in the collection. If *objects* is specified and contains designs, this command removes user specified colors from all cells of designs in the collection. If *objects* contains voltage areas, this command removes user specified colors from the voltage areas in the collection and all cells associated with them. If *objects* is omitted or contains no cells, designs or voltage areas, the commands removes user specified colors on all objects in the current design whose color can be set by the set_colors command.

SEE ALSO

set_colors(2)

remove_command_hook

Remove hook from command execution

SYNTAX

string **remove_command_hook** -before *name*
-after *name*
-replace *name*
commandName

string *name*
string *commandName*

ARGUMENTS

-before *name*

Remove the before hook named *name*

-after *name*

Remove the after hook named *name*

-replace *name*

Remove the replace hook named *name*

commandName

Command to update

DESCRIPTION

The **remove_command_hook** removes a hook previously added to a command. When a hook is created via the **add_command_hook** the name of the hook is returned. Use that name to remove the hook. The get_command_hooks command can also be used to determine the name of each registered hook.

EXAMPLES

```
prompt> remove_command_hook place_opt -before before0
```

SEE ALSO

add_command_hook(2)
get_current_hook_command(2)
get_command_hooks(2)

remove_constraint_groups

Removes constraint groups from the current design.

SYNTAX

int **remove_constraint_groups**
-all | *constraint_group_list*

Data Types

constraint_group_list string or collection

ARGUMENTS

-all

Removes all constraint groups in the current design. This is mutually exclusive with *constraint_group_list*.

constraint_group_list

Specifies a list of constraint groups to remove. The list may contain constraint group collections, specified using the **get_constraint_groups** command. This is mutually exclusive with *-all*.

DESCRIPTION

This command removes all specified constraint groups. Constituent objects are disassociated from the removed constraint groups.

The number of removed constraint groups is returned.

EXAMPLES

The following example removes constraint groups:

```
prompt> set a [get_constraint_groups shield*]
{"shielding_0", "shielding_1"}

prompt> remove_constraint_groups $a
2
```

The following example removes all constraint groups:

```
prompt> remove_constraint_groups -all
10
```

SEE ALSO

create_length_limit(2)
create_differential_group(2)
create_net_shielding(2)
create_net_priority(2)
create_bus_routing_style(2)
get_constraint_groups(2)

remove_corners

Removes one or more corners in multi corner analysis.

SYNTAX

status **remove_corners**
-all | *corner_list*

Data Types

corner_list collection

ARGUMENTS

-all

Removes all corners from memory.

corner_list

Specifies a list of unique corner strings to remove from memory.

DESCRIPTION

This command removes the specified corners from memory. To list the corners in the design, use the **all_corners** command.

The command returns the number of corners that were removed.

EXAMPLES

The following example removes the two corners named corner1 and corner2.

```
prompt> remove_corners {corner1 corner2}
1
```

SEE ALSO

all_corners(2)
create_corner(2)
current_corner(2)
get_corners(2)
report_corner(2)
set_scenario_status(2)

remove_custom_shields

Removes shielding for the specified nets if the shielding was created with Custom Router previously.

SYNTAX

status **remove_custom_shields**
[-nets nets]
[-keep_session (false|true)]

Data Types

nets a collection of nets to process

ARGUMENTS

-nets *nets*

Specifies the collection of nets for which shielding witll be deleted. If not specified, all top level nets in the design will be processed. Nets without shielding shapes created by the custom router will be skipped.

-keep_session *bool*

Specifies whether or not the custom router view of the data will be retained after the command completes. Use true only if you expect to perform additional custom route commands immediately after the current command. The default is false.

DESCRIPTION

The **remove_custom_shields** command removes shielding created by the custom router for a set of specified nets.

remove_cut_metals

This command removes cut metals at metal cut ends, where the cut metals are generated by **create_cut_metals** command.

SYNTAX

status **remove_cut_metals**

Data Types

DESCRIPTION

This command deletes cut metal shapes of top-design, where the cut metals shapes are created by **create_cut_metals** command.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

prompt> **remove_cut_metals**

SEE ALSO

remove_cut_metals(2)

remove_data_check

Removes specified data-to-data checks previously set by the **set_data_check** command.

SYNTAX

string **remove_data_check**
  -modes *mode_list*
  -corners *corner_list*
  -scenarios *scenario_list*
  -from *from_object*
    | -rise_from *from_object*
    | -fall_from *from_object*
  -to *to_object*
    | -rise_to *to_object*
    | -fall_to *to_object*
  [-setup | -hold]
  [-clock *clock*]
  [-all]

Data Types

from_object collection
to_object collection
clock_object collection

ARGUMENTS

-modes *mode_list*

Removes data check for scenarios of these modes (default is current mode, or current scenario if neither mode nor corner is specified)

-corners *corner_list*

Removes data check for scenarios of these corners (default is current scenario if neither mode nor corner is specified)

-scenarios *scenario_list*

Removes data check for these scenarios (default is current scenario)

-from *from_object*

Specifies a pin or port in the current design as the related pin of the data-to-data check to be removed. Both rising and falling checks are removed. You must specify one of **-from**, **-rise_from**, or **-fall_from**.

-to *to_object*

Specifies a pin or port in the current design as the constrained pin of the data-to-data check to be created. Both rising and falling checks are removed. You must specify one of **-to**, **-rise_to**, or **-fall_to**.

-rise_from *from_object*

Specifies a pin or port in the current design as the related pin of the data-to-data check to be removed. This is similar to the **-from** option, but applies to only rising delays at the related pin. You must specify one of **-from**, **-rise_from**, or **-fall_from**.

-fall_from *from_object*

Specifies a pin or port in the current design as the related pin of the data-to-data check to be removed. This is similar to the **-from** option, but applies to only falling delays at the related pin. You must specify one of **-from**, **-rise_from**, or **-fall_from**.

-rise_to *to_object*

Specifies a pin or port in the current design as the constrained pin of the data-to-data check to be created. This is similar to the **-to** option, but applies to only rising delays at the constrained pin. You must specify one of **-to**, **-rise_to**, or **-fall_to**.

-fall_to *to_object*

Specifies a pin or port in the current design as the constrained pin of the data-to-data check to be created. This is similar to the **-to** option, but applies to only falling delays at the constrained pin. You must specify one of **-to**, **-rise_to**, or **-fall_to**.

-setup

Indicates that only the setup data check is to be removed. If neither **-setup** nor **-hold** is specified, both setup and hold checks are removed.

-hold

Indicates that only the hold data check is to be removed. If neither **-setup** nor **-hold** is specified, both setup and hold checks are removed.

-clock *clock_object*

Indicates that the data check for the specified clock at the related pin is to be removed. This option applies only if a previous **set_data_check** command used the **-clock** option to specify the same clock; otherwise, this option is ignored.

-all

Indicates that all the data checks to be removed. The command ignores all other options and removes all data checks.

DESCRIPTION

The **remove_data_check** command specifies data-to-data check(s) to be removed between the *from* object and the *to* object for the specified options. These checks were previously set using the **set_data_check** command.

Multicorner-Multimode Support

This command applies to the current scenario only.

EXAMPLES

The following example removes a data-to-data check from and1/B to and1/A with respect to the rising edge of signals at and1/B. Both setup and hold checks are removed.

```
prompt> remove_data_check -rise_from and1/B -to and1/A
```

The following example removes setup data-to-data checks between and1/B and and1/A with respect to the rising edge of signals at and1/B and the falling edge of signals at and1/A, coming from startpoints triggered by the CK1 clock:

```
prompt> remove_data_check -rise_from and1/B \
  -fall_to and1/A -setup -clock [get_clock CK1]
```

SEE ALSO

report_timing(2)
set_data_check(2)
update_timing(2)
timing_enable_multiple_clocks_per_reg(3)

remove_density_rules

Removes density rules from the specified technology data.

SYNTAX

status **remove_density_rules**
[-tech *tech*]
[-library *library*]
[-all]
[*density_rules*]

Data Types

tech collection
library collection
density_rules collection

ARGUMENTS

-tech *tech*

Specifies the technology data from which to remove the density rules.

If you do not specify the **-tech** or **-library** option, the command removes the rules from the technology data of the current library.

-library *library*

Specifies the library from which to remove the density rules.

If you do not specify the **-tech** or **-library** option, the command removes the rules from the technology data of the current library.

-all

Removes all density rules from the specified technology data.

The **-all** option and **density_rules** argument are mutually exclusive; you must specify one of these arguments.

density_rules

Specifies the density rules to remove. You can specify any combination of rule names, patterns, or collections, which are created by the **get_density_rules** command.

The **-all** option and **density_rules** argument are mutually exclusive; you must specify one of these arguments.

DESCRIPTION

The **remove_density_rules** command removes the specified density rules from the specified technology data.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

You can use either of the commands in the following example to remove all density rules from the technology data in the current library.

```
prompt> remove_density_rules -all
```

```
prompt> remove_density_rules [get_density_rules *]
```

The following example removes the density rules associated with the M3 layer from the technology data in the current library.

```
prompt> remove_density_rules \
  [get_density_rules -filter "layer_name==M3"]
1
```

SEE ALSO

create_density_rule(2)
get_density_rules(2)

remove_design_rules

Removes design rules (design_rule) from the current technology object.

SYNTAX

integer **remove_design_rules**
[-all]
[*design_rule_list*]

Data Types

design_rule_list collection

ARGUMENTS

-all

Removes all design rules.

The **-all** option and *design_rule_list* argument are mutually exclusive; you must specify one.

design_rule_list

Specifies the design rules to remove. You can specify the rules by name or as a collection.

The **-all** option and *design_rule_list* argument are mutually exclusive; you must specify one.

DESCRIPTION

This command removes design rules from the current technology object.

This command returns the number of rules removed. If there is a command syntax error, it raises a TCL_ERROR.

EXAMPLES

The following example removes the design rule named DESIGN_RULE_0.

prompt> **remove_design_rules DESIGN_RULE_0**

1

SEE ALSO

create_design_rule(2)
get_design_rules(2)
report_design_rules(2)
set_design_rule_attribute(2)

remove_dff_trace_filters

Removes filter patterns from the list of filters used by the **compute_dff_connections** command

SYNTAX

compute_dff_connections
[-blocks *list_of_blocks*]
-type pin | net
-patterns *list_of_patterns* | -all

Data Types

list_of_blocks list
list_of_patterns list

ARGUMENTS

-blocks *list of blocks*

Specifies a list of block names from which to remove the specified filter patterns. If not specified, the patterns are removed from the special "all blocks" list.

-type pin | net

Specifies the type of filter to remove, either *pin* or *net*.

-patterns *list_of_patterns*

Specifies a list of patterns to remove from the specified filter type list. Patterns must match existing patterns exactly (no wildcard support during removal).

-all

Removes all patterns from the specifies blocks, or if **-blocks** is not specified, from all block lists including the special "all blocks" list.

DESCRIPTION

This command removes trace filter patterns used by the Data Flow Flylines (DFF) tracer. See the **compute_dff_connections** command for more information.

A GUI interface to manage filter patterns is available as part of the Data Flow Flylines tool in the GUI. You can access the interface

with the Reload option.

GENERAL USAGE

This command removes one or more patterns from a list of existing patterns used by the **compute_dff_connections** command when tracing through the netlist.

EXAMPLES

The following example removes a pattern "M1/*" from the trace filter list previously added for block B1.

```
prompt> remove_dff_trace_filters -type pin -blocks B1 -patterns "M1/*"
1
```

SEE ALSO

compute_dff_connections(2)
create_dff_trace_filters(2)
write_dff_trace_filters(2)

remove_dft_location

Removes DFT hierarchy location specifications for the current design.

SYNTAX

status **remove_dft_location**
[-type *logic_type*]

Data Types

logic_type string

ARGUMENTS

-type *logic_type*

Specifies the types of DFT hierarchy location specifications to be removed from the current design. The following values are valid for *logic_type*:

CODEC
WRAPPER
PLL
SERIAL_CNTRL

You can specify a list of multiple types with this option.

To remove a default DFT hierarchy location specification that was applied using the **set_dft_location** command without the **-include** option, do not specify a value for this option.

DESCRIPTION

The **remove_dft_location** command removes DFT hierarchy location specifications for the current design.

EXAMPLES

The following example removes the DFT hierarchy location for the design named *top*:

prompt> **current_design top**

```
prompt> set_dft_location -include {CODEC} core_inst/CODEC

prompt> remove_dft_location -type {CODEC}
Removed DFT location 'core_inst/CODEC' for type 'CODEC' for design 'top'.
1
```

SEE ALSO

report_dft(2)
set_dft_location(2)

remove_dft_signal

Removes from specified ports the attributes that identify those ports as DFT signals in the current design.

SYNTAX

status **remove_dft_signal**
[-port *port_list*]
[-test_mode *mode_name_list*]
[-hookup_pin *pin_name*]

Data Types

port_list list
mode_name_list list
pin_name string

ARGUMENTS

-port *port_list*

Specifies a list of ports to which the command applies.

-test_mode *mode_name_list*

Specifies the mode(s) to which the command applies. The default mode is **Internal_scan**. Specifying **all** as the *mode_list* indicates that the specification applies to all modes. Any mode other than the default mode or **all** must be created before running the command with this option.

-hookup_pin *pin_name*

Specifies the hookup pin to which the command applies.

DESCRIPTION

The **remove_dft_signal** command removes from specified ports the attributes that identify those ports as DFT signal ports in the current design. These attributes were placed on the ports with the **set_dft_signal** command.

EXAMPLES

The following example removes the DFT signal attributes from the *TM* port:

```
prompt> remove_dft_signal -port TM
```

SEE ALSO

remove_disable_clock_gating_check

Restores clock gating checks previously disabled by the **set_disable_clock_gating_check** command.

SYNTAX

string **remove_disable_clock_gating_check**
object_list

Data Types

object_list list

ARGUMENTS

object_list

Specifies a list of cells and pins for which the clock gating check is restored.

DESCRIPTION

The **remove_disable_clock_gating_check** command restores clock gating checks previously disabled by the **set_disable_clock_gating_check** command. These two commands only affect automatically inferred clock gating checks, not library-defined checks.

Specify the list of cells and pins for which to restore the clock gating checks. The command restores clock gating checks for those objects.

The command does not tell you whether any clock gating checks are being performed on the specified objects or whether any such checks were previously disabled. To get this type of information, use the **report_clock_gating_check** command.

Multicorner-Multimode Support

This command has no dependency on scenario-specific, mode-specific, or corner-specific information.

EXAMPLES

The following command restores clock gating checks on cell U123 previously disabled by the **set_disable_clock_gating_check** command.

prompt> **remove_disable_clock_gating_check [get_cells U123]**

The following command restores clock gating checks that use pin U123/I as a gating enable pin or gating clock pin, previously disabled by the **set_disable_clock_gating_check** command.

prompt> **remove_disable_clock_gating_check [get_pins U123/I]**

SEE ALSO

report_clock_gating_check(2)
set_disable_clock_gating_check(2)

remove_disable_timing

Enables the previously disabled timing arcs.

SYNTAX

string **remove_disable_timing**
  [-from *from_pin_name*]
  [-to *to_pin_name*]
  [-loop_break]
  object_list

string *from_pin_name*
string *to_pin_name*
list *object_list*

ARGUMENTS

-from *from_pin_name*

-to *to_pin_name*

Specifies that only the arcs between these two pins on the specified cell or library cell be disabled.

-loop_break

Indicate whether constraints coming from tool, not user.

object_list

Specifies a list of cells, pins, library cells, library cell pins, or ports. The *object_list* must contain only cells or library cells (if **-from** and **-to** are specified).

DESCRIPTION

Restore timing arcs previously disabled with the **set_disable_timing** command. When **-from** and **-to** pins are specified, all arcs between these two pins on the cell or library cell are restored.

To list the timing arcs for a library cell, use **report_lib -timing_arcs**.

Multicorner-Multimode Support

EXAMPLES

The following example restores disabled setup and hold arcs between pins CLK and TE on library cell SFF1.

prompt> **remove_disable_timing -from CLK -to TE tech_lib/SFF1**

The following example restores all disabled cell arcs from or to pin A on cell U1/U2.

prompt> **remove_disable_timing U1/U2/A**

SEE ALSO

report_lib(2)
set_disable_timing(2)
report_lib(2)

remove_drc_error_data

Removes DRC error data objects.

SYNTAX

status **remove_drc_error_data**
drc_error_data
[-force]

Data Types

drc_error_data collection

ARGUMENTS

drc_error_data

Specifies the collection of DRC error data objects to remove.

-force

Removes the specified DRC error data object, regardless of pending multiple opens that have not been matched with a close.

DESCRIPTION

The **remove_drc_error_data** command removes the specified DRC error data objects. The command first closes the error data objects, which decrements the open count for the error data objects. If the open count decrements to zero, the command removes the error data object from memory. If the error data object was created as an external error data file, the error data file is removed from disk.

The open count for a DRC error data object is incremented each time you run the **create_drc_error_data** or **open_drc_error_data** command on it. The open count is decremented each time you run the **close_drc_error_data** command. The error data object is removed from memory when the open count reaches zero.

Use the **-force** option to remove the error data object from memory and remove the external error data file from disk, regardless of the open count value.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example removes the DRC error data object named "dppinassgn.err".

```
prompt> remove_drc_error_data dppinassgn.err
1
```

The following example first opens an error data object named "dppinassgn.err", and then deletes it.

```
prompt> set data [open_drc_error_data -all dppinassgn.err]
{"dppinassgn.err"}
prompt> remove_drc_error_data $data
1
```

SEE ALSO

remove_drc_error_types

Removes physical DRC error type objects.

SYNTAX

status **remove_drc_error_types**
-error_data *drc_error_data*
drc_error_types

Data Types

drc_error_data collection
drc_error_types collection

ARGUMENTS

-error_data *drc_error_data*

Specifies the error data from which to remove physical DRC error types.

drc_error_types

A collection of physical DRC error type objects to remove.

DESCRIPTION

The **remove_drc_error_types** command removes physical DRC error type objects from the given error data. When an error type is removed, all errors of the type are also deleted from the error data.

EXAMPLES

The following example opens a physical DRC error data file that is named "my_design_dppinassgn.err", then removes all error_types that have the error_class value of **short**.

```
prompt> set data [open_drc_error_data -file_name my_design_dppinassgn.err]
{"my_design_dppinassgn.err"}
prompt> remove_drc_error_types -error_data $data \
  [get_drc_error_types -error_data $data -filter {error_class==short}]
```

The following example opens a physical DRC error data file that is named "my_design_dppinassgn.err", then removes the error type named "pin short".

```
prompt> set data [open_drc_error_data -file_name my_design_dppinassgn.err]
{"my_design_dppinassgn.err"}
prompt> remove_drc_error_types -error_data $data \
  [get_drc_error_types -error_data $data {"pin short"}]
```

SEE ALSO

remove_drc_error_data(2)
open_drc_error_data(2)

remove_drc_errors

Removes physical DRC error data objects.

SYNTAX

status **remove_drc_errors**
-error_data *drc_error_data*
drc_errors

Data Types

drc_error_data collection
drc_errors collection

ARGUMENTS

-error_data *drc_error_data*

Specifies the error data from which to remove errors.

drc_errors

A collection of physical DRC error data objects to remove.

DESCRIPTION

The **remove_drc_errors** command removes physical DRC error objects from the given error data.

EXAMPLES

The following example opens a physical DRC error data file that is named "my_design_dppinassgn.err", then removes all errors that have the status value of **fixed**.

```
prompt> set data [open_drc_error_data -file_name my_design_dppinassgn.err]
{"my_design_dppinassgn.err"}
prompt> remove_drc_errors -error_data $data \
    [get_drc_errors -error_data $data -filter {status==fixed}]
```

The following example opens a physical DRC error data file that is named "my_design_dppinassgn.err", then removes all errors that are of type "pin short".

```
prompt> set data [open_drc_error_data -file_name my_design_dppinassgn.err]
{"my_design_dppinassgn.err"}
prompt> set pinShortType [get_drc_error_types -error_data $data {"pin short"}]
{"pin short"}
prompt> remove_drc_errors -error_data $data \
    [get_drc_errors -error_data $data -of_objects $pinShortType]
```

SEE ALSO

open_drc_error_data(2)
remove_drc_error_data(2)
remove_drc_error_types(2)

remove_drive_resistance

Removes drive resistance for input or inout ports.

SYNTAX

string **remove_drive_resistance**
[-modes *mode_list*]
[-corners *corner_list*]
[-scenarios *scenario_list*]
port_list

Data Types

mode_list list
corner_list list
scenario_list list
port_list list

ARGUMENTS

-modes *mode_list*

Specifies the scenarios from which to remove the drive resistance. If this option is given, all scenarios of the specified modes will be used. The **-scenarios** option must not be specified with this option. If both **-modes** and **-corners** are specified, all scenarios whose mode is specified by **-modes** and whose corner is specified by **-corners** will be used.

-corners *corner_list*

Specifies the scenarios from which to remove the drive resistance. If this option is given, all scenarios of the specified corners and the current mode will be used. The **-scenarios** option must not be specified with this option. If both **-modes** and **-corners** are specified, all scenarios whose mode is specified by **-modes** and whose corner is specified by **-corners** will be used.

-scenarios *scenario_list*

Specifies the scenarios from which to remove the drive resistance. The **-modes** or **-corners** option must not be specified with this option.

port_list

Specifies a list of input or inout port names in the current design from which to remove the drive values.

DESCRIPTION

The **remove_drive_resistance** command removes the drive resistance value from one or more input or inout ports. This is equivalent to using **set_drive 0**. In fact, that is how this command works. If output ports are passed into **remove_drive_resistance**, a DES-003 message is issued, indicating that **set_drive** could not be performed on those ports.

Port drive resistance is managed on a per-scenario basis. For designs with multiple scenarios, you can specify different drive resistance for different scenarios by using **-modes**, **-corners**, and **-scenarios** options.

By default, if none of these options are specified, the command applies to the current scenario. The tool issues an error if there is no current scenario. If the **-scenarios** option is given, the command applies to all of the specified scenarios.

If the **-modes** option is given, the command applies to all scenarios of the specified modes. The tool issues an error if none of the specified modes have any scenarios.

If the **-corners** option is given, the command applies to all scenarios of the specified corners and the current mode. The tool issues an error if none of the specified corners have any scenarios with the current mode. If both the **-modes** and **-corners** options are given, the command applies to all scenarios of the specified corners and the specified modes. The tool issues an error if there are no such scenarios. It is an error to specify **-scenarios** with **-modes** or **-corners**.

Multicorner-Multimode Support

By default, this command works on the current scenario. To specify a different scenario, use the **-scenarios** option or the **-corners** and **-modes** options.

EXAMPLES

The following example sets a drive resistance of 5 on ports A, B, and C, reports the new drive resistance, removes the drive resistance on port A, and reports the resistance after removal. In the final report, only drive resistance for ports B and C is reported.

```
prompt> set_drive_resistance 5 [get_ports {A B C}]
1

prompt> report_ports -drive {A B C}

****************************************
Report : port
Design : counter
****************************************

            Resistance        Transition
Input Port  Rise     Fall     Rise     Fall
------------------------------------------------------------
A           5.00     5.00     --       --
B           5.00     5.00     --       --
C           5.00     5.00     --       --
1

prompt> remove_drive_resistance A
1

prompt> report_ports -drive {A B C}

****************************************
Report : port
```

```
Design : counter
****************************************

                Resistance          Transition
Input Port    Rise      Fall      Rise      Fall
--------------------------------------------------------------------
A              --        --        --        --
B            5.00      5.00        --        --
C            5.00      5.00        --        --

1
```

SEE ALSO

remove_driving_cell

Removes port driving cell information.

SYNTAX

string **remove_driving_cell**
[-rise]
[-fall]
[-min]
[-max]
[-clock *clock_name*]
[-clock_fall]
[-modes *mode_list*]
[-corners *corner_list*]
[-scenarios *scenario_list*]
port_list

Data Types

clock_name string
mode_list list
corner_list list
scenario_list list
port_list list

ARGUMENTS

-rise

Removes driving cell information only for the rising port transition.

-fall

Removes driving cell information only for the falling port transition.

-min

Removes driving cell information only for minimum timing analysis.

-max

Removes driving cell information only for maximum timing analysis.

-clock *clock_name*

Removes the driving cell set relative to the specified clock.

-clock_fall

Removes the driving cell relative to the falling edge of the clock. The default is the rising edge.

-modes ***mode_list***

Specifies the scenarios from which to remove the driving cells. If this option is given, all scenarios of the specified modes will be used. The **-scenarios** option must not be specified with this option. If both **-modes** and **-corners** are specified, all scenarios whose mode is specified by **-modes** and whose corner is specified by **-corners** will be used.

-corners ***corner_list***

Specifies the scenarios from which to remove the driving cells. If this option is given, all scenarios of the specified corners and the current mode will be used. The **-scenarios** option must not be specified with this option. If both **-modes** and **-corners** are specified, all scenarios whose mode is specified by **-modes** and whose corner is specified by **-corners** will be used.

-scenarios ***scenario_list***

Specifies the scenarios from which to remove the driving cells. The **-modes** or **-corners** option must not be specified with this option.

port_list

Provides a list of input or output ports.

DESCRIPTION

Removes driving cell information from the specified ports. The driving cell information is specified with the **set_driving_cell** command. The default is to remove all **-rise** and **-fall** information.

To see port drive information, use the **report_ports -drive** command.

Driving cells are managed on a per-scenario basis. For designs with multiple scenarios, you can specify scenarios by using **-modes**, **-corners**, and **-scenarios** options.

By default, if none of these options are specified, the command applies to the current scenario. The tool issues an error if there is no current scenario. If the **-scenarios** option is given, the command applies to all of the specified scenarios.

If the **-modes** option is given, the command applies to all scenarios of the specified modes. The tool issues an error if none of the specified modes have any scenarios.

If the **-corners** option is given, the command applies to all scenarios of the specified corners and the current mode. The tool issues an error if none of the specified corners have any scenarios with the current mode. If both the **-modes** and **-corners** options are given, the command applies to all scenarios of the specified corners and the specified modes. The tool issues an error if there are no such scenarios. It is an error to specify **-scenarios** with **-modes** or **-corners**.

Multicorner-Multimode Support

By default, this command works on the current scenario. To specify a different scenario, use the **-scenarios** option or the **-corners** and **-modes** options.

EXAMPLES

The following example removes all driving cell information for port IN2.

```
prompt> remove_driving_cell IN2
```

SEE ALSO

report_ports(2)
set_driving_cell(2)

remove_duplicate_timing_contexts

Removes duplicate Scenarios, Modes and Corners for the current block

SYNTAX

int **remove_duplicate_timing_contexts**
[-analyze_only]
[-exclude_group_path_directives]

ARGUMENTS

-analyze_only

Only perform minimization analysis.

-exclude_group_path_directives

Disregard the group_path directive, which may allow further mode minimization.

DESCRIPTION

This command removes duplicate Scenarios, Modes and Corners. Scenarios that are determined to be duplicates and have the same Scenario status values are removed. Scenarios of Modes that are determined to be duplicate are re-assigned to a common Mode. Corners may be added to achieve that reassignment. Additional Corners will be named consistently to the Corner they were created from, with an _d suffix, where d is an integer. Scenarios of Corners that are determined to be duplicate are reassigned to a common Corner.

If the reduction of Modes, Corners or Scenarios is possible, it is expected that both runtime and capacity will be improved.

Switching activity is not considered when determining duplicate Modes. It may therefore be necessary to re-annotate switching activity manually where mode reduction was achieved.

If the design makes use of the **set_block_to_top_map** command to map Block to top corners, this mapping will need to be manually updated when a mapped top corner is removed. The **report_block_to_top_map** command may be used to determine the current mapping.

This command writes temporary files into the directory specified by the **shell.common.tmp_dir_path** application option. If the command reports an error in creating files, check the value of the application option and ensure that the directory is writable.

Multicorner-Multimode Support

This command uses information from all scenarios

EXAMPLES

The following example uses the **remove_duplicate_timing_contexts** command to analyze the timing contexts of the design and implement all possible mode, corner and scenario reductions. Any reduction is expected to reduce the design's memory footprint and runtime through the subsequent design flow. In order to reduce the current memory footprint it is necessary to save the design, quit the tool session and restart the tool session.

```
prompt> save_block -as des/pre-reduction;
prompt> report_qor -summary -include {setup hold};
prompt> remove_duplicate_timing_contexts;
...
Minimization Summary:
Modes    : Reduced from 4 to 2
Corners  : No reduction was possible
Scenarios: Reduced from 10 to 8
1
prompt> report_qor -summary -include {setup hold};
prompt> save_block -as des/post-reduction;
prompt> exit;
1
```

remove_eco_bus_buffer_patterns

Removes the specified ECO bus buffer pattern.

SYNTAX

status **remove_eco_bus_buffer_patterns**
[*patterns* | -all]
[-verbose]

Data Types

patterns collection

ARGUMENTS

patterns

Specifies the list of ECO bus buffer patterns to remove.

-all

Removes all ECO bus buffer patterns.

-verbose

Reports the names of the ECO bus buffer patterns, in addition to the number of ECO bus buffer pattern, that were removed.

By default, the command reports only the number of ECO bus buffer patterns that were removed.

DESCRIPTION

Removes the specified ECO bus buffer patterns.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example removes all ECO bus buffer patterns with names that start with "or2t".

```
prompt> remove_eco_bus_buffer_patterns or2t*
2
```

SEE ALSO

create_eco_bus_buffer_pattern(2)
get_eco_bus_buffer_patterns(2)
report_eco_bus_buffer_patterns(2)

remove_eco_repeater

Remove buffer cells.

SYNTAX

remove_eco_repeater
cell_list
[-keep_net_name *keep_net_name*]
[-lib_cell_input *input_pin*]
[-lib_cell_output *output_pin*]
[-verbose]

ARGUMENTS

cell_list

Specifies the repeaters to remove.

-keep_net_name *keep_net_name*

Specifies the names of the net to keep. It must be connected with either input or output pin of the specified repeater to remove. This is optional.

-lib_cell_input *input_pin*

Specifies the name of the input pin to connect if the removed cell has multiple input pins. This is optional.

-lib_cell_output *output_pin*

Specifies the name of the output pin to connect if the removed cell has multiple output pins. This is optional.

-verbose

Show the verbose information. This is optional.

DESCRIPTION

This command removes repeaters. The input or output net of such repeater, which is specified by *keep_net_name*, will be kept. The other input or output net will be removed.

This command will specify the input pin for multiple inputs cells and output pin for multiple outputs cell with the option *lib_cell_input* or *lib_cell_output*. The kept net must connect with either the specified input pin or output pin.

This command support transparent interface optimization(TIO) flow, which can remove buffer cells in sub blocks of abstract view from top block.

This command supports editing a verilog module in the module aspect, through **edit_module**.

This command will check the editability of the block before removing buffer cells.

This command honors design.eco_freeze_silicon_mode. When this app option is true, buffers to remove will be marked as spare cell and renamed by adding _Spare post-fix, instead of being removed from database.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example removes repeater buf1. Its input net will be kept.

```
prompt> edit_module h1m {remove_eco_repeater -keep_net_name input_net_n1 buf1 }
```

The following example removes repeater buf1. Its output net will be kept.

```
prompt> edit_module h1m {remove_eco_repeater -keep_net_name output_net_n1 buf1 }
```

SEE ALSO

add_eco_repeater(2)
edit_module(2)

remove_edit_groups

Removes edit groups from the current design.

SYNTAX

int **remove_edit_groups**
[-force]
[-verbose]
[-all]
[*edit_group_list*]

Data Types

edit_group_list list

ARGUMENTS

-force

Ignore locked status of the objects. If this option is not provided and any of the affected objects has locked status, command will fail generating tcl error.

-verbose

Displays verbose deletion information.

-all

Removes all edit groups from the current design.

edit_group_list

Specifies a list of edit groups to remove. The list may contain edit group names, patterns, or collections. A collection may be specified by using the **get_edit_groups** command.

RETURN VALUE

The number of removed edit groups.

DESCRIPTION

This command removes edit groups from the current design. Note that objects that are contained by an edit group at the time of removal are not themselves removed from the design, rather they are removed from the edit group and are no longer contained within any edit group.

EXAMPLES

The following example removes edit groups named "edit_group1" and "edit_group2".

```
prompt> remove_edit_groups { edit_group1 edit_group2 }
2
```

The following example removes edit groups that match the pattern "edit_group*".

```
prompt> remove_edit_groups edit_group*
3
```

The following example removes all edit groups in the design.

```
prompt> remove_edit_groups -all
5
```

SEE ALSO

get_edit_groups(2)
add_to_edit_group(2)
remove_from_edit_group(2)
report_edit_groups(2)

remove_ems_rules

Removes user-defined EMS rules.

SYNTAX

remove_ems_rules
pattern | -all

Data Types

pattern pattern/collection capturing EMS user-defined rules

ARGUMENTS

pattern

This is a mandatory argument. It can be the name of a rule or a pattern capturing names of multiple rules or a collection of EMS rules. EMS rules by given name or matching given pattern or part of collection, should be already available in EMS memory; otherwise the command will fail with an error message. Option -all and argument "pattern" are mutually exclusive. If the EMS rules have messages instantiated for them then such rules are not removed.

-all

This is a mandatory option. This is mutually exclusive with argument "pattern". This option removes all user-defined rules in current EMS memory. Again if there are messages which have been created for the EMS rules then such rules are not removed.

DESCRIPTION

Command **remove_ems_rules** removes the user-defined rules if they do not have EMS messages created for them already.

EXAMPLES

prompt> **create_ems_database abc.ems**
prompt> **create_ems_rule -name "TEMP-001" -severity "Info" -message "Pin:%pin has capacitance:%cap"**
prompt> **create_ems_rule -name "TMP-002" -severity "Error" -message "Cell %cell is not placed"**
prompt> **remove_ems_rules "TEMP-001"**
prompt> **create_ems_message -rule "TMP-002" -parameters "cell:U1"**

```
prompt> remove_ems_rules "TMP-002"
Warning: Failed to remove EMS rules. (EMS-142)
```

SEE ALSO

create_ems_rule(2)
create_ems_message(2)
create_ems_database(2)

remove_feasibility_constraints

Removes constraints from timing paths that were added by feasibility constraint files.

SYNTAX

status **remove_feasibility_constraints**
-input_dir *dir_name*

Data Types

dir_name string

ARGUMENTS

-input_dir *dir_name*

Specifies the name of the directory **dir_name** that contain the feasibility constraint files.

DESCRIPTION

The *remove_feasibility_constraints* command removes the timing constraints added to the current design by the feasibility constraints files. It uses the files present in the specified directory to revert back the design before these files was applied to it.

A **input_dir** is required to be specified for the command to be able to remove the feasibility constraints applied to the current design.

EXAMPLE

The following example removes the timing constraints added by write_feasibility_constraints.

prompt> **remove_feasibility_constraints -input_dir Multicycle_Path_2**

SEE ALSO

write_feasibility_constraints(2)

remove_feedthroughs

Removes feedthrough ports and nets from blocks.

SYNTAX

string **remove_feedthroughs**
[-cells *cell_collection*]
[-nets *net_collection*]
[-include_original_feedthroughs]

Data Types

cell_collection collection
net_collection collection

ARGUMENTS

-cells cell_collection

Specifies the blocks from which to remove feedthrough ports and nets. By default, the command removes feedthroughs from all blocks.

-nets net_collection

Specifies the nets from which to remove feedthrough ports. By default, the command removes feedthroughs from all nets.

-include_original_feedthroughs

Removes the original feedthrough ports and new feedthrough ports that are created by the **place_pins** command. If you specify this option, the tool removes these feedthrough ports and the connections to these ports at the top level. By default, the command preserves the original ports and their top level connections.

DESCRIPTION

This command removes feedthrough ports and nets that exist within the design. By default, the command removes all added feedthrough nets and ports, and preserves all original nets and ports, for all blocks. To apply the command to a specific set of nets, use the **-nets** option to specify a collection of nets. To apply the command to certain blocks, use the **-cells** option to specify a collection of blocks.

The **-include_original_feedthroughs** option removes original and new feedthrough nets and ports An original port is a port on a block that is a feedthrough port in the original netlist. By default the command looks at multiple levels of physical hierarchy (MPH support) for feedthrough removal. The **set_editability** can be used to enable/disable removal on individual reference-blocks or

levels of physical hierarchy. If a net is connected to even a single instance that is disabled for design planning such a net will be skipped for feedthrough removal.

All the redundant feedthroughs in the whole design will always be removed, as long as the parent block of the redundant feedthrough is enabled for design planning.

EXAMPLES

The following example removes feedthrough nets and ports on all nets and all blocks, for both new and existing feedthroughs.

```
prompt> remove_feedthroughs -include_original_feedthroughs
```

SEE ALSO

place_pins(2)
report_feedthroughs(2)
set_editability(2)

remove_fill_cells

Removes the specified fill cells from the current block.

SYNTAX

status **remove_fill_cells**
[-remove_reference]
[-all]
[*fill_cell_list*]

Data Types

fill_cell_list list

ARGUMENTS

-remove_reference

Remove the reference internal designs of the specified fill cells, if unused after removing the fill cells.

fill_cell_list

Specifies the fill cells to remove.

The *fill_cell_list* argument and **-all** option are mutually exclusive; you must specify one.

-all

Removes all fill cells from the current block.

The **-all** option and *fill_cell_list* argument are mutually exclusive; you must specify one.

DESCRIPTION

Removes the specified fill cells from the current block.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example removes the fill cells whose name includes "_1".

```
prompt> get_fill_cells *_1*
{FILL_INST_1 FILL_INST_10}

prompt> remove_fill_cells -remove_reference *_1*
2
```

SEE ALSO

get_fill_cells(2)

remove_floorplan_rules

Removes the floorplan rules in the design.

SYNTAX

status **remove_floorplan_rules**
[-object_types *type_list*]
[-lib_cells *lib_cells*]
[-all]
[*rule_list*]

Data Types

type_list list
lib_cells collection
rule_list list

ARGUMENTS

-object_types *type_list*

Specifies the list of object types for which some floorplan rules are defined. Floorplan rules that have specified object types in their **-from_object_types** or **-to_object_types** or **-object_types** will be removed. Valid values for this option are *block_boundary*, *core_area*, *hard_macro*, *placement_blockage*, *routing_blockage*, *shape*, *soft_macro* and *std_cell_area*. This option is mutually exclusive with the **-all** and *rule_list* options.

-lib_cells *lib_cells*

Specifies the collection of library cells for which some floorplan rules are defined. Floorplan rules that have specified library cells in their **-from_lib_cells** or **-to_lib_cells** or **-lib_cells** will be removed. This option is mutually exclusive with the **-all** and *rule_list* options.

-all

Removes all floorplan rules defined in the design. This option is mutually exclusive with the **-object_types**, **-lib_cells** and *rule_list* options.

rule_list

Specifies the list of floorplan rule names to remove. This option is mutually exclusive with the **-object_types**, **-lib_cells** and **-all** options.

DESCRIPTION

The **remove_floorplan_rules** command removes existing floorplan rules in a design based on specified input parameters. On successful removal, the command returns a status of 1.

The *rule_list* option is mutually exclusive with the **-object_types**, **-lib_cells** and **-all** options. If any named rule in *rule_list* does not exist or no rule exists for the given object types or library cells, a warning is issued.

EXAMPLES

The following example tries to remove two floorplan rules named e2 and ab. The floorplan rule ab does not exist.

```
prompt> remove_floorplan_rules {e2 ab}

Warning: Floorplan rule 'ab' does not exist.
0
prompt> report_floorplan_rules e2
Warning: Floorplan rule 'e2' does not exist.
0
```

The following example tries to remove floorplan rules for object type std_cell_area and library cell lc4. Since no floorplan rule exists for library cell lc4, the command issues a warning message and removes floorplan rule e2 for object type std_cell_area.

```
prompt> remove_floorplan_rules -object_types std_cell_area -lib_cells \
  [get_lib_cells */lc4]

Warning: No floorplan rules exists for given lib cells.
1
prompt> report_floorplan_rules e2
Warning: Floorplan rule 'e2' does not exist.
0
```

remove_from_bound

Unassigns cells and ports from a bound in the current design.

SYNTAX

int **remove_from_bound**
bound_object
cell_and_port_list

Data Types

bound_object list
cell_and_port_list list

ARGUMENTS

bound_object

Specifies the name or collection of a single bound. The bound object can be specified by using the **get_bounds** command. However it must return a collection of one bound object.

cell_and_port_list

Specifies a list of cells and ports to unassign from the bound. The list may contain names, patterns, or collections. If a cell or port is not assigned to the bound, it is skipped and not removed. Cells that are implicitly in the bound (because its parent hierarchical cell is the bound) cannot be unassigned from the bound. Only assigned cells may be unassigned. However such cells may be assigned to a different bound using the **add_to_bound** command.

DESCRIPTION

The **remove_from_bound** command unassigns cells and ports from an existing bound, which are currently assigned to the bound.

You can readjust the utilization by unassigning cells from the bound. The placer assumes that the cells are no longer constrained by placement bounds.

EXAMPLES

The following example unassigns all cells from a bound named "movebound1".

```
prompt> remove_from_bound movebound1 *
1
```

The following example unassigns a hierarchical cell from a bound named "movebound2".

```
prompt> remove_from_bound movebound2 mid
1
```

SEE ALSO

create_bound(2)
get_bounds(2)
add_to_bound(2)
report_bounds(2)
remove_bounds(2)

remove_from_bundle

Removes one or more objects from the specified bundle.

SYNTAX

status_value **remove_from_bundle**
-bundle *bundle*
[-all]
object_list

Data Types

bundle collection
object_list list

ARGUMENTS

-bundle *bundle*

Specifies the bundle to remove object from.

-all

Removes all occurrences of the specified object from the bundle. By default, only the first occurrence of the object is removed.

object_list

Specifies the list of objects to remove from the bundle.

DESCRIPTION

Removes a list of objects from the specified bundle.

EXAMPLES

The following example removes objects from a bundle.

prompt> **remove_from_bundle -bundle [get_bundles BUNDLE_5] [get_nets Clk]**

1

SEE ALSO

add_to_bundle(2)
create_bundle(2)
get_bundles(2)
remove_bundles(2)
report_bundles(2)

remove_from_collection

Removes objects from a collection, resulting in a new collection. The base collection remains unchanged.

SYNTAX

collection **remove_from_collection**
[-intersect]
collection1
object_spec

Data Types

collection1	collection
object_spec	list

ARGUMENTS

-intersect

Removes objects from collection1 not found in object_spec. Without this option, removes objects from collection1 that are found in object_spec.

collection1

Specifies the base collection to be copied to the result collection. Objects matching *object_spec* are removed from the result collection.

object_spec

Specifies a list of named objects or collections to remove. The object class of each element in this list must be the same as in the base collection. If the name matches an existing collection, the collection is used. Otherwise, the objects are searched for in the database using the object class of the base collection.

DESCRIPTION

The **remove_from_collection** command removes elements from a collection, creating a new collection.

If the base collection is homogeneous, any element of the *object_spec* that is not a collection is searched for in the database using the object class of the base collection. If the base collection is heterogeneous, any element of the *object_spec* that is not a collection is ignored.

If the *-intersect* option is not specified, which is the default mode, and if nothing matches the *object_spec*, the resulting collection is a

copy of the base collection. If everything in the *collection1* option matches the *object_spec*, the result is the empty collection. With the *-intersect* option the results are reversed.

For background on collections and querying of objects, see the **collections** man page.

EXAMPLES

The following example from PrimeTime gets all input ports except "CLOCK".

```
pt_shell> set cPorts [remove_from_collection [all_inputs] CLOCK]
{"in1", "in2"}
```

SEE ALSO

add_to_collection(2)
collections(2)

remove_from_edit_group

Removes objects from an edit group in the current design.

SYNTAX

int **remove_from_edit_group**
edit_group_object
object_list

Data Types

edit_group_object list
object_list list

ARGUMENTS

edit_group_object

Specifies the name or collection of a single edit group. The edit group object can be specified by using the **get_edit_groups** command, however, it must return a collection of exactly one edit group object.

object_list

Specifies a list of objects to remove from the edit group. The list can contain names, patterns, or collections. Objects which are not contained in the edit group are skipped.

DESCRIPTION

The **remove_from_edit_group** command removes objects from an existing edit group.

The command returns a collection containing the modified edit group as the only object, or an empty collection if the edit group was removed due to its ungroup_on_remove attribute setting. If the command fails, it return a Tcl error.

EXAMPLES

The following example removes all shapes from an edit group named "edit_group1".

```
prompt> remove_from_edit_group edit_group1 [get_shapes]
```

{"edit_group1"}

SEE ALSO

add_to_edit_group(2)
create_edit_group(2)

remove_edit_groups(2)
report_edit_groups(2)

remove_from_group

Removes objects from the group in the current design.

SYNTAX

int **remove_from_group**
group
object_list

Data Types

group list
object_list list

ARGUMENTS

group

Specifies the name or collection of group. The group object can be specified by using the **get_groups** command.

object_list

Specifies a list of objects to remove from the group. The list can contain names, patterns, or collections. Removing an object which is not a member of the group is an error.

RETURN VALUE

The number of object removed the group or TCL_ERROR if the command fails.

DESCRIPTION

The **remove_from_group** command removes objects from the group.

EXAMPLES

The following example removes shape R1 from group named "group1".

```
prompt> remove_from_group group1 [get_shapes R1 ]
1
```

SEE ALSO

remove_from_io_guide

Removes pad cells from an I/O guide in the current design.

SYNTAX

int **remove_from_io_guide**
io_guide_object
pad_cell_list

Data Types

io_guide_object list
pad_cell_list list

ARGUMENTS

io_guide_object

Specifies the name or collection of a single I/O guide. The *io_guide_object* can be specified with the **get_io_guides** command, however, it must return a collection of one I/O guide object.

pad_cell_list

Specifies a list of pad cells to remove from the I/O guide. The list can contain names, patterns, or collections. If a cell or port is assigned to another I/O guide, it is skipped and not removed.

DESCRIPTION

The **remove_from_io_guide** command removes pad cells from an existing I/O guide. The command returns 1 if successful, 0 if it fails, or a Tcl error if there is a command syntax error.

EXAMPLES

The following example removes all cells from a I/O guide named "io_guide1".

```
prompt> remove_from_io_guide io_guide1 *
1
```

SEE ALSO

add_to_io_guide(2)

remove_from_io_ring

Removes I/O guides from an I/O ring in the current design.

SYNTAX

int **remove_from_io_ring**
io_ring_object
guide_list

Data Types

io_ring_object list
guide_list list

ARGUMENTS

io_ring_object

Specifies the name or collection of a single I/O ring. The *io_ring_object* can be specified by using the **get_io_rings** command. However it must return a collection of one I/O ring object.

guide_list

Specifies a list of I/O guides to remove from the I/O ring. The list can contain names, patterns, or collections. If a cell or port is assigned to another I/O ring, it is skipped and not removed.

DESCRIPTION

The **remove_from_io_ring** command removes I/O guides from an existing I/O ring. The command returns 1 if the successful, 0 if it fails, or a Tcl error if there is a command syntax error.

EXAMPLES

The following example removes all I/O guides from a I/O ring named "io_ring1".

```
prompt> remove_from_io_ring io_ring1 *
1
```

SEE ALSO

remove_from_matching_type

Removes cells, pins, and terminals from the matching type.

SYNTAX

int **remove_from_matching_type**
[-auto_fix]
matching_type
object_list

Data Types

matching_type list
object_list list

ARGUMENTS

-auto_fix

Removes non-existent objects from the matching type. Objects become non-existent when reference libraries or designs are modified, and objects no longer exist in the cell hierarchy.

The **-auto_fix** and *object_list* options are mutually exclusive; you can specify only one of them.

matching_type

Specifies the name or collection of a single matching type. The matching type can be specified by using the **get_matching_types** command. However it must return a collection of one matching type.

object_list

Specifies a list of cells, pins, and terminals to remove from the matching type. The list may contain names, patterns, or collections. If an object is not in the matching type, it is skipped and not removed.

The **-auto_fix** and *object_list* options are mutually exclusive; you can specify only one of them.

DESCRIPTION

The **remove_from_matching_type** command removes cells, pins, and terminals from an existing matching type, which are currently in the matching_type.

EXAMPLES

The following example removes a cell from a matching type named "myMatchingType1".

```
prompt> remove_from_matching_type myMatchingType1 [get_cells inv1]
1
```

remove_from_multisource_clock_sink_group

Removes sinks from a sink group defined for multisource clock tap assignment

SYNTAX

status **remove_from_multisource_clock_sink_group**
-name *name*
-sinks *pin_or_port_list*

Data Types

name	string
pin_or_port_list	collection

ARGUMENTS

-name *name*

This required option defines the name of the sink group from which sinks are to be removed. Sink groups are defined using the **create_multisource_clock_sink_group** command.

-sinks *pin_or_port_list*

This required option specifies a list of sinks that should get removed from the sink list of the sink group given by option **-name**.

DESCRIPTION

The **remove_from_multisource_clock_sink_group** command is used to remove clock tree sinks from a sink group defined for multisource clock tap assignment.

The list of assigned sinks to a sink group can be obtained by accessing the sink group attribute **sinks**.

Multicorner-Multimode Support

This command has no dependency on scenario-specific, mode-specific, or corner-specific information.

EXAMPLES

This example removes the clock tree sink reg1/CK from sink group sink_group1.

```
prompt> remove_from_multisource_clock_sink_group -name sink_group1 -sinks [get_pins reg1/CK]
```

SEE ALSO

remove_from_net

Removes shapes vias, and via_matrixes from a net in the current design.

SYNTAX

int **remove_from_net**
[-force]
net
shape_and_via_list

Data Types

net collection
shape_and_via_list collection

ARGUMENTS

-force

Ignore locked status of the objects. If this option is not provided and any of the affected objects has locked status, command will fail generating tcl error.

net

Specifies the net from which to remove shapes, vias and via_matrixes.

shape_and_via_list

Specifies the shapes, vias and via_matrixes to remove from the net. The list may contain names, patterns, or collections. If a shape, via or via_matrix is assigned to another net, it is skipped and not removed.

DESCRIPTION

The **remove_from_net** command removes shapes, vias and via_matrixes from an existing net.

EXAMPLES

The following example removes a shape from a net.

```
prompt> remove_from_net net1 [get_shapes RECT_18_10]
1
```

The following example removes a via from a net.

```
prompt> remove_from_net net1 [get_vias VIA_SA_132]
1
```

SEE ALSO

remove_from_net_bus

Removes the specified net from the existing net bus in the current design.

SYNTAX

collection **remove_from_net_bus**
net_bus
net

Data Types

net_bus string or collection
net string or collection

ARGUMENTS

net_bus

Specifies the net bus from which to remove the net.

net

Specifies the net which needs to be removed from the net bus. The *net* should have the same base name as net bus.

RETURN VALUE

This command returns the updated net bus (as a collection), an empty string if it fails, or a TCL_ERROR if there is a command syntax error

DESCRIPTION

This command removes the specified net from an existing net bus in the current design. Individual nets will remain. Net removal is allowed only when no gaps are created in bus numbering and at least one net remains in the bus.

EXAMPLES

The following example creates a bus net named bus1 , then removes net bus1[7] from the net bus. The third command tries to remove a bit from bus net in the middle of the bus, which causes the tool to issue an error message.

```
prompt> create_net_bus -create_nets bus1[0:7]
{bus1}

prompt> remove_from_net_bus bus1 bus1[7]
{bus1}

prompt> remove_from_net_bus bus1 bus1[4]
Error: Net removal will create a hole in the net bus. (NDM-120)
```

SEE ALSO

remove_from_pin_blockage

Removes pins, nets, and ports from pin blockages in the current design.

SYNTAX

int **remove_from_pin_blockage**
pin_blockage_list
object_list

Data Types

pin_blockage_list list
object_list list

ARGUMENTS

pin_blockage_list

Specifies the names or collection of pin blockages. The pin blockages can be specified by using the **get_pin_blockages** command.

object_list

Specifies a list of physical pins, nets, or ports to remove from the pin blockages.

DESCRIPTION

The **remove_from_pin_blockage** command removes pins, nets, and ports from existing pin blockages.

EXAMPLES

The following example removes all pins a pin blockage named "PIN_BLOCKAGE_1".

```
prompt> remove_from_pin_blockage PIN_BLOCKAGE_1 [get_pins *]
1
```

SEE ALSO

create_pin_blockage(2)

remove_from_pin_guide

Removes pins, nets, and ports from pin guides in the current design.

SYNTAX

int **remove_from_pin_guide**
pin_guide_list
object_list

Data Types

pin_guide_list list
object_list list

ARGUMENTS

pin_guide_list

Specifies the names or collection of pin guides. The pin guides can be specified by using the **get_pin_guides** command.

object_list

Specifies a list of physical pins, nets, or ports to remove from the pin guides.

DESCRIPTION

The **remove_from_pin_guide** command removes pins, nets, and ports from existing pin guides.

EXAMPLES

The following example removes all pins a pin guide named "PIN_GUIDE_1".

```
prompt> remove_from_pin_guide PIN_GUIDE_1 [get_pins *]
1
```

SEE ALSO

remove_from_placement_attraction

Unassigns cells from a placement_attraction in the current design.

SYNTAX

int **remove_from_placement_attraction**
placement_attraction_object
cell_list

Data Types

placement_attraction_object list
cell_list list

ARGUMENTS

placement_attraction_object

Specifies the name or collection of a single placement_attraction. The placement_attraction object can be specified by using the **get_placement_attractions** command. However it must return a collection of one placement_attraction object.

cell_list

Specifies a list of cells to unassign from the placement_attraction. The list may contain names, patterns, or collections. If a cell is not assigned to the placement_attraction, it is skipped and not removed. Cells that are implicitly in the placement_attraction (because its parent hierarchical cell is the placement_attraction) cannot be unassigned from the placement_attraction. Only assigned cells may be unassigned.

DESCRIPTION

The **remove_from_placement_attraction** command unassigns cells from an existing placement_attraction, which are currently assigned to the placement_attraction.

EXAMPLES

The following example unassigns all cells from a placement_attraction named "placement_attraction1".

```
prompt> remove_from_placement_attraction placement_attraction1 *
1
```

The following example unassigns a hierarchical cell from a placement_attraction named "placement_attraction2".

```
prompt> remove_from_placement_attraction placement_attraction2 mid
1
```

remove_from_port_bus

Removes the specified port from the existing port bus in the current design.

SYNTAX

collection **remove_from_port_bus**
port_bus
port

Data Types

port_bus string or collection
port string or collection

ARGUMENTS

port_bus

Specifies the port bus from which to remove the port.

port

Specifies the port which needs to be removed from the port bus. The *port* should have the same base name as port bus.

RETURN VALUE

This command returns the updated port bus (as a collection), an empty string if it fails, or a TCL_ERROR if there is a command syntax error

DESCRIPTION

This command removes the specified port from an existing port bus in the current design. Individual ports will remain. Port removal is allowed only when no gaps are created in bus numbering and at least one port remains in the bus.

EXAMPLES

The following example creates a bus port named bus1 , then removes port bus1[7] from the port bus. The third command tries to remove a bit from bus port in the middle of the bus, which causes the tool to issue an error message.

```
prompt> create_port_bus -create_ports bus1[0:7]
{bus1}

prompt> remove_from_port_bus bus1 bus1[7]
{bus1}

prompt> remove_from_port_bus bus1 bus1[4]
Error: Port removal will create a hole in the port bus. (NDM-115)
```

remove_from_routing_corridor

Dissociates nets, supernets and their bundles from routing corridor.

SYNTAX

status **remove_from_routing_corridor**
routing_corridor
object_list

Data Types

routing_corridor string
object_list list

ARGUMENTS

routing_corridor

Specifies the name or collection of a single routing corridor. The routing corridor can be specified by using the **get_routing_corridors** command. However it must return a collection of only one routing corridor object.

object_list

Specifies the nets, supernets and their bundles to dissociate from their routing corridors. This is a required option.

DESCRIPTION

This command dissociates the specified nets, supernets and their bundles from the routing corridor.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example dissociates nets whose names start with "clock" from routing corridor RC_2.

prompt> **remove_from_routing_corridor RC_2 [get_nets clock*]**

```
1
```

The following example dissociates a bundle of supernets from routing corridor RC_2.

```
prompt> remove_from_routing_corridor RC_2 supernet_bundle_0
1
```

SEE ALSO

remove_from_rp_group

Removes cell, relative placement group or relative placement blockage from a relative placement group.

SYNTAX

int **remove_from_rp_group**
rp_group_object
-cells *cell_list* | -rp_group *rp_group_object* | -blockage *blockage_object*

Data Types

rp_group_object collection
cell_list list or collection
blockage_object list or collection

ARGUMENTS

rp_group_object

Specifies the name or collection of a single relative placement group, from which the objects will be removed. The relative placement group can be specified using the **get_rp_groups** command. However it must return a collection of one and only one relative placement group.

-cells *cell_list*

Specifies a list of cells to remove from relative placement group. The list may contain names, patterns, or collections. It is an error to provide a cell, which does not belong to provided relative placement group.

-rp_group *hier_rp_group_object*

Specifies the relative placement group name or collection to remove from the relative placement group. It is an error to provide a relative placement group, which does not belong to provided relative placement group.

-blockage *blockage_object*

Specifies the relative placement blockage name or collection to remove from the relative placement group. It is an error to provide a relative placement blockage, which does not belong to provided relative placement group.

DESCRIPTION

The **remove_from_rp_group** command removes cells, relative placement group or relative placement blockage from existing

relative placement group. If the object being removed is at location specified for *rp_location* anchor corner then anchor corner will be removed from relative placement group.

EXAMPLES

The following example uses **remove_from_rp_group** to remove a cell from an existing relative placement group.

```
prompt> get_rp_groups grp_ripple
{grp_ripple}

prompt> remove_from_rp_group grp_ripple -cells carry_in_1
1
```

The following example uses **remove_from_rp_group** to remove a blockage from an existing relative placement group.

```
prompt> remove_from_rp_group grp_ripple -blockage grp_ripple_blkg2
1
```

SEE ALSO

remove_from_scan_chain

Removes the specified stub chains from the existing scan chain in the current design.

SYNTAX

collection **remove_from_scan_chain**
scan_chain
stub_chains

Data Types

scan_chain string or collection
stub_chains string or collection

ARGUMENTS

scan_chain

Specifies the scan_chain from which to remove stub chains.

stub_chains

Specifies the stub chains which needs to be removed from the scan chain. The *stub_chains* must be in the scan_chain.

DESCRIPTION

This command removes the specified stub_chains from an existing scan_chain in the current design. Individual stub chain will continue to exist.

EXAMPLES

The following example creates a scan chain named scan1 with a stub chain named stub1 added to it, then removes the stub chain stub1 from the scan chain.

```
prompt> create_stub_chain -name stub1
{bus1}

prompt> create_scan_chain -name scan1 {stub1}
```

```
{bus1}

prompt> remove_from_scan_chain scan1 {stub1}
1
```

SEE ALSO

remove_generated_clock

Removes generated clock objects from the current design.

SYNTAX

status **remove_generated_clocks**
-all | *generated_clock_list*

Data Types

generated_clock_list list

ARGUMENTS

-all

Indicates that all generated clocks are to be removed.

generated_clock_list

Specifies a list of names of generated clocks to be removed.

DESCRIPTION

This command removes from the current design generated clocks previously created using the **create_generated_clock** command. The command returns the number of generated clocks removed. All attributes set on generated clocks (for example, **false_paths, multicycle_paths**) are also removed.

To display information about clocks and generated clocks in the design, use the **report_clocks** command.

Multicorner-Multimode Support

EXAMPLES

The following example removes the generated clock GEN1 from the design.

prompt> **remove_generated_clocks GEN1**

The following example removes all generated clocks from the design.

```
prompt> remove_generated_clocks -all
```

SEE ALSO

create_generated_clock(2)
report_clocks(2)

remove_generated_clocks

Removes generated clock objects from the current design.

SYNTAX

status **remove_generated_clocks**
-all | *generated_clock_list*

Data Types

generated_clock_list list

ARGUMENTS

-all

Indicates that all generated clocks are to be removed.

generated_clock_list

Specifies a list of names of generated clocks to be removed.

DESCRIPTION

This command removes from the current design generated clocks previously created using the **create_generated_clock** command. The command returns the number of generated clocks removed. All attributes set on generated clocks (for example, **false_paths, multicycle_paths**) are also removed.

To display information about clocks and generated clocks in the design, use the **report_clocks** command.

Multicorner-Multimode Support

EXAMPLES

The following example removes the generated clock GEN1 from the design.

prompt> **remove_generated_clocks GEN1**

The following example removes all generated clocks from the design.

```
prompt> remove_generated_clocks -all
```

SEE ALSO

create_generated_clock(2)
report_clocks(2)

remove_grids

Removes the specified grids from the current design.

SYNTAX

status **remove_grids**
-all | *grid*

Data Types

grid collection

ARGUMENTS

-all

Remove all grids from the current design. This option is mutually exclusive with the *grid* argument, you must specify **-all** or the *grid*.

grid

Specifies the grid object to be removed. You can specify a single object or a collection of grids. This option is mutually exclusive with the **-all** argument, you must specify **-all** or the *grid*.

DESCRIPTION

This command removes the specified grids from the current design. The grids could be of any type, block or user.

EXAMPLES

The following example removes all the grids in the current design:

prompt> **remove_grids -all**

The following example uses the *grid* argument to remove the grid named gr1:

prompt> **remove_grids [get_grids gr1]**

The following example uses the *grid* argument to remove all the user grids:

```
prompt> remove_grids [get_grids -type user]
```

remove_groups

Removes groups from the current design.

SYNTAX

int **remove_groups**
[-verbose]
[*group_list*]

Data Types

group_list list

ARGUMENTS

-verbose

Displays verbose deletion information.

group_list

Specifies a list of groups to remove. The list may contain group names, patterns, or collections. A collection may be specified by using the **get_groups** command. If *group_list* is not provided then it will delete all groups from the current design.

RETURN VALUE

The number of removed groups.

DESCRIPTION

This command removes groups from the current design. Note that objects that are contained by an group at the time of removal are not removed from the design, rather they are removed from that group.

EXAMPLES

The following example removes groups named "group1" and "group2".

```
prompt> remove_groups { group1 group2 }
2
```

The following example removes groups that match the pattern "group*".

```
prompt> remove_groups group*
3
```

The following example removes all groups in the design.

```
prompt> remove_groups
5
```

SEE ALSO

create_group(2)
get_groups(2)
add_to_group(2)
remove_from_group(2)
report_groups(2)

remove_host_options

Remove settings for multi-threaded and distributed processing created by **set_host_options**.

SYNTAX

status **remove_host_options**
[-all]
[-name *options_name*]
[-target ICC2 | ICV | PrimeTime | StarRC | ALL]

Data Types

options_name string

ARGUMENTS

-all

Specifies that all host options should be deleted.

-target ICC2 | **ICV** | **PrimeTime** | **StarRC** | **ALL**

The target tool of set of options to be deleted.

The user could also pass combination of -all, name and -target to selectively remove option settings.

DESCRIPTION

The **remove_host_options** command is used to unset the parameters set by the **set_host_options** command.

If the **-name** argument is given, any host options of that name will be deleted. If the **-all** argument is given, all host options will be deleted, and the **-max_cores** value for the main (parent) job will be restored to the default setting.

SEE ALSO

set_host_options(2)
report_host_options(2)

remove_hot_spots

Removes all data structure generated by the **generate_hot_spots** command in the previous run..

SYNTAX

status **remove_hot_spots**

ARGUMENTS

The **remove_hot_spots** command is used to clear all data structure created by the **generate_hot_spots** command. Within the same session, users are not allowed to invoke the **generate_hot_spots** command twice without first clearing any remaining data structure from the first **generate_hot_spots** command run.

SEE ALSO

generate_hot_spots(2)
report_hot_spots(2)

remove_ideal_latency

Removes ideal latency values from the specified objects.

SYNTAX

int **remove_ideal_latency**
[-modes *mode_list*]
[-corners *corner_list*]
[-scenarios *scenario_list*]
[-all]
[-rise] [-fall]
[-min] [-max]
object_list

list *object_list*

ARGUMENTS

-modes *mode_list*

Specifies the modes for which to remove the ideal latency value. Each active scenario of the modes specified by the **-modes** option and the corners specified by the **-corners** option is de-annotated separately. If this option is not given, the command removes latency for every scenario that is active with the specified corner(s). It is an error to give this option with the **-scenarios** option.

-corners *corner_list*

Specifies the corners for which to remove the ideal latency value. Each active scenario of the modes specified by the **-modes** option and the corners specified by the **-corners** option is de-annotated separately. If this option is not given, the command removes latency for every scenario that is active with the specified mode(s). It is an error to give this option with the **-scenarios** option.

-scenarios *scenario_list*

Specifies the scenarios for which to remove the ideal latency value. Each of the specified scenarios is de-annotated separately. It is an error to give this option with the **-modes** or the **-corners** options. If none of the **-modes**, **-corners**, or **-scenarios** options are specified, the command applies to the current scenario only.

-all

Removes the ideal latency time from every pin in the current design. If you specify **-all**, you cannot specify any other arguments.

-rise

Removes the rise ideal latency time. If you do not specify the **-rise** or **-fall** options, both values are removed.

-fall

Removes the fall ideal latency time. If you do not specify the **-rise** or **-fall** options, both values are removed.

-min

Removes the minimum ideal latency time. If you do not specify the **-min** or **-max** options, both values are removed.

-max

Removes the maximum ideal latency time. If you do not specify the **-min** or **-max** options, both values are removed.

object_list

Specifies a list of ports or pins from where to remove ideal latency.

DESCRIPTION

Removes the user-specified ideal latency that was previously set by the **set_ideal_latency** command from specified objects in *object_list*.

To list ideal latency values, use the **report_ideal_network** command.

Multicorner-Multimode Support

By default, this command works on the current scenario. To specify a different scenario, use the **-scenarios** option or the **-corners** and **-modes** options.

EXAMPLES

The following example removes ideal latency from the output pin named *Z* of cell instance *U1/U2/U3*.

```
prompt> remove_ideal_latency {U1/U2/U3/Z}
```

The following example removes only rise ideal latency information from a port named *A*.

```
prompt> remove_ideal_latency -rise {A}
```

SEE ALSO

remove_ideal_network(2)
remove_ideal_transition(2)
report_ideal_network(2)
set_ideal_network(2)
set_ideal_latency(2)

remove_ideal_network

Removes sources of ideal networks in the current design. Cells and nets in the transitive fanout of the specified objects are no longer treated as ideal.

SYNTAX

status **remove_ideal_network**
-all | *object_list*

Data Types

object_list collection

ARGUMENTS

-all

Removes the ideal network for all objects in the current design.

object_list

Specifies a list of ideal sources. The source objects may be ports or pins of leaf cells at any hierarchical level of the design. If nets are specified in the *object_list* option, then all of the nets' global driver ideal source pins that were set with the **-no_propagate** option are removed.

DESCRIPTION

This command removes the ideal network property from a set of ports or pins in the design that were previously marked as ideal sources using the **set_ideal_network** command. You specify only the source of the network. The ideal network is automatically updated. The criteria for propagating the ideal property are detailed in the **set_ideal_network** man page.

All ideal networks are removed using the **reset_design** command.

Multicorner-Multimode Support

This command has no dependency on scenario-specific, mode-specific, or corner-specific information.

EXAMPLES

The following example sets up an ideal network on objects in the design CLOCK_GEN and then removes part of the network:

```
prompt> current_design CLOCK_GEN
prompt> set_ideal_network {port1 port2}
prompt> remove_ideal_network port2
```

The following example creates an ideal network and then removes part of the ideal network.

```
prompt> current_design {TOP}
prompt> set_ideal_network {IN1 IN2}
prompt> remove_ideal_network {IN1}
```

The following example removes an ideal network that was set on a net.

```
prompt> set_ideal_network -no_propagate {netB}
Warning: Transferring ideal net attribute onto driver pin 'AN2/Z' of net 'netB'. (UITE-450)
prompt> remove_ideal_network {netB}
```

SEE ALSO

remove_ideal_latency(2)
remove_ideal_transition(2)
reset_design(2)
set_ideal_network(2)

remove_ideal_transition

Removes ideal transition values from the specified objects.

SYNTAX

int **remove_ideal_transition**
[-modes *mode_list*]
[-corners *corner_list*]
[-scenarios *scenario_list*]
[-all]
[-rise] [-fall]
[-min] [-max]
object_list

list *object_list*

ARGUMENTS

-modes *mode_list*

Specifies the modes for which to remove the ideal transition value. Each active scenario of the modes specified by the **-modes** option and the corners specified by the **-corners** option is de-annotated separately. If this option is not given, the command removes transition for every scenario that is active with the specified corner(s). It is an error to give this option with the **-scenarios** option.

-corners *corner_list*

Specifies the corners for which to remove the ideal transition value. Each active scenario of the modes specified by the **-modes** option and the corners specified by the **-corners** option is de-annotated separately. If this option is not given, the command removes transition for every scenario that is active with the specified mode(s). It is an error to give this option with the **-scenarios** option.

-scenarios *scenario_list*

Specifies the scenarios for which to remove the ideal transition value. Each of the specified scenarios is de-annotated separately. It is an error to give this option with the **-modes** or the **-corners** options. If none of the **-modes**, **-corners**, or **-scenarios** options are specified, the command applies to the current scenario only.

-all

Removes the ideal transition time from every pin in the current design. If you specify **-all**, you cannot specify any other arguments.

-rise

Removes the rise ideal transition time. If you do not specify the **-rise** or **-fall** options, both values are removed.

-fall

Removes the fall ideal transition time. If you do not specify the **-rise** or **-fall** options, both values are removed.

-min

Removes the minimum ideal transition time. If you do not specify the **-min** or **-max** options, both values are removed.

-max

Removes the maximum ideal transition time. If you do not specify the **-min** or **-max** options, both values are removed.

object_list

Specifies a list of ports or pins from which to remove ideal transition.

DESCRIPTION

Removes the user-specified ideal transition that was previously set by the **set_ideal_transition** command from specified objects in the *object_list* option.

To list ideal transition values, use the **report_ideal_network** command.

Multicorner-Multimode Support

By default, this command works on the current scenario. To specify a different scenario, use the **-scenarios** option or the **-corners** and **-modes** options.

EXAMPLES

The following example removes ideal transition from the output pin named *Z* of cell instance *U1/U2/U3*.

```
prompt> remove_ideal_transition {U1/U2/U3/Z}
```

The following example removes only rise ideal transition information from a port named *A*.

```
prompt> remove_ideal_transition -rise {A}
```

SEE ALSO

remove_ignored_layers

Removes ignored routing layers in congestion analysis and RC estimation. This command can also remove the design minimum and maximum routing layers if those layers have been already set.

SYNTAX

status **remove_ignored_layers**
[-min_routing_layer]
[-max_routing_layer]
[-all]
[-rc_congestion_ignored_layers *tech_layer_list*]

Data Types

tech_layer_list list

ARGUMENTS

-min_routing_layer

Removes the setting for the design minimum routing layer.

-max_routing_layer

Removes the setting for the design maximum routing layer.

-all

Removes all RC congestion ignored layers between design minimum and maximum routing layer inclusive.

-rc_congestion_ignored_layers *tech_layer_list*

Lists the routing layers that should no longer be ignored during congestion analysis and RC estimation.

DESCRIPTION

This command removes the ignored setting from some or all routing layers. You can specify routing layers to be ignored during congestion analysis and RC estimation.

Note that congestion analysis and RC estimation require that at least one horizontal and one vertical layer not be ignored.

You can also use this command to remove the settings for the design minimum and maximum routing layers.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following command removes all RC congestion ignored layers between design minimum and maximum routing layer inclusive.

prompt> **remove_ignored_layers -all**

SEE ALSO

report_ignored_layers(2)
set_ignored_layers(2)

remove_individual_pin_constraints

Removes the existing individual pin constraints from nets and pins.

SYNTAX

string **remove_individual_pin_constraints**
[-nets *net_collection*]
[-pins *pin_collection*]
[-ports *port_collection*]

Data Types

net_collection	collection
pin_collection	collection
port_collection	collection

ARGUMENTS

-nets *net_collection*

Specifies the collection of nets from which to remove pin physical constraints.

-pins *pin_collection*

Specifies the collection of pins from which to remove pin physical constraints.

-ports *port_collection*

Specifies the collection of ports from which to remove pin physical constraints.

DESCRIPTION

This command removes all existing pin constraints from nets, pins and ports. If you do not specify any arguments, this command removes all pin constraints for all pins, nets and ports.

The **set_editability** command can enable or disable the **remove_individual_pin_constraints** command for specified blocks or levels of physical hierarchy. This command has no effect on the blocks that are disabled with the **set_editability** command.

EXAMPLES

The following example removes the pin constraints for all pins, nets and ports.

```
prompt> remove_individual_pin_constraints
```

SEE ALSO

report_individual_pin_constraints(2)
set_individual_pin_constraints(2)
set_editability(2)

remove_input_delay

Removes input delay information from ports or pins.

SYNTAX

string **remove_input_delay** [-clock *clock_name*]
[-clock_fall]
[-level_sensitive]
[-rise]
[-fall]
[-max]
[-min]
[-modes *mode_list*]
[-corners *corner_list*]
[-scenarios *scenario_list*]
port_pin_list

Data Types

clock_name list
mode_list list
corner_list list
scenario_list list
port_pin_list list

ARGUMENTS

-clock *clock_name*

Relative clock; '' for no clock. Use this option to remove only input delay relative to one clock.

-clock_fall

Delay is relative to falling edge of clock.

-level_sensitive

Delay is from level-sensitive latch.

-rise

Removes rising input delay.

-fall

Removes falling input delay.

-max

Removes maximum input delay.

-min

Removes minimum input delay.

-modes *mode_list*

Specifies the scenarios that input delays will be removed from. If this option is given, all scenarios of the given modes will be used. The **-scenarios** option cannot be given with this option. If both **-modes** and **-corners** are given, all scenarios whose mode is specified by **-modes** and whose corner is specified by **-corners** will be used.

-corners *corner_list*

Specifies the scenarios that input delays will be removed from. If this option is given, all scenarios of the given corners and the current mode will be used. The **-scenarios** option cannot be given with this option. If both **-modes** and **-corners** are given, all scenarios whose mode is specified by **-modes** and whose corner is specified by **-corners** will be used.

-scenarios *scenario_list*

Specifies the scenarios that input delays will be removed from. The **-modes** or **-corners** option cannot be given with this option.

port_pin_list

Specifies a list of ports and pins.

DESCRIPTION

Removes input delay information from ports or pins in the current design. Input delay is specified with the **set_input_delay** command. To show input delays on ports, use **report_ports -input_delay**. The default is to remove all input delay information in the *port_pin_list*.

Input delay is managed on a per-scenario basis. For designs with multiple scenarios, you can specify scenarios by using **-modes**, **-corners**, and **-scenarios** options.

By default, if none of these options are specified, the command is applied to the current scenario. (It will be an error if there is no current scenario). If the **-scenarios** option is given, the command will be applied to all of the specified scenarios. If the **-modes** option is given, the command will be applied to all scenarios of the specified modes. (It will be an error if none of the specified modes have any scenarios.) If the **-corners** option is given, the command will be applied to all scenarios of the specified corners and the current mode. (It will be an error if none of the specified corners have any scenarios with the current mode.) If both the **-modes** and **-corners** options are given, the command will be applied to all scenarios of the specified corners and the specified modes. (It will be an error there are no such scenarios.) It is an error to give **-scenarios** with **-modes** or **-corners**.

Multicorner-Multimode Support

By default, this command works on the current scenario. To specify a different scenario, use the **-scenarios** option or the **-corners** and **-modes** options.

EXAMPLES

The following example removes all input delay from ports IN*.

prompt> **remove_input_delay [get_ports IN*]**

The following example removes input delay relative to CLK rise edge from port DATA[5].

prompt> **remove_input_delay -clock CLK { DATA[5] }**

SEE ALSO

remove_output_delay(2)
report_ports(2)
set_input_delay(2)
set_output_delay(2)

remove_io_filler_cells

Removes I/O filler cells from the current design.

SYNTAX

int **remove_io_filler_cells**
[-cells *cell_list*]

Data Types

cell_list list

ARGUMENTS

-cells *cell_list*

Specifies a list of I/O filler cells to remove. The list can contain I/O filler cell names, patterns, or collections. A collection can be specified by using the **get_cells** command. If no *cell_list* is specified the command removes all the I/O filler cells in the design.

DESCRIPTION

This command removes I/O filler cells from the current design, and returns the number of filler cells removed. An error will occur if you specify an incorrect set of cells or I/O filler cells. The removal of a filler cell, which is a member of user defined signal I/O constraints, will result in a warning.

EXAMPLES

The following example removes I/O filler cells named "io_filler1" and "io_filler2".

```
prompt> remove_io_filler_cells -cells { io_filler1 io_filler2 }
2
```

The following example removes I/O fillers that match the pattern "io_filler*".

```
prompt> remove_io_filler_cells -cells {io_filler*}
3
```

The following example removes all I/O filler cells in the design.

```
prompt> remove_io_filler_cells
5
```

SEE ALSO

create_io_filler_cells(2)

remove_io_guides

Removes I/O guides from the current design.

SYNTAX

int **remove_io_guides**
[-force]
[-verbose]
[-all]
[*io_guide_list*]

Data Types

io_guide_list list

ARGUMENTS

-force

Removes the I/O guide, even if the I/O guide object is locked. If this option is not specified, the command fails and generates a Tcl error if any of the specified objects is locked.

-verbose

Displays additional debugging information.

-all

Removes all I/O guides from the current design.

io_guide_list

Specifies a list of I/O guides to remove. The list can contain I/O guide names, patterns, or collections. A collection can be specified by using the **get_io_guides** command.

DESCRIPTION

This command removes I/O guide constraints from the current design. The number of removed I/O guides are returned. The command returns the number of I/O guides that were removed.

EXAMPLES

The following example removes I/O guides named "io_guide1" and "io_guide2".

```
prompt> remove_io_guides { io_guide1 io_guide2 }
2
```

The following example removes I/O guides that match the pattern "io_guide*".

```
prompt> remove_io_guides io_guide*
3
```

The following example removes all I/O guides in the design.

```
prompt> remove_io_guides -all
5
```

SEE ALSO

add_to_io_guide(2)
create_io_guide(2)
get_io_guides(2)
remove_from_io_guide(2)
report_io_guides(2)

remove_io_rings

Removes I/O rings from the current design.

SYNTAX

int **remove_io_rings**
[-force]
[-verbose]
[-all]
[*io_ring_list*]

Data Types

io_ring_list list

ARGUMENTS

-force

Removes the I/O ring, even if the object is locked. If this option is not provided and any of the specified objects has locked status, command fails and generates a Tcl error.

-verbose

Displays verbose debugging information.

-all

Removes all I/O rings from the current design.

io_ring_list

Specifies a list of I/O rings to remove. The list can contain I/O ring names, patterns, or collections. A collection can be specified with the **get_io_rings** command.

DESCRIPTION

This command removes I/O ring constraints from the current design. The command returns the number of removed I/O rings, or a Tcl error if there is a command syntax error.

EXAMPLES

The following example removes I/O rings named "io_ring1" and "io_ring2".

prompt> **remove_io_rings { io_ring1 io_ring2 }**

SEE ALSO

add_to_io_ring(2)
create_io_ring(2)
get_io_rings(2)
remove_from_io_ring(2)
report_io_rings(2)

remove_ivm

Reads via variation file(.ivm) for current desgin.

SYNTAX

status **remove_ivm**
[-corners *corners*]

Data Types

corners list

ARGUMENTS

-corners *corners*

Specifies the list of corners for which to apply the extraction options. If corners are not specified then the ivm file will be applied to all corners.

DESCRIPTION

This command removes via variation from the current design.

EXAMPLES

The following example removes via variation for specified two corners.

prompt> **remove_ivm -corners {FuncMode_max.SS.081v.125c_FuncCmax.corner FuncMode_min.FF.099v.125c_FuncCmax.**

SEE ALSO

report_ivm(2)
read_ivm(2)
write_ivm(2)

write_parasitics(2)

remove_keepout_margins

Removes the specified keepout margins.

SYNTAX

integer **remove_keepout_margins**
keepout_list

Data Types

keepout_list collection

ARGUMENTS

keepout_list

Specifies the keepout margins to remove. You can specify a single object or a collection of keepout margins.

This is a required argument.

DESCRIPTION

This command removes the specified keepout margins. If you delete a routing-blockage keepout margin, the command also deletes the corresponding layers in the owner object.

The command returns the number of keepout margins that were successfully deleted.

EXAMPLES

The following command removes all the keepouts in the current block:

prompt> **remove_keepout_margins [get_keepout_margins]**

SEE ALSO

create_keepout_margin(2)
get_keepout_margins(2)
report_keepout_margins(2)

remove_layer_map_file

Removes a layer mapping file from a library.

SYNTAX

status **remove_layer_map_file**
-format gds | starrc
[-library *library_name*]

Data Types

library_name string

ARGUMENTS

-format gds | **starrc**

Specifies the format of the layer mapping file, **gds** for GDS in/out or **starrc** for StarRC.

-library_name ***library_name***

Specifies the name of the library in which to store the layer mapping file. If not specified, the command applies to the current open library. This option is not valid for library shell. Library shell uses current open library only.

DESCRIPTION

This command removes a layer mapping file from a library.

EXAMPLES

The following example removes the GDS layer mapping file from current open library:

```
prompt> remove_layer_map_file \
    -format gds
```

SEE ALSO

set_layer_map_file(2)

remove_layers

Removes the given layer objects from the technology data.

SYNTAX

collection **remove_layers**
[-tech *tech*]
[-library *library*]
patterns

Data Types

tech string
library string
patterns string or collection

Data Types

patterns Collection or regexp pattern of layers to remove

ARGUMENTS

-tech *tech*

Specifies the technology data for finding the layer objects; the default is the current library's technology data.

-library *library*

Specifies the library for finding the layer objects; the default is the current library.

patterns

Specifies the collection of layers to be removed.

DESCRIPTION

This command removes the specified layers from the library's technology data. Objects on those layers, if any, will become unbound. If a layer is later re-added to the technology data, the unbound objects are re-bound to that layer.

RETURN VALUE

This command returns the number of layers removed. or an empty string if the command fails. If a command syntax error exists,

the command returns a TCL_ERROR.

EXAMPLES

The following example removes a layer named 'M1' from the technology data of the current library.

```
prompt> remove_layers M1
{1}
```

SEE ALSO

create_layer(2)
get_layers(2)
report_unbound(2)

remove_libcell_subset

Removes library cell subset family constraints from specified cells or removes a library cell subset family defined by the **define_libcell_subset** command.

SYNTAX

status **remove_libcell_subset**
[-object_list *cells*]
[-family_name *name*]

Data Types

cells list
name string

ARGUMENTS

-object_list *cells*

Specifies the cells from which to remove the library cell subset family. The cells must be unmapped sequential cells. You must specify either **-object_list** or **-family_name**. If neither **-object_list** nor **-family_name** is specified, an error occurs and the command quits.

-family_name *name*

Specifies the library cell subset family to be removed. You must specify either **-family_name** or **-object_list**. If neither **-family_name** nor **-object_list** is specified, an error occurs and the command quits.

DESCRIPTION

This command removes the library cell subset family specified by the **set_libcell_subset** command from the cells to be optimized, or it removes a library cell subset family defined by the **define_libcell_subset** command.

EXAMPLES

The following example removes the library cell subset family from the u1 sequential cell:

prompt> **remove_libcell_subset -object_list [get_cells u1]**

The following example removes the special_flops library cell subset family:

prompt> **remove_libcell_subset -family_name special_flops**

SEE ALSO

remove_license

Removes a license of the feature.

SYNTAX

status **remove_licenses**
feature_name
[-keep *num_licenses*]

Data Types

feature_name	string
num_licenses	integer

ARGUMENTS

feature_name

Specifies the feature name to remove.

-keep *num_licenses*

Specifies the number of license features to be retained. If this option is not specified, all licenses of this feature are checked in.

DESCRIPTION

This command removes the specified license feature.

The **-keep** option keeps the specific number of licenses checked out and remaining are removed.

The **list_licenses** command provides a list of the features that are currently checked out.

The command **remove_licenses** will not be allowed while there are background jobs from redirect -bg running.

EXAMPLES

The following example removes all the licenses of the specified feature:

```
prompt> remove_licenses Fusion-Compiler-FE
```

The following example removes some, but not all:

```
prompt> list_licenses

Licenses in use:
        Fusion-Compiler-BE (4)
1
prompt> remove_licenses -keep 2 Fusion-Compiler-BE
1
prompt> list_licenses

Licenses in use:
        Fusion-Compiler-BE (2)
1
```

SEE ALSO

check_license(2)
list_licenses(2)
get_licenses(2)

remove_licenses

Removes a license of the feature.

SYNTAX

status **remove_licenses**
feature_name
[-keep *num_licenses*]

Data Types

feature_name	string
num_licenses	integer

ARGUMENTS

feature_name

Specifies the feature name to remove.

-keep *num_licenses*

Specifies the number of license features to be retained. If this option is not specified, all licenses of this feature are checked in.

DESCRIPTION

This command removes the specified license feature.

The **-keep** option keeps the specific number of licenses checked out and remaining are removed.

The **list_licenses** command provides a list of the features that are currently checked out.

The command **remove_licenses** will not be allowed while there are background jobs from redirect -bg running.

EXAMPLES

The following example removes all the licenses of the specified feature:

```
prompt> remove_licenses Fusion-Compiler-FE
```

The following example removes some, but not all:

```
prompt> list_licenses

Licenses in use:
        Fusion-Compiler-BE (4)
1
prompt> remove_licenses -keep 2 Fusion-Compiler-BE
1
prompt> list_licenses

Licenses in use:
        Fusion-Compiler-BE (2)
1
```

SEE ALSO

remove_macro_constraints

Removes macro placement constraints.

SYNTAX

status **remove_macro_constraints**
[-allowed_orientations]
[-preferred_location]
[-alignment_grid]
[-alignment_point]
[-align_pins_to_tracks]
[-alignment_orientation_set all | R0 | R90]
[*hard_macro_list*]

Data Types

hard_macro_list list

ARGUMENTS

-allowed_orientations

Removes the allowed orientation constraints.

-preferred_location

Removes the preferred macro location constraints.

-alignment_grid

Removes the alignment grid and alignment point constraints.

-alignment_point

Removes the alignment point constraints.

-align_pins_to_tracks

Removes the align pins to tracks setting.

-alignment_orientation_set all| R0 | R90

Removes the alignment constraints for the specified orientation. By default, the all argument is used.

hard_macro_list

Specifies the list of hard macros on which to remove constraints. If not specified, all hard macros are processed when removing

constraints.

DESCRIPTION

This command removes various macro constraints set by the **set_macro_constraints** command.

EXAMPLES

The following command removes the allowed orientation and preferred location constraints from all hard macros.

```
prompt> remove_macro_constraints -allowed_orientations -preferred_location
1
```

SEE ALSO

create_placement(2)
report_macro_constraints(2)
set_macro_constraints(2)

remove_macro_groups

Remove macro groups.

SYNTAX

status **remove_macro_groups**
object object_list

Data Types

object collection of objects

ARGUMENTS

object collection_of_macro_group

Specifies macro groups to be removed

DESCRIPTION

This command remove specified macro groups.

EXAMPLES

The following command remove macro groups G1 and G2

prompt> **remove_macro_groupss** {G1 G2}

SEE ALSO

create_macro_group(2)

remove_macro_relative_location

Removes the previously set constraint which place a hard macro or a macro array relative to an anchor object.

SYNTAX

status **remove_macro_relative_location**
[*target_list*]
[-hierarchical]

Data Types

target_list list

ARGUMENTS

target_list

Specifies the list of hard macros or macro array edit groups on which to remove relative location constraints.

-hierarchical

Remove macro relative location constraints in current block and child block. Default only remove constraints in current block.

DESCRIPTION

This command removes specified hard macro or macro array constraints set by the **set_macro_relative_location** command.

EXAMPLES

The following command removes the relative location constraint set on hard macro cmem0/dtags0_0/x0_t0.

prompt> **remove_macro_relative_location [get_cells {cmem0/dtags0_0/x0_t0}]**
1

remove_macros_from_group

Remove macros from their belonging macro groups.

SYNTAX

Status **remove_macros_from_group**
objects object_list

ARGUMENTS

objects object_list

Specifies collection of macros.

DESCRIPTION

This command remove macros from the macro group they belong to. If a macro belongs to a macro array, the whole array will be removed from the macro group.

EXAMPLES

The following command remove macros M1, M2 from their macro groups.

prompt> **remove_macros_from_groups** {M1 M2}

SEE ALSO

create_macro_groups(2)
add_macro_to_group(2)

remove_matching_types

Removes the matching type.

SYNTAX

int **remove_matching_types**
[-verbose]
[-all]
[*matching_type_list*]

Data Types

matching_type_list list

ARGUMENTS

-verbose

Displays verbose deletion information.

-all

Removes all matching types from the current design.

matching_type_list

Specifies a list of matching types to remove. The list may contain matching type names, patterns, or collections. A collection may be specified by using the **get_matching_types** command.

DESCRIPTION

This command removes matching types from the current design. The number of removed matching types are returned.

EXAMPLES

The following example removes matching types named "myMatchingType1" and "myMatchingType2".

```
prompt> remove_matching_types { myMatchingType1 myMatchingType2 }
2
```

The following example removes matching types that match the pattern "myMatchingType*".

```
prompt> remove_matching_types myMatchingType*
3
```

The following example removes all matching types in the design.

```
prompt> remove_matching_types -all
5
```

remove_max_capacitance

Removes maximum capacitance limits from ports, lib_pins, cell instance pins, clocks or designs.

SYNTAX

string **remove_max_capacitance**
[-modes *mode_list*]
[-corners *corner_list*]
[-scenarios *scenario_list*]
object_list

Data Types

mode_list list
corner_list list
scenario_list list
object_list list

ARGUMENTS

-modes *mode_list*

Specifies the scenarios that the capacitance limit will be removed from. If this option is given, all scenarios of the given modes will be used. The **-scenarios** option cannot be given with this option. If both **-modes** and **-corners** are given, all scenarios whose mode is specified by **-modes** and whose corner is specified by **-corners** will be used.

-corners *corner_list*

Specifies the scenarios that the capacitance limit will be removed from. If this option is given, all scenarios of the given corners and the current mode will be used. The **-scenarios** option cannot be given with this option. If both **-modes** and **-corners** are given, all scenarios whose mode is specified by **-modes** and whose corner is specified by **-corners** will be used.

-scenarios *scenario_list*

Specifies the scenarios that the capacitance limit will be removed from. The **-modes** or **-corners** option cannot be given with this option.

object_list

Provides a list of ports, lib_pins, cell instance pins, clocks or designs from which to remove maximum capacitance limits.

DESCRIPTION

Removes maximum capacitance limits from pins, ports, lib_pins, clocks or designs. A maximum capacitance limit is specified with the **set_max_capacitance** command. The command removes all limits set with or without **-corners** option of the **set_max_capacitance** command.

For lib_pin objects, it removes design specific overrides and the max capacitance values from the library will be used after this command.

The **report_ports -design_rule** command shows port maximum capacitance limits. The **report_design** command shows the default maximum capacitance setting for the scenarios of the current design.

Maximum capacitance limits are managed on a per-scenario basis. For designs with multiple scenarios, you can specify scenarios by using **-modes**, **-corners**, and **-scenarios** options.

By default, if none of these options are specified, the command is applied to the current scenario. (It will be an error if there is no current scenario). If the **-scenarios** option is given, the command will be applied to all of the specified scenarios. If the **-modes** option is given, the command will be applied to all scenarios of the specified modes. (It will be an error if none of the specified modes have any scenarios.) If the **-corners** option is given, the command will be applied to all scenarios of the specified corners and the current mode. (It will be an error if none of the specified corners have any scenarios with the current mode.) If both the **-modes** and **-corners** options are given, the command will be applied to all scenarios of the specified corners and the specified modes. (It will be an error there are no such scenarios.) It is an error to give **-scenarios** with **-modes** or **-corners**.

Multicorner-Multimode Support

By default, this command works on the current scenario. To specify a different scenario, use the **-scenarios** option or the **-corners** and **-modes** options.

EXAMPLES

The following example removes the maximum capacitance limit on ports "OUT*".

```
prompt> remove_max_capacitance [get_ports "OUT*"]
```

The following example removes the maximum capacitance limit on the current scenario.

```
prompt> remove_max_capacitance [current_design]
```

remove_max_fanout

NOTE

remove_max_fanout

Command not supported

remove_max_lvth_percentages

This command removes the constraint for maximum allowable percentage of low-Vth cells.

SYNTAX

status **remove_max_lvth_percentages**

DESCRIPTION

This command removes the maximum allowable percentage of low-Vth cells, a value which is a soft constraint set using set_max_lvth_percentage cmd. Optimization tries to meet timing and other constraints while using no more than the specified percentage of low-Vth cells, to control leakage power. But this is a soft constraint and Opto does not sacrifice TNS convergence to adhere to this percentage. After removal of this constraint, there is no soft target for lvt cells. Note that the percentage is computed based on cell count.

Multicorner-Multimode Support

This command has no dependency on scenario-specific, mode-specific, or corner-specific information.

EXAMPLES

The following example removes the specified limit on low-Vth cells

prompt> **remove_max_lvth_percentages**

SEE ALSO

set_max_lvth_percentage(2)
set_threshold_voltage_group_type(2)

remove_max_time_borrow

Removes time borrow limit for latches.

SYNTAX

string **remove_max_time_borrow**
object_list
[-modes *mode_list*]
[-corners *corner_list*]
[-scenarios *scenario_list*]

Data Types

object_list list
mode_list list
corner_list list
scenario_list list

ARGUMENTS

object_list

Lists clocks, cells, data pins, or clock (enable) pins. If you specify a cell, all enable pins on that cell are affected.

-modes ***mode_list***

Specifies the scenarios that the time borrow limit will be removed from. If this option is given, all scenarios of the given modes will be used. The **-scenarios** option cannot be given with this option. If both **-modes** and **-corners** are given, all scenarios whose mode is specified by **-modes** and whose corner is specified by **-corners** will be used.

-corners ***corner_list***

Specifies the scenarios that the time borrow limit will be removed from. If this option is given, all scenarios of the given corners and the current mode will be used. The **-scenarios** option cannot be given with this option. If both **-modes** and **-corners** are given, all scenarios whose mode is specified by **-modes** and whose corner is specified by **-corners** will be used.

-scenarios ***scenario_list***

Specifies the scenarios that the time borrow limit will be removed from. The **-modes** or **-corners** option cannot be given with this option.

DESCRIPTION

Removes maximum time borrow limit on objects. Time borrowing limits are specified with the **set_max_time_borrow** command. When the limit is removed, full time borrowing is allowed on level-sensitive latches.

Max_time_borrow values are managed on a per-scenario basis. For designs with multiple scenarios, you can specify scenarios by using **-modes**, **-corners**, and **-scenarios** options.

By default, if none of these options are specified, the command is applied to the current scenario. (It will be an error if there is no current scenario). If the **-scenarios** option is given, the command will be applied to all of the specified scenarios. If the **-modes** option is given, the command will be applied to all scenarios of the specified modes. (It will be an error if none of the specified modes have any scenarios.) If the **-corners** option is given, the command will be applied to all scenarios of the specified corners and the current mode. (It will be an error if none of the specified corners have any scenarios with the current mode.) If both the **-modes** and **-corners** options are given, the command will be applied to all scenarios of the specified corners and the specified modes. (It will be an error there are no such scenarios.) It is an error to give **-scenarios** with **-modes** or **-corners**.

Multicorner-Multimode Support

By default, this command works on the current scenario. To specify a different scenario, use the **-scenarios** option or the **-corners** and **-modes** options.

EXAMPLES

The following example removes the maximum time borrow limit on clock PHI1.

```
prompt> remove_max_time_borrow [get_clocks PHI1]
```

The following example removes the maximum time borrow limit on all the pins of cells matching U1/latch*.

```
prompt> remove_max_time_borrow [get_cells U1/latch*]
```

SEE ALSO

set_max_time_borrow(2)

remove_max_transition

Removes maximum transition limits from ports, library cell pins, cell instance pins, clocks or designs.

SYNTAX

string **remove_max_transition**
[-modes *mode_list*]
[-corners *corner_list*]
[-scenarios *scenario_list*]
object_list

Data Types

mode_list list
corner_list list
scenario_list list
object_list list

ARGUMENTS

-modes *mode_list*

Specifies the scenarios from which to remove the maximum transition limit. If this option is given, all scenarios of the specified modes will be used. The **-scenarios** option must not be specified with this option. If both **-modes** and **-corners** are specified, all scenarios whose mode is specified by **-modes** and whose corner is specified by **-corners** will be used.

-corners *corner_list*

Specifies the scenarios from which to remove the max transition limit. If this option is given, all scenarios of the specified corners and the current mode will be used. The **-scenarios** option must not be specified with this option. If both **-modes** and **-corners** are specified, all scenarios whose mode is specified by **-modes** and whose corner is specified by **-corners** will be used.

-scenarios *scenario_list*

Specifies the scenarios from which to remove the max transition limit. The **-modes** or **-corners** option must not be specified with this option.

object_list

Specifies the cell instance pins, ports, library cell pins, clocks or designs from which to remove maximum transition limits.

DESCRIPTION

This command removes maximum transition limits from pins, ports, library cell pins, clocks or designs. A maximum transition limit is specified with the **set_max_transition** command. The command removes all limits set with or without **-corners** option of **set_max_transition**.

For library cell pin objects, this command removes design-specific overrides. The max transition values from the library will be used after this command.

The **report_ports -design_rule** command shows maximum transition limits for the port. The **report_design** command shows the default maximum transition setting for the scenarios of the current design.

Maximum transition limits are managed on a per-scenario basis. For designs with multiple scenarios, you can specify scenarios by using **-modes**, **-corners**, and **-scenarios** options.

By default, if none of these options are specified, the command applies to the current scenario. The tool issues an error if there is no current scenario. If the **-scenarios** option is specified, the command applies to all of the specified scenarios.

If the **-modes** option is specified, the command applies to all scenarios of the specified modes. The tool issues an error if none of the specified modes have any scenarios.

If the **-corners** option is specified, the command applies to all scenarios of the specified corners and the current mode. The tool issues an error if none of the specified corners have any scenarios with the current mode. If both the **-modes** and **-corners** options are specified, the command applies to all scenarios of the specified corners and the specified modes. The tool issues an error if there are no such scenarios. It is an error to specify **-scenarios** with **-modes** or **-corners**.

Multicorner-Multimode Support

By default, this command works on the current scenario. To specify a different scenario, use the **-scenarios** option or the **-corners** and **-modes** options.

EXAMPLES

The following example removes the maximum transition limit on ports "OUT*".

```
prompt> remove_max_transition [get_ports "OUT*"]
```

The following example removes the maximum transition limit on the current scenario.

```
prompt> remove_max_transition [current_design]
```

remove_min_capacitance

Removes minimum capacitance limits from ports, lib_pins or designs.

SYNTAX

string **remove_min_capacitance**
[-modes *mode_list*]
[-corners *corner_list*]
[-scenarios *scenario_list*]
object_list

Data Types

mode_list list
corner_list list
scenario_list list
object_list list

ARGUMENTS

-modes *mode_list*

Specifies the scenarios that the min capacitance limit will be removed from. If this option is given, all scenarios of the given modes will be used. The **-scenarios** option cannot be given with this option. If both **-modes** and **-corners** are given, all scenarios whose mode is specified by **-modes** and whose corner is specified by **-corners** will be used.

-corners *corner_list*

Specifies the scenarios that the min capacitance limit will be removed from. If this option is given, all scenarios of the given corners and the current mode will be used. The **-scenarios** option cannot be given with this option. If both **-modes** and **-corners** are given, all scenarios whose mode is specified by **-modes** and whose corner is specified by **-corners** will be used.

-scenarios *scenario_list*

Specifies the scenarios that the min capacitance limit will be removed from. The **-modes** or **-corners** option cannot be given with this option.

object_list

Lists the ports, lib_pins or designs from which to remove minimum capacitance limits.

DESCRIPTION

Removes minimum capacitance limits from ports or designs. A minimum capacitance limit is specified with the **set_min_capacitance** command. The command removes all limits set with or without **-corners** option of set_min_capacitance command.

For lib_pin objects, it removes design specific overrides and the min capacitance values from the library will be used after this command.

The **report_ports -design_rule** command shows port minimum capacitance limits. The **report_design** command shows the default minimum capacitance setting for the scenarios of the current design.

Minimum capacitance limits are managed on a per-scenario basis. For designs with multiple scenarios, you can specify scenarios by using **-modes**, **-corners**, and **-scenarios** options.

By default, if none of these options are specified, the command is applied to the current scenario. (It will be an error if there is no current scenario). If the **-scenarios** option is given, the command will be applied to all of the specified scenarios. If the **-modes** option is given, the command will be applied to all scenarios of the specified modes. (It will be an error if none of the specified modes have any scenarios.) If the **-corners** option is given, the command will be applied to all scenarios of the specified corners and the current mode. (It will be an error if none of the specified corners have any scenarios with the current mode.) If both the **-modes** and **-corners** options are given, the command will be applied to all scenarios of the specified corners and the specified modes. (It will be an error there are no such scenarios.) It is an error to give **-scenarios** with **-modes** or **-corners**.

Multicorner-Multimode Support

By default, this command works on the current scenario. To specify a different scenario, use the **-scenarios** option or the **-corners** and **-modes** options.

EXAMPLES

The following example removes the minimum capacitance limit on ports "OUT*".

```
prompt> remove_min_capacitance [get_ports "OUT*"]
```

The following example removes the minimum capacitance limit on the current scenario.

```
prompt> remove_min_capacitance [current_design]
```

set_min_capacitance(2)

remove_min_pulse_width

Removes a previously specified minimum pulse width constraint from specified clocks or clock pins.

SYNTAX

status **remove_min_pulse_width**
[-modes *mode_list*]
[-corners *corner_list*]
[-scenarios *scenario_list*]
[-low]
[-high]
[*object_list*]

Data Types

mode_list list
corner_list list
scenario_list list
object_list list

ARGUMENTS

-modes *mode_list*

Specifies the scenarios on which to set the input delay value. If this option is given, all scenarios of the given modes are used. The **-scenarios** option must not be specified with this option. If both **-modes** and **-corners** are specified, all scenarios whose mode is specified by **-modes** and whose corner is specified by **-corners** are used.

-corners *corner_list*

Specifies the scenarios on which to set the input delay value. If this option is given, all scenarios of the given corners and the current mode is used. The **-scenarios** option must not be specified with this option. If both **-modes** and **-corners** are specified, all scenarios whose mode is specified by **-modes** and whose corner is specified by **-corners** are used.

-scenarios *scenario_list*

Specifies the scenarios on which to set the input delay value. The **-modes** or **-corners** option must not be given with this option.

-low

Removes the minimum pulse width constraint only for low clock pulses (high-low-high).

-high

Removes the minimum pulse width constraint only for high clock pulses (low-high-low).

If you do not specify the *-low* or *-high* option, the command removes the minimum pulse width constraint for all types of clock pulses.

object_list

Specifies a list of clocks or clock pins in the current design from which to remove the minimum pulse width constraint. If you specify a clock, all clock pins connected to the clock have their minimum pulse width constraints removed.

DESCRIPTION

The **remove_min_pulse_width** command removes pulse width checks previously specified by the **set_min_pulse_width** command for clock signals at clock pins of sequential devices. This command removes the constraints for current scenario.

To generate a report of pulse width constraints, use the **report_min_pulse_width** command.

Multicorner-Multimode Support

By default, this command works on the current scenario. To specify a different scenario, use the **-scenarios** option or the **-corners** and **-modes** options.

EXAMPLES

The following example removes a minimum pulse width requirement previously set for clock CK1.

```
prompt> remove_min_pulse_width [get_clocks CK1]
```

The following example removes a minimum pulse width requirement previously set for pin reg1/CK.

```
prompt> remove_min_pulse_width reg1/CK
```

SEE ALSO

report_min_pulse_width(2)
set_min_pulse_width(2)

remove_missing_via_check_options

Removes missing via check options for the RedHawk Analysis Fusion check missing via analysis flow that were previously defined with the **set_missing_via_check_options** command.

SYNTAX

status **remove_missing_via_check_options**
[-redhawk_script_file]
[-exclude_stack_via]
[-check_valid_vias]
[-exclude_cell]
[-exclude_inst]
[-exclude_regions]
[-sort_by_hot_inst]
[-threshold]
[-min_width]
[-pitch]
[-ignore_inter_met]
[-toplayer]
[-bottomlayer]
[-gds]
[-all]

ARGUMENTS

-redhawk_script_file *redhawk_script_file*

Removes the setting to use an existing script file for missing via check.

-exclude_stack_via

Removes the setting to exclude stack vias from missing via check.

-check_valid_vias

Removes the setting to report if metal overlap can accommodate a valid via model.

-exclude_cell *exclude_cell_masters*

Removes the setting to exclude the area covered by all instances of the specified list of cells.

-exclude_inst *exclude_cell_instances*

Removes the setting to exclude the area covered by the specified cell instances.

-exclude_regions {{{x1 y1} {x2 y2}}}

Removes the setting to exclude from multiple rectangular regions.

-sort_by_hot_inst

Removes the setting to sort missing vias by voltage drop.

-threshold -1 | **<voltage_V>**

Removes voltage threshold that triggers a missing via.

-min_width ***min_width_value***

Removes the setting to ignore segments with less than specified width.

-pitch ***pitch_value***

Removes the specified pitch for missing vias on parallel wires crossing or touching GDS blocks.

-ignore_inter_met

Removes the setting to ignore wires on all layers between top layer and bottom layer.

-toplayer ***toplayer_name***

Removes the setting on the top layer.

-bottomlayer ***bottomlayer_name***

Removes the setting on the bottom layer.

-gds

Removes the setting to report missing vias both inside the GDS block region and in routes cross over GDS blocks.

-all

Removes all missing via setting.

EXAMPLES

The following example configures the current check missing via settings not to report if metal overlap can accommodate a valid via model.

prompt> **remove_missing_via_check_options -check_valid_vias**

SEE ALSO

set_missing_via_check_options(2)
report_missing_via_check_options(2)
set_app_options(2)

remove_modes

Removes modes in multi mode analysis.

SYNTAX

remove_modes -all | *mode_list*

ARGUMENTS

-all

Specifies to remove all modes in the current design.

mode_list

A list of unique strings used to identify each mode.

DESCRIPTION

This command removes the specified modes from memory. To list the modes in the design, use the **all_modes** command.

The command returns the number of modes that were removed.

EXAMPLES

In the following example, two modes named mode1 and mode2 are removed.

```
prompt> remove_modes {mode1 mode2}
1
```

SEE ALSO

create_mode(2)
all_modes(2)

remove_modules

Removes one or more unused modules from a design.

SYNTAX

collection_handle **remove_modules**
  [-design *design*]
  modules

modules list

ARGUMENTS

-design *design*

Specifies the design to remove the modules from. If no design is specified, the modules are removed from the current_design.

modules

Specifies the names of the modules to be removed from the design. Each module name must be unique.

DESCRIPTION

This command removes modules from a design. A module is a definition of logical hierarchy within a physical design block. The module must not be in use, there must be no cells that are instances of the module. The top module of a design cannot be removed with **remove_modules**, use the **remove_block** command instead.

EXAMPLES

The following example removes a module named *FOO*.

prompt> **remove_modules FOO**

The following example removes modules named *HOP*, *SKIP*, and *JUMP*.

prompt> **remove_modules {HOP SKIP JUMP}**

SEE ALSO

current_design(2)

remove_multisource_clock_sink_groups

Removes sink groups defined for multisource clock tap assignment

SYNTAX

status **remove_multisource_clock_sink_groups**
[*sink_groups*]

Data Types

sink_groups collection

ARGUMENTS

sink_groups

Specifies a list of sink groups to be removed. Sink groups are defined using the **create_multisource_clock_sink_group** command. This argument is optional. By default, the command will remove all defined sink groups.

DESCRIPTION

The **remove_multisource_clock_sink_group** command is used to remove sink groups defined for multisource clock tap assignment.

The argument **sink_groups** can be used to remove only the given list of sink groups.

Multicorner-Multimode Support

This command has no dependency on scenario-specific, mode-specific, or corner-specific information.

EXAMPLES

This example removes all defined sink groups.

```
remove_multisource_clock_sink_groups
```

This example removes only sink group sink_group1.

```
remove_multisource_clock_sink_groups sink_group1
```

This example removes a collection of sink groups.

```
remove_multisource_clock_sink_groups [get_multisource_clock_Sink_groups sink_group*]
```

SEE ALSO

synthesize_multisource_clock_taps(2)
set_multisource_clock_tap_options(2)

remove_multisource_clock_subtree_constraints

Removes constraints for structural synthesis of multisource clock tree synthesis (CTS) subtrees.

SYNTAX

status **remove_multisource_clock_subtree_constraints**
[-names *name_list*]
[-clocks *clock_list*]
[-cells *cell_list*]
[-pins *pins_or_ports*]
[-target_level *levels*]
[-ignore_for_icg_reordering]

Data Types

name_list list of names
clock_list collection of clocks
cell_list collection of cells
pins_or_ports list or collection
levels integer

ARGUMENTS

-names *name_list*

Specifies the subtree sets for which to remove constraints on pins or cells. If neither this option nor the **-clocks** option are specified, constraints are removed for all subtree option sets. If only this option is specified, all structural subtree synthesis constraints are removed for the specified named subtree sets.

-clocks *clock_list*

Specifies the subtree sets for which to remove constraints on pins or cells. If neither this option nor the **-names** option are specified, constraints are removed for all subtree sets. If only this option is specified, all subtree synthesis constraints are removed for the specified clocks.

-cells *cell_list*

Specifies a collection of cells on which to remove constraints. An example constraint is "ignore for ICG reordering".

-pins *pins_or_ports*

Specifies a collection of pins on which to remove constraints. An example constraint is "target level".

-target_level *levels*

Specifies the exact number of target levels for any pin. Any existing pin constraint matching the number of target levels will be

removed. The minimum level value is 0 while the maximum is restricted to 100.

-ignore_for_icg_reordering

Specifies that the "ignore for ICG reordering" constraint is removed for cells specified by the **-cells** option. If the **-cells** option is not specified, the constraint is removed for all cells.

DESCRIPTION

The **remove_multisource_clock_subtree_constraints** command removes constraints on cells or pins; these constraints are read and honored by the structural multisource CTS synthesis using the **synthesize_multisource_clock_subtrees** command.

For constraint removal on pins, the **-target_level** option helps you to better control subtree logic level balancing.

For constraint removal on cells, the **-ignore_for_icg_reordering** option helps you to better control subtree synthesis transform ICG reordering.

Use the **set_multisource_clock_subtree_constraints** command to set clock subtree constraints; use the **report_multisource_clock_subtree_constraints** command to report clock subtree constraints; use the **synthesize_multisource_clock_subtrees** command to synthesize the subtrees based on the specified constraints.

Multicorner-Multimode Support

This command has no dependency on scenario-specific, mode-specific, or corner-specific information.

EXAMPLES

This example removes all constraints on all clocks.

```
prompt> remove_multisource_clock_subtree_constraints
```

This example removes all constraints on the clock named "clk".

```
prompt> remove_multisource_clock_subtree_constraints \
  -clocks [get_clock clk]
```

This example removes constraints from pins reg1/ck and reg2/ck.

```
prompt> remove_multisource_clock_subtree_constraints \
  -clocks [get_clock clk] -pins [get_pins {reg1/ck reg2/ck}]
```

This example removes constraints from pins reg1/ck and reg2/ck with a target level of 5.

```
prompt> remove_multisource_clock_subtree_constraints \
  -clocks [get_clock clk] -pins [get_pins {reg1/ck reg2/ck}] \
  -target_level 5
```

This example removes constraints from all pins with the specific target level.

```
prompt> remove_multisource_clock_subtree_constraints \
  -clocks [get_clock clk] -target_level 4
```

This example removes constraints from specific cells:

```
prompt> remove_multisource_clock_subtree_constraints \
  -clocks [get_clock clk] -cells [get_cells {icg1 icg2}]
```

This example removes ignore_for_icg_reordering constraints from all cells.

```
prompt> remove_multisource_clock_subtree_constraints \
  -clocks [get_clock clk] -ignore_for_icg_reordering
```

remove_multisource_clock_subtree_options

Removes structural multisource subtree synthesis constraints that were previously applied with **set_multisource_clock_subtree_options**

SYNTAX

status **remove_multisource_clock_subtree_options**
[-names *string_list*]
[-clocks *clock_list*]
[-driver_objects]
[-max_total_wire_delay]
[-corners *corner_list*]
[-dont_merge_cells *cell_list*]
[-target_level]

Data Types

string_list list
clock_list collection
corner_list collection
cell_list collection

ARGUMENTS

-names *string_list*

Specifies the subtree sets for which to remove constraints. If neither this option nor the **-clocks** option are specified, then constraints are removed for all subtree option sets. If only this option is specified, then all structural subtree synthesis constraints are removed for the specified named subtree sets.

This option can also be specified together with one or more of the **-driver_objects**, **-max_total_wire_delay**, or **-corners** options. Including these options clear only those constraints for the specified subtree sets.

-clocks *clock_list*

Specifies the subtree sets for which to remove constraints. If neither this option nor the **-names** option are specified, then constraints are removed for all subtree sets. If only this option is specified, then all subtree synthesis constraints are removed for the specified clocks.

This option can also be specified together with one or more of the **-driver_objects**, **-max_total_wire_delay**, or **-corners** options. Including these options clear only those constraints for the specified sets.

-driver_objects

Removes the driver object constraint settings. If you use **-driver_objects** without the **-names** or **-clocks** option, the driver objects

constraints for all subtree sets are removed. If you use the **-driver_objects** option with the **-names** or **-clocks** option, then the driver object constraints is cleared only for the specified subtree sets.

This option can be specified together with any of the **-max_total_wire_delay**, or **-corners** options to clear multiple constraint types in one command invocation.

-max_total_wire_delay

Removes the max total wire delay settings. If you use **-max_total_wire_delay** without the **-names** or **-clocks** option, the maximum total wire delay settings for all subtree sets is removed. If you use **-max_total_wire_delay** with the **-names** or **-clocks** option, then the maximum total wire delay settings is cleared only for the specified subtree sets.

If you use **-max_total_wire_delay** without the **-corners** option, then all maximum total wire delay settings are cleared for the subtree sets. If you use **-max_total_wire_delay** with the **-corners** option, then only the maximum total wire delay settings for the specified corners is cleared.

If the maximum total wire delay constraint is cleared for all corners for a particular option set, by default, the maximum total wire delay is unconstrained for that set of subtrees.

This option can be specified together with **-driver_objects** to clear multiple constraint types in one command invocation.

-corners ***corner_list***

Removes the maximum total wire delay settings for specified corners. you must use **-corners** together with the **-max_total_wire_delay** option, otherwise an error occurs.

If you use **-corners** without the **-names** or **-clocks** option, the maximum total wire delay constraints for the specified corners is cleared for all subtree sets. If you use **-corners** with the **-names** or **-clocks** option, the maximum total wire delay constraints for the specified corners is cleared only for the specified subtree sets.

-dont_merge_cells ***cell_list***

This option accepts a collection of cells which should get removed from the list of not to be merged cells of the option set.

-target_level

Removes the target level setting. If level balancing is still enabled for an option set, then level balancing falls back to automatically determining the number of levels.

DESCRIPTION

This command clears settings applied with the **set_multisource_clock_subtree_options** command. By default, this command operates on all subtree sets at one time. The scope of this command can be limited to just a subset of the subtrees by using the **-names** or **-clocks** option.

This command can clear two types of subtree set constraints:

(1) The driver objects for the subtrees (2) Maximum total wire delay constraints in one or more corners

If none of the **-driver_objects**, or **-max_total_wire_delay** options are specified, then the entire subtree sets are removed.

The **-corners** option can only be used together with the **-max_total_wire_delay** option to clear only the maximum total wire delay constraints for the specified corners. If the corners option is not used but **-max_total_wire_delay** is specified, then the maximum total wire delay constraints are cleared for all corners.

If all constraints for a subtree set are cleared, then the set itself is also removed. If only some of the constraints are cleared, then the constraint definition remain and the cleared settings revert to their defaults, which are described under each argument description

above.

EXAMPLES

This example clears all subtree synthesis sets.

```
prompt> remove_multisource_clock_subtree_options
```

This example clears all settings only for *subtree1*. The *subtree1* definition is removed, since all of its settings were cleared.

```
prompt> remove_multisource_clock_subtree_options -names subtree1
```

This example clears all settings of the subtree sets defined with respect to clock *clk*. The subtree set is removed, since all of its settings were cleared.

```
prompt> remove_multisource_clock_subtree_options -clocks [get_clock clk]
```

This example clears the max total wire delay settings for corners *c1* and *c2* for subtree set *subtree1* and *subtree2*.

```
prompt> remove_multisource_clock_subtree_options -names "subtree1 subtree2" \
  -max_total_wire_delay -corners [get_corners {c1 c2}]
```

This example clears the max total wire delay settings for corners *c1* and *c2* for subtree settings of clock *clk1* and *clk2*.

```
prompt> remove_multisource_clock_subtree_options -clocks [get_clocks {clk1 clk2}] \
  -max_total_wire_delay -corners [get_corners {c1 c2}]
```

SEE ALSO

report_multisource_clock_subtree_options(2)

remove_multisource_clock_tap_options

Removes multisource clock tree synthesis (CTS) tap assignment constraints that were previously applied with **set_multisource_clock_tap_options**

SYNTAX

status **remove_multisource_clock_tap_options**
[-names *string_list*]
[-clocks *clock_list*]
[-dont_merge_cells *cell_list*]
[-relax_split_restrictions_for_cells *cell_list*]

Data Types

string_list list
clock_list collection
cell_list collection

ARGUMENTS

-names *string_list*

Specifies the tap assignment option sets which should get removed. If neither this option nor the **-clocks** option are specified, then all tap assignment option sets are removed. If only this option is specified, then all option sets with the given names are removed.

-clocks *clock_list*

Specifies the tap assignment option sets for which to remove constraints. If neither this option nor the **-names** option are specified, then all tap assignment option sets are removed. If only this option is specified, then all option sets for the given clocks are removed.

-dont_merge_cells *cell_list*

This option accepts a collection of cells which should get removed from the list of not to be merged cells of the option set.

-relax_split_restrictions_for_cells *cell_list*

This option accepts a collection of cells which should get removed from the list of cells with user_dont_touch/user_size_only allowed for splitting during tap assignment with the option set.

DESCRIPTION

This command clears settings applied with the **set_multisource_clock_tap_options** command. By default, this command removes all option sets at one time. The scope of this command can be limited to just a subset of options by using the **-names** or **-clocks** option.

Multicorner-Multimode Support

This command has no dependency on scenario-specific, mode-specific, or corner-specific information.

EXAMPLES

This example clears all subtree synthesis option sets.

```
prompt> remove_multisource_clock_tap_options
```

This example clears all settings only for *subtree1*. The *subtree1* definition is removed.

```
prompt> remove_multisource_clock_tap_options -names subtree1
```

This example clears all settings of the clock *clk*.

```
prompt> remove_multisource_clock_tap_options -clocks [get_clock clk]
```

set_multisource_clock_tap_options(2)
synthesize_multisource_clock_taps(2)

remove_multisource_global_clock_trees

Removes clock cells and routes inserted by *synthesize_multisource_global_clock_trees*.

SYNTAX

status **remove_multisource_global_clock_trees**
[-nets *net_list*]
[-prefix *name*]

Data Types

net_list collection
name string

ARGUMENTS

-nets *net_list*

Only those cells are deleted which are in the forward cone of the pins driving the specified nets.

-prefix *name*

Only those cells are deleted which have a name starting exactly with the specified prefix. The passed name should not contain a wildcard.

DESCRIPTION

The *remove_multisource_global_clock_trees* command will delete cells and routes inserted by previous calls of command *synthesize_multisource_global_clock_trees*. With the two provided options the user can limit the set of cells being deleted. By using the option *-nets* only those cells are deleted which are in the forward cone of the pins driving the specified nets. With the option *-prefix* the set of removed cells can be limited to those which start exactly with the specified prefix. If needed both options can be specified.

Multicorner-Multimode Support

This command has no dependency on scenario-specific, mode-specific, or corner-specific information.

EXAMPLES

The following example removes all cells inserted with calls to *synthesize_multisource_global_clock_trees* having a name starting with foo.

prompt> **remove_multisource_global_clock_trees -prefix foo**

The following example removes all cells inserted with calls to *synthesize_multisource_global_clock_trees* which are in the forward cone of the driver of net clk1 and have name starting with bar.

prompt> **remove_multisource_global_clock_trees -nets [get_nets clk1] -prefix bar**

SEE ALSO

remove_clock_drivers(2)

remove_net

Removes nets from the specified design.

SYNTAX

int **remove_nets**
[-design *design*]
[-force]
[-remove_shapes]
net_list | -all

net_list list

ARGUMENTS

-design *design*

Specifies the design in which to remove the net(s). If no design is specified, the net(s) are removed from the current design.

-force

Ignore locked status of the objects. If this option is not provided and any of the affected objects has locked status, command will fail generating tcl error.

-remove_shapes

Removes the shapes, including vias, owned by the nets being removed. When this option is not specified, the shapes remain in the design without an owner and may be reassigned to another net.

net_list

Specifies a list of nets to be removed from the design. Each net name in *net_list* must exist in the design.

You must specify *net_list* or **-all**. The *net_list* and **-all** options are mutually exclusive.

-all

Removes all nets in the design. The *net_list* and **-all** options are mutually exclusive.

DESCRIPTION

This command removes nets from the current design (unless otherwise specified by -design). Net connections to pins or ports are disconnected.

To create nets, use the **create_net** command.

EXAMPLES

The following example removes all nets specified by the *N** collection in the current design.

```
prompt> get_nets "*"
{"NET0", "NET1", "NET2", "NET3", "MY_CHECK", "PARITY"}

prompt> remove_nets "N*"
Removing net 'NET0' in design 'my_design'.
Removing net 'NET1' in design 'my_design'.
Removing net 'NET2' in design 'my_design'.
Removing net 'NET3' in design 'my_design'.

prompt> get_nets "*"
{"MY_CHECK", "PARITY"}
```

The following example removes all the remaining nets in the current design shown in the example given above.

```
prompt> get_nets "*"
{VSS out S in CLK VDD clkf clki0 clki1 clk din}

prompt> remove_nets -all
11

prompt> get_nets "*"
Warning: No net objects matched '*' (SEL-004)
Error: Nothing matched for collection (SEL-005)
```

SEE ALSO

create_net(2)
current_design(2)

remove_net_buses

Removes net buses from the current design.

SYNTAX

collection **remove_net_buses**
[-design *design*]
[-force]
[-block *block*]
[-cell *cell*]
[-all]
net_bus_list

Data Types

block string or collection
cell string or collection
net_bus_list string or collection

ARGUMENTS

-design *design*

Specifies the design in which to remove the net buses. If no design is specified, the net buses are removed from the current design.

-block *block*

Specifies the block where the net bus is to be removed. If specified, **remove_net_buses** has the same effect as **edit_module** in which the module is changed and changes will be on all module occurrences.

-cell *cell*

Specifies the cell where the net bus is to be removed. The net bus is removed on the cell's reference module. **remove_net_buses** will first uniquify the reference if needed, then remove the net bus. When not specified, the net bus is removed on the current module.

-force

Ignores the locked status of nets of the bus net. If this option is not specified and any of the affected objects has locked status, the command issues a Tcl error and exits.

-all

Removes all net buses.

net_bus_list

Specifies a list of net buses to remove.

RETURN VALUE

This command returns the removed net bus count, an empty string if it fails, or a TCL_ERROR if there is a command syntax error.

DESCRIPTION

This command removes a list of net buses from the current design (unless otherwise specified by -design). Individual members of buses remain.

EXAMPLES

The following example removes net bus named *bus1*

```
prompt> remove_net_buses bus1
1
```

SEE ALSO

add_to_net_bus(2)
create_net_bus(2)

remove_net_estimation_rules

Removes a net estimation rule.

SYNTAX

int **remove_net_estimation_rules**
[-cell *cell*]
[rules]

Data Types

rules net_estimation_rules
cell collection

ARGUMENTS

rules

Specifies the name of a net estimation rule or rules to remove. The rule must have been previously define by the **set_net_estimation_rule** command.

-cell *cell*

Specifies the physical cell from which to remove the net estimation rule.

By default, the current block is searched for the specified net estimation rule(s)..

DESCRIPTION

Removes net estimation rules as previously defined by the **set_net_estimation_rule** command.

Only rules which are not in use can be removed. Also, the default rule cannot be removed. The default rule has the name default.

NET ESTIMATION RULES AND HIERARCHY

Net estimation rules can be created in any physical block at any level of the hierarchy and multiple blocks can have different rules with the same name. However, rules are often stored/retrieved by name, and doing this can cause confusion as to which rule is being used by a given command. Generally, the "current" (top) block's list of rules is searched by commands such as *estimate_timing*. This means that if you define rule R1 in "top" and rule R1 in block "B1", if you make block B1 the current block, commands will use B1's R1. When you go back to top, top's R1 is used. To avoid confusion, use globally unique rule names and define them at the top - they will be propagated to child blocks during distributed commands as necessary. Rules in child blocks that have the same name as rules in top may also be overwritten during distributed commands.

EXAMPLES

The following example creates a rule named new_rule and removes it.

```
prompt> set_net_estimation_rule -parameter register_spacing -value 10 new_rule
prompt> remove_net_estimation_rules new_rule
(info) Removed net estimation rule new_rule.
1
```

The following example removes net estimation rules rule1 and rule2.

```
prompt> remove_net_estimation_rules {rule1 rule2}
(info) Removed net estimation rule rule1
(info) Removed net estimation rule rule2
1
```

SEE ALSO

get_net_estimation_rules(2)

remove_net_weight_effort

Remove net weight effort for coarse placement.

SYNTAX

status **remove_net_weight_effort**
[-nets *collection of nets*]

ARGUMENTS

-nets *collection of nets*

Removes the net weight effort for all nets, or for the nets specified.

DESCRIPTION

The **remove_net_weight_effort** command removes the net weight effort on nets for coarse placement. If no nets are specified, the net weight effort is cleared for all nets.

EXAMPLES

The following example removes the net weight effort for the net n123.

prompt> **remove_net_weight_effort -nets [get_nets n123]**

SEE ALSO

set_net_weight_effort(2)
report_net_weight_effort(2)

remove_nets

Removes nets from the specified design.

SYNTAX

int **remove_nets**
[-design *design*]
[-force]
[-remove_shapes]
net_list | -all

net_list list

ARGUMENTS

-design *design*

Specifies the design in which to remove the net(s). If no design is specified, the net(s) are removed from the current design.

-force

Ignore locked status of the objects. If this option is not provided and any of the affected objects has locked status, command will fail generating tcl error.

-remove_shapes

Removes the shapes, including vias, owned by the nets being removed. When this option is not specified, the shapes remain in the design without an owner and may be reassigned to another net.

net_list

Specifies a list of nets to be removed from the design. Each net name in *net_list* must exist in the design.

You must specify *net_list* or **-all**. The *net_list* and **-all** options are mutually exclusive.

-all

Removes all nets in the design. The *net_list* and **-all** options are mutually exclusive.

DESCRIPTION

This command removes nets from the current design (unless otherwise specified by -design). Net connections to pins or ports are disconnected.

To create nets, use the **create_net** command.

EXAMPLES

The following example removes all nets specified by the *N** collection in the current design.

```
prompt> get_nets "*"
{"NET0", "NET1", "NET2", "NET3", "MY_CHECK", "PARITY"}

prompt> remove_nets "N*"
Removing net 'NET0' in design 'my_design'.
Removing net 'NET1' in design 'my_design'.
Removing net 'NET2' in design 'my_design'.
Removing net 'NET3' in design 'my_design'.

prompt> get_nets "*"
{"MY_CHECK", "PARITY"}
```

The following example removes all the remaining nets in the current design shown in the example given above.

```
prompt> get_nets "*"
{VSS out S in CLK VDD clkf clki0 clki1 clk din}

prompt> remove_nets -all
11

prompt> get_nets "*"
Warning: No net objects matched '*' (SEL-004)
Error: Nothing matched for collection (SEL-005)
```

SEE ALSO

create_net(2)
current_design(2)
get_nets(2)

remove_noise_margin

Removes noise margin for a library pin, port, or pin.

SYNTAX

status **remove_noise_margin**
[-above]
[-below]
[-low]
[-high]
[-modes *mode_list*]
[-corners *corner_list*]
[-scenarios *scenario_list*]
object_list

Data Types

mode_list list
corner_list list
scenario_list list
object_list list

ARGUMENTS

-above

Removes the noise margin for above ground or power rail noise analysis region.

-below

Removes the noise margin for below ground or power rail noise analysis region.

-low

Removes the noise margin for ground rail noise.

-high

Removes the noise margin for power rail noise.

-modes *mode_list*

Specifies the scenarios on which to remove the noise margin value. If this option is given, all scenarios of the given modes are used. The **-scenarios** option must not be specified with this option. If both **-modes** and **-corners** are specified, all scenarios whose mode is specified by **-modes** and whose corner is specified by **-corners** are used.

-corners ***corner_list***

Specifies the scenarios on which to remove the noise margin value. If this option is given, all scenarios of the given corners and the current mode is used. The **-scenarios** option must not be specified with this option. If both **-modes** and **-corners** are specified, all scenarios whose mode is specified by **-modes** and whose corner is specified by **-corners** are used.

-scenarios ***scenario_list***

Specifies the scenarios on which to remove the noise margin value. The **-modes** or **-corners** option must not be given with this option.

object_list

Specifies a list of library pins, ports, or pins.

DESCRIPTION

This command removes the noise margin information set by the set_noise_margin command.

For a library pin, this command is for current corner when without **-corners** option, and only supports **-corners** option to specify corners. For a design port or pin, this command is for current scenario when without **-scenarios**, **-corners** and **-modes** options, or using the three options to specify scenarios.

EXAMPLES

This example removes noise margin information for above the ground rail noise for pin A of library cell IV in the lsi_10k library:

prompt> **remove_noise_margin -above lsi_10k/IV/A**

SEE ALSO

set_noise_margin(2)

remove_objects

Removes a collection of database objects.

SYNTAX

int **remove_objects**
[-force]
object_list

Data Types

object_list collection

ARGUMENTS

-force

Ignore locked status of the objects. If this option is not provided and any of the affected objects has locked status, command will fail generating tcl error.

object_list

Specifies a list of objects to remove.

DESCRIPTION

This command removes a heterogenous collection of objects from the database, and returns the number of objects removed. For most object types, an error will occur if one or more of the objects could not be removed. The failure to remove a select few object types, such as voltage_areas and voltage_area_shapes when they are the respective defaults, will result in a warning.

EXAMPLES

The following removes a collection of cells and site rows:

```
prompt> set myobjs [get_cells U21*]
{U210 U211 U212 U213 U214 U215 U216 U217 U218 U219}
```

```
prompt> append_to_collection myobjs [get_site_rows ROW_5*]
{U210 U211 U212 U213 U214 U215 U216 U217 U218 U219 ROW_50 ROW_51 ROW_52 ROW_5}

prompt> remove_objects $myobjs
14
```

SEE ALSO

collections(2)

remove_ocvm

Removes advanced and parametric on-chip variation modeling (AOCVM / POCVM) information.

SYNTAX

int **remove_ocvm**
[-coefficient]
[-derate]
[-corners *list_of_corners*]
[*object_list*]

Data Types

list_of_corners list or collection
object_list list

Data Types

object_list list

ARGUMENTS

-coefficient

Removes only the AOCV coefficients. The *-coefficient* and *-derate* options are mutually exclusive.

-derate

Removes only the AOCV/POCV derating factors. The *-coefficient* and *-derate* options are mutually exclusive.

-corners

Specifies the list of corners for which the AOCV/POCV derating factors are removed. If this option is not provided, the corner associated with the current scenario is used.

object_list

If *-coefficient* has been specified, indicates that the AOCV coefficients set on the library cells and cells in the *object_list* are removed. If *-derate* has been specified, indicates that the AOCV/POCV derating factors set on the design, hierarchical cells, and library cells in the *object_list* are removed.

DESCRIPTION

Removes user-specified AOCV coefficients and AOCV/POCV derating factors that were previously set using the **set_aocvm_coefficient** and **read_ocvm** commands respectively. If the command has been specified with no options, all AOCV/POCV data is removed.

To display AOCV/POCV deratings and coefficients, use the **report_ocvm** command.

Multicorner-Multimode Support

By default, this command works on the current corner. To specify a different corner, use the **-corners** option.

EXAMPLES

The following example removes the AOCV coefficients from the library cell named lib/bufA:

```
prompt> remove_ocvm -coefficient lib/bufA
```

The following example removes all AOCV/POCV derating factors that were set using the **read_ocvm** command for the current corner.

```
prompt> remove_ocvm -derate
```

The following example removes all AOCV/POCV derating factors set on the current design for the current corner.

```
prompt> remove_ocvm -derate [current_design]
```

SEE ALSO

read_ocvm(2)
report_ocvm(2)

remove_output_delay

Removes output delay from output ports or pins.

SYNTAX

string **remove_output_delay**
[-clock *clock_name*]
[-clock_fall]
[-level_sensitive]
[-rise]
[-fall]
[-max]
[-min]
[-modes *mode_list*]
[-corners *corner_list*]
[-scenarios *scenario_list*]
port_pin_list

Data Types

clock_name string
mode_list list
corner_list list
scenario_list list
port_pin_list list

ARGUMENTS

-clock *clock_name*

Specifies the relative clock. Specify {""} as the *clock_name* to remove delays not relative to any clock.

-clock_fall

Removes the delay relative to falling edge of clock. If you specify *clock_name* without **-clock_fall**, the delay relative to rising edge of the clock is removed.

-level_sensitive

Removes level-sensitive output delay.

-rise

Removes rising output delay.

-fall

Removes falling output delay.

-max

Removes maximum output delay.

-min

Removes minimum output delay.

-modes ***mode_list***

Specifies the scenarios that output delays will be removed from. If this option is given, all scenarios of the given modes will be used. The **-scenarios** option cannot be given with this option. If both **-modes** and **-corners** are given, all scenarios whose mode is specified by **-modes** and whose corner is specified by **-corners** will be used.

-corners ***corner_list***

Specifies the scenarios that output delays will be removed from. If this option is given, all scenarios of the given corners and the current mode will be used. The **-scenarios** option cannot be given with this option. If both **-modes** and **-corners** are given, all scenarios whose mode is specified by **-modes** and whose corner is specified by **-corners** will be used.

-scenarios ***scenario_list***

Specifies the scenarios that output delays will be removed from. The **-modes** or **-corners** option cannot be given with this option.

port_pin_list

Specifies a list of ports and pins. Each element in the list is either a collection of ports or pins, or a pattern which matches ports or pins on the current design.

DESCRIPTION

Removes output delay values for objects in the current design. Set output delay with **set_output_delay**. By default, all output delays on each object in *port_pin_list* are removed. To restrict the removed output delay values, use **-clock**, **-clock_fall**, **-min**, **-max**, **-rise**, or **-fall**. To show output delays associated with ports, use **report_ports -output_delay**.

Output delay is managed on a per-scenario basis. For designs with multiple scenarios, you can specify scenarios by using **-modes**, **-corners**, and **-scenarios** options.

By default, if none of these options are specified, the command is applied to the current scenario. (It will be an error if there is no current scenario). If the **-scenarios** option is given, the command will be applied to all of the specified scenarios. If the **-modes** option is given, the command will be applied to all scenarios of the specified modes. (It will be an error if none of the specified modes have any scenarios.) If the **-corners** option is given, the command will be applied to all scenarios of the specified corners and the current mode. (It will be an error if none of the specified corners have any scenarios with the current mode.) If both the **-modes** and **-corners** options are given, the command will be applied to all scenarios of the specified corners and the specified modes. (It will be an error there are no such scenarios.) It is an error to give **-scenarios** with **-modes** or **-corners**.

Multicorner-Multimode Support

By default, this command works on the current scenario. To specify a different scenario, use the **-scenarios** option or the **-corners** and **-modes** options.

EXAMPLES

The following example removes all output delay values from all output ports in the current scenario.

```
prompt> remove_output_delay [all_outputs]
```

The following example removes output maximum rise delay values from OUT1, OUT3, and BIDIR12.

```
prompt> remove_output_delay -max -rise { OUT1 OUT3 BIDIR12 }
```

The following example removes all output delays for port OUT1 relative to the falling edge of CLK2.

```
prompt> remove_output_delay -clock CLK2 -clock_fall OUT1
```

The following example removes all output delays not relative to any clock for port OUT2.

```
prompt> remove_output_delay -clock {""} OUT2
```

SEE ALSO

all_outputs(2)
collections(2)
report_ports(2)
set_input_delay(2)
set_output_delay(2)

remove_path_group

Removes path group objects.

SYNTAX

status **remove_path_groups**
-all | *group_list*

Data Types

group_list list

ARGUMENTS

-all

Removes all path groups in the current mode.

group_list

Specifies path groups to remove. Each element in the list is either a collection of path groups or a pattern that matches path group names.

DESCRIPTION

The **remove_path_groups** command removes path groups in the current mode.

The **group_path** and **create_clock** commands create path groups. Path groups affect the cost function for optimization and influence the timing reports. If you remove a path group, any paths in that group are implicitly assigned to the default path group.

Multicorner-Multimode Support

This command works only on the current mode.

EXAMPLES

The following example removes all path groups in the current mode.

prompt> **remove_path_groups -all**

The following example removes the path group named BUS1.

prompt> **remove_path_groups BUS1**

SEE ALSO

collections(2)
create_clock(2)
group_path(2)

remove_path_groups

Removes path group objects.

SYNTAX

status **remove_path_groups**
-all | *group_list*

Data Types

group_list list

ARGUMENTS

-all

Removes all path groups in the current mode.

group_list

Specifies path groups to remove. Each element in the list is either a collection of path groups or a pattern that matches path group names.

DESCRIPTION

The **remove_path_groups** command removes path groups in the current mode.

The **group_path** and **create_clock** commands create path groups. Path groups affect the cost function for optimization and influence the timing reports. If you remove a path group, any paths in that group are implicitly assigned to the default path group.

Multicorner-Multimode Support

This command works only on the current mode.

EXAMPLES

The following example removes all path groups in the current mode.

prompt> **remove_path_groups -all**

The following example removes the path group named BUS1.

prompt> **remove_path_groups BUS1**

SEE ALSO

collections(2)
create_clock(2)
group_path(2)

remove_path_margin

Removes path margin.

SYNTAX

status **remove_path_margin**
[-comment *comment*]
[-all]
[-modes *mode_list*]
[-corners *corner_list*]
[-scenarios *scenario_list*]

Data Types

comment string
mode_list list
corner_list list
scenario_list list

ARGUMENTS

-comment *comment*

Remove path margin with specified comment only.

-all

This option removes path margins with any comment from specified mode, corner or scenario. If no mode, corner or scenario is specified it works in current scenario only.

-modes *mode_list*

Specifies the scenarios to remove path margin. If this option is given, all scenarios of the given modes are used. The **-scenarios** option must not be specified with this option. If both **-modes** and **-corners** are specified, all scenarios whose mode is specified by **-modes** and whose corner is specified by **-corners** are used.

-corners *corner_list*

Specifies the scenarios to remove path margin. If this option is given, all scenarios of the given corners and the current mode is used. The **-scenarios** option must not be specified with this option. If both **-modes** and **-corners** are specified, all scenarios whose mode is specified by **-modes** and whose corner is specified by **-corners** are used.

-scenarios *scenario_list*

Specifies the scenarios to remove path margin. The **-modes** or **-corners** option must not be given with this option.

DESCRIPTION

This command removes path margin.

Multicorner-Multimode Support

By default, this command works on the current scenario. To specify a different scenario, use the **-scenarios** option or the **-corners** and **-modes** options.

EXAMPLES

This example removes path margins from scenario s1

prompt> **remove_path_margin -all -scenarios s1**

This example removes all path margin with comment pm2 in mode m1.

prompt> **remove_path_margin -comment pm2 -modes m1**

SEE ALSO

reset_paths(2)
set_path_margin(2)

remove_pg_mask_constraints

Removes the specified PG mask constraints.

SYNTAX

status **remove_pg_mask_constraints**
[-all]
name

Data Types

name string

ARGUMENTS

-all

Removes all predefined PG mask constraints.

name

Specifies the PG mask constraint to remove.

DESCRIPTION

This command removes PG mask constraints.

EXAMPLES

The following example removes the PG mask constraint named rule1.

prompt> **remove_pg_mask_constraints rule1**

The following example removes all PG mask constraints.

prompt> **remove_pg_mask_constraints -all**

SEE ALSO

report_pg_mask_constraints(2)
set_pg_mask_constraint(2)

remove_pg_patterns

Removes the specified power ground patterns.

SYNTAX

status **remove_pg_patterns**
[-all]
pattern_name

Data Types

pattern_name string

ARGUMENTS

-all

Removes all predefined power ground patterns.

pattern_name

Removes the specified power ground pattern.

DESCRIPTION

This command removes power ground patterns such as wire pattern, ring pattern, macro connection pattern, standard cell connection pattern, and composite pattern.

EXAMPLES

The following example removes the power ground pattern named pattern1.

prompt> **remove_pg_patterns pattern1**

The following example removes all power ground patterns.

prompt> **remove_pg_patterns -all**

SEE ALSO

create_pg_wire_pattern(2)
create_pg_ring_pattern(2)
create_pg_macro_conn_pattern(2)
create_pg_std_cell_conn_pattern(2)
create_pg_composite_pattern(2)
create_pg_special_pattern(2)
report_pg_patterns(2)

remove_pg_regions

Removes the specified power ground regions.

SYNTAX

status **remove_pg_regions**
[-force]
[-all]
[*region*]

Data Types

region collection

ARGUMENTS

-force

Ignores locked status of the objects. If this option is not provided and any of the affected objects has locked status, the command fails and generates a Tcl error.

-all

Remove all power ground regions.

region

Removes the specified collection of power ground regions.

DESCRIPTION

This command removes the specified power ground regions.

EXAMPLES

The following example removes the power ground region named region1.

prompt> **remove_pg_regions region1**

The following example removes all power ground regions.

```
prompt> remove_pg_regions -all
```

SEE ALSO

create_pg_region(2)
report_pg_regions(2)

remove_pg_strategies

Removes the specified power ground strategy.

SYNTAX

status **remove_pg_strategies**
[-all]
strategy_name

Data Types

strategy_name string

ARGUMENTS

-all

Removes all power ground strategies. By default, the command removes only the specified power ground strategy.

strategy_name

Removes the specified power ground strategy. You must specify a *strategy_name* or the **-all** option.

DESCRIPTION

This command removes the specified power ground strategy. Use the **-all** option to remove all power ground strategies.

EXAMPLES

The following example removes the top_strategy power ground strategy.

prompt> **remove_pg_strategies top_strategy**

The following example removes all power ground strategies.

prompt> **remove_pg_strategies -all**

SEE ALSO

compile_pg(2)
report_pg_strategies(2)
set_pg_strategy(2)

remove_pg_strategy_via_rules

Removes the specified power ground strategy via rule.

SYNTAX

status **remove_pg_strategy_via_rules**
[-all]
rule_name

Data Types

rule_name string

ARGUMENTS

-all

Removes all power ground strategy via rules. By default, the command removes only the specified power ground strategy via rule.

rule_name

Removes the specified power ground strategy via rule. You must specify a *rule_name* or the **-all** option.

DESCRIPTION

This command removes the specified power ground strategy via rule. Use the **-all** option to remove all power ground strategy via rules.

EXAMPLES

The following example removes the power ground strategy via rule r1.

prompt> **remove_pg_strategy_via_rules r1**

The following example removes all power ground strategy via rules.

prompt> **remove_pg_strategy_via_rules -all**

SEE ALSO

compile_pg(2)
report_pg_strategy_via_rules(2)
set_pg_strategy_via_rule(2)

remove_pg_via_master_rules

Removes the specified power ground via rule.

SYNTAX

status **remove_pg_via_master_rules**
[-all]
rule_name

Data Types

rule_name string

ARGUMENTS

-all

Removes all predefined power ground via rules.

rule_name

Removes the specified power ground via rule.

DESCRIPTION

This command removes the specified power ground via rule.

EXAMPLES

The following example removes power ground via rule rule1.

prompt> **remove_pg_via_master_rules rule1**

The following example removes all power ground via rules.

prompt> **remove_pg_via_master_rules -all**

SEE ALSO

report_pg_via_master_rules(2)
set_pg_via_master_rule(2)

remove_physical_objects

Removes physical shapes of specified objects.

SYNTAX

status **remove_physical_objects**
[*object_list*]
[-remove_disconnected]
[-quiet]

Data Types

object_list collection or selection

ARGUMENTS

object_list

Specifies a collection or selection set containing objects to remove. If this option is not specified, global selection set is used.

-remove_disconnected

Removes any vias that are not longer connected on its upper or lower layer when a new shape is deleted.

Note: this option is not supported in the library manager as this tool does not support the required connectivity analysis functionality.

-quiet

Suppress all messages.

DESCRIPTION

Removes physical shapes of specified objects. It does not remove nets or bundles , but it does remove shapes of specified nets and bundles.

EXAMPLES

The following example removes all bound objects:

```
prompt> change_selection [get_bounds *]
prompt> remove_physical_objects
```

The alternative syntax uses a collection to specify objects.

```
prompt> remove_physical_objects [get_bounds *]
```

SEE ALSO

change_selection(2)
get_selection(2)

remove_physical_rules

Removes abstract physical rules and attributes from target library and all its cells. This command can only remove physical rules and attributes which can only be added by read_physical_rules.

SYNTAX

int **remove_physical_rules**
[-library *lib*]

Data Types

lib string

ARGUMENTS

-library *lib*

Specifies the target library to remove the rules and attributes. This option is only avaiable in ICC2. If not specified, current library will be used.

In library manager, it's always the current worksapce library.

DESCRIPTION

This command removes abstract physical rules/attributes from target library and all its cells.

EXAMPLES

The following example removes all rules from library and cells.

```
prompt> remove_physical_rules
2
```

SEE ALSO

read_physical_rules(2)
write_physical_rules(2)

remove_pin_blockages

Removes pin blockages from the current design.

SYNTAX

status **remove_pin_blockages**
[-force]
[-verbose]
-all | *pin_blockage_list*

Data Types

pin_blockage_list list

ARGUMENTS

-force

Ignore locked status of the objects. If this option is not provided and any of the affected objects has locked status, command will fail generating tcl error.

-verbose

Prints additional messages.

-all

Removes all pin blockages in the current design.

pin_blockage_list

Specifies the pin blockages. The pin_blockage_list can be a collection handle of pin blockages or names of patterns. You can use the *get_pin_blockages* command to specify objects.

RETURN VALUE

The number of removed pin blockages.

DESCRIPTION

This command removes pin blockages from the design.

EXAMPLES

The following example removes pin blockages whose names begin with *PIN_BLOCKAGE*:

prompt> **remove_pin_blockages PIN_BLOCKAGE***

SEE ALSO

create_pin_blockage(2)
get_pin_blockages(2)
report_pin_blockages(2)
add_to_pin_blockage(2)
remove_from_pin_blockage(2)

remove_pin_buses

Removes pin buses from the current design.

SYNTAX

collection **remove_pin_buses**
[-design *design*]
[-force]
[-block *block*]
-all | *pin_bus_list*

Data Types

pin_bus_list string or collection

ARGUMENTS

-design *design*

Specifies the design in which to remove the pin buses. If no design is specified, the pin buses are removed from the current design.

-force

Ignores the locked status of pins of the bus pin. If this option is not specified and any of the affected objects has locked status, the command issues a Tcl error and exits.

-block *block*

Specifies the block where the pin bus is to be removed. If specified, **remove_pin_buses** has the same effect as **edit_module** in which the module is changed and changes will be on all module occurrences.

-all

Removes all pin buses.

pin_bus_list

Specifies a list of pin buses to remove.

RETURN VALUE

This command returns the removed pin bus count, an empty string if it fails, or a TCL_ERROR if there is a command syntax error.

DESCRIPTION

This command removes a list of pin buses from the current design (unless otherwise specified by -design). Individual members of buses remain.

EXAMPLES

The following example removes pin bus named *bus_cell/bus1*

```
prompt> remove_pin_buses bus_cell/bus1
1
```

SEE ALSO

create_pin_bus(2)
get_pin_buses(2)
report_pin_buses(2)

remove_pin_constraints

Remove the specified pin constraint(s).

SYNTAX

int **remove_pin_constraints**
pin_constraints_list

pin_constraints_list collection

ARGUMENTS

pin_constraints_list

A collection of pin constraint objects to be removed.

DESCRIPTION

This command removes a set of pin constraint objects from the database. The command takes a collection of pin constraints as an argument and will error out if the collection does not contain exclusive pin constraints. Upon success the command will return the number of objects removed.

EXAMPLES

The following example removes all pin constraints from the design.

```
prompt> remove_pin_constraints [get_pin_constraints]
1
```

SEE ALSO

place_pins(2)
create_pin_constraint(2)
report_pin_constraints(2)

set_editability(2)

remove_pin_guides

Removes pin guides from the current design.

SYNTAX

status **remove_pin_guides**
[-force]
[-verbose]
-all | *pin_guide_list*

Data Types

pin_guide_list list

ARGUMENTS

-force

Ignore locked status of the objects. If this option is not provided and any of the affected objects has locked status, command will fail generating tcl error.

-verbose

Prints additional messages.

-all

Removes all pin guides in the current design.

pin_guide_list

Specifies the pin guides. The pin_guide_list can be a collection handle of pin guides or names of patterns. You can use the *get_pin_guides* command to specify objects.

RETURN VALUE

The number of removed pin guides.

DESCRIPTION

This command removes pin guides from the design.

EXAMPLES

The following example removes pin guides whose names begin with *PIN_GUIDE*:

prompt> **remove_pin_guides PIN_GUIDE***

SEE ALSO

create_pin_guide(2)
get_pin_guides(2)
report_pin_guides(2)
add_to_pin_guide(2)
remove_from_pin_guide(2)

remove_pin_name_synonym

Removes pin name synonym definitions.

SYNTAX

status **remove_pin_name_synonym**
[-all]
[synonym_list *synonym_list*]

Data Types

synonym_list list

ARGUMENTS

-all

Removes all pin name synonym definitions. You must specify either the -all option or the synonym_list argument. The option and argument are mutually exclusive.

synonym_list

Removes pin name synonym definitions that match one of the pin name synonym strings in the list. You must specify either the -all option or the synonym_list argument. The option and argument are mutually exclusive.

DESCRIPTION

The remove_pin_name_synonym command deletes some or all pin name synonym definitions.

EXAMPLES

The following examples set and remove pin name synonyms:

```
prompt> set_pin_name_synonym SYN_CD CD
1

prompt> set_pin_name_synonym SYN_QN QN
1
```

```
prompt> set_pin_name_synonym \
     -full_name this/is/a/synonym mid1/FJK2SP_at_mid/TI
1

prompt> set_pin_name_synonym \
     -full_name mid1/FJK2SP_at_mid/J mid2/bot2/LSR0P_at_bot/Q
1

SEE ALSO

remove_pin_name_synonym(2)
report_pin_name_synonym(2)

remove_pins

Removes pins from a cell.

SYNTAX

remove_count **remove_pins**
[-design *design*]
[-force]
pin_list

pin_list list of pins to remove

ARGUMENTS

-design *design*

Specifies the design in which to remove the pin(s). If no design is specified, the pin(s) are removed from the current design.

-force

Ignore locked status of the objects. If this option is not provided and any of the affected objects has locked status, command will fail generating tcl error.

pin_list

Specifies a list of pins to remove from their cells.

DESCRIPTION

This command removes a list of pins from their cells in the current design (unless otherwise specified by -design).

Any nets connected to removed pins are disconnected from the pins before they are removed. Remaining net connections are not disturbed. Unconnected nets are not removed.

If the cell is an instance of another block, the corresponding ports on that block will also be removed. If the cell is an instance of a multiply instantiated block (MIB) then each cell that instantiates that block will also have its corresponding pins removed.

The **remove_pins** command returns the number of pins from *pin_list* that were removed.

EXAMPLES

The following example removes pin i3 from cell u1.

```
prompt> get_pins u1/*
{u1/i1 u1/i2 u1/i3 u1/o1}
prompt> remove_pins u1/i4
1
prompt> get_pins u1/*
{u1/i1 u1/i2 u1/o1}
```

The following example removes pins from several cells.

```
prompt> remove_pins [get_pins u*/i3]
14
```

The following example removes 3 pins from instance uMID1 of multiply instantiated block MID. The corresponding pins are also removed from the other instance uMID2.

```
prompt> get_pins uMID1/*
{uMID1/i1 uMID1/a1 uMID1/a2 uMID1/a3 uMID1/o1}
prompt> get_pins uMID2/*
{uMID2/i1 uMID2/a1 uMID2/a2 uMID2/a3 uMID2/o1}

prompt> remove_pins uMID1/a*
3

prompt> get_pins uMID1/*
{uMID1/i1 uMID1/o1}
prompt> get_pins uMID2/*
{uMID2/i1 uMID2/o1}
```

SEE ALSO

remove_pins_from_virtual_connection

Disconnects pins or ports from the virtual connection.

SYNTAX

status **remove_pins_from_virtual_connection**
-object *virtual_connection*
-pins *pin_port_list*

Data Types

virtual_connection list or collection
pin_port_list list or collection

ARGUMENTS

-object *virtual_connection*

Specifies one virtual connection.

-pins *pin_port_list*

Specifies a list of pins and ports to be disconnected from the virtual connection. The command errors out if any pin is not connected to the specified virtual connection.

DESCRIPTION

This command disconnects pins from the specified virtual connection.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following examples disconnect pins from the specified virtual connection.

prompt> **remove_pins_from_virtual_connection** \

```
        -object [get_virtual_connections -name SNPS_vc_0] \
        -pins {lh1/ff3/Y U2/A U3/A MemData[0]}\

prompt> remove_pins_from_virtual_connection \
        -object [get_virtual_connections -name SNPS_vc_0] \
        -pins [get_pins {U2/A U3/A}]\

prompt> remove_pins_from_virtual_connection \
        -object [get_virtual_connections -name SNPS_vc_0] \
        -pins [get_ports MemData[0]]\
```

remove_placement_attractions

Removes placement_attractions from the current design.

SYNTAX

int **remove_placement_attractions**
[-force]
[*placement_attraction_list*]

Data Types

placement_attraction_list list

ARGUMENTS

-force

Ignore locked status of the objects. If this option is not provided and any of the affected objects has locked status, command will fail generating tcl error.

placement_attraction_list

Specifies a list of placement_attractions to remove. The list may contain placement_attraction names, patterns, or collections. A collection may be specified by using the **get_placement_attractions** command.

DESCRIPTION

This command removes placement_attraction constraints from the current design. The number of removed placement_attractions are returned.

EXAMPLES

The following example removes placement_attractions named "placement_attraction1" and "placement_attraction2".

```
prompt> remove_placement_attractions { placement_attraction1 placement_attraction2 }
2
```

The following example removes placement_attractions that match the pattern "placement_attraction*".

```
prompt> remove_placement_attractions placement_attraction*
3
```

SEE ALSO

create_placement_attraction(2)
get_placement_attractions(2)
add_to_placement_attraction(2)
remove_from_placement_attraction(2)
report_placement_attractions(2)

remove_placement_blockages

Removes placement blockages.

SYNTAX

status **remove_placement_blockages**
[-force]
[-verbose]
-all | *blockage_list*

Data Types

blockage_list collection

ARGUMENTS

-force

Ignore locked status of the objects. If this option is not provided and any of the affected objects has locked status, command will fail generating tcl error.

-verbose

Show detailed information while removing placement blockages

-all

Remove all placement blockages from the current design. This option is mutually exclusive with the *blockage_list* argument, but you must specify one.

blockage_list

Specifies the list of objects by which this command finds and removes a placement blockage. The list can be a collection of blockages, or a pattern, such as * or PB_* (removes all placement blockages) or PB_7789 (removes one placement blockage whose *object_id* is 7789).

The *blockage_list* and the **-all** option are mutually exclusive.

DESCRIPTION

This command removes all specified placement blockages.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example removes all placement blockages:

prompt> **remove_placement_blockages -all**

The following example uses the *patterns* argument to remove placement blockages:

prompt> **remove_placement_blockages [get_placement_blockages PB_*]**

SEE ALSO

create_placement_blockage(2)
create_routing_guide(2)
get_placement_blockages(2)
get_routing_guides(2)
remove_routing_guides(2)

remove_placement_spacing_rules

Removes placement spacing labels and rules set with *set_placement_spacing_label* and *set_placement_spacing_rule* commands..

SYNTAX

status **remove_placement_spacing_rules**
-label *label_name*
-rule *label_names*
-all

Data Types

label_name	string
label_names	pair of strings

ARGUMENTS

-label *label_name*

Specifies a name for label to be removed. Additionally all rules referencing this label are removed. A built-in label such as "SNPS_BOUNDARY" may not be removed.

-rule *label_names*

Specifies the names of the labels that constitute the rule to be removed. The labels are nore removed.

-all

Specifies that all labels, other than built-in labels, and.rules are to be removed.

Options *-label*, *-rule*, and *-all* are mutually exclusive. One and only one of these options must be specified.

DESCRIPTION

This command removes placement spacing rules that have been set with commands set_placement_spacing_label and set_placement_spacing_rule. The user may optionally remove a single label, rule, or all label and rules. In order to re-instate placement spacing constraints, the user will have to rerun set_placement_spacing_label and set_placement_spacing_rule commands.

EXAMPLES

The following example removes label X

prompt> **remove_placement_spacing_rules -label X**

The following example removes rule between labels X and Y

prompt> **remove_placement_spacing_rules -rule {X Y}**

SEE ALSO

set_placement_spacing_rule(2)
set_placement_spacing_label(2)
report_placement_spacing_rules(2)

remove_pop_up_object_options

Resets options for the **pop_up_objects** command to their default values.

SYNTAX

string **remove_pop_up_object_options**
[-object_type {pg_routing routing_guide blockage pin_guide pin_blockage cells}]

ARGUMENTS

-object_type {pg_routing routing_guide blockage pin_guide pin_blockage cells}

Specifies the types of the objects whose options will be reset. You can specify one or more of the supported object types by using the following keywords: *pg_routing*, *routing_guide and blockage*, *pin_guide*, *pin_blockage* and *cells*. If **-object_type** is not specified, the settings for all object types are reset.

DESCRIPTION

This command resets options for the **pop_up_objects** command to their default values. You can check the default values of each object type with the **report_pop_up_object_options** command.

EXAMPLES

The following example resets the options for *pg_routing*.

prompt> **remove_pop_up_object_options -object_type pg_routing**

SEE ALSO

pop_up_objects(2)
report_pop_up_object_options(2)
set_pop_up_object_options(2)

remove_port_buses

Removes port buses from the current design.

SYNTAX

collection **remove_port_buses**
[-design *design*]
[-force]
[-block *block*]
[-cell *cell*]
[-all]
port_bus_list

Data Types

block string or collection
cell string or collection
port_bus_list string or collection

ARGUMENTS

-design *design*

Specifies the design in which to remove the port bus. If no design is specified, the port bus is removed from the current design.

-block *block*

Specifies the block where the port bus is to be removed. If specified, **remove_port_buses** has the same effect as **edit_module** in which the module is changed and changes will be on all module occurrences.

-cell *cell*

Specifies the cell where the port bus is to be removed. The port bus is removed on the cell's reference module. **remove_port_buses** will first uniquify the reference if needed, then remove the port bus. When not specified, the port bus is removed on the current module.

-force

Ignores the locked status of ports of the bus port. If this option is not specified and any of the affected objects has locked status, the command issues a Tcl error and exits.

-all

Removes all port buses.

port_bus_list

Specifies a list of port buses to remove.

RETURN VALUE

This command returns the removed port bus count, an empty string if it fails, or a TCL_ERROR if there is a command syntax error.

DESCRIPTION

This command removes a list of port buses from the current design (unless otherwise specified by -design). Individual members of buses remain.

EXAMPLES

The following example removes port bus named *bus1*

```
prompt> remove_port_buses bus1
1
```

SEE ALSO

add_to_port_bus(2)
create_port_bus(2)
get_port_buses(2)
remove_from_port_bus(2)
report_port_buses(2)

remove_ports

Removes ports from the current design.

SYNTAX

status_value **remove_ports**
[-design *design*]
[-force]
[-remove_shapes]
port_list

port_list list

ARGUMENTS

-design *design*

Specifies the design in which to remove the port(s). If no design is specified, the port(s) are removed from the current design.

-force

Ignore locked status of the objects. If this option is not provided and any of the affected objects has locked status, command will fail generating tcl error.

-remove_shapes

Specifies that pin shapes also need to be removed.

port_list

Specifies a list of ports to remove from the current design.

DESCRIPTION

This command removes a list of ports from the current design (unless otherwise specified by -design).

EXAMPLES

The following example removes all ports.

```
prompt> get_ports *
{"VDD", "VSS", "data2", "data1"}
```

The following example removes the port named *data2*.

```
prompt> remove_ports data2
1
```

The following example removes the ports that start with *data*, specified by the **get_ports** command.

```
prompt> set a [get_ports data*]
{"data1"}
prompt> remove_ports $a
1
```

The following example removes the port named *data3* along with pin shapes.

```
prompt> remove_ports -remove_shapes data3
1
```

remove_post_route_filler

Removes unfixed filler cells inserted with the **create_stdcell_fillers -rules {post_route_auto_delete}** command.

SYNTAX

status **remove_post_route_filler**
[-skip_filler_type_check]
[-hierarchical]

Data Types

No data types

ARGUMENTS

-skip_filler_type_check

If this option is specified, the command checks cells of other cell types. By default, the command only checks and removes cells that are physical_only or are filler cell types.

-hierarchical

If this option specified, the command checks cells in sub-blocks and at the top level. By default, command only checks and removes cells only in the current block.

DESCRIPTION

This command deletes filler cells in the route_opt flow. It deletes all unfixed filler cells inserted with the **create_stdcell_fillers -rules {post_route_auto_delete}** command.

EXAMPLES

The following example first inserts filler cells with post_route_auto_delete option, then removes them all with the **remove_post_route_filler** command.

```
prompt> create_stdcell_fillers \
  -lib_cells {mylib/FILL_4X mylib/FILL_2X mylib/FILL_1X}
```

```
prompt> remove_post_route_filler
```

SEE ALSO

create_stdcell_fillers(2)

remove_power_io_constraints

Removes power constraints from the specified I/O guides.

SYNTAX

int **remove_power_io_constraints**
[-io_guide_list *io_guides*]

Data Types

io_guides list

ARGUMENTS

-io_guide_list

Specifies the names or collection of target I/O guides. If this option is not used, all I/O guides are processed.

DESCRIPTION

This command removes power constraints from I/O guides.

EXAMPLES

The following example removes power constraints from an I/O guides io_guide1 and io_guide2.

prompt> **remove_power_io_constraints -io_guide_list {io_guide1 io_guide2}**

The following example removes power constraints from all I/O guides.

prompt> **remove_power_io_constraints**

SEE ALSO

place_io(2)
report_power_io_constraints(2)
set_power_io_constraints(2)
set_signal_io_constraints(2)

remove_pr_rules

Removes cell row spacing rules (pr_rules) from the current technology object.

SYNTAX

integer **remove_pr_rules**
[-all]
[*pr_rule_list*]

Data Types

pr_rule_list collection

ARGUMENTS

-all

Removes all cell row spacing rules.

The **-all** option and *pr_rule_list* argument are mutually exclusive; you must specify one.

pr_rule_list

Specifies the cell row spacing rules to remove. You can specify the rules by name or as a collection.

The **-all** option and *pr_rule_list* argument are mutually exclusive; you must specify one.

DESCRIPTION

This command removes cell row spacing rules from the current technology object.

This command returns the number of rules removed. If there is a command syntax error, it raises a TCL_ERROR.

EXAMPLES

The following example removes the cell row spacing rule named PR_RULE_0.

prompt> **remove_pr_rules PR_RULE_0**

1

SEE ALSO

create_pr_rule(2)
get_pr_rules(2)
report_pr_rules(2)

remove_programmable_spare_cell_mapping_rule

This command remove rules for programmable spare cells mapping.

SYNTAX

status **remove_programmable_spare_cell_mapping_rule**
-psc_type_id *id_list* | -all

Data Types

id_list list

ARGUMENTS

-psc_type_id *id_list*

Specify the list of psc_type_id of which the mapping rules will be removed. This option is mutually exclusive with option *-all*.

-all *id_list*

Remove all mapping rules for all psc types. This option is mutually exclusive with option *-psc_type_id*.

DESCRIPTION

This command remove rules for programmable spare cells mapping. Users can specify the list of psc_type_id to remove mapping rules or remove all mapping rules for all types.

After removing mapping rules for a psc_type_id, the psc mapping of the command **place_freeze_silicon** does not honor any mapping rule for this psc_type_id.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example remove the rule for psc_type_id 1 and 2.

prompt> **remove_programmable_spare_cell_mapping_rule -psc_type_id {1 2}**\

The following example remove all rules.

prompt> **remove_programmable_spare_cell_mapping_rule -all**\

SEE ALSO

remove_propagated_clock

Removes a propagated clock specification.

SYNTAX

string **remove_propagated_clocks** *object_list*

list *object_list*

ARGUMENTS

object_list

Lists clocks, ports, or pins.

DESCRIPTION

Removes propagated clock specification from clocks, ports, or pins in the current design. The **set_propagated_clock** command specifies that delays be propagated through the clock network to determine latency at register clock pins. If this is not specified, ideal clocking is assumed. Ideal clocking means clock networks have a user specified latency (set by the **set_clock_latency** command) or zero latency, by default. Propagated clock latency is normally used for post layout, after final clock tree generation.

Ideal clock latency provides an estimate of the clock tree for prelayout. You can also use **set_clock_latency** to specify an ideal latency, which overrides the propagated clock specification for an object.

For information on propagated clock attributes on clocks, see the **report_clock** command man page.

Multicorner-Multimode Support

EXAMPLES

The following example removes propagated clock specifications from all clocks in the design.

```
prompt> remove_propagated_clocks [all_clocks]
```

SEE ALSO

report_clock(2)
set_clock_latency(2)
set_propagated_clock(2)

remove_propagated_clocks

Removes a propagated clock specification.

SYNTAX

string **remove_propagated_clocks** *object_list*

list *object_list*

ARGUMENTS

object_list

Lists clocks, ports, or pins.

DESCRIPTION

Removes propagated clock specification from clocks, ports, or pins in the current design. The **set_propagated_clock** command specifies that delays be propagated through the clock network to determine latency at register clock pins. If this is not specified, ideal clocking is assumed. Ideal clocking means clock networks have a user specified latency (set by the **set_clock_latency** command) or zero latency, by default. Propagated clock latency is normally used for post layout, after final clock tree generation.

Ideal clock latency provides an estimate of the clock tree for prelayout. You can also use **set_clock_latency** to specify an ideal latency, which overrides the propagated clock specification for an object.

For information on propagated clock attributes on clocks, see the **report_clock** command man page.

Multicorner-Multimode Support

EXAMPLES

The following example removes propagated clock specifications from all clocks in the design.

```
prompt> remove_propagated_clocks [all_clocks]
```

SEE ALSO

report_clock(2)
set_clock_latency(2)
set_propagated_clock(2)

remove_purposes

Removes technology purposes from the technology data.

SYNTAX

collection **remove_purposes**
purpose_list | *-all*

Data Types

purpose_list collection

ARGUMENTS

purpose_list

Specifies the collection of purposes to be removed from the technology data.

-all

Removes all purposes. The **-all** and purpose_list options are mutually exclusive.

DESCRIPTION

This command removes the specified technology purposes from the library's technology data. The **remove_purposes** command will not remove the default technology purpose, "drawing". If you try to remove the "drawing" purpose, the tool will issue a warning message.

RETURN VALUE

This command returns the removed technology purpose count, or an empty string if the command fails. If a command syntax error exists, the command returns a TCL_ERROR.

EXAMPLES

The following example removes a purpose named 'test_purpose' from the technology data of the current library.

prompt> **remove_purposes test_purpose**

{1}

SEE ALSO

create_purpose(2)
get_purposes(2)

remove_push_down_object_options

Resets options for the **push_down_objects** command to their defaults.

SYNTAX

string **remove_push_down_object_options**
[-object_type *types*

Data Types

type list

ARGUMENTS

-object_type *types*

Specifies the types of objects whose options are reset. Specify one or more of the following object types: **pg_routing**, **signal_routing**, **routing_guide**, **routing_corridor**, **blockage**, **pin_guide**, **pin_blockage**, **cells**, and **charging_station**.

If you do not specify this option, the command resets the settings for all object types.

DESCRIPTION

This command resets options for the **push_down_objects** command to their defaults. You can report the current push down settings with the **report_push_down_object_options** command.

EXAMPLES

The following example resets the options for *pg_routing*.

prompt> **remove_push_down_object_options -object_type pg_routing**

SEE ALSO

push_down_objects(2)
report_push_down_object_options(2)
set_push_down_object_options(2)

remove_qor_snapshot

Removes an existing QoR snapshot from the location specified by the application option **time.snapshot_storage_location**.

SYNTAX

void **remove_qor_snapshot**
[-name *snapshot_name* | -all]

Data Types

snapshot_name string

ARGUMENTS

-name *snapshot_name*

Remove QoR snapshot named **snapshot_name** for this design, from the location designated by **time.snapshot_storage_location**. The **-name**, and **-all** options are mutually exclusive; you must choose only one.

-all

Remove all QoR snapshots for this design, from the location designated by **time.snapshot_storage_location**. The **-name**, and **-all** options are mutually exclusive; you must choose only one.

DESCRIPTION

This command removes one or more QoR snapshots.

Multicorner-Multimode Support

This command has no dependency on scenario-specific, mode-specific, or corner-specific information.

EXAMPLES

In the following example, the **remove_qor_snapshot** command removes the QoR snapshot named "preroute" that is saved under the design/snapshot directory.

```
prompt> remove_qor_snapshot -name preroute
```

SEE ALSO

create_qor_snapshot(2)
report_qor_snapshot(2)
query_qor_snapshot(2)
time.snapshot_storage_location(3)

remove_redundant_shapes

Removes dangling wires and vias on user-specified nets.

SYNTAX

status **remove_redundant_shapes**
[-nets {*collection_of_nets*}]
[-route_types {*list_of_route_types*}]
[-layers {*collection_of_layers*}]
[-initial_drc_from_input true | false]
[-remove_loop_shapes true | false]
[-remove_floating_shapes true | false]
[-remove_dangling_shapes true | false]
[-report_changed_nets true | false]

Data Types

{*collection_of_nets*} collection
{*list_of_route_types*} list
{*collection_of_layers*} collection

ARGUMENTS

-nets {*collection_of_nets*}

Specifies the nets from which to remove dangling wires and vias.

If you do not specify this option, dangling wires and vias are removed from all nets.

-route_types {*list_of_route_types*}

Specifies which route types to remove. The valid values are fixed_route and nonfixed_route.

If you do not specify this option, wires with both fixed_route and nonfixed_route route types are removed.

-layers {*collection_of_layers*}

Specifies the layers from which to remove dangling wires or vias. Metal and cut layer names in technology file are supported.

If you do not specify this option, dangling wires and vias are removed from all layers.

-initial_drc_from_input true | false

Specifies whether to run the **check_routes** command before removing the dangling wires and vias.

By default (true), the tool uses the DRC information stored in the CEL view. If you specify **false**, the tool runs the **check_routes**

command.

-remove_loop_shapes true | false

Specifies whether loops are removed.

The default is false.

-remove_floating_shapes true | false

Specifies whether floating shapes are removed.

The default is true.

-remove_dangling_shapes true | false

Specifies whether dangling shapes are removed.

The default is true.

-report_changed_nets true | false

Specifies whether trimmed nets are reported.

The default is false.

DESCRIPTION

The **remove_redundant_shapes** command remove dangling wires and vias on the specified nets.

By default, this command runs the **check_routes** command and then removes the dangling and floating net shapes from all nets in the design, based on the results. When removing dangling net shapes, the tool does not change topologies or connections and does not touch terminals. In addition, no changes are made to open nets or nets with DRC violations.

EXAMPLES

The following example removes the dangling wires and vias from the n1 net.

prompt> **remove_redundant_shapes -nets n1**

The following example removes only those dangling wires and vias that have a route type of nonfixed_route.

prompt> **remove_redundant_shapes -route_types {nonfixed_route}**

The following example removes the dangling wires and vias from the Metal2, Via23, and Metal3 layers.

prompt> **remove_redundant_shapes -layers {METAL2 VIA23 METAL3}**

The following example does not run the **check_routes** command before removing the dangling wires and vias. Instead, it uses the DRC information stored in the CEL view.

prompt> **remove_redundant_shapes -initial_drc_from_input true**

The following example removes loops in addition to dangling wires and vias.

prompt> **remove_redundant_shapes -remove_loop_shapes true**

The following example removes only dangling wires and vias and not floating wires and vias.

prompt> **remove_redundant_shapes -remove_floating_shapes false**

The following example removes only floating wires and vias and not dangling wires and vias.

prompt> **remove_redundant_shapes -remove_dangling_shapes false**

SEE ALSO

check_routes(2)

remove_reference_only_related_supply

Removes the reference-only supply net or supply set that is used as related supply of boundary ports.

SYNTAX

status **remove_reference_only_related_supply**
supply

Data Types

supply string

ARGUMENTS

supply

Specifies the reference-only supply net or supply set to be removed.

DESCRIPTION

The **remove_reference_only_related_supply** command removes the reference-only supply net or supply set that is used as related supply of boundary ports in the current design. It is an error if the specified supply is not reference-only or used in other UPF constraints, except for setting related supply net, driver/receiver supply and attribute that declaring the supply as reference-only.

EXAMPLES

The following example shows a typical use of the *remove_reference_only_related_supply* command:

```
prompt> remove_reference_only_related_supply vddref
1
```

SEE ALSO

remove_regular_multisource_clock_tree_options

It removes options from command set_regular_multisource_cloc_tree_options for performing auto tap synthesis and global clock tree synthesis for regular multisource clock trees.

SYNTAX

status **remove_regular_multisource_clock_tree_options**

DESCRIPTION

The **remove_regular_multisource_clock_tree_options** command removes options set through the corresponding set option command.

Multicorner-Multimode Support

This command has no dependency on scenario-specific, mode-specific, or corner-specific information.

EXAMPLES

The following example sets the auto tap synthesis options, removes and reports the options.

```
prompt> set_regular_multisource_clock_tree_options -clock clk \
  -net clk -tap_lib_cells [get_lib_cells */CKBUF*] \
  -htree_lib_cells [get_lib_cells */CKBUF*] \
  -topology htree_only -tap_boxes {4 4}
prompt> remove_regular_multisource_clock_tree_options
prompt> report_regular_multisource_clock_tree_options
```

SEE ALSO

report_regular_multisouce_clock_tree_options(2)

remove_repeater_group_constraints

Removes constraints that are assigned to groups of repeaters.

SYNTAX

status **remove_repeater_group_constraints**
-type *type_list*

Data Types

type_list list

ARGUMENTS

-type *type_list*

Specifies the type of repeater group constraints. The valid values are, "placement", "insertion" and "all". When you specify "placement", the constraints for repeater groups placement are removed. Afterwards, when you run the place_group_repeaters command, this command uses the default settings or the command option settings. When you specify "insertion", the constraints for repeater groups insertion are removed. Afterwards, when you run the add_group_repeaters command, this command uses the default settings or the command option settings. When you specify "all", all the constraints for repeater groups placement and insertion are removed. Afterwards, when you run the place_group_repeaters command or the add_group_repeaters command, these commands use the default settings or the command option settings.

DESCRIPTION

This command removes constraints that are assigned to groups of repeaters.

EXAMPLES

The following examples show the usages of command.

prompt> **set_repeater_group_constraints -type insertion -horizontal_repeater_spacing 7 -layer_cutting_distance {{M1 2.12 13.2} {M2 0.5 0.78} {M3 3.01 3.78}}**
prompt> **set_repeater_group_constraints -type placement -horizontal_repeater_spacing 10**
prompt> **remove_repeater_group_constraints -type insertion**
prompt> **report_repeater_group_constraints**

Report Format:

```
 Type:  Placement
-------------------------------------------------------
 Horizontal repeater spacing: 10
 Vertical repeater spacing: -
 Layer cutting distance: { }

 -------------------------------------------------------
```

SEE ALSO

set_repeater_group_constraints(2)
report_repeater_group_constraints(2)

remove_route_aware_estimation

Prepares the block for final routing when preroute optimization has been run with global-route-based RC estimation.

SYNTAX

status **remove_route_aware_estimation**

ARGUMENTS

This command has no arguments.

DESCRIPTION

This command removes all global-route-based estimation from a block to prepare it for final routing with the **route_global** or **route_auto** commands.

The global-route-based estimation information is set on nets in the block when the **opt.common.use_route_aware_estimation** application option is **true** during preroute optimization.

SEE ALSO

clock_opt(2)
place_opt(2)
refine_opt(2)
route_auto(2)
route_global(2)
opt.common.use_route_aware_estimation(3)

remove_routes

Removes net shapes for the specified nets.

SYNTAX

status **remove_routes**
[-nets *nets*]
[-net_types *list_of_net_types*]
[-detail_route]
[-global_route]
[-user_route]
[-shield_route]
[-ring]
[-stripe]
[-lib_cell_pin_connect]
[-macro_pin_connect]
[-follow_pin]
[-core_wire]
[-zero_skew]
[-area_fill]
[-opc]
[-rdl]
[-keep_pg_pins_at_boundary]
[-keep_frozen_nets]

Data Types

nets list or collection
list_of_net_types list

ARGUMENTS

-nets *nets*

Specifies the nets for which to remove net shapes.

-net_types *list_of_net_types*

Specifies the types of nets for which to remove net shapes. Specify one or more of the following values: **analog_ground**, **analog_power**, **analog_signal**, **clock**, **power**, **ground**, **signal**,**tie_high**, and **tie_low**.

If a net specified in the **-nets** option does not have one of the net types specified in this option, the net is ignored. If the design does not contain any net shapes with the specified net types and shape use, the command does not remove any net shapes.

-detail_route

Removes net shapes with a shape use of detail route.

-global_route

Removes net shapes with a shape use of global route.

-user_route

Removes net shapes with a shape use of user route.

-shield_route

Removes net shapes with a shape use of shield route.

-ring

Removes net shapes with a shape use of ring.

-stripe

Removes net shapes with a shape use of stripe.

-lib_cell_pin_connect

Removes net shapes with a shape use of lib cell pin connect.

-macro_pin_connect

Removes net shapes with a shape use of macro pin connect.

-follow_pin

Removes net shapes with a shape use of follow pin.

-core_wire

Removes net shapes with a shape use of core wire.

-zero_skew

Removes net shapes with a shape use of zero skew.

-area_fill

Removes net shapes with a shape use of area fill.

-opc

Removes net shapes with a shape use of opc.

-rdl

Removes net shapes with a shape use of rdl.

-keep_pg_pins_at_boundary

Keeps the PG boundary pins generated by PG routing of standard cells.

By default, pins covered by PG net shapes at the cell boundary are removed with the PG net shapes.

If you specify this option, the pins are preserved and cannot be removed by subsequent **remove_routes** runs, because they are no longer covered by PG routes.

-keep_frozen_nets

Keeps the net shapes of frozen nets, which have a **physical_status** attribute value of **locked**.

DESCRIPTION

This command deletes the net shapes that meet the specified criteria. You can specify the net names, net types, and shape uses.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example removes the net shapes for all detailed routed signal nets.

```
prompt> remove_routes -net_types signal -detail_route
```

remove_routing_blockages

Removes the specified routing blockages.

SYNTAX

status **remove_routing_blockages**
[-force]
[-verbose]
-all | *blockage_list*

Data Types

patterns list

ARGUMENTS

-force

Ignore locked status of the objects. If this option is not provided and any of the affected objects has locked status, command will fail generating Tcl error.

-verbose

Show detailed information while removing routing blockages

-all

Remove all routing blockages from the current design. This option is mutually exclusive with the *blockage_list* argument, but you must specify one.

blockage_list

Specifies the routing blockages. You can specify a collection or the patterns by using the following formats:

- A collection of routing blockages
- An asterisk (*), which indicates all routing blockages
- A string, for example, RB_1234 matches the routing blockage named RB_1234

DESCRIPTION

This command removes the specified routing blockages.

EXAMPLES

The following example removes all routing blockages within the rectangle with the lower-left corner at {2 2} and the upper-right corner at {25 25}.

```
prompt> remove_routing_blockages \
  [get_objects_by_location -classes routing_blockage -within {{2 2} {25 25}}]
1
```

The following example removes all metal routing blockages.

```
prompt> remove_routing_blockages [get_routing_blockages -type metal]
1
```

SEE ALSO

create_routing_blockage(2)
get_routing_blockages(2)

remove_routing_corridor_shapes

Removes routing corridor shapes from the current design.

SYNTAX

int **remove_routing_corridor_shapes**
[-force]
[-verbose]
[-all]
[*routing_corridor_shape_list*]

Data Types

routing_corridor_shape_list list

ARGUMENTS

-force

Ignores the locked status of the objects. If this option is not provided and any of the specified objects has a locked status, the command generates a Tcl error and exits without removing the shape.

-verbose

Displays additional debugging information.

-all

Removes all routing corridors from the current design.

routing_corridor_shape_list

Specifies a list of corridor shapes to remove. The list can contain routing corridor shape collections specified by using the **get_routing_corridor_shapes** command.

DESCRIPTION

This command removes corridor shapes from the current design. If all corridor shapes of a particular routing corridor are removed, the routing corridor is also removed.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example removes one corridor shape named CORRIDOR_SHAPE_1.

```
prompt> remove_routing_corridor_shapes CORRIDOR_SHAPE_1
1
```

The following example removes all routing corridor shapes from the routing corridor named RC_1.

```
prompt> remove_routing_corridor_shapes \
    [get_routing_corridor_shapes -of_objects {RC_1}]
2
```

SEE ALSO

create_routing_corridor(2)
create_routing_corridor_shape(2)
remove_from_routing_corridor(2)
remove_routing_corridors(2)
report_routing_corridors(2)

remove_routing_corridors

Removes routing corridors from the current design.

SYNTAX

int **remove_routing_corridors**
[-force]
[-verbose]
[-all]
[*routing_corridor_list*]

Data Types

routing_corridor_list list

ARGUMENTS

-force

Ignores the locked status of the objects. If this option is not provided and any of the specified objects has locked status, the command issues a Tcl error and exits without removing the routing corridor.

-verbose

Displays additional debugging information.

-all

Removes all routing corridors from the current design.

routing_corridor_list

Specifies a list of routing corridors to remove. The list can contain routing corridor names, patterns, or collections. A collection can be specified by using the **get_routing_corridors** command.

The *routing_corridor_list* and **-all** options are mutually exclusive; you must specify only one.

DESCRIPTION

This command removes the specified routing corridors from the current design. The number of removed routing corridors is returned.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example removes the routing corridors whose names start with "clock_corridor".

```
prompt> remove_routing_corridors [get_routing_corridors clock_corridor*]
2
```

The following example removes all corridors from the current design.

```
prompt> remove_routing_corridors -all
7
```

SEE ALSO

remove_routing_guides

Removes routing guides.

SYNTAX

int **remove_routing_guides**
[-force]
[-verbose]
-all | *patterns*

Data Types

routing_guide_name string
patterns collection

ARGUMENTS

-force

Ignore locked status of the objects. If this option is not provided and any of the affected objects has locked status, command will fail generating tcl error.

-verbose

Show detailed information while removing routing guides

-all

Remove all routing guides from the current design. This option is mutually exclusive with the *patterns* argument, but you must specify one.

patterns

Specifies the routing guides to remove. This argument is mutually exclusive with the **-all** option, but you must specify one.

DESCRIPTION

The **remove_routing_guides** command removes all specified routing guides.

EXAMPLES

The following example removes the routing guides specified by the **get_routing_guides** command:

```
prompt> remove_routing_guides [get_routing_guides -within {{2 2} {25 25}}]
1
```

The following example removes all routing guides:

```
prompt> remove_routing_guides -all
1
```

SEE ALSO

create_routing_guide(2)
get_routing_guides(2)

remove_routing_rules

Removes non-default routing rules from the design.

SYNTAX

int **remove_routing_rules**
[-verbose]
[-all]
[*routing_rule_list*]

Data Types

routing_rule_list list

ARGUMENTS

-verbose

Displays verbose deletion information.

-all

Removes all non-default routing rules.

routing_rule_list

Removes the non-default routing rules with the specified names.

DESCRIPTION

This command removes the non-default routing rules defined in the design. If you use the **-all** option, all non-default routing rules in the design are removed. If you specify a list, the non-default routing rules in the list are removed.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example removes the non-default routing rule named *wire_rule1*.

prompt> **remove_routing_rules wire_rule1**

SEE ALSO

create_routing_rule(2)
report_routing_rules(2)
set_routing_rule(2)

remove_rp_group_options

Remove relative placement constraints from the specified relative placement groups.

SYNTAX

int **remove_rp_group_options**
rp_group_list
[-group_orientation]
[-anchor_corner]
[-rp_only_keepout_margin]
[-allow_non_rp_cells]
[-allow_non_rp_cells_on_blockages]

Data Types

rp_group_list list or collection

ARGUMENTS

rp_group_list

Specifies the list of names or collection of a relative placement groups, from which the given relative placement constraints will be removed.

-group_orientation

Removes orientation constraint of a relative placement group.

-anchor_corner

Removes anchor_corner, x_offset, y_offset, anchor_row, anchor_column constraints of a relative placement group.

-rp_only_keepout_margin

Removes rp_only_keepout_margin from a relative placement group.

-allow_non_rp_cells

Removes allow_non_rp_cells from a relative placement group.

-allow_non_rp_cells_on_blockages

Removes allow_non_rp_cells_on_blockages from a relative placement group.

DESCRIPTION

The **remove_rp_group_options** command removes the placement constraints of relative placement groups.

EXAMPLES

The following example uses the **remove_rp_group_options** command to remove the constraint for a relative placement group.

```
prompt> remove_rp_group_options grp_ripple -group_orientation
1
```

remove_rp_groups

Removes relative placement groups from the current design.

SYNTAX

int **remove_rp_groups**
rp_group_list [-hierarchical] | -all

Data Types

rp_group_list list or collection

ARGUMENTS

-all

Removes all relative placement groups from the current block. Please note that relative placement groups of child blocks are not removed. This option is mutually exclusive with *rp_group_list*.

rp_group_list

Specifies a list of relative placement groups to remove. The list may contain relative placement group names, patterns, or collections. A collection may be specified using the **get_rp_groups** command. This option is mutually exclusive with *-all*.

-hierarchical

Specifies that hierarchical relative placement groups at all levels should be removed too, along with specified groups. By default, hierarchical relative placement groups are not removed.

DESCRIPTION

This command removes relative placement groups from the current design. The number of removed groups are returned.

EXAMPLES

The following example removes relative placement group named "top_rp1" and "top_rp2".

```
prompt> remove_rp_groups { top_rp1 top_rp2 }
2
```

The following example removes relative placement groups that match the pattern "rp**".

```
prompt> remove_rp_groups rp*
3
```

The following example removes all relative placement group in the design.

```
prompt> remove_rp_groups -all
5
```

SEE ALSO

create_rp_group(2)

remove_sadp_track_rule

Removes a track rule.

SYNTAX

int **remove_sadp_track_rule**
rules_names | -all

Data Types

rules_names string

ARGUMENTS

rule_names

Specifies the list of SADP track rules to remove. You must specify one or more SADP track rule names or use the **-all** option.

-all

Removes all SADP track rules. You must specify the **-all** option or specify SADP track names.

DESCRIPTION

This command removes the specified self-aligned double patterning (SADP) track rule created with the **create_sadp_track_rule** command.

EXAMPLES

The following examples removes all SADP track rules from the current library.

```
prompt> remove_sadp_track_rule -all
Track rule "tr1" is removed
Track rule "tr2" is removed
Track rule "tr3" is removed
3
```

The following example removes SADP track rules tr1 and tr2 from the current library.

```
prompt> remove_sadp_track_rule {tr1 tr2}
Track rule "tr1" is removed
Track rule "tr2" is removed
2
```

SEE ALSO

check_sadp_tracks(2)
create_sadp_track_rule(2)
generate_sadp_tracks(2)
report_sadp_track_rule(2)

remove_safety_register_groups

Removes safety register groups from the current design.

SYNTAX

status **remove_safety_register_groups**
[*objects*]
[-all]

Data Types

objects collection

ARGUMENTS

objects

Specifies the group objects or names which need to be removed

-all

Removes all the safety_register_group objects defined in the current design.

DESCRIPTION

Removes (deletes) the specified group objects from the current design.

EXAMPLES

The following example creates a collection of safety_register_group objects and then deletes them.

prompt> **remove_safety_register_groups [get_safety_register_groups group1*]**

SEE ALSO

create_safety_register_group(2)
report_safety_register_groups(2)
write_safety_register_script(2)

remove_safety_register_rules

Removes safety register rules from the current design.

SYNTAX

status **remove_safety_register_rules**
[*objects*]
[-all]
[-from *registers*]

Data Types

objects	collection
registers	collection

ARGUMENTS

objects

Specifies the rule objects or names which need to be removed

-all

Removes all the safety_register_rule objects defined in the current design.

-from *registers*

Dissociates the safety_register_rule objects from the specified registers. In other words, it deletes the rule-register association.

DESCRIPTION

Removes the specified rule objects from the current design. If the specified rules are being referenced by any safety_register_group, the command will error out with an appropriate warning.

EXAMPLES

The following example creates a collection of safety_register_rule objects and then deletes them.

prompt> **remove_safety_register_rules [get_safety_register_rules rule1*]**

SEE ALSO

create_safety_register_rule(2)
report_safety_register_rules(2)
write_safety_register_script(2)

remove_scaling_lib_group

Remove a scaling group created with **define_scaling_lib_group**

SYNTAX

string **remove_scaling_lib_group**
group_name | -reflibs libs

Data Types

string *group_name*
collection *libs*

ARGUMENTS

group_name

The name of a scaling group already created. Group names are unique within the system. This argument is exclusive with the *-reflibs* argument, and one or the other is required.

-reflibs *libs*

This is a list of one or more reference libraries in which to remove **ALL** scaling groups.

DESCRIPTION

The **remove_scaling_lib_group** command is provided to allow removal of unneeded or incorrectly created scaling groups with **define_scaling_lib_group**. You can remove a specific group by name, or you can remove all groups in one or more libraries. If all groups are removed from a library, then all traces of them are removed. If a single group is removed by name, and it is not the last group created, then **report_lib** will still show an inactive pane for that group.

EXAMPLES

This example shows the removal of a scaling group.

```
prompt> remove_scaling_lib_group -reflib stdcell.ndm
Information: Removed scaling library group G1 in lib stdcell.ndm (SG-010)
```

SEE ALSO

define_scaling_lib_group(2)

remove_scan_chains

Removes scan chains from the current design.

SYNTAX

int **remove_scan_chains**
[-verbose]
[-all | *scan_chains*]

Data Types

scan_chains collection

ARGUMENTS

-verbose

Display verbose deletion information.

-all

Removes all scan chains in the current design.

scan_chains

Specifies a list of scan chains to remove. The list may contain scan chain collections, specified using the **get_scan_chains** command.

DESCRIPTION

This command removes all specified scan chains.

The number of removed scan chains is returned.

EXAMPLES

The following example removes scan chains:

```
prompt> set a [get_scan_chains SCAN*]
{"SCAN1", "SCAN2", "SCAN3"}

prompt> remove_scan_chains $a
3
```

The following example removes scan chains specified by a pattern list:

```
prompt> remove_scan_chains SCAN* -verbose
Removed scan chain SCAN1
Removed scan chain SCAN2
Removed scan chain SCAN3
3
```

SEE ALSO

create_scan_chain(2)
get_scan_chains(2)

remove_scan_def

Removes any SCANDEF scan chain data in current design.

SYNTAX

status **remove_scan_def**

DESCRIPTION

This command removes any SCANDEF scan chain data in current design. This scan chain data has been previously initialized by using the **read_def** command to read a scan Design Exchange Format (DEF) file, also referred to as a SCANDEF file. The **remove_scan_def** command does not affect the design netlist.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

SEE ALSO

read_def(2)
check_scan_chain(2)
report_scan_chains(2)

remove_scan_rp_group

Removes a DFT Scan relative placement group setup.

SYNTAX

status **remove_scan_rp_group**
rp_group_list
[-all]

Data Types

rp_group_list list or collection

ARGUMENTS

rp_group_list

Specifies the name, a list or a collection of the relative placement groups to be removed from the Scan RP group setup. All groups provided, or their names, must be valid relative placement groups, defined by command **create_rp_group**.

This argument is incompatible with the *-all* argument, and it must be used in an either-or fashion.

-all

Specifies that all Scan RP group setup for all relative placement groups must be removed.

This argument is incompatible with the *rp_group_list* argument, and it must be used in an either-or fashion.

DESCRIPTION

The **remove_scan_rp_group** command removes the setup defined previously by the command **set_scan_rp_group**.

The expected result of the command will be observed by the **report_scan_rp_group** command, and the RP group Scan cells will be used by DFT Scan Synthesis as normal individual Scan cells, allowing DFT Scan Synthesis architecting to put them freely in different Scan chains and/or in arbitrary order, not following any specific order or relationship between other RP group Scan cells but the needs of the overall DFT setup.

Using this command after the design was DFT inserted during commands **compile_fusion** or **insert_dft**, and therefore the Scan chains were already stitched, will not change the original stitching outcome.

EXAMPLES

The following example removes a Scan relative placement setup for RP group named "top_rp".

prompt> **remove_scan_rp_group top_rp**

The following example removes Scan relative placement setup for all RP group that match the pattern "*bottom_rp*".

prompt> **remove_scan_rp_group [get_rp_groups *bottom_rp*]**

The following example removes Scan relative placement setup for all RP group of the design.

prompt> **remove_scan_rp_group -all**

SEE ALSO

create_rp_group(2)
get_rp_groups(2)
write_scan_def(2)
compile_fusion(2)
insert_dft(2)
set_scan_rp_group(2)
report_scan_rp_group(2)

remove_scan_skew_group

Removes scan skew groups defined by the **set_scan_skew_group** command.

SYNTAX

status **remove_scan_skew_group**
scan_skew_group_list

Data Types

scan_skew_group_list list

ARGUMENTS

scan_skew_group_list

Specifies the list of scan skew groups to remove. Wildcards and collections are not supported.

DESCRIPTION

This command removes the specified scan skew groups, which were previously defined by the set_scan_skew_group command.

EXAMPLES

Consider a case where three scan skew groups are initially defined:

```
prompt> report_scan_skew_group

****************************************
Report : Scan Skew Group
Design : top
Version: O-2018.06-SP5-VAL
Date   : Thu Aug 15 00:00:00 2019
****************************************

----------------------------------------
TEST MODE: all_dft
```

```
VIEW    : Specification
----------------------------------------
Scan_skew_group
---------------
Number of user-defined scan skew groups: 3
G1
G2
G3

1
```

To remove two of these scan skew groups, use the following command:

```
prompt> remove_scan_skew_group {G1 G3}
1
```

Now, only a single scan skew group remains:

```
prompt> report_scan_skew_group

****************************************
Report : Scan Skew Group
Design : top
Version: O-2018.06-SP5-VAL
Date   : Thu Aug 15 00:00:00 2019
****************************************

----------------------------------------
TEST MODE: all_dft
VIEW    : Specification
----------------------------------------
Scan_skew_group
---------------
Number of user-defined scan skew groups: 1
G2

1
```

SEE ALSO

set_scan_skew_group(2)
report_scan_skew_group(2)

remove_scenarios

Removes one or more scenarios in multi-mode-multi-corner analysis.

SYNTAX

status **remove_scenarios**
scenario_list
[-all]

Data Types

scenario_list collection

ARGUMENTS

scenario_list

Specifies the scenarios to remove.

-all

Removes all scenarios. This option is mutually exclusive with the *scenario_list* argument and you must specify **-all** or *scenario_list*.

DESCRIPTION

This command deletes the given scenarios, or all scenarios if the *-all* option is given. Note that this command does not delete the mode or corner for the scenario.

The command returns the number of scenarios that were removed.

SEE ALSO

create_scenario(2)
remove_corners(2)
remove_modes(2)
report_scenarios(2)

remove_sdc

Remove constraints from modes, corners, or scenarios

SYNTAX

string **remove_sdc**
[-design]
[-modes *mode_list*]
[-corners *corner_list*]
[-scenarios *scenario_list*]
[-include *include_list*]
[-exclude *exclude_list*]

Data Types

mode_list list
corner_list list
scenario_list list
include_list list
exclude_list list

ARGUMENTS

-design

Remove constraints not associated with any mode, corner, or scenario

-modes *mode_list*

Remove constraints on these modes

-corners *corner_list*

Remove constraints on these corners

-scenarios *scenario_list*

Remove constraints on these scenarios

-include *include_list*

Specifies the types of data to be removed.

Valid values are **case_analysis**, **clock**, **clock_gating_check**, **clock_group**, **clock_latency**, **clock_sense**, **clock_transition**, **clock_uncertainty**, **data_check**, **data_check_ignore**, **disable_timing**, **drive_info**, **edrc**, **exception**, **file_line_info**,

ideal_network, **input_delay**, **load**, **max_time_borrow**, **output_delay**, **path_group**, **pvt**, and **timing_derate**.

By default, all types of data are removed.

This option cannot be specified with the **-exclude** option.

-exclude ***exclude_list***

Specifies the types of data to exclude from removal.

Valid values are **case_analysis**, **clock**, **clock_gating_check**, **clock_group**, **clock_latency**, **clock_sense**, **clock_transition**, **clock_uncertainty**, **data_check**, **data_check_ignore**, **disable_timing**, **drive_info**, **edrc**, **exception**, **file_line_info**, **ideal_network**, **input_delay**, **load**, **max_time_borrow**, **output_delay**, **path_group**, **pvt**, and **timing_derate**.

By default, all types of data are removed.

This option cannot be specified with the **-include** option.

DESCRIPTION

Removes SDC constraints from designs, corners, scenarios, or the design as a whole. Constraints (including clocks) are removed from the specified modes, corners, or scenarios, but the actual modes, corners, or scenarios are **not** deleted.

If no options are given, all SDC constraints are removed from all modes, corners, and scenarios. If the **-design** option is given, the constraints associated with the design as a whole (i.e. not associated with any particular mode, corner, or scenario) are removed. If the **-modes** option is given, all constraints associated with the given mode(s) are removed. Any scenario-based constraints referring to the mode's clocks will also be deleted. If the **-corners** option is given, all constraints associated with the given corner(s) are removed. If the **-scenarios** option is given, all constraints associated with the given scenario(s) are removed.

The analysis settings are cleared for all affected scenarios.

Note that when no options are given, the behavior will be equivalent to:

```
remove_sdc -design -modes [all_modes] -corners [all_corners] -scenarios [all_scenarios]
```

Multicorner-Multimode Support

By default, this command works on all scenarios. To specify different scenarios, use the **-scenarios** option or the **-corners** and **-modes** options.

EXAMPLES

In the following example, the constraints of mode mode1 and scenarios mode1_c1 and mode1_c2 are removed.

```
prompt> remove_sdc -modes mode1 -scenarios {mode1_c1 mode1_c2}
1
```

remove_secondary_pg_placement_constraints

Remove specific secondary pg placement constraints that will allow dual rail cells to be inserted into specific regions.

SYNTAX

status **remove_secondary_pg_placement_constraints**
[-all]
[*constraint_name_list*]

Data Types

constraint_name_list list of string

ARGUMENTS

-all

Remove all secondary pg constraints.

constraint_name_list

Remove the specific secondary pg constraints.

DESCRIPTION

command will remove the secondary power placement constraint previously specified with create_secondary_pg_placement_constraints. One of the following two specifications must be given. If -all is specified, all the secondary power placement constraints previously specified with create_secondary_pg_placement_constraints will be removed. Otherwise, the constraints specified by the list of constraint names will be removed. VA shapes are updated to reflect the state with the constraint(s) removed when the remove_secondary_pg_placement_constraints is followed by commit_secondary_pg_placement_constraints.

EXAMPLES

The following example removes the pg constraint named pg_cstr0.

prompt> **remove_secondary_pg_placement_constraints pg_cstr0**

The following example removes all pg constraints.

```
prompt> remove_secondary_pg_placement_constraints -all
```

SEE ALSO

commit_secondary_pg_placement_constraints(2)
create_secondary_pg_placement_constraints(2)
report_secondary_pg_placement_constraints(2)

remove_sense

Removes unateness information defined on pins or cell timing arcs.

SYNTAX

string **remove_sense**
[-type *type*]
[-all]
[-clocks *clock_list*]
object_list

Data Types

type string
clock_list list
object_list list

ARGUMENTS

-type *type*

Specifies whether the type of sense being removed refers to clock networks or data networks. The possible values for the type variable are: 'clock', 'data'. Note that 'clock' is assumed to be the default if **-type** option is not given.

-clocks *clock_list*

Optionally specifies a list of clock objects to be associated with the given pin objects in object_list. If the **-clocks** option is specified, only the unateness specified for that particular clock domain will be removed. Otherwise, unateness information for all clocks passing through the given pin objects will be removed. The **-clocks** option can only remove clock sense predefined by **set_sense -clock**. It does not remove the default clock sense setting for this given pin.

-all

Remove all unateness information in current design.

object_list

Lists of pins or cell timing arcs with predefined unateness to remove.

DESCRIPTION

Removes the unateness information predefined by the user. To set the unateness information, use the **set_sense** command.

Multicorner-Multimode Support

This command works only on the current mode.

EXAMPLES

The following example removes positive unateness defined on a pin named **XOR/Z** with respect to clock **CLK1**, but does not remove the negative unateness.

```
prompt> set_sense -positive -clocks [get_clocks CLK1] XOR/Z
prompt> set_sense -negative XOR/Z
prompt> remove_sense -clocks [get_clocks CLK1] XOR/Z
```

The following example removes all unateness information in the current design.

```
prompt> remove_sense -all
```

SEE ALSO

set_sense(2)

remove_shape_patterns

Removes shape_patterns from the current design.

SYNTAX

int **remove_shape_patterns**
[-force]
[-verbose]
shape_pattern_list

Data Types

shape_pattern_list collection

ARGUMENTS

-force

Ignore locked status of the objects. If this option is not provided and any of the affected objects has locked status, command will fail generating tcl error.

-verbose

Display verbose deletion information.

shape_pattern_list

Specifies a list of shape_patterns to remove. The list may contain shape_pattern collections, specified using the **get_shape_patterns** command.

DESCRIPTION

This command removes all specified shape_patterns. Shape_patterns are disassociated from their nets, layers, edit groups and groups if any.

The number of removed shape_patterns are returned.

EXAMPLES

The following example removes shape_patterns:

```
prompt> set a [get_shape_patterns -of_objects [get_nets VDD]]
{"PATH_PATTERN_18_06", "PATH_PATTERN_31_256", "PATH_PATTERN_28_122", "PATH_PATTERN_31_255"}

prompt> remove_shape_patterns $a
4
```

The following example removes shape_patterns specified by a pattern list:

```
prompt> remove_shape_patterns POLYGON_PATTERN_28_* -verbose
Removed shape_pattern POLYGON_PATTERN_28_173
Removed shape_pattern POLYGON_PATTERN_28_174
2
```

SEE ALSO

get_shape_patterns(2)

remove_shapes

Removes shapes from the current design.

SYNTAX

int **remove_shapes**
[-force]
[-verbose]
shape_list

Data Types

shape_list collection

ARGUMENTS

-force

Ignore locked status of the objects. If this option is not provided and any of the affected objects has locked status, command will fail generating tcl error.

-verbose

Display verbose deletion information.

shape_list

Specifies a list of shapes to remove. The list may contain shape collections, specified using the **get_shapes** command.

DESCRIPTION

This command removes all specified shapes. Shapes are disassociated with their nets, ports, terminals, layers, and edit groups if any.

When a terminal shape is removed, the associated terminal is removed as well. A terminal cannot exist without its shape.

When a port shape is removed, the associated terminal is removed as well. However the port is not removed, because a port may have zero or more terminals.

The number of removed shapes are returned.

EXAMPLES

The following example removes shapes:

```
prompt> set a [get_shapes -of_objects n300
{"PATH_18_1906", "PATH_31_256", "PATH_28_1322", "PATH_31_255"}

prompt> remove_shapes $a
4
```

The following example removes shapes specified by a pattern list:

```
prompt> remove_shapes POLYGON_28_* -verbose
Removed shape POLYGON_28_1738
Removed shape POLYGON_28_1740
2
```

SEE ALSO

get_shapes(2)

remove_shaping_blockages

Removes the specified shaping blockages.

SYNTAX

status **remove_shaping_blockages**
[-force]
[-verbose]
-all | *blockage_list*

Data Types

blockage_list list

ARGUMENTS

-force

Force the removal of the shaping blockage, even if the shaping blockage is locked. If this option is not provided and any of the affected objects has locked status, the command fails and generates a Tcl error.

-verbose

Show detailed information while removing shaping blockages.

-all

Removes all shaping blockages from the current design. This option is mutually exclusive with the *blockage_list* argument, but you must specify one.

blockage_list

Specifies the shaping blockages. You can specify a collection or the patterns by using the following formats:

* A collection of shaping blockages
* An asterisk (*), which indicates all shaping blockages
* A string

For example, specify a "*blockage_list*" of {SB_1234} to match the shaping blockage named SB_1234.

DESCRIPTION

This command removes the specified shaping blockages.

EXAMPLES

The following example removes all shaping blockages, even if some shaping blockages are locked.

```
prompt> remove_shaping_blockages -all -force
1
```

SEE ALSO

create_shaping_blockage(2)
get_shaping_blockages(2)

remove_shaping_channels

Removes a list or collection of channels from the current block.

SYNTAX

int **remove_shaping_channels**
channel_objects

Data Types

channel_objects list or collection

ARGUMENTS

channel_objects

Specifies the list or collection of channels to remove from the current block.

DESCRIPTION

This command removes a list or collection of channels. Any channel can be removed, even if it is assigned to a shaping_constraint object. Removing a channel might cause a shaping_constraint object to become unset. In that case, the channel removal also triggers a removal of the shaping_constraint object.

EXAMPLES

The following command removes a channel.

prompt> **remove_shaping_channels OBJECT_CHANNEL_0**

The following command removes all channels associated with the given shaping_constraint object.

prompt> **remove_shaping_channels DEFAULT_VA/SHAPING_CONSTRAINT_0_external_channels/***

The following command removes all channels associated with the given constrainable object.

prompt> **remove_shaping_channels DEFAULT_VA/***

SEE ALSO

create_shaping_channel(2)
get_shaping_channels(2)
channel(3)

remove_shaping_constraints

Removes a list of shaping_constraint objects.

SYNTAX

int **remove_shaping_constraints**
shaping_constraint_objects

Data Types

shaping_constraint_objects list or collection

ARGUMENTS

shaping_constraint_objects

A list or collection of shaping_constraint objects to be removed from the current block.

DESCRIPTION

Removes a list or collection of shaping_constraint objects from the current block. Note that shaping_constraint objects of type boundary_status cannot be removed by this (or any) command as they are derived constraints and as such the tool automatically creates and removes them as needed.

EXAMPLES

The following command removes a specific shaping_constraint.

prompt> **remove_shaping_constraints */SHAPING_CONSTRAINT_0_target_location**

The following command removes all shaping_constraints for the object u1/u2.

prompt> **remove_shaping_constraints u1/u2/***

SEE ALSO

create_shaping_constraint(2)
get_shaping_constraints(2)
shaping_constraint(3)

remove_shield_association

Disassociates shielding shapes and vias from shielded nets.

SYNTAX

status **remove_shield_association**
[-objects *shape_and_via_list*]
[-nets *net_list*]

Data Types

shape_and_via_list string, list or collection
net_list string, list or collection

ARGUMENTS

-objects *shape_and_via_list*

Specifies a list of shielding shapes and vias to remove from shield association.

-nets *net_list*

Specifies a list of shielded nets to remove from shield association.

DESCRIPTION

This command disassociates the specified shielding shapes and vias from the shielded nets. At least one of the **-objects** or **-nets** options must be specified. This command will return 1 even if this is no existing shield association between the specified shielding objects and shielded nets.

EXAMPLES

The following example removes shielding shape 'shape1' and shielded net 'net1' from shield association.

```
prompt> remove_shield_association -objects shape1 -nets net1
1
```

The following example removes shielding shape 'shape1' from all shield associations.

```
prompt> remove_shield_association -objects shape1
1
```

The following example removes shielding via 'via1' from all shield associations.

```
prompt> remove_shield_association -objects via1
1
```

The following example removes shielded net 'net1' from all shield associations.

```
prompt> remove_shield_association -nets net1
1
```

SEE ALSO

add_shield_association(2)

remove_signal_io_constraints

Removes signal I/O constraints from the specified I/O guides.

SYNTAX

status **remove_signal_io_constraints**
[-io_guide_list *io_guide*]

Data Types

io_guide list

ARGUMENTS

-io_guide_list

Specifies the name or collection of I/O guides. If no I/O guides are specified, signal constraints on all I/O guides are removed.

DESCRIPTION

This command removes signal constraints from I/O guides.

EXAMPLES

The following example removes signal constraints from an I/O guides io_guide1 and io_guide2.

prompt> **remove_signal_io_constraints -io_guide_list {io_guide1 io_guide2}**

The following example removes signal constraints from all I/O guides.

prompt> **remove_signal_io_constraints**

SEE ALSO

place_io(2)
report_signal_io_constraints(2)
set_signal_io_constraints(2)

remove_site_arrays

Removes site arrays from the current design.

SYNTAX

int **remove_site_arrays**
[-force]
[-verbose]
-all | *site_array_list*

Data Types

site_array_list collection

ARGUMENTS

-force

Ignore locked status of the objects. If this option is not provided and any of the affected objects has locked status, command will fail generating tcl error.

-verbose

Display verbose deletion information.

-all

Removes all site arrays in the current design.

site_array_list

Specifies a list of site arrays to remove. The list may contain site array collections, specified using the **get_site_arrays** command.

DESCRIPTION

This command removes all specified site arrays. Site arrays are disassociated from their environment like stack of site arrays.

Removal of a site array will result in change in stack order and may affect site rows of other site arrays if the removed site array is opaque.

The number of removed site arrays is returned.

EXAMPLES

The following example removes site arrays:

```
prompt> set a [get_site_arrays SA*]
{"SA1", "SA2_4", "SA3"}

prompt> remove_site_arrays $a
3
```

The following example removes site arrays specified by a pattern list:

```
prompt> remove_site_arrays SA* -verbose
Removed site array SA1
Removed site array SA2_4
Removed site array SA3
3
```

SEE ALSO

create_site_array(2)
get_site_arrays(2)

remove_site_defs

Removes site defs from the tech of current or specified library.

SYNTAX

int **remove_site_defs**
[-library *library*]
[-tech *tech_object*]
[-verbose]
-all | *site_def_list*

Data Types

library string or collection
tech_object collection
site_def_list string or collection

ARGUMENTS

-library *library*

Removes the site definition from the technology of this library. Default is current library's tech. This is mutually exclusive with the **-tech** option.

-tech *tech_object*

Removes the site definition from this technology. Default is current library's tech. This is mutually exclusive with the **-library** option.

-verbose

Display verbose deletion information.

-all

Removes all site defs in the tech of current or specified library.

site_def_list

Specifies a list of site defs to remove. The list can contain site def collections, specified using the **get_site_defs** command.

DESCRIPTION

This command removes all specified site defs. Site defs are disassociated from their site_row and site_array usages.

Removal of a site def will result in unbound site_row and site_array objects.

The number of removed site defs is returned.

EXAMPLES

The following example removes site defs:

```
prompt> set a [get_site_defs SD*]
{"SD1", "SD2_4", "SD3"}

prompt> remove_site_defs $a
3
```

The following example removes site defs specified by a pattern list:

```
prompt> remove_site_defs SD* -verbose
Removed site def SD1
Removed site def SD2_4
Removed site def SD3
3
```

SEE ALSO

create_site_def(2)
get_site_defs(2)
report_site_defs(2)

remove_site_rows

Removes site rows from the current design.

SYNTAX

int **remove_site_rows**
[-force]
[-verbose]
-all | *site_row_list*

Data Types

site_row_list collection

ARGUMENTS

-force

Ignore locked status of the objects. If this option is not provided and any of the affected objects has locked status, command will fail generating tcl error.

-verbose

Display verbose deletion information.

-all

Removes all site rows in the current design.

site_row_list

Specifies a list of site rows to remove. The list may contain site row collections, specified using the **get_site_rows** command.

DESCRIPTION

This command removes all specified site rows. Site rows are disassociated from their environment.

Removal of a site row will result in change in core area of block.

The number of removed site rows is returned.

EXAMPLES

The following example removes site rows:

```
prompt> set a [get_site_rows SR*]
{"SR1", "SR2_4", "SR3"}

prompt> remove_site_rows $a
3
```

The following example removes site rows specified by a pattern list:

```
prompt> remove_site_rows SR* -verbose
Removed site row SR1
Removed site row SR2_4
Removed site row SR3
3
```

SEE ALSO

create_site_row(2)
get_site_rows(2)

remove_skew_macros

Removes existing specifications defined by the **set_skew_macros** command.

SYNTAX

int **remove_skew_macros**
[-bank_name *name*]

Data Types

name string

ARGUMENTS

-bank_name *name*

Specifies the bank whose **set_skew_macros** specification needs to be removed. If no banks are specified, then all the **set_skew_macros** specifications on all banks are removed.

DESCRIPTION

The **remove_skew_macros** command removes existing specifications set by using the **set_skew_macros** command. If the bank_name is not specified, the command removes all **set_skew_macros** specifications.

EXAMPLES

The following example removes the bank named 'data1' specification set with the **set_skew_macros** command.

prompt> **remove_skew_macros -bank_name data1**

The following example removes **set_skew_macros** specifications on all banks.

prompt> **remove_skew_macros**

SEE ALSO

report_skew_macros(2)
set_skew_macros(2)

remove_stdcell_fillers_with_violation

Deletes filler cells that have routing DRC violations.

SYNTAX

status **remove_stdcell_fillers_with_violation**
[-name *cell_name*]
[-check_only true | false]
[-check_between_fixed_objects true | false]
[-boundary *rectangular_regions*]
[-post_eco true | false]
[-shorts_only true | false]

Data Types

cell_name list
rectangular_regions list

ARGUMENTS

-name *cell_name*

Specifies the cell instances to consider for removal. The names can include wildcard characters.

If you do not specify this option (or if you specify '*'), the name defaults to '*xofiller*'. If you use this default pattern, all instance names that have the 'xofiller' substring in them, including hierarchical names, are considered for removal.

If the specified cells are not filler cells (which have connections to signal nets), a warning message alerts you about the cells that are not deleted.

-check_only true | false

Controls whether the command runs in checking mode or removal mode.

If **false** (the default), the command runs in removal mode.

If **true**, the command runs in checking mode and does not actually remove the filler cells. In checking mode, the command checks for violations and outputs a file named <*current_design_name*>_fillers_with_violation.rpt that contains a list of the filler cells to be removed with the first violation for each filler cell. This output file is overwritten every time you run the command with the **-check_only true** option.

-check_between_fixed_objects true | false

Controls which objects are checked for violations.

If **false** (the default), the command checks only for violations between filler objects and top-level signal routing objects.

If **true**, the command checks for violations between filler objects and all neighboring objects, including signal routing objects, filler cells, standard cells, PG rail objects, terminals, and so on.

-boundary ***rectangular_regions***

Specifies the rectangular regions within which to delete filler cells with violations. Use the following syntax to specify each rectangular region:

{{*llx lly*} {*urx ury*}}

The *llx* and *lly* arguments specify the x- and y-coordinates of the lower-left corner of the rectangular region; the *urx* and *ury* arguments specify the x- and y-coordinates of the upper-right corner of the rectangular region. The units of the coordinates are the main library units. You can specify one or more rectangular regions.

If you do not specify this option, the command deletes filler cells with violations for the entire design.

-post_eco true | **false**

Controls whether the command deletes only filler cells marked as post-ECO cells by the **create_stdcell_fillers** command.

If **false** (the default), the command deletes filler cells with violations for the entire design.

If **true**, the command deletes only filler cells with violations marked as post-ECO cells by the **create_stdcell_fillers -post_eco** command. After filler cell removal, the command removes the post-ECO markings on the remaining filler cells. The runtime depends on the distribution of the added filler cells; if they are scattered across the design, the runtime can increase significantly.

This option is mutually exclusive with the **-name** and **-boundary** options.

-shorts_only true | **false**

Controls whether the command deletes filler cells with short violations only.

If **false** (the default), the command deletes filler cells with all violations.

If **true**, the command deletes filler cells with short violations only.

This option is mutually exclusive with the **-check_only** option.

DESCRIPTION

This command deletes the specified filler cells that have routing DRC violations. Filler cells are standard cells that do not have any connections to signal nets. The command does not remove filler cells whose **physical_status** attribute has a value of **fixed** or **locked**, even if they have violations. To remove these filler cells, you must first set their **physical_status** attribute to **placed**.

This command is useful when you add filler cells after performing signal routing.

The command deletes filler cells that have power or ground (PG) pins but are not assigned to a PG net if they touch other PG objects, such as rails or pins assigned to a PG net. Therefore, you should connect these pins to PG nets before running the **remove_stdcell_fillers_with_violation** command. For information about connecting pins to PG nets, see the man pages for the **connect_pg_net** and **create_stdcell_fillers** commands.

The command does not remove filler cells that have internal violations, which are violations between objects of the same cell; however, it does issue a warning if it detects this type of violation.

The command outputs an information message about the violation type that causes the deletion for the first 50 deleted cells. If there are multiple violations for the same cell, only one of them is listed.

It is a known limitation of the **remove_stdcell_fillers_with_violation** command that when filler cells are removed, new violations

might be introduced with neighboring filler cells. Therefore, you should run the **remove_stdcell_fillers_with_violation** command multiple times until no more filler cells are removed. In other words, until the command issues the "Deleted 0 cell instances" message.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example removes all filler cells with the prefix "xofiller" that have routing DRC violations. Before removing the filler cells, their status is set to unfixed.

```
prompt> change_selection [get_cells -quiet {xofiller*}]
prompt> set_locked_objects [get_selection] -unlock
prompt> change_selection [get_cells -quiet {xofiller*}] -remove
prompt> remove_stdcell_fillers_with_violation -name "xofiller*"
```

The following example removes the filler cells with routing DRC violations within the specified rectangular region.

```
prompt> remove_stdcell_fillers_with_violation -boundary { { {16.12 32.38} {18.28 34.66} } }
```

The following example shows the post-ECO filler cell insertion flow.

```
prompt> create_stdcell_fillers -post_eco \
  -lib_cells {mylib/DCAP_4X mylib/DCAP_2X mylib/DCAP_1X}
prompt> remove_stdcell_fillers_with_violation -post_eco true
```

The following example removes the filler cells with short violations only.

```
prompt> remove_stdcell_fillers_with_violation -shorts_only true
```

The following example reports all filler cells with routing DRC violations, but does not remove the filler cells.

```
prompt> remove_stdcell_fillers_with_violation -check_only true
```

The following is the content of the generated my_design_fillers_with_violation.rpt file:

```
****************************************
Report : fillers_with_violation
Design : my_design
Version: J-2014.06
Date   : Mon Jun 16 01:10:44 2014
****************************************

instance_name     master_name  violation_type
  layer  violation_location              all_fixed_shapes
xofiller!DCAP!26  DCAP         Less than minimum edge length
  M1-M1  (504.565 635.990  504.585 636.155)  yes
xofiller!DCAP!13  DCAP         Diff net spacing
  M1-M1  (302.075 235.245  302.105 235.410)  no
xofiller!DCAP!59  DCAP         Less than minimum edge length

remove_stub_chains

Removes stub chains from the current design.

SYNTAX

int **remove_stub_chains**
[-verbose]
[-all | *stub_chains*]

Data Types

stub_chains collection

ARGUMENTS

-verbose

Display verbose deletion information.

-all

Removes all stub chains in the current design.

stub_chains

Specifies a list of stub chains to remove. The list may contain stub chain collections, specified using the **get_stub_chains** command.

DESCRIPTION

This command removes all specified stub chains.

The number of removed stub chains is returned.

EXAMPLES

The following example removes stub chains:

```
prompt> set a [get_stub_chains STUB*]
{"STUB1", "STUB2", "STUB3"}

prompt> remove_stub_chains $a
3
```

The following example removes stub chains specified by a pattern list:

```
prompt> remove_stub_chains STUB* -verbose
Removed stub chain STUB1
Removed stub chain STUB2
Removed stub chain STUB3
3
```

SEE ALSO

create_stub_chain(2)
get_stub_chains(2)

remove_supernet_exceptions

Removes supernet transparent settings from the current block.

SYNTAX

status **remove_supernet_exceptions**
-pins *pins_list* | -cells *cells_list* | -all

Data Types

pins_list list
cells_list list

ARGUMENTS

-pins

Specifies the pins in the block whose supernet transparent markings are to be removed. The pins in the list must belong to the same instance.

-cells

Specifies the cells in the block whose supernet transparent settings are to be removed. If the specified cell is a repeater then its *-disable_cell* settings are removed. If the specified cell is non-repeater then supernet transparent settings on the pins are removed.

-all

Removes all the markings of supernet transparent from the block.

DESCRIPTION

This command removes cells and pins as being transparent for supernets from the block.

EXAMPLES

The following example removes all the supernet transparent pins of the instance cntrl/U166

```
prompt> remove_supernet_exceptions -cell {cntrl/U166}
```

SEE ALSO

report_supernet_exceptions(2)
set_supernet_exceptions(2)

remove_supernets

Remove a supernet.

SYNTAX

int **remove_supernets**
[-design *design*]
supernet_collection

ARGUMENTS

-design *design*

Specifies the design in which to remove the supernet. If no design is specified, the supernet is removed from the current design.

supernet_collection

Required argument. The supernets to be removed.

DESCRIPTION

This command allows the user to remove (i.e. delete) supernets. The specified supernets are removed.

EXAMPLES

The following example removes a supernet named IF1.

```
prompt> remove_supernets [get_supernets IF1]
```

SEE ALSO

get_supernets(2)
create_supernet(2)

remove_taps

Removes existing tap points from the design.

SYNTAX

status **remove_taps**
[*taps*]

Data Types

taps list or collection

ARGUMENTS

taps

Specifies a list of taps to be removed. The taps can be specified as name patterns or collections of taps. When this argument is not specified, the **remove_taps** command removes all of the taps from the design.

DESCRIPTION

The **remove_taps** command removes tap points that are previously created using the **create_taps** command. To remove specific taps, use the **get_taps** command to select the tap cells.

Multicorner-Multimode Support

This command has no dependency on scenario-specific, mode-specific, or corner-specific information.

EXAMPLES

The following example shows how to remove all the taps that are currently defined in the design:

```
prompt> remove_taps

INFO: All session taps are removed
```

The following example shows how to remove particular taps:

prompt> **remove_taps Tap_2**

INFO: Removing the specified tap(Tap_2) successfully.

prompt> **remove_taps [get_taps Tap_3]**

INFO: Removing the specified tap(Tap_3) successfully.

SEE ALSO

create_taps(2)
get_taps(2)
report_taps(2)

remove_target_library_subset

Removes target library subsets from the top block and hierarchical cells.

SYNTAX

status **remove_target_library_subset**
[-objects *objects*]
[-top]

Data Types

objects list or collection

ARGUMENTS

-objects *objects*

Specifies the hierarchical cells from which to remove the target library subsets. The cells must be in the current block.

If you do not specify this option or the **-top** option, the tool uses the **-top** option by default. Specifying both options is also supported.

-top

Removes the target library subset from the top block.

If you do not specify this option or the **-objects** option, the tool uses the **-top** option by default. Specifying both options is also supported.

DESCRIPTION

This command removes the target library subsets from the top block and hierarchical cells. This command only removes the subsets which were explicitly set on the objects with the set_target_library_subset command. This command does not remove subsets which are inherited from an ancestor hierarchical cell.

EXAMPLES

The following example removes the target library subset from the top hierarchy.

```
prompt> remove_target_library_subset -top
```

The following example removes the target library subset from a hierarchical cell.

```
prompt> remove_target_library_subset -objects [get_cells top/mid]
```

SEE ALSO

set_target_library_subset(2)
report_target_library_subset(2)

remove_tech

Removes the given technology object from the library.

SYNTAX

string **remove_tech**
tech_object

Data Types

tech_object list

ARGUMENTS

tech_object

Provides a list of tech objects to remove.

DESCRIPTION

This command removes the given tech object from the library that contains it.

EXAMPLES

The following command removes the tech object from the current library.

prompt> **remove_tech [get_techs -of_objects [current_lib]]**
1

SEE ALSO

create_tech(2)
get_techs(2)

remove_terminals

Removes terminals from the current design.

SYNTAX

int **remove_terminals**
[-force]
[-verbose]
terminal_list

Data Types

terminal_list collection

ARGUMENTS

-force

Ignore locked status of the objects. If this option is not provided and any of the affected objects has locked status, command will fail and generate a Tcl error.

-verbose

Display verbose deletion information.

terminal_list

Specifies a list of terminals to remove. The list can contain terminal collections specified using the **get_terminals** command.

DESCRIPTION

This command removes all specified terminals. The terminal is disassociated from its port and its shape or via. The shape or via is no longer owned by any terminal.

The number of removed terminals are returned.

EXAMPLES

The following example removes terminals of a port.

```
prompt> set a [get_terminals -of_objects [get_ports port1]]
{"TM_1", "TM_2", "TM_3", "TM_4"}
prompt> remove_terminals $a
4
```

SEE ALSO

create_terminal(2)
get_terminals(2)

remove_test_model

Permanently removes the test model associated with a design.

SYNTAX

status **remove_test_model**
[-design *design_name*]

ARGUMENTS

-design *design_name*

Specifies the design from which to remove the test model. If this option is not specified, the current design is used.

DESCRIPTION

This command permanently removes the test model associated with a design. If no design name is specified, the test model for the current design is removed.

EXAMPLES

The following command removes the test model for the design named *my_design*:

prompt> **remove_test_model -design my_design**

SEE ALSO

list_test_models(2)
read_test_model(2)

remove_test_protocol

Removes a test protocol from memory for the current design.

SYNTAX

status **remove_test_protocol**

ARGUMENTS

The **remove_test_protocol** command has no arguments.

DESCRIPTION

The **remove_test_protocol** command removes the test protocol from the current design.

EXAMPLES

The following example removes the test protocol from the current design named *my_design*:

```
prompt> remove_test_protocol
1
```

SEE ALSO

create_test_protocol(2)
write_test_protocol(2)

remove_tie_cells

Removes tie cells from the current design.

SYNTAX

status **remove_tie_cells**
[-objects *object_name_or_collection*]

Data Types

object_name_or_collection collection or list

ARGUMENTS

-objects *object_name_or_collection*

Specifies the objects for tie cell removal. Currently supported object types are cell and lib_cell. If this option is not used, all tie cells in current design will be removed. If the object type is cell and it is a tie cell, only the cell will be removed. If the object type is lib_cell, and the lib_cell is a tie cell, all the instances of the lib_cell will be removed.

DESCRIPTION

This command removes tie cells from the design.

SEE ALSO

add_tie_cells(2)
set_lib_cell_purpose(2)

remove_timing_paths_disabled_blocks

Restore the reg2reg timing paths across sub-bocks previously ignored by command **set_timing_paths_disabled_blocks**.

SYNTAX

string **remove_timing_paths_disabled_blocks**

ARGUMENTS

N/A

DESCRIPTION

Restore the reg2reg timing paths across sub-blocks previously ignored by command **set_timing_paths_disabled_blocks**.

Multicorner-Multimode Support

This command has no dependency on scenario-specific, mode-specific, or corner-specific information.

EXAMPLES

prompt> **remove_timing_paths_disabled_blocks**

SEE ALSO

set_timing_paths_disabled_blocks(2)
report_timing(2)
report_qor(2)

remove_topological_constraints

Removes the topological constraints from the current design.

SYNTAX

integer **remove_topological_constraints**
topological_constraints | -all

topological_constraints collection

ARGUMENTS

topological_constraints

Specifies a list of topological pin feedthrough constraints to be removed from the design. Each topological pin feedthrough constraint name in the *topological_constraints* must exist in the design.

You must specify the *topological_constraints* or **-all**. The *topological_constraints* and **-all** options are mutually exclusive.

-all

Removes all the topological pin feedthrough constraints in the design. The *topological_constraints* and **-all** options are mutually exclusive.

DESCRIPTION

This command removes the topological pin feedthrough constraints from the design. To create topological pin feedthrough constraints, use the **create_topological_constraint** command.

EXAMPLES

The following example removes all the topological pin feedthrough constraints specified by the \FITPF_CONSTRAINT_1*\FP collection in the current design.

```
prompt> get_topological_constraints TPF_CONSTRAINT_1*
{TPF_CONSTRAINT_1 TPF_CONSTRAINT_10 TPF_CONSTRAINT_11 TPF_CONSTRAINT_12}

prompt> remove_topological_constraints TPF_CONSTRAINT_1*
```

4

The following example removes all the remaining topological pin feedthrough constraints in the current design.

```
prompt> remove_topological_constraints -all
```

SEE ALSO

create_topological_constraint(2)
get_topological_constraints(2)
report_topological_constraints(2)

remove_topology_edges

Removes topology edges.

SYNTAX

int **remove_topology_edges**
[-all]
[-verbose]
[*topology_edge_list*]

Data Types

topology_edge_list list

ARGUMENTS

-all

Removes all topology_edges from the current block.

-verbose

Displays verbose deletion information.

topology_edge_list

Specifies a list of topology edges to remove. The list may contain topology edge names, patterns, or collections. A collection may be specified by using the **get_topology_edges** command.

RETURN VALUE

The number of removed topology edges.

DESCRIPTION

This command removes topology edges from the current block. Topology nodes that are endpoints of the edges at the time of removal are not themselves removed from the block, however, all topology repeaters owned by the removed edges are also

removed.

EXAMPLES

The following example removes topology_edges that match the pattern "TOPOLOGY_EDGE*".

```
prompt> remove_topology_edges TOPOLOGY_EDGE*
3
```

The following example removes all topology edges in the block.

```
prompt> remove_topology_edges -all
5
```

SEE ALSO

create_topology_edge(2)
create_topology_repeater(2)
get_topology_edges(2)
get_topology_repeaters(2)
remove_topology_repeaters(2)
report_topology_plans(2)

remove_topology_nodes

Removes topology nodes.

SYNTAX

int **remove_topology_nodes**
[-all]
[-join_edges]
[-verbose]
[*topology_node_list*]

Data Types

topology_node_list list

ARGUMENTS

-all

Removes all topology nodes from the current block.

-join_edges

After removing the node, set the start nodes of the removed node outbound edges to the node driving its inbound edge.

-verbose

Displays verbose deletion information.

topology_node_list

Specifies a list of topology nodes to remove. The list may contain topology node names, patterns, or collections. A collection may be specified by using the **get_topology_nodes** command.

RETURN VALUE

The number of removed topology nodes.

DESCRIPTION

This command removes topology nodes from the current block. Any topology_edges that are connected to topology nodes at the time of removal are not themselves removed from the block, rather their endpoints are disconnected from the topology nodes and remain disconnected.

EXAMPLES

The following example removes topology nodes that match the pattern "TOPOLOGY_NODE*".

```
prompt> remove_topology_nodes TOPOLOGY_NODE*
3
```

The following example removes all topology nodes in the block.

```
prompt> remove_topology_nodes -all
5
```

remove_topology_plans

Removes topology plans.

SYNTAX

int **remove_topology_plans**
[-all]
[-verbose]
[*topology_plan_list*]

Data Types

topology_plan_list list

ARGUMENTS

-all

Removes all topology_plans from the current block.

-verbose

Displays verbose deletion information.

topology_plan_list

Specifies a list of topology plans to remove. The list may contain topology plan names, patterns, or collections. A collection may be specified by using the **get_topology_plans** command.

RETURN VALUE

The number of removed topology plans.

DESCRIPTION

This command removes topology_plans from the current block. All topology_nodes and topology_edges owned by the removed plans are also removed.

EXAMPLES

The following example removes topology_plans that match the pattern "TOPOLOGY_PLAN*".

```
prompt> remove_topology_plans TOPOLOGY_PLAN*
3
```

The following example removes all topology_plans in the block.

```
prompt> remove_topology_plans -all
5
```

SEE ALSO

remove_topology_repeaters

Removes topology repeaters.

SYNTAX

int **remove_topology_repeaters**
[-all]
[-verbose]
[*topology_repeater_list*]

Data Types

topology_repeater_list list

ARGUMENTS

-all

Removes all topology repeaters from the current block.

-verbose

Displays verbose deletion information.

topology_repeater_list

Specifies a list of topology repeaters to remove. The list may contain topology repeater names, patterns, or collections. A collection may be specified by using the **get_topology_repeaters** command.

RETURN VALUE

The number of removed topology repeaters.

DESCRIPTION

This command removes topology repeaters from the current block. topology_nodes that are endpoints of the repeaters at the time of removal are not themselves removed from the block, however all topology repeaters owned by the removed repeaters are also

removed.

EXAMPLES

The following example removes topology repeaters that match the pattern "TOPOLOGY_repeater*".

```
prompt> remove_topology_repeaters TOPOLOGY_repeater*
3
```

The following example removes all topology_repeaters in the block.

```
prompt> remove_topology_repeaters -all
5
```

SEE ALSO

create_topology_repeater(2)
create_topology_repeater(2)
get_topology_repeaters(2)
get_topology_repeaters(2)
remove_topology_repeaters(2)
report_topology_plans(2)

remove_track_constraint

This command removes a set of existing track constraints.

SYNTAX

int **remove_track_constraint**
[-all]
[-block *block*]
[-layer *layer*]
[-mask *masks*]
[-track_direction horizontal | vertical]

Data Types

block string
layer string
masks list of masks

ARGUMENTS

-all

The -all argument allows for the removal of all defined track constraints in the given block. It may not be used with any of the -layer, -mask, or -track_direction arguments.

-block *block*

The -block argument specifies the block on which to remove the track constraints. If no block is specified then the current block is used.

-layer *layer*

The -layer argument specifies the layer for which the track constraints should be removed.

-mask *masks*

The -mask argument specifies the mask(s) for which corresponding constraints will be removed. Giving an individual mask value such as mask_one will only remove constraints associated with mask_one. Giving a list of mask values will remove constraints associated with any of the mask values in the list.

Omitting the -mask argument will remove constraints associated with un-colored tracks.

-track_direction horizontal | vertical

The -track_direction argument specifies the track orientation for which corresponding constraints will be removed. Specifying either "horizontal" or "vertical" will remove track constraints associated with the given direction. Omitting this argument will

remove track constraints associated with both track directions.

DESCRIPTION

The remove_track_constraint command removes existing track constraints in the given block.

The user may choose to remove track constraints by either giving the -all argument or a combination of the -layer, -mask, and -track_direction arguments. In the latter case, the three arguments specify the exact constraints to be removed. The arguments specify in an exclusive manner rather than an inclusive manner, meaning that in order to be removed, the constraints must match the layer AND the mask(s) AND the direction.

EXAMPLES

The following command removes the constraints that apply to both vertical and horizontal tracks with a mask color of 1 on layer M1 in block current_block.

```
prompt> remove_track_constraint -block [current_block] -layer M1 -mask mask_one
```

SEE ALSO

set_track_constraint(2)
report_track_constraints(2)

remove_tracks

Removes tracks from the current design.

SYNTAX

status **remove_tracks**
-all | *track_list* | -layer *layer* [-dir X | Y]
[-force]
[-verbose]

Data Types

track_list list
layer collection of one item

ARGUMENTS

-force

Ignore locked status of the objects. If this option is not provided and any of the affected objects has locked status, command will fail generating tcl error.

-all

Removes all tracks in the current design.

The *track_list*, **-all**, and **-layer** arguments are mutually exclusive; you must specify one of these arguments.

track_list

Specifies a list of tracks to remove. The list may contain track names, patterns, or collections. A collection may be specified by using the **get_tracks** command.

The *track_list*, **-all**, and **-layer** arguments are mutually exclusive; you must specify one of these arguments.

-layer *layer*

Specifies the routing layer from which to remove the track. You can specify only one layer, either by layer name, or a collection containing one layer.

The *track_list*, **-all**, and **-layer** arguments are mutually exclusive; you must specify one of these arguments.

-dir X | Y

Specifies the direction of the routing tracks to be removed. The valid values are **X** and **Y**.

By default, the direction is the routing direction of the layer specified in the physical library.

The option must be used with the **-layer** option.

-verbose

Prints additional messages.

DESCRIPTION

This command removes the specified tracks from the current design.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example removes all tracks that are inside {{2 2} {25 25}}.

```
prompt> remove_tracks [get_tracks -within {{2 2} {25 25}}]
1
```

The following example removes all tracks that are located on the metal2 layer.

```
prompt> remove_tracks [get_tracks -of_objects METAL2] -verbose
Removing track TRACK_4683
1
```

The following example removes the routing tracks from the routing layer named m3 on the floorplan.

```
prompt> remove_tracks -layer m3
Warning: Direction is not specified. Using the layer preferred direction.
(NDMUI-125)
1
prompt> remove_tracks -layer m3 -dir X
1
```

remove_utilization_configurations

Removes an existing utilization configuration.

SYNTAX

remove_utilization_configurations
[-scope *config_scope*]
-all | *config*

Data Types

config_scope	string
config	collection

ARGUMENTS

-scope *config_scope*

The values it can take are 'lib', 'tech' and 'block'. Restricts the scope of search for the configurations. By default, the order of search is block, lib and then tech i.e. the configuration is first searched in the current block, then the current library and finally the tech associated with the current library.

-all

Removes all existing configurations.

config

Specifies the name of the configuration to be deleted. A collection of utilization-configs can also be provided as input to this option.

DESCRIPTION

This command can be used to remove an existing utilization configuration.

EXAMPLES

The following example removes a utilization configuration with name 'config1'.

prompt> **remove_utilization_configurations config1**

The following example removes utilization configuration with name 'config2' stored in the current-design library (-scope lib).

prompt> **remove_utilization_configurations config2 -scope lib**

The following example removes all the utilization configurations in the current block.

prompt> **remove_utilization_configurations -all -scope block**

SEE ALSO

create_utilization_configuration(2)
get_utilization_configurations(2)
report_utilization(2)

remove_verification_priority

Removes the **verification_priority** attribute from the specified objects.

SYNTAX

status **remove_verification_priority**
[-all]
object_list

Data Types

object_list list

ARGUMENTS

-all

Removes the **verification_priority** attribute from all of the designs and instances in the designs.

object_list

Specifies a list of objects from which the attribute is to be removed.

DESCRIPTION

This command removes the **verification_priority** attribute from the specified objects.

EXAMPLES

The following example removes the **verification_priority** attribute from all of the designs:

prompt> **remove_verification_priority -all**

SEE ALSO

get_attribute(2)
list_attributes(2)
set_verification_priority(2)

remove_via_defs

Removes via defs from block or technology file.

SYNTAX

int **remove_via_defs**
[-design *design*]
[-library *library*]
[-tech *tech_object*]
[-verbose]
via_def_list

Data Types

design	collection
library	string or collection
tech_object	collection
via_def_list	string or collection

ARGUMENTS

-design *design*

Via definition will be removed from this block. Default is current block. This is mutually exclusive with -library and -tech option.

-library *library*

Via definition will be removed from the technology of this library. Default is current block. This is mutually exclusive with -library and -tech option.

-tech *tech_object*

Via definition will be removed from this technology. Default is current block. This is mutually exclusive with -library and -tech option.

-verbose

Display verbose deletion information.

via_def_list

Specifies a list of via defs to remove. The list may contain via def collections, specified using the **get_via_defs** command.

DESCRIPTION

This command removes all specified via defs. Via defs are disassociated from their via usages.

Removal of a via def will result in unbound via objects.

The number of removed via defs is returned.

EXAMPLES

The following example removes via defs:

```
prompt> set a [get_via_defs VD*]
{"VD1", "VD2_4", "VD3"}

prompt> remove_via_defs $a
3
```

The following example removes via defs specified by a pattern list:

```
prompt> remove_via_defs VD* -verbose
Removed via def VD1
Removed via def VD2_4
Removed via def VD3
3
```

SEE ALSO

create_via_def(2)
get_via_defs(2)
report_via_defs(2)

remove_via_ladder_constraints

Removes via ladder constraints for pins.

SYNTAX

status **remove_via_ladder_constraints**
[-pins *pins*]
[-all]

Data Types

pins collection

ARGUMENTS

-pins *pins*

Specifies the pins from which to remove the via ladder constraints. The pins must have block context and belong to the current block.

The command issues a warning message for each specified pin that does not have via ladder constraints.

This option is mutually exclusive with the **-all** option; you must specify one of these options.

-all

Removes the via ladder constraints from all pins.

This option is mutually exclusive with the **-pins** option; you must specify one of these options.

DESCRIPTION

The **remove_via_ladder_constraints** command removes the via ladder constraints from the specified pins.

This command returns 1 if it succeeds, 0 otherwise.

EXAMPLES

The following example removes the via ladder constraints for all pins.

```
prompt> remove_via_ladder_constraints -all
1
```

The following example removes the via ladder constraints for the specified pin.

```
prompt> remove_via_ladder_constraints -pins [get_pins u1/i2]
1
```

SEE ALSO

set_via_ladder_constraints(2)
report_via_ladder_constraints(2)
set_via_ladder_candidate(2)
reset_via_ladder_candidates(2)
report_via_ladder_candidates(2)

remove_via_ladder_rules

Removes via ladders rules for the block.

SYNTAX

status **remove_via_ladder_rules**

DESCRIPTION

This command removes via ladder rules for the block set using set_via_ladder_rules.

This command returns 1 if succeeded, 0 otherwise.

EXAMPLES

```
prompt> remove_via_ladder_rules
1
```

SEE ALSO

set_via_ladder_rules(2)
report_via_ladder_rules(2)

remove_via_ladders

Removes via ladder from the current design.

SYNTAX

int **remove_via_ladders**
[-verbose]
[-force]
[-nets *nets*]
[-pins *pins*]
[*via_ladder_list*]

Data Types

nets collection
via_ladder_list collection

ARGUMENTS

-force

Ignores the locked status of the objects. If this option is not provided and any of the affected objects has locked status, command will fail generating a Tcl error.

-verbose

Displays verbose deletion information.

-nets *nets*

Removes all the via ladders which are connected to the specified net or collection of nets.

-pins *pins*

Removes all the via ladders which are connected to the specified pin or collection of pins.

via_ladder_list

Specifies a list of via ladders to be removed. The list may contain via ladder collections specified using the **get_via_ladders** command.

DESCRIPTION

This command removes all specified via ladders. All the shapes associated with the specified via ladders will be removed from the design.

The command returns the number of via ladders that were removed.

EXAMPLES

The following example removes a via ladder:

```
prompt> set a [get_via_ladder -of_objects MemData[31]]
{VIA_LADDER_0 VIA_LADDER_1}

prompt> remove_via_ladders $a
2
```

The following example removes via ladders specified by a pattern list:

```
prompt> remove_via_ladders -verbose *_1
Removed via ladder VIA_LADDER_1
1
```

SEE ALSO

get_via_ladders(2)

remove_via_mappings

Removes the via-mapping options used during redundant via insertion, from current block.

SYNTAX

status **remove_via_mappings**
[-from {*via_pattern*}]
[-to {*via_pattern*}]
[-all]

Data Types

via_pattern string

ARGUMENTS

-from {*via_pattern*}

Specifies the via-pattern corresponding to the vias to be replaced during redundant via insertion.

Any via-mapping whose "to be replaced" via matches with this pattern will be removed.

A via-pattern has two parts: viaDefName and site_spec mxn. viaDefName is via definition name. mxn specifies the number of contacts in the horizontal (m) and vertical (n) directions.

-to {*via_pattern*}

Specifies the via-pattern corresponding to the vias to be inserted during redundant via insertion.

Any via-mapping option whose "replacement" via matches with this pattern will be removed.

-all

Removes all the via-mapping options in the current-block.

DESCRIPTION

The **remove_via_mappings** command removes from the current block, any existing via-mapping options. One of the optional arguments must be specified.

EXAMPLES

The following example removes the via-mapping options for the replacement of vias with via-def 'VIA12':

prompt> **remove_via_mappings -from {VIA12 1x1}**

The following example removes the via-mapping options where, the replacement via is a double via with via-def 'VIA12':

prompt> **remove_via_mappings -to {VIA12 1x2}**

The following example removes the via-mapping options for via replacement from vias with via-def 'VIA12' to a double via with via-def 'VIA12':

prompt> **remove_via_mappings -from {VIA12 1x1} -to {VIA12 1x2}**

The following example removes all the existing via-mapping options in the current block:

prompt> **remove_via_mappings -all**

SEE ALSO

add_via_mapping(2)
report_via_mapping(2)

remove_via_matrixes

Removes via matrixes from the current design.

SYNTAX

int **remove_via_matrixes**
[-verbose]
[-force]
[via_matrix_list]

Data Types

via_matrix_list collection

ARGUMENTS

-force

Ignore locked status of the objects. If this option is not provided and any of the affected objects has locked status, command will fail generating tcl error.

-verbose

Display verbose deletion information.

via_matrix_list

Specifies a list of via matrixes to remove. The list may contain via matrix collections, specified using the **get_via_matrixes** command.

DESCRIPTION

This command removes all specified via matrixes. Via matrixes are disassociated with their nets, and edit groups if any.

The number of removed via matrixes are returned.

EXAMPLES

The following example removes via matrixes:

```
prompt> set a [get_via_matrixes -of_objects MemData[31]]
{VIA_MATRIX_1 VIA_MATRIX_0}

prompt> remove_via_matrixes $a
2
```

The following example removes via matrixes specified by a pattern list:

```
prompt> remove_via_matrixes -verbose *_1
Removed via matrix VIA_MATRIX_1
1
```

SEE ALSO

get_via_matrixes(2)

remove_via_regions

Removes user and system via regions from a frame block.

SYNTAX

int **remove_via_regions**
[-design *design*]
[-verbose]
[*via_regions*]

Data Types

design collection
via_regions collection

ARGUMENTS

-design *design*

Specifies the design for frame block from which to remove via regions. By default, the command removes via regions from the current frame block.

-verbose

Show detailed information while removing via regions.

via_regions

Specifies via regions to remove. The list may contain via region collections, specified using the **get_via_regions** command.

By default, the command removes all via regions from the frame block.

DESCRIPTION

This command removes all specified user and system via regions.

The number of removed via regions are returned.

EXAMPLES

The following example removes via regions:

```
prompt> set a [get_via_regions -of_objects Clk
{"Clk/VR_0", "Clk/VR_3"}

prompt> remove_via_regions $a
2
```

The following example removes vias specified by a pattern list:

```
prompt> remove_via_regions D1/*
2
```

SEE ALSO

create_via_region(2)
get_via_regions(2)
report_via_regions(2)

remove_via_rules

Removes via_rule objects from the block or technology file.

SYNTAX

collection **remove_via_rules**
[-design *design*]
[-library *library*]
[-tech *tech*]
[-all]
[*via_rule_list*]

Data Types

design	collection
library	collection
tech	collection
via_rule_list	string or collection

ARGUMENTS

-design *design*

Removes via rule the specified block. This option is mutually exclusive with the **-library** and **-tech** options. By default, via rules are removed from the current block.

-library *library*

Removes via rules from the technology for this library. This option is mutually exclusive with the **-tech** and **-design** options. By default, via rules are removed from the current block.

-tech *tech*

Removes via rules from the specified technology. This option is mutually exclusive with the **-library** and **-design** options. By default, via rules are removed from the current block.

-all

Removes all via rules in the specified scope. You must specify either **-all** or *via_rule_list*.

via_rule_list

Specifies a list of via rules to remove in the specified scope. You must specify either **-all** or *via_rule_list*.

RETURN VALUE

This command returns the removed via rule's count, an empty string if it fails, or a TCL_ERROR if there is a command syntax error.

DESCRIPTION

This command removes all specified via rules from the specified block or the technology file. Via rules are disassociated from their usages. You must specify either **-all** or *via_rule_list*.

EXAMPLES

The following example removes the via rule named *VR1*

```
prompt> remove_via_rules VR1
1
```

SEE ALSO

create_via_rule(2)
get_via_rules(2)
report_via_rules(2)

remove_vias

Removes vias from the current design.

SYNTAX

int **remove_vias**
[-force]
[-verbose]
via_list

Data Types

via_list collection

ARGUMENTS

-force

Ignore locked status of the objects. If this option is not provided and any of the affected objects has locked status, command will fail generating tcl error.

-verbose

Display verbose deletion information.

via_list

Specifies a list of vias to remove. The list may contain via collections, specified using the **get_vias** command.

DESCRIPTION

This command removes all specified vias. Vias are disassociated with their nets, ports, terminals, and edit groups if any.

When a terminal via is removed, the associated terminal is removed as well. A terminal cannot exist without its via.

When a port via is removed, the associated terminal is removed as well. However the port is not removed, because a port may have zero or more terminals.

The number of removed vias are returned.

EXAMPLES

The following example removes vias:

```
prompt> set a [get_vias -of_objects n300
{"VIA_S_1", "VIA_S_2", "VIA_SA_31", "VIA_C_43"}

prompt> remove_vias $a
3
```

The following example removes vias specified by a pattern list:

```
prompt> remove_vias VIA_S_* -verbose
Removed via VIA_S_1
Removed via VIA_S_2
2
```

SEE ALSO

get_vias(2)

remove_virtual_connections

Remove all virtual connections or specified virtual connections.

SYNTAX

status **remove_virtual_connections**
patterns
| *-all*

Data Types

ARGUMENTS

patterns

Remove matched virtual connection against patterns. Patterns can include the wildcard characters "*" and "?". Patterns can also include collections of type virtual connection. The two options are mutually exclusive with each other. You must specify one, but not both.

-all

Removes all the virtual connections. The two options are mutually exclusive with each other.

DESCRIPTION

This command removes all virtual connections or specified virtual connections.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following examples removes the virtual connection.

Remove all virtual connections.
prompt> **remove_virtual_connections -all**

Remove one virtual connection.

```
prompt> remove_virtual_connections \
    [get_virtual_connections -name SNPS_vc_2]

prompt> remove_virtual_connections SNPS_vc_2
```

Remove some virtual connections.

```
prompt> remove_virtual_connections \
    {SNPS_vc_2 SNPS_vc_3}

prompt> remove_virtual_connections SNPS_vc*

prompt> remove_virtual_connections \
    [get_virtual_connections -of_objects [get_pins {U212/ZN U256/I}]
```

remove_virtual_pads

Removes existing virtual pads.

SYNTAX

status **remove_virtual_pads**
[-net *net*]
[-coordinate {*x y*}]
[-layer *layer_name*]
[-all]

Data Types

net collection
x float
y float
layer_name collection

ARGUMENTS

-net *net*

Specifies the net from which to remove the virtual pads.

-coordinate *coordinate*

Specifies the coordinate of the virtual pads to remove.

-layer *layer_name*

Specifies the layer name on which to remove the virtual pads.

-all

Removes all virtual pads from the current design.

DESCRIPTION

This command removes existing virtual pads from the current design.

Multicorner-Multimode Support

This command is not supported in a multi-scenario design flow.

EXAMPLES

The following example removes the virtual pad for net VDD at location {1000 1000}.

prompt> **remove_virtual_pads -net VDD -coordinate {1000 1000}**

The following example removes all existing virtual pads.

prompt> **remove_virtual_pads -all**

SEE ALSO

analyze_power_plan(2)
read_virtual_pad_file(2)
report_virtual_pads(2)
set_virtual_pad(2)
write_virtual_pad_file(2)

remove_voltage_area_rules

Removes voltage area rules from the design.

SYNTAX

int **remove_voltage_area_rules**
[-verbose]
-all | *voltage_area_rules*

Data Types

voltage_area_rules collection

ARGUMENTS

-verbose

Displays verbose deletion information. Prints the name of each rule as it is deleted.

-all

Removes all voltage area rules in the design.

voltage_area_rules

Specifies the voltage area rules to remove. This can be a collection handle of voltage area rules or names of patterns. You can use the **get_voltage_area_rules** command to specify objects.

RETURN VALUE

The number of removed voltage area rules.

DESCRIPTION

This command removes voltage area rules from the design.

EXAMPLES

The following example removes the voltage area rule named "RULE1" from the design.

prompt> **remove_voltage_area_rules RULE1**

The following example removes all voltage area rules from the design.

prompt> **remove_voltage_area_rules -all**

SEE ALSO

create_voltage_area_rule(2)
get_voltage_area_rules(2)
report_voltage_area_rules(2)

remove_voltage_area_shapes

Removes voltage_area shapes from the current design.

SYNTAX

status **remove_voltage_area_shapes**
[-force]
[-verbose]
-all | *voltage_area_shape_list*

Data Types

voltage_area_shape_list list

ARGUMENTS

-force

Ignore locked status of the objects. If this option is not provided and any of the affected objects has locked status, command will fail generating tcl error.

-verbose

Prints additional messages.

-all

Removes all voltage_area shapes in the current design.

voltage_area_shape_list

Specifies the list of voltage_area shapes to be removed. The voltage_area_shape_list can be a collection handle of voltage_area_shapes or names of patterns. You can use the **get_voltage_area_shapes** command to specify objects.

RETURN VALUE

The number of removed voltage_area_shapes.

DESCRIPTION

This command removes voltage_area shapes from the design. If all voltage_area shapes of a particular voltage_area are removed, the voltage_area is removed as well.

EXAMPLES

The following example removes voltage_area shapes of voltage_area tap1:

```
prompt> remove_voltage_area_shapes [get_voltage_area_shapes -of_objects tap1]
3
```

The following example removes all voltage_area shapes in the design:

```
prompt> remove_voltage_area_shapes -all
10
```

SEE ALSO

create_voltage_area_shape(2)
get_voltage_area_shapes(2)
create_voltage_area(2)
get_voltage_areas(2)
report_voltage_areas(2)
remove_voltage_areas(2)

remove_voltage_areas

Removes voltage_areas from the current design.

SYNTAX

status **remove_voltage_areas**
[-force]
[-verbose]
-all | *voltage_area_list*

Data Types

voltage_area_list list

ARGUMENTS

-force

Ignore locked status of the objects. If this option is not provided and any of the affected objects has locked status, command will fail generating tcl error.

-verbose

Prints additional messages.

-all

Removes all voltage_areas in the current design.

voltage_area_list

Specifies the voltage_areas. The voltage_area_list can be a collection handle of voltage_areas or names of patterns. You can use the **get_voltage_areas** command to specify objects.

RETURN VALUE

The number of removed voltage_areas.

DESCRIPTION

This command removes voltage_areas from the design.

EXAMPLES

The following example removes voltage_areas whose names begin with *tap*:

```
prompt> remove_voltage_areas tap*
1
```

SEE ALSO

create_voltage_area(2)
get_voltage_areas(2)
report_voltage_areas(2)
create_voltage_area_shape(2)
remove_voltage_area_shapes(2)
get_voltage_area_shapes(2)

rename

Renames or deletes a command.

SYNTAX

string **rename**
old_name
new_name

ARGUMENTS

old_name

Specifies the current name of the command.

new_name

Specifies the new name of the command.

DESCRIPTION

Renames the *old_name* command so that it is now called *new_name*. If *new_name* is an empty string, then *old_name* is deleted. The *old_name* and *new_name* arguments may include namespace qualifiers (names of containing namespaces). If a command is renamed into a different namespace, future invocations of it will execute in the new namespace. The **rename** command returns an empty string as result.

Note that the **rename** command cannot be used on permanent procedures. Depending on the application, it can be used on all basic builtin commands. In some cases, the application will allow all commands to be renamed.

WARNING: **rename** can have serious consequences if not used correctly. When using **rename** on anything other than a user-defined Tcl procedure, you will be warned. The **rename** command is intended as a means to wrap other commands: that is, the command is replaced by a Tcl procedure which calls the original. Parts of the application are written as Tcl procedures, and these procedures can use any command. Commands like **puts**, **echo**, **open**, **close**, **source** and many others are often used within the application. Use **rename** with extreme care and at your own risk. Consider using **alias**, Tcl procedures, or a private namespace before using **rename**.

EXAMPLES

This example renames my_proc to my_proc2:

```
prompt> proc my_proc {} {echo "Hello"}
prompt> rename my_proc my_proc2
prompt> my_proc2
Hello
prompt> my_proc
Error: unknown command 'my_proc' (CMD-005).
```

SEE ALSO

define_proc_attributes(2)

rename_block

Renames a block in memory to a new block in the same or different library, view or label.

SYNTAX

block_return **rename_block**
[-force]
[-verbose]
[-hierarchical]
[-from_block *block*]
-to_block *block_name*

Data Types

block_return Collection containing block or "".
block Block name in [libName:]blockName[/labelName][.view-Name] format or a collection of one block.
block_name Name in form [libName:]designName[/labelName][.viewName]

ARGUMENTS

-force

This option is used when the destination is (or may be) open and modified but not yet saved.

-verbose

Prints out additional debugging and informational messages.

-hierarchical

This option is used to rename an entire physical hierarchy of the given block. When used with a specific label name, it rename each non lib-cell sub-block and all its views into the specified label. It follows the hierarchy into the reference blocks and rename the sub-blocks referenced by its instances, stopping when it reaches the leaf-level lib-cell references. Each labeled block is renamed in-place in the library of the original block, and each of its non lib-cell instances would have their reference updated to point to the new labeled block.

-from_block *block*

Source block name with optional library , label, and view specifications. If the library specification is not present, the **current_lib** is used. If the label specification is not present, then the default un-named label is used. If the view specification is not present, then *design* is used. If the option is not given, the **current_block** is used.

-to_block *block_name*

The destination block name with optional library and view specifications. If the library, block, or view specifications are not

present, the values from the source block are used.

RETURN VALUE

Returns the block if successful, or O if not. If an illegal name is given for the source or destination block names, a Tcl error is raised.

DESCRIPTION

This command renames a source block to a destination with the same or different library or block in memory. If the source block is freshly created and has no on-disk copy, the in-memory block will just be renamed to the destination and the original block is gone. if the source block has a disk copy, it will be renamed in-memory only, while the on-disk copy is untouched. The renamed in-memory block will then be saved temporarily to disk so that it becomes independent from the source block (in case the source block is later removed). The temporarily saved disk copy will remain valid until a close_block **-force** command is issued to discard the change, or a **close_lib** command is used to close the library without saving the change, at which point the temporary design file and directory will be removed.

Note that the block cannot be renamed if any of its views are referenced by another blocks. For instance, in a top-mid-bot 3-level hierarchy setup, "top" itself can be renamed with the **rename_block** command, and the entire top-mid-bot hierarchy can be renamed with the **rename_block -hierarchical** command. But it is an error to individually rename "mid" or "bot" while "top" references them.

The command will fail if the destination library or block is opened in read-only mode, or if the destination block is opened and has been modified but not saved and the **-force** option is not used, or if an illegal name is given for the source or destination library, block or view.

When no view is explicitly specified for both source and destination then all available views of source block are renamed into destination block and the design view of destination block is returned.

A given source block view can't be renamed into a different destination block view, like a design view can't be renamed to an abstract view. An error is issued while trying to do such operation.

EXAMPLES

This example renames a current_block "Top" to "Top2". The destination library and view are taken from the original block.

```
prompt> current_block Top
prompt> rename_block -to_block Top2
{"Lib:Top2.design"}
prompt> current_block
{"Lib:Top2.design"}
```

This example renames a block Top into a different label Top/label1

```
prompt> rename_block -from_block Top -to_block Top/label1
{"Lib:Top/label1.design"}
```

This example renames the entire design hierarchy into a different label:

```
prompt> rename_block -from_block Top -to_block Top/label1 -hierarchical -verbose
Information: Renaming 'Lib:Top.design' to 'Lib:Top/label1.design'. (DES-055)
Information: Renaming 'Lib:Mid.design' to 'Lib:Mid/label1.design'. (DES-055)
Information: Renaming 'Lib:Mid.abstract' to 'Lib:Mid/label1.abstract'. (DES-055)
Information: Renaming 'Lib:Bot.design' to 'Lib:Bot/label1.design'. (DES-055)
Information: Renaming 'Lib:Bot.abstract' to 'Lib:Bot/label1.abstract'. (DES-055)
Information: Renaming 'Lib:Top.outline' to 'Lib:Bot/label1.outline'. (DES-055)
```

This example renames a block Mid into a new library RefLib1.

```
prompt> rename_block -from_block Mid -to_block RefLib1:
{"RefLib1:Mid.design"}
```

rename_module

Rename module(s) in memory.

SYNTAX

status **rename_module**
module_list
[*target_name*]
[-prefix *prefix_name*]
[-postfix *postfix_name*]

Data Types

module_list	list
target_name	string
prefix_name	string
postfix_name	string

ARGUMENTS

module_list

Specifies a list of modules to be renamed.

target_name

Specifies the new name of the module. *target_name* can only be used when *module_list* contains one module,

You must specify either *target_name*, or *-prefix*, or *-postfix*. These arguments are mutually exclusive; you can only specify one.

-prefix *prefix_name*

Specifies the prefix name that is inserted in front of names of modules in *module_list*. One of *target_name*, *-prefix*, or *-postfix* is required, but they are mutually exclusive.

-postfix *postfix_name*

Specifies the postfix name that is appended to the names of modules in *module_list*. One of *target_name*, *-prefix*, or *-postfix* is required, but they are mutually exclusive.

DESCRIPTION

The most simple use of this command is to assign a new name to a single module. Another use of this command is to add a prefix or postfix to multiple modules by using the -prefix or -postfix options.

Note that within a block, every module name must be unique and an error occurs if the name of the new module already exists.

EXAMPLES

The following example renames the module named *middle* to *mid*:

```
prompt> rename_module middle mid
Information: In design 'top', renaming module 'middle' to 'mid'.
1
```

The *-prefix* and *-postfix* options provide a convenient and efficient way to rename multiple modules. For instance, the following script prepends the string *NEW_* to the name of module *D*. The new module name will be reflected when querying for the reference name of the cells

```
prompt> get_cells -hierarchical -filter "ref_name == D"
{b_in_a/c_in_b/d1_in_c b_in_a/c_in_b/d2_in_c}

prompt> rename_module D -prefix NEW_
Information: In design 'myBlock', renaming module 'D' to 'NEW_D'. (NDMUI-623)

prompt> get_cells -hierarchical -filter "ref_name == D"   ;# no such cells!
prompt> get_cells -hierarchical -filter "ref_name == NEW_D"
{b_in_a/c_in_b/d1_in_c b_in_a/c_in_b/d2_in_c}
```

remove_modules(3)

reopen_block

Changes the open mode of an open block and sets the top module of the block as current. The default open mode is "edit".

SYNTAX

return_val **reopen_block**
[-edit | -read | -new]
[-force]
[*block*]

Data Types

return_val 0 (or 1) if command failed (or succeeded).
block Block name in [libName:]blockName[/labelName][.viewName] format or a collection of one block.

ARGUMENTS

-edit

This is the default option when no open-mode is specified. It can be used to upgrade a block from read mode to edit mode. It can also be used to downgrade a block from new mode to edit mode, discard the in-memory block content and revert to the last saved state. It is an error to downgrade from new mode to edit mode if the block does not have a copy on disk.

-read

Downgrade a block from edit/new mode to read mode. Discard the in-memory block content and revert to the last saved state. Downgrade a block from edit/new mode to read mode. Discard the in-memory block content and revert to the last saved state. The block must have a copy on disk, otherwise an error message is printed. If the block has in-memory changes that haven't been saved to disk, the **-force** option must be used or an error message is printed.

-new

Discard the in-memory block content and reinitialize the block in new mode. If the block has in-memory changes that haven't been saved to disk, the **-force** option must be used or an error message is printed.

-force

When used with the **-read** option, force the block to be downgraded and reverted to the last saved state, even if the block has in-memory modifications that are not saved. When used with the **-new** option, force the block content to be discarded and become an empty block even if the block is modified but not yet saved.

block

The source block name with optional library, label, and view specifications. If the library specification is not present, the **current_lib** is used. If the label specification is not present, the default unnamed label is used. If the view specification is not

present, then *design* is used. If the option is not given, the **current_block** is used.

RETURN VALUE

Returns 1 if the block is saved and 0 if not. If an illegal name (with a slash) is given for the block, a Tcl error is raised.

DESCRIPTION

This command modifies the open mode of an already-open block. It is most often used to "downgrade" the open mode from edit to read, and can be used to reinitialize a block by re-opening it with the **-new** option. The command fails if you attempt to "downgrade" from edit or new mode to read mode, or from new mode to edit mode, and there is no copy on disk. The command also fails if you attempt to "downgrade" or reinitialize a block and it has been modified but not saved and the **-force** option is not used.

If the library is already open in read mode, **reopen_block -edit** will promote the library open mode to edit. This can be disabled by setting the **design.edit_read_only_libs** application option to false.

EXAMPLES

Reopen a read only Top to edit mode so it can be edited:

```
prompt> reopen_block -edit Top
1
```

Reopen a read only block, reinitialize it to re-create it:

```
prompt> reopen_block -new Top
1
```

Reopen an already-modified edit mode block into read mode, abandoning the changes along the way:

```
prompt> reopen_block -force -read Top
1
```

reparent_cells

Moves one or more cells from their current hierarchy location to a new one.

SYNTAX

<new_cells> **reparent_cells**
[-remove_floating_pins]
[-port_prefix *prefix_name*]
[-cell_prefix *prefix_name*]
[-check_only]
-cells [*cell_list*]
-to *cell_path*

Data Types

cell_list list
cell_path string
prefix_name string
new_cells collection of moved cells

ARGUMENTS

-to *cell_path*

Specifies a destination to where the cells will be moved. As each object is moved, it carries with it its connectivity, which may result in port-punching and possibly port removal in the intervening levels between the object source location and the destination.

-cells *cell_list*

Specifies a list of hierarchical cells that will be moved from their current location to the destination given in the *-to* argument. Note that not all of the given cells must currently be in the same hierarchical path in the design.

-remove_floating_pins

If this option is given, when ports become unused as a result of the movement of the specified objects, they will be removed. By default, they are left alone so that the port signature of cells will match the original definition, possibly including additional ports due to the port-punching necessary when moving the cells.

-port_prefix *prefix_name*

When new ports are created during port-punching as cells are moved, they are given a default name which will match the net name of the original net (if possible, or that name with a suffix of _# to make the name unique). If the user would prefer a specific port prefix for the newly-created ports, they can specify it with this option.

-cell_prefix *prefix_name*

When the cells are moved, they are given a default name which will match the cell name of the original cell (if possible, or that name with a suffix of _# to make the name unique). If the user would prefer a specific cell prefix for the newly-created cells, they can specify it with this option. This can make it easier to identify moved cells at a later time.

-check_only

When this option is used, all of the pre-command checks are executed, and a report is given indicating which (if any) moves will be made. But nothing is moved, no ports are punched, no cells are uniquified. This option is used for script debugging to make sure the command will behave as desired.

DESCRIPTION

This command moves one or more cell from their current location in the logic hierarchy to a different place in the logic hierarchy. It preserves the connectivity of the cells during the move, which can result in new ports being created to carry the connectivity and keep it intact (this is called port-punching). Note that the specified cells need not be rooted at the same place in the design hierarchy (although they will most frequently be found together).

On successful completion, the command will destroy any input collection (as the moved cells no longer exist in their previous location(s)). The command returns a collection of the newly-moved cells, in the same order as they appeared in the one or more -cells options.

The command is undoable, and if undo is executed after the command completes, the entire system will be restored to the state it was at before the command executed. Note that many subsequent operations can clear the system undo stack, making it impossible to undo any previous commands, including this one. So exercise care when using this command.

If possible, the cell name will be kept the same after the move. Note that this is not the cell path, but the tail component of that path. If there is an already-existing cell with that name in the destination, a _# will be appended to the name in order to make it unique. If the -cell_prefix option is used it will be prepended to the cell name.

Note that before the command will execute, it will check that:

- All levels between and including the source(s) and destination are writable and editable
- Ports will be able to be made on all intermediate cells subject to dont_touch
- It is possible to update UPF as needed
- It is possible to update constraints as needed

If one or more of these checks fails the entire command will fail and report which of the above condition(s) are present and preventing the command from operating as specified.

This command currently operates on a gate-level netlist. When the gen_sys flow is in effect, the command operates on the post-elaboration (generic) netlist created in the system. In this case it will fail if one or more of the moved cells is not at or above the synthesis-invariant level (meaning that this move has no direct correspondent at the RTL level).

Other than the restrictions listed above, there are no restrictions in moving cells.

In order to keep the original port signature for each logic cell as intact as possible, by default any ports which become completely disconnected in reaction to the move will be left in place. If the -remove_floating_ports option is used, then those disconnected ports will be removed to leave the port signature as small as possible.

As is the case with all design-modification commands, in the case of multiply-instantiated modules, reparenting that affects one of a set of MIMs will cause a uniquification of the affected MIM(s) before the move takes place. Specifically, if an *instance* of a module that is multiply-instantiated is moved, no uniquification will (or needs to) take place. However, if an instance *inside* a multiply-instantiated module is moved, then the uniquification will take place.

As port-punching takes place, the command will attempt to preserve the names of the moved cells' internal nets as it creates new ports through the logic hierarchy. If there is a conflict at any given level with an already-existing port, the command will append _# to the net name, cycling through numbered additions until a port name with no conflict is found. If a user would prefer that the created ports have a specific prefix instead (perhaps to be able to identify punched ports later on), then the specified prefix will be prepended to the net name.

Also note that as the cells, both timing constraints and UPF are adjusted to account for the new structure. If the design is set to use the Golden UPF flow, the changes will be made consistent with that flow. SVF data will be updated to help Formality properly compute the correspondence of the modified design to previous versions. This helps underscore the economy of scale present when moving a cloud of connected logic all at the same time as opposed to moving the same set of cells one at a time.

EXAMPLES

The following example takes the classic top/mid/bot logic hierarchy, and moves mid1/bot2 into mid2.

```
prompt> reparent_cell mid1/bot2 -to mid2
{mid2/bot2_1}
```

Note that since there already was a mid2/bot2, that mid1/bot2 had _1 appended to it to make it unique and avoid the conflict with the other bot2.

The following example finds every cell called "glue_logic" and moves them to the top level.

```
prompt> reparent_cell [get_cells -hierarchical glue_logic] -to /
{glue_logic glue_logic_1 glue_logic_2 glue_logic_3}
```

Note that in this case since the command itself would have created cell name conflicts that the second and subsequent cells have _# appended to their name.

replace_clock_gates

Automatically searches for and replaces all combinational cells that are clock gates with integrated latch-based clock gate cells.

SYNTAX

status **replace_clock_gates**

ARGUMENTS

The replace_clock_gates command has no arguments.

DESCRIPTION

This command performs replaces all combinational cells in the design that are clock gates with integrated latch-based clock gates. Before clock-gating replacement can be performed, the clock ports must be identified with the **create_clock** command. All combinational cells in the design that are identified as clock gates are candidates for replacement. The combinational cells that can be considered for replacement possess the following **function_id {a2.0, la2.0, a2.1, la2.1, a2.2, la2.2}**. The basic rule for replacement is that any AND cell with function_id a2.0 shall be replaced by a rising-edge integrated latch-based clock gate.

If a combinational cell has two clock different clock inputs it is not considered for replacement.

A combinational cell that has edge conflicts with its registers cannot be replaced. For example, if an AND cell is driving a falling-edge register, it is not replaced. The number of cells with edge conflicts will be printed as an output of the execution.

If a combinational cell has any constraints, they are inherited by the new replacement cell, unless the combinational cell has restrictions that void replacement. When a cell is reported as restricted it could be due to an inferred or an user restriction. The number of restricted cells will be printed as an output of the execution.

If a design has already been placed, no replacement is carried out in the entire design.

Multicorner-multimode is not supported. The replacement occurs in all scenarios defined in the session.

If a combinational cell drives a register that has already been scan-stitched, no replacement is performed for that combinational cell. The number of scan-stitched cells will be printed as an output of the execution.

Make sure that **set verification_clock_gate_hold_mode low** is set on **Formality** configuration.

EXAMPLES

The commands in the following example show the typical flow for using the **replace_clock_gates** command. After reading or elaborating the design and defining the clock ports, the **replace_clock_gates** command replaces the combinational clock gates.

```
prompt> read_verilog design.v

prompt> current_design top

prompt> link

prompt> create_clock clk

prompt> replace_clock_gates
 Combinational clock tree candidates 8
 Replaced 4
 Not Replaced 4
   Scan stitched 0
   Edge conflict 0
   Restricted 4
```

Data Types

rule string

cons_lib_cells collection
non_cons_lib_cells collection
non_cons_left_lib_cells collection
non_cons_right_lib_cells collection
distance float
exception_lib_cells collection
target_custom_lib_cell_pair collection
lib_cells collection
lib_cell string
min_max pair of floats
prefix string
exception_lib_cells collection
orientation_type string
table list of list
layer_name string

ARGUMENTS

-replacement_rule *rule*

Specify which rule you want to apply. You must specify one of the following keywords:

- **max_vertical_constraint**
  Repair max vertical edge length violations: It is a violation when a column of vertically aligned and constrained cells has a total stacked height greater than max_constraint_length. It is repaired by replacing fillers from the constraint list with the ones from the non_constraint list. Options for this rule are: **-constraint_fillers**, **-non_constraint_fillers**, **-exception_cells**, **-max_constraint_length**, **-non_constraint_left_fillers**, **-non_constraint_right_fillers** and **-no_violation_along_exception_cells**.

- **half_row_adjacency**
  This replacement rule scans for half height fillers and replace them with correct half height fillers based on if abutting cells are inbound cells or regular cells. The replacement half height fillers are specified in following options:-n_left, -n_right, -p_left, -p_right, -n_left_right, -p_left_right, -n_left_center_right, -p_center_right, -n_none, -p_none. See the description for each option for details

- **boundary_cell_vertical_constraint**
  This replacement rule scans the vertical stack distance of the left and right boundary cells specified by left_bdy_cell and right_bdy_cell. If the vertical stack exceed the distance specified, the boundary cell at the location will be replaced by left_replacement_cell or right_replacement_cell. Cells specified in the exception cell list (exception_cells) are considered "safe" and will cause the vertical scanning to be reset. A boundary cell not specified on the left/right/exception cell list are considered "unsafe" and will be included in vertical stack distance but will not be replaced. The replacement cell must have the same height as the boundary cells specified. Only left/right boundary cells are replaced. Horizontal boundary cells are not processed. Options for this rule are: **-left_boundary_cell**, **-right_boundary_cell**, **-exception_cells**, **-max_constraint_length**, **-left_replacement_cell**, **-right_repelacement_cell**

- **illegal_abutment**
  Repair illegal abutment violations: It is a violation if a target filler abuts a filler of the same library cell or cells in the illegal_abutment list. This violation is repaired by replacing the target filler with matching custom filler. Options for this rule are: **-replace_abutment** and **-illegal_abutment**.

- **od_tap_distance**
  Repair Tap OD width violations: It is a violation when OD layer distance between tap cell and neighboring cells falls within tap_distance_range. If **-adjacent_non_od_cells** are specified, these cells are assumed to have no OD layer and OD distance is measured to the nearest cells with OD. If **-adjacent_non_od_cells** is not specified, the OD distance is measured

between tap cell and abutting neighbors. This violation is repaired by replacing tap cells with left_vilation_tap, right_violation_tap, or both_violation_tap if violation is on the left, right or both side. Options for this rule are: **-tap_cells**, **-adjacent_non_od_cells**, **-left_violation_tap**, **-right_violation_tap**, **-both_violation_tap**, and **-tap_distance_range**.

- **od_horizontal_distance**
  Max horizontal length violations: It is a violation when a continuous row of constrained cells has a total horizontal length greater than max_constraint_length. This violation is repaired by replacing the target filler with a matching custom filler. Options for this rule are: **-max_constraint_length** and either specify replace rule using table style with **-refill_table** or by using list style with **-constraint_fillers**, **-non_constraint_fillers**, or **-exception_cells**

  Note that command does not check for any other rules, so when your design has multiple custom fillers of same size, you should use **-refill_table** to provide a map for the tool when replacing target fillers with other custom fillers. For example, when fillers have min-vth width rules, you should use **-refill_table** to specify a custom filler to use to replace target fillers of same vt to avoid introducing new vt layer rule violations

- **random**
  Replace specified fillers with another fillers randomly chosen from a list. Option for this rule is: **-random_replace**

- **horizontal_edges_distance**
  This rule will scan for a continuous horizontal sequence of abutted layer objects for a maximum of the given distance. When a violator cell in the constraint list is found in the current row, replace it with a non-constraint filler cell. Option for this rule is: **-constraint_fillers, -non_constraint_fillers, -layer, -max_constraint_length, -refill_table**

- **small_filler_stacking**
  Repair max vertical small filler stacking violations: This type of violation occurs when vertically stacked small fillers (no greater than 2x) excceds more than max_constraint_length. Two ways to repair this violation: replace a series of horizontally abuting small fillers with a replacement filler, or swap a small filler with horizontally abutting replacement filler. Tool will use replacement fillers of same VT type as small fillers. Tool however, will not check any other rule. Options for this rule are: **-small_fillers**, **-replacement_fillers**, **-max_constraint_length**.

- **end_orientation**
  Modify the orientation of the left-most and/or right-most filler cells in a continuous horizontal sequence of specified filler cells so that they have the correct orientation. The continuous sequence of cells must have at least two filler cells. Options for this rule are: **-target_fillers**, **-left_end**, **-right_end**, and **-check_only**.

-small_fillers *lib_cells*

To be used with small_filler_stacking rule. Use this option to specify small fillers (no greater than 2x).

-replacement_fillers *lib_cells*

To be used with small_filler_stacking rule. Use this option to specify replacement fillers (greater than 2x).

-n_left *lib_cells*

To be used with half_row_adjacency rule. Use fillers from this list for n-type half height filler abutting inbound cells on left side only.

-n_right *lib_cells*

To be used with half_row_adjacency rule. Use fillers from this list for n-type half height filler abutting inbound cells on right side only.

-n_left_right *lib_cells*

To be used with half_row_adjacency rule. Use fillers from this list for n-type half height filler abutting inbound cells on left and right sides only.

-n_left_center_right *lib_cells*

To be used with half_row_adjacency rule. Use fillers from this list for n-type half height filler abutting inbound cells on right, left

and center sides only.

-n_none ***lib_cells***

To be used with half_row_adjacency rule. Use fillers from this list for n-type half height filler not abutting inbound cells.

-p_left ***lib_cells***

To be used with half_row_adjacency rule. Use fillers from this list for p-type half height filler abutting inbound cells on left side only.

-p_right ***lib_cells***

To be used with half_row_adjacency rule. Use fillers from this list for p-type half height filler abutting inbound cells on right side only.

-p_left_right ***lib_cells***

To be used with half_row_adjacency rule. Use fillers from this list for p-type half height filler abutting inbound cells on left and right sides only.

-p_left_center_right ***lib_cells***

To be used with half_row_adjacency rule. Use fillers from this list for p-type half height filler abutting inbound cells on right, left and center sides only.

-p_none ***lib_cells***

To be used with half_row_adjacency rule. Use fillers from this list for p-type half height filler not abutting inbound cells.

-left_boundary_cell ***lib_cell***

Specifies the left boundary cell that are to be considered for replacement

-right_boundary_cell ***lib_cell***

Specifies the right boundary cell that are to be considered for replacement

-left_replacement_cell ***lib_cell***

Specifies the lib cell that will be used to replace -left_boundary_cell

-right_replacement_cell ***lib_cell***

Specifies the lib cell that will be used to replace -right_boundary_cell

-layer ***layer_name***

Specify the layer name.

-random_replace ***table***

Specify a list of {target {custom cell list}} library cell pairs. Target filler cell will be replaced by a filler randomly chosen from custom cell list. Note that not all target fillers are replaced. The goal is to have target + custom cells in the design equally. Target and custom cells must be of same dimension.

-replace_abutment ***target_custom_lib_cell_pair***

Specify a list of {target custom} library cell pairs. Target filler cell will be replaced by pairing custom filler cell when it has illegal abutment. Please specify full lib cell name. Patten matching (*) cannot be used

-illegal_abutment ***lib_cells***

Specify the list of library cells that are considered illegal abutment when abutting to one.

-constraint_fillers *cons_lib_cells*

Specifies the list of library filler cells that can be replaced, if needed.

-non_constraint_fillers *non_cons_lib_cells*

Specifies the list of library filler cells that can used to replace the constrained ones.

-non_constraint_left_fillers *non_cons_left_lib_cells*

Specifies the list of library filler cells that have property that the left side of the cell can be used to break a continuous edge of constrained cells.

-non_constraint_right_fillers *non_cons_right_lib_cells*

Specifies the list of library filler cells that have property that the right side of the cell can be used to break a continuous edge of constrained cells.

-no_violation_along_exception_cells

When this option is specified, the edges of cells abutting exception cells are not considered to be violating the maximum constraint length.

-max_constraint_length *distance*

Specifies the maximum length of constrained cells that can align vertically, or can be continuously horizontally without a custom filler or exception cell.

-exception_cells *exception_lib_cells*

Specifies the list of library cells (typically not fillers) that are to be considered unconstrained. All cells that are not listed are considered constrained.

-target_fillers *exception_lib_cells*

Specifies the list of library cells that are considered for continuous horizontal sequence checking for the end_orientation replacement rule.

-check_only

When this option is specified the command reports violations rather than fixing them. This option only works with the end_orientation rule replacement rule.

-left_end *orientation_type*

Specifies how to correct the orientation of the left-most filler cell in the continuous horizontal sequence of filler cells. The following strings can be specified: "inverse", "R0_or_MX" or "MY_or_R180". If R0_or_MX is specified, the orientation of the cell is changed to R0 (MX) if it was MY (R180). If MY_or_R180 is specified, the orientation of the cell is changed to MY (R180) if it was R0 (MX).

-right_end *orientation_type*

Specifies how to correct the orientation of the right-most filler cell in the continuous horizontal sequence of filler cells. The following strings can be specified: "inverse", "R0_or_MX" or "MY_or_R180". If R0_or_MX is specified, the orientation of the cell is changed to R0 (MX) if it was MY (R180). If MY_or_R180 is specified, the orientation of the cell is changed to MY (R180) if it was R0 (MX).

-refill_table *table*

Specify replacement rule using table style. The syntax is:

-refill_table {{{ customA } { targetA1 targetA2... }}
{ customB } { targetB1 targetB2 ...}}}

customA is replaces targetA1 and targetA2, while customB replaces targetB1 and targetB2. Please specify full lib cell name. Patten matching (*) cannot be used

-prefix *prefix*

Adds the specified prefix to the instance names of new filler cells inserted by this command. You can later use the prefix to identify the new filler cell instances.

-left_violation_tap

This option is for doing Tap OD width violations fix. Use this option to specify replacement tap to fix violations on left. See "-rules {od_tap_distance} " for details.

-right_violation_tap

This option is for doing Tap OD width violations fix. Use this option to specify replacement tap to fix violations on right. See "-rules {od_tap_distance} " for details.

-both_violation_tap

This option is for doing Tap OD width violations fix. Use this option to specify replacement tap to fix violations on both sides. See "-rules {od_tap_distance} " for details.

-tap_cells

This option is for doing Tap OD width violations fix. Use this option to specify existing tap cells to be checked. See "-rules {od_tap_distance} " for details.

-tap_distance_range

This option is for doing Tap OD width violations fix. Specify tap OD distance range. It is a violation if tap OD distnace falls inside this range . See "-rules {od_tap_distance} " for details.

-adjacent_non_od_cells

This option is for doing Tap OD width violations fix. By default, OD distance is measured between tap cell and cells abutting the tap cell. This option specify list of cells that have no OD. When tap is adjacent such non-OD cell, those NO-OD cells skipped and the distance is measured against first cell that is not a non-od cell. See "-rules {od_tap_distance} " for details.

-skip_fixed_cells

Skips fixed and locked cells during filler cell replacement. This option is supported only for the following rules: **illegal_abutment**, and **random**. The command fails if you use this option with an unsupported rule.

DESCRIPTION

This command repairs various placement rule violations by replacing target fillers with custom fillers. It does not repair standard cell placement errors. You must specify which rule to apply by specifying the **-replacement_rule** option. The supported rules are: max vertical edge length rule, FILL1 illegal abutments, tap OD width violations, and max horizontal length rule.

1. Max vertical edge length violations: This type of violations occurs when a column of vertically aligned constrained cells has a total stacked height greater than max_constraint_length. It is repaired by replacing fillers from the constraint list with the ones from the non_constraint list. Options for this rule are: **-constraint_fillers**, **-non_constraint_fillers**, **-exception_cells**, and **-max_constraint_length**.

2. FILL1 illegal abutment violations: It is a violation if a target filler abuts filler of same library cell or cells in illegal_abutment list. This is repaired by replacing target filler with matching custom filler. Options for this rule are: **-replace_abutment** and **-illegal_abutment**.

3. Tap OD width violations: It is a violation when total OD width of a tap cell and abutting cell falls within tap_distance_range. It is repaired by replacing tap cells with left_vilation_tap, right_violation_tap, or both_violation_tap if violation is on the left, right or both side. Options for this rule are: **-tap_cells**, **-left_violation_tap**, **-right_violation_tap**, **-both_violation_tap**, and **-tap_distance_range**.

4. Max horizontal length violations: It is a violation when a continuous row of constrained cells has a total horizontal length greater than max_constraint_length. It is repaired by replacing target filler with matching custom filler. Options for this rule are: **-constraint_fillers**, **-non_constraint_fillers**, **-exception_cells**, and **-max_constraint_length**.

5. Random replace: This replace a target filler randomly chosen from a list of other fillers. Note that not all target fillers are replaced. The goal is to have target + custom cells in the design equally, but it is not possible because filler insertion with **create_stdcell_fillers** always use the first legal filler listed. So during filler insertion, you specify only target fillers, and then use **replace_fillers_by_rules -replacement_rule random** to randomly replace target fillers with custom fillers.

The command is meant to be run after adding filler cells. It can only repair one rule at a time. It does not consider other placement rule other than the rule it is repairing. It is your responsibility to ensure that filler swapping with **replace_fillers_by_rules** will not create other rule violations.

EXAMPLES

The following example repairs max vertical edge length violations.

```
prompt> replace_fillers_by_rules \
    -replacement_rule {max_vertical_constraint} \
    -constraint_fillers  [get_lib_cells  { mylib/FILL_4X mylib/FILL_2X } ] \
    -non_constraint_fillers [get_lib_cells { mylib/FILL_1X } ] \
    -max_constraint_length 50 \
    -exception_cells [get_lib_cells { mylib/BUFF_1 } ]
```

The following example repairs max boundary cell vertical stack length violations.

```
prompt> replace_fillers_by_rules \
    -replacement_rule {boundary_cell_vertical_constraint} \
    -left_boundary_cell {old_left_cell} \
    -left_replacement_cell { new_left_cell} \
    -right_boundary_cell {old_right_cell} \
    -right_replacement_cell { new_right_cell} \
    -max_constraint_length 50 \
    -exception_cells [get_lib_cells { mylib/other_boundary_cell } ]
```

The following example repairs max small filler stacking length violations.

```
prompt> replace_fillers_by_rules \
    -replacement_rule {small_filler_stacking} \
    -small_fillers {FILL1SVT FILL1LVT FILL2SVT FILL2LVT} \
    -replacement_fillers { FILL3SVT FILL3LVT FILL4SVT FILL4LVT} \
    -max_constraint_length 20
```

The following example repairs FILL1 abutment violations:

```
prompt> replace_fillers_by_rules \
    -replacement_rule {illegal_abutment } \
    -replace_abutment  { {target_FILL1a custom_FILL1a} { target_FILL1b custom_FILL1b} } \
```

```
    -illegal_abutment [get_lib_cells { mylib/FILL_2* } ]
```

The following example repairs Tap OD width violations:

```
prompt> replace_fillers_by_rules \
    -replacement_rule { od_tap_distance } \
    -tap_cells  { mylib/TARGET_TAP } \
    -left_violation_tap {mylib/TAP_L } \
    -right_violation_tap {mylib/TAP_R}  \
    -both_violation_tap { mylib/TAP_BOTH}
```

The following example repairs max horizontal length violations using list style. It will use FILL_1X to replace FILL_4X or FILL_2X:

```
prompt> replace_fillers_by_rules \
    -replacement_rule { od_horizontal_distance } \
    -constraint_fillers  [get_lib_cells  { mylib/FILL_4X mylib/FILL_2X } ] \
    -non_constraint_fillers [get_lib_cells { mylib/FILL_1X } ] \
    -max_constraint_length 50 \
    -exception_cells [get_lib_cells { mylib/BUFF_1 } ]
```

The following example repairs max horizontal length violations using table style. customA is used to replace targetA1 and targetA2, while customB is used to replace targetB1 and targetB2:

```
prompt> replace_fillers_by_rules \
    -replacement_rule { od_horizontal_distance } \
    -refill_table { { {customA} { targetA1 targetA2} }
            { {customB} { targetB1 targetB2} }}
    -max_constraint_length 50
```

The following example randomly replace FILL4M with FILL4MTH or FILL4MTL, and replace FILL2M with FILL2MTH or FILL2MTL:

```
prompt> replace_fillers_by_rules \
     -replacement_rule { random } \
     -random_replace {{{FILL4M} {FILL4MTH FILL4MTL}} \
             {{FILL2M} {FILL2MTH FILL2MTL}}}
```

report_3d_chip_placement

Reports placement-related information of the chip in a 3DIC top-level design.

SYNTAX

status **report_3d_chip_placement**
-chips *chips*
-all

Data Types

chips list or collection

ARGUMENTS

-chips *chips*

Specifies a list of chip names to report. In a 3DIC design, the chip names are the cell instance names.

-all

Reports all chips within the 3DIC design.

DESCRIPTION

This command reports placement information set by the **set_cell_location** command for a 3DIC design. In a 3DIC design, multiple dies are stacked vertically or placed side-by-side on one large silicon interposer, and the collection of chips is modeled as a virtual top-level design. The individual chips are modeled as cells within the top-level design.

The placement information includes the design origin which describes the origin point of the chip relative to the 3-dimensional coordinate system. The orientation determines how the chip rotates in 3D space using the 3-dimensional coordinate system. The scaling factor describes the actual size of chip in the design.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example command reports information for a chip named **cpu**.

```
prompt> set_cell_location cpu -coordinates {300 400 1} -orientation FS -z_offset 1
1
prompt> report_3d_chip_placement -chips cpu
--------------------------------------------------------------------------------
chip_name      stack_z     location          orientation   scaling_factor
--------------------------------------------------------------------------------
cpu              1    (300.0000  400.0000 )     FS         1.000000
```

SEE ALSO

check_3d_design(2)
set_cell_location(2)

report_abstracts

Reports details of abstract views for the specified designs.

SYNTAX

status **report_abstracts**
[*design_list*]

Data Types

design_list list

ARGUMENTS

design_list

Specifies the list of designs for which to report abstract views. By default, the command generates a report for all the abstract view designs linked in the current design.

DESCRIPTION

Reports details of abstract view designs. If one or more abstract view designs are given, the command generates a report for the specified designs. If no abstract view design is given, the command generates a report for all the abstract view designs linked in the current design, as well as report the top level compression data.

EXAMPLES

The following example reports details about the abstract view of design BlkA:

prompt> **report_abstracts [get_designs BlkA -filter "view_name == abstract"]**

The following example reports all the abstract view designs linked in the current design, plus the compression data at the current design level.

prompt> **report_abstracts**

SEE ALSO

create_abstract(2)

report_activity

Reports switching activity.

SYNTAX

int **report_activity**
[-rtl]
[-driver]
[-verbose]
[-show_zeros]
[-scenarios *scenario_list*]
[-modes *mode_list*]
[-corners *corner_list*]
[-print_objects {*activity_type_list object_type_list*}]

Data Types

scenario_list list
mode_list list
corner_list list
activity_type_list list
object_type_list list

ARGUMENTS

-rtl

Reports switching activity similar to the **report_saif -rtl_saif** command in Design Compiler. The object types listed are port, sequential cell ("seq-cell") and tristate cells ("tri-cell").

-driver

Reports drivers based on their logic function. Two special situations occur: 1) a driver with an unknown function ("no-func") and 2) signals that have no driver at all ("no-driver"). The logic function listed are: primary input ports ("primary-input"), primary inout ports ("primary-inout"), sequential pins ("seq-pin"), tristate pins ("tri-pin"), combinational pins ("comb-pin"), unknown function ("no-func"), and no drivers ("no-driver"). If user essential activity points have been created, these will be printed in a second report as well.

-verbose

Reports minor switching activity categories in addition to the default major categories. By default, the report shows the major categories for activity types: "simulated" (retrieved from simulation files), "annotated" (annotated by the user), "derived" (activities retrieved from constraints), "calculated" (activities computed by activity propagation) and "default" (all other activities). If this option is used also the minor categories are shown.

For "simulated" there are no minor categories.

For "annotated" the minor categories are "set_switching_activity" (set by the user) and "abstract" (created during abstraction)

For "derived" the minor categories are "create_clock" (from SDC), "create_generated_clock" (from SDC), "set_case_analysis" (from SDC), "timer_implied" (propagated set_case_analysis by the timer), "logic_constant" (from netlist) and "supply_constant" (from netlist).

For "calculated" the minor categories are "implied" (propagation of activity through repeater cells), "propagated" (computed after propagate_switching_activity) and estimated (created during optimization).

For "default" there are no minor categories.

-show_zeros

Include zero-valued columns in the report. By default, zero-valued columns are suppressed in the report.

-scenarios *scenario_list*

Specifies the scenarios to be considered. If this option is not specified, then only those scenarios are considered which contain the modes and corners specified through **-modes** and **-corners** options. Output of the command is generated separately for each scenario. If none of the **-modes**, **-corners**, or **-scenarios** options are specified, the command reports for the current scenario in the design.

-modes *mode_list*

Specifies the mode filter on the set of scenarios to be considered. A scenario is considered if its mode is present in *mode_list*. If this option is not specified, no filtering on modes occurs.

-corners *corner_list*

Specifies the corner filter on the set of scenarios to be considered. A scenario is considered if its corner is present in *corner_list*. If this option is not specified, no filtering occurs on corners.

-print_objects {*activity_type_list object_type_list*}

Prints all objects counted in the report with the given set of activity_types and object_types. Use the shorthand "all" for all activity types or all object types.

DESCRIPTION

Reports the switching activity type for objects. The objects that are reported depends on the command options used. By default, this command mimics the **report_saif** command in Design Compiler. With the **-rtl** option this command mimics the **report_saif -rtl_saif** command in Design Compiler. With the **-driver** option this command prints out a driver-centric report.

Multicorner-Multimode Support

By default, this command works on the current scenario. To specify different scenarios, use the **-scenarios** option or the **-corners** and **-modes** options.

EXAMPLES

The following examples report switching activities for the current design.

```

report_annotated_check

Displays all annotated timing checks on the current design.

SYNTAX

status **report_annotated_check**
[-nosplit]

ARGUMENTS

-nosplit

Prevents line splitting and facilitates writing software to extract information from the report output. Most of the design information is listed in fixed-width columns. If the information for a given field exceeds the column width, the next field begins on a new line, starting in the correct column.

DESCRIPTION

This command lists all annotated timing checks in the current design. The pin-to-pin timing checks reported are setup and hold.

To list annotated delays, use the **report_annotated_delay** command.

Multicorner-Multimode Support

This command works only on the current scenario.

EXAMPLES

The following is an example of an annotated report:

```
prompt> report_annotated_check

****************************************
Report : annotated_check
Design : counter
Version: v3.1
Date   : Tue Apr 14 19:42:25 2016
```

```
****************************************

Cell Name     From    To        Rise      Fall      Timing Check
--------------------------------------------------------------------------------
U1            c       d         -0.20     -0.20     hold
U1            c       d          2.20      2.20     setup
```

SEE ALSO

remove_annotated_check(2)
report_annotated_delay(2)
reset_design(2)
set_annotated_check(2)

report_annotated_delay

Displays delays annotated on cells and nets of the current design.

SYNTAX

status **report_annotated_delay**
[-cell]
[-net]
[-nosplit]
[-summary]
[-min]

ARGUMENTS

-cell

Reports delay data annotated on cells only. By default, both cell- and net-annotated data are reported.

-net

Reports delay data annotated on nets only. By default, both cell- and net-annotated data are reported.

-nosplit

Prevents line splitting and facilitates writing tools to extract information from the report output. Most of the design information is listed in fixed-width columns. If the information for a given field exceeds the column width, the next field begins on a new line, starting in the correct column.

-summary

Reports the total number of cell and net delay arcs and how many are annotated with delay data. An arc is considered annotated with delays only if all the four delay values (rise, fall, min, max) are present on it.

-min

Reports minimum delay data annotated on cells and nets of the current design. If you do not use this option, the command reports maximum delay data instead.

DESCRIPTION

The **report_annotated_delay** command lists all delay data annotated on cells and nets in the current design. The cell-annotated delay data consists of pin-to-pin delays. The net-annotated delay data consists of pin-to-pin delays, net capacitance values, and net

resistance values.

Note that the delay values reported are the resulting cell and net delays used in the **report_timing** command and might be different from your annotated values if the delays were annotated using the **-load_delay net** option of the **read_sdf** or **set_annotated_delay** command.

Multicorner-Multimode Support

This command works only on the current scenario.

EXAMPLES

The following is an example of an annotated delay report:

```
prompt> report_annotated_delay

****************************************

report_annotated_power

Reports user-annotated cell power dissipation.

SYNTAX

status **report_annotated_power**
-scenarios *scenario_list*
-supply_net *supply_net*
-list_annotated
-significant_digits *digits*

Data Types

scenario_list list
digits integer

ARGUMENTS

-scenarios

Specifies the set of scenarios for which the annotated power should be reported. The default is the current_scenario value.

-supply_net

Specifies the supply net for which the annotated power should be reported. Default, the annotated power of all supply nets is reported.

-list_annotated

Specifies that a per-cell annotation should be printed for all annotated cells. By default, only a summary with the number of annotated cells per cell category is printed.

-significant_digits *digits*

Specifies the number of digits to the right of the decimal point to report. Allowed values are from 0 to 13. The default is 2.

DESCRIPTION

This command reports on the cells that have user-annotated power values. The annotations were set with the *set_annotated_power* command. The command generates a summary of the number of annotated cells per cell category. Four categories are distinguished.

1. Unresolved black-box cells
2. Black-box cells
3. Physical blocks
4. Leaf cells

Unresolved black-box cells are cells that were not bound to a reference module. Physical blocks are hierarchical cells that are bound to physical block's view.

Multicorner-Multimode Support

EXAMPLES

The following example reports annotated power for all scenarios and all supply nets in the current design. In this design, there is one physical sub block (not annotated). Out of the 36 leaf cells, 1 leaf cell has annotated power.

```
prompt> report_annotated_power

================================================
Scenario: default
================================================

                    |         |         |   NOT   |
   Cell type        |   Total  | Annotated | Annotated |
-----------------------------+-----------+-----------+-----------+
Physical block          |      1 |      0 |      1 |
Leaf cell               |     36 |      1 |     35 |
-----------------------------+-----------+-----------+-----------+
                    |     37 |      1 |     36 |
```

The following example also reports details about the annotated cells.

```
prompt> report_annotated_power -list_annotated

================================================
Scenario: default
================================================

 Attributes
 ----------
   l - Leaf cell

Annotated cell powers:
-------------------------------
1. bot/c1  (leakage: 0.023) : l

                    |         |         |   NOT   |
   Cell type        |   Total  | Annotated | Annotated |
-----------------------------+-----------+-----------+-----------+
Physical block          |      1 |      0 |      1 |
Leaf cell               |     36 |      1 |     35 |
-----------------------------+-----------+-----------+-----------+
                    |     37 |      1 |     36 |
```

The following example reports the annotations for supply net VDD only.

```
prompt> report_annotated_power -supply_net VDD

================================================
Supply net: VDD
Scenario: default
================================================

                    |         |         |   NOT   |
   Cell type        |  Total  | Annotated | Annotated |
-----------------------+-----------+-----------+-----------+
Physical block         |      1 |      0 |      1 |
Leaf cell              |     36 |      0 |     36 |
-----------------------+-----------+-----------+-----------+
                    |     37 |      0 |     37 |
```

SEE ALSO

set_annotated_power(2)
remove_annotated_power(2)

report_annotated_transition

Displays annotated transitions on all pins of the current design.

SYNTAX

status **report_annotated_transition**
-nosplit

ARGUMENTS

-nosplit

Prevents line splitting and facilitates writing software to extract information from the report output. Most of the design information is listed in fixed-width columns. If the information for a given field exceeds the column width, the next field begins on a new line, starting in the correct column.

DESCRIPTION

The **report_annotated_transition** command lists annotated transition times at every pin in the current design.

Multicorner-Multimode Support

This command works only on the current scenario.

EXAMPLES

The following is an example of an annotated transition time report:

```
prompt> report_annotated_transition

report_annotated_transition

Pin Name    max_rise     max_fall     min_rise     min_fall
------------------------------------------------------------
U0/A        10.00        -            -            17.00
U1/A        -            -            -            9.10
U1/Z        -            -            -            7.00
```

report_antenna_rules

Name

report_antenna_rules

Reports the given antenna rules defined in the library.

SYNTAX

integer **report_antenna_rules**
[-mode *antenna_mode*]
[-library *library*]
[*rule_names*]

Data Types

antenna_mode integer
library collection
rule_names string

ARGUMENTS

-mode *antenna_mode*

An integer value between 1 and 6, that represents the way the antenna areas are computed. When this option is specified, only the antenna rules that use the given mode for antenna area calculation, are reported. This is an optional option.

-library *library*

Specifies the library from which the antenna rules are to be reported. This is an optional option.

rule_names

Specifies a list of antenna rule-names that are to be reported. This is an optional option. When not specified, all the antenna-rules defined in the current library are reported.

DESCRIPTION

This command reports the given antenna rules for the specified mode that are defined in the given library.

By default, with no options specified, the command reports all the antenna rules defined in the current library. The command returns the number of antenna rules reported.

EXAMPLES

The following example reports all the antenna rule names in the current library that use antenna-mode 1 for antenna area calculation.

```
prompt> report_antenna_rules -mode 1

Rule name  r100
Antenna mode  Diode-mode value
------------  ----------------
 1    1

Column information:
-------------------
   A - Layer name
   B - Layer type
   C - Antenna mode
   D - Ratio
   E - P Ratio
   F - N Ratio
   G - Gate diffusion length
   H - P Gate diffusion length
   I - N Gate diffusion length
   J - Layer scale
   K - Accumulate scale
   L - Protected scale
   M - Diode ratio
   N - Scale factor

   A         B      C      D         E         F         G

report_app_options

Reports application options on a block or in the global scope.

SYNTAX

integer **report_app_options**
[-block *block*]
[-global]
[-non_default]
[-as_list]
[-include_equivalent_variable]
[-data *data_file*]
[-csv *file_name*]
[*patterns*]

Data Types

block block name or collection
patterns list
data_file A file-name of an encoded data file. The output of write_app_options.
file_name String. Report contents to this file in CSV format.

ARGUMENTS

-block *block*

Specifies the block, which the options to be reported are set on. This option cannot be specified with the *-global* option. If this option is specified, the command reports the options in the scope of the specified block.

-global

Indicates that options in the global scope will be reported. This option cannot be specified with the *-block* option. This option is deprecated.

-non_default

Returns app options set to different behavior than the system-default. This includes:

- Block-scope app options set to a non-default setting with set_app_options
- Global-scope app options set to a non-default setting with set_app_options
- Block-scope app options given a user default setting with set_app_options -as_user_default

-as_list

Specifies that the report should follow the format expected by the set_app_options command, i.e. one pair of application option {name value} for every line in the report. Selectively reports the application options that has user or system value set.

-include_equivalent_variable

Indicates that the corresponding app var name will be reported for the listed app options. All app options may not have a corresponding app var.

-data *data_file*

A string that represents a filename of a write_app_options *data_file* report_app_options will report app options stored in this file instead of the current executable.

Note: When using this option, obsolete app options are not reported.

-csv *file_name*

Specifies the output CSV file name. The report contents will be output to this file in CSV format. The *file_name* argument can be a local file name or a full path name to the file.

patterns

Specifies a list of patterns for the option names. A pattern can include the wildcard characters asterisk (*) and question mark (?). "*" will match zero or more of any character, and "?" will match any single character. If this option is specified, the command reports those option names that match any of the specified patterns. If not specified, reports all options.

DESCRIPTION

This command generates a report of application options on the specified block or in the global scope, depending on the scope of the application option.

Each block will store only the options explicitly set on it. Any option values not set on the block will be reported as '--' (empty).

The default behavior is to report both the design scoped and global scoped application options, where the value reported for the design scoped application option would be w.r.t the current block.

The report also contains entry for the user-default and system-default.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example reports application options, both design scoped and global scoped. The design scoped values are w.r.t the current block.

```
prompt> report_app_options
****************************************
Report : app_option
Design : NO_DESIGN
Version: O-2018.06-SP4-BETA
```

```
Date   : Tue Oct 30 19:17:03 2018
****************************************

Name                          Type      Value     User-default System-default Scope     Status    Source
------------------------------------ ---------- ---------- ------------ -------------- ---------- ---------- ----------
abstract.high_fanout_limit integer  --        --                 600          block     normal
. . .
file.verilog.default_user_label    string    --       {}        --          global    normal
file.verilog.keep_unconnected_cells bool      --                 true         global    normal
------------------------------------ ---------- ---------- ------------ -------------- ---------- ---------- ----------
1
```

The following example reports application options, that are global scoped and have values different from the default.

```
prompt> report_app_options -global -non_default
****************************************
Report : app_option
 ...
****************************************

Name                Type      Value     User-default System-default Scope     Status    Source
---------------------- ---------- ---------- ------------ -------------- ---------- ---------- --------------------
test.global_only_bool  bool      true      true        false         global    normal
test.global_only_int   integer   12        12          10            global    normal    app_option.tcl:1151
---------------------- ---------- ---------- ------------ -------------- ---------- ---------- --------------------
1
```

The following example reports the application options using the '-as_list' option.

```
prompt> report_app_options -as_list
****************************************
Report : app_option
 ...

****************************************
abstract.high_fanout_limit 600
\...
test.layer_name_number_list_new {M1 31}
verilog.default_user_label {}
1
```

The following example illustrates reporting using the '-as_list' option when the user and system defined value is absent.

```
prompt> reset_app_options -user_default opt.power.mode
1
prompt> reset_app_options opt.power.mode
1
prompt> report_app_options opt.power.mode
****************************************
Report : app_option
Design : r4000
Version: M-2016.12-DEV
Date   : Wed Feb 24 05:43:30 2016

report_app_var

Shows the application variables.

SYNTAX

string **report_app_var**
[-verbose]
[-only_changed_vars]
[*pattern*]

Data Types

pattern string

ARGUMENTS

-verbose

Shows detailed information.

-only_changed_vars

Reports only changed variables.

pattern

Reports on variables matching the pattern. The default is "*".

DESCRIPTION

The **report_app_var** command prints information about application variables matching the supplied pattern. By default, all descriptive information for the variable is printed, except for the help text.

If no variables match the pattern, an error is returned. Otherwise, this command returns the empty string.

If the **-verbose** option is used, then the command also prints the help text for the variable. This text is printed after the variable name and all lines of the help text are prefixed with " #".

The Constraints column can take the following forms:

{val1 ...}

The valid values must belong to the displayed list.

val \<= a

The value must be less than or equal to "a".

val \>= b

The value must be greater than or equal to "b".

b \<= val \<= a

The value must be greater than or equal to "b", and less than or equal to "a".

EXAMPLES

The following are examples of the **report_app_var** command:

```
prompt> report_app_var sh*
Variable              Value    Type    Default   Constraints
------------------------ --------- ------- --------- ----------------------
sh_continue_on_error    false    bool    false
sh_script_stop_severity  none     string  none     {none W E}
 \.\.\.

prompt> report_app_var sh* -verbose
Variable              Value    Type    Default    Constraints
------------------------- --------- ------- --------- ----------------------
sh_continue_on_error    false    bool    false
  # Allows source to continue after an error
sh_script_stop_severity  none     string  none     {none W E}
  # Indicates the error message severity level which would cause
  # a script to stop executing before it completes
 \.\.\.
```

report_area

Displays area information for the current design or instance.

SYNTAX

status **report_area**
[-nosplit]
[-significant_digits digits]
[-physical]
[-hierarchy]
[-designware]
[-logical]

ARGUMENTS

-nosplit

Prevents line splitting. Most of the design information is listed in fixed-width columns. If the information for a given field exceeds the column width, the next field begins on a new line, starting in the correct column.

-significant_digits *digits*

Specifies the number of digits to the right of the decimal point that are reported. Allowed values are from 0 through 13. The default value is 2. Using this option overrides the value set by the **shell.common.report_default_significant_digits** app option.

-physical

Reports the size of the core area and the aspect ratio of the design.

-hierarchy

Reports the area used by cells across the design hierarchy. Reports the absolute value and the percentage of area consumed by each of the cells across the hierarchy. This option also reports the details of area contribution by combinational, non-combinational, and macro or black box cells. The "black boxes" column includes macro area.

-designware

Reports the area of synthetic cells. There are two types of synthetic cells:

- Datapath cells
  The datapath cells are extracted complex datapath cells.
- DesignWare singleton cells
  The DesignWare singleton cells are instantiated or inferred synthetic component cells.

The report shows the total synthetic cell area and the total datapath cell area. If the synthetic cells are ungrouped during compile, the report shows the estimated area of the ungrouped synthetic cells.

-logical

Reports the area using logical area. If there are lib cells without logical area, physical area will be used instead. And a warning message will be printed out.

DESCRIPTION

The **report_area** command lists the area statistics for the current instance or the current design. The report includes combinational, non-combinational, and total area information. If you set the **current_instance** command, the report is generated for the design of that instance. Otherwise the report is generated for the current design.

The number of combinational cells, number of sequential cells, and the number of macros/black boxes only include leaf cells. For the purposes of the **report_area** command, macros and leaf-level black box cells are reported together. Hierarchical black-box cells are not counted because no area is associated with them.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example generates an area report:

```
prompt> report_area

****************************************
Report : area
 ...

****************************************

Number of cells:                  256
Number of combinational cells:        254
Number of sequential cells:           0
Number of macros/black boxes:         0
Number of buf/inv:                   31
Number of references:                23

Combinational area:          228294.4006
Buv/Inv area:                21384.0142
Noncombinational area:           0.0000
Macro/Black Box area:            0.0000

Total cell area:             228294.4006
1
```

The following example generates an area report for a hierarchical design using the **-hierarchy** option:

```
prompt> report_area -hierarchy
```

```
****************************************

report_qor(2)
report_design(2)

report_attachments

Reports the details of the given attachments from the specified owner object.

SYNTAX

string **report_attachments**
names
[-of_object *object*]

Data Types

names list
object string or collection

ARGUMENTS

names

List of attachment names to be reported. Supports glob style patterns.

-of_object *objects*

Specifies the object whose attachments will be reported. By default current block and current library will be considered in that order as owner object.

DESCRIPTION

This command reports the attachments with the names in the given list from the objects provided through the *-of_object* option. If *-of_object* is not used, then the current block is used as the owner object. If current block is not set, current library is used as the owner object For the attachment names, Glob style pattern is supported.

EXAMPLES

The following example removes the attachment test_att from the current block.

```
prompt> report_attachments -of_object [current_block] test_attachment
############################################################
#
```

```
# Attachments Report
# Owner Design : ORCA_TOP
#
################################################################

 ------------ ------------------------------------------------
    No      test_attachment

################################################################
test_attachment
```

SEE ALSO

add_attachment(2)
remove_attachments(2)
open_attachment(2)

report_attribute

Reports the attributes on one or more objects.

SYNTAX

string **report_attributes**
[-class *class_name*]
[-nosplit]
[-application]
[-compact]
object_spec

Data Types

class_name string
object_spec list

ARGUMENTS

-class *class_name*

If object_spec is a name, this is its class. Allowable values are *design*, *port*, *cell*, *pin*, *net*, *lib*, *lib_cell*, or *lib_pin*.

-nosplit

Does not split lines if column overflows.

-application

Lists application attributes as well as user-defined attributes.

-compact

Shortens design/object name strings to fit within defined column width.

object_spec

List of objects to report. Each element in the list is either a collection or a pattern which combines with the *class_name* to find the objects.

DESCRIPTION

Generates a report of attributes on the specified objects. By default, only user-defined attributes display. Using the **-application** option adds application attributes to the report. For application attributes which are of the type *collection*, the name first of the first object in the collection will be displayed.

Some application lib_cell, lib_pin, terminal, shape, and layer attributes may be overridden by the user. These overrides are scoped to and stored persistently in the current design. This command prints the string "(override)" next to the attribute value if the value is one of these design-specific overrides.

EXAMPLES

This example defines an attribute 'X' for cells, then sets the value on all cells in this level of the hierarchy, and reports the result.

```
prompt> define_user_attribute -type int -class cell X
prompt> set_user_attribute [get_cells *] X 30
Set attribute 'X' on 'i1'
Set attribute 'X' on 'i2'

prompt> report_attributes [get_cells *]
****************************************
Report : Attribute
Design : my_des
****************************************

Design    Object      Type    Attribute Name   Value
-------------------------------------------------------------
my_des    i1          int     X                30
my_des    i2          int     X                30
```

This example displays application attributes.

```
prompt> report_attributes -application [get_designs my_des]
****************************************
Report : Attribute
Design : my_des
****************************************

Design  Object   Type     Attribute Name    Value
-----------------------------------------------------
my_des  my_des   string   full_name         my_des
my_des  my_des   string   object_class      design
my_des  my_des   float    area              56.000000
my_des  my_des   string   tree_type_max     balanced_case
my_des  my_des   string   tree_type_min     balanced_case
my_des  my_des   float    wire_load_min_block_size
                          0.000000
my_des  my_des   string   wire_load_mode    top
```

This example displays the report with compacted design and object names.

```
prompt> report_attributes -app -compact [get_vias my_long_via_name]
****************************************
Report : Attribute
Design : my_long_design_name
****************************************
```

```

report_attributes

Reports the attributes on one or more objects.

SYNTAX

string **report_attributes**
[-class *class_name*]
[-nosplit]
[-application]
[-compact]
object_spec

Data Types

class_name string
object_spec list

ARGUMENTS

-class *class_name*

If object_spec is a name, this is its class. Allowable values are *design*, *port*, *cell*, *pin*, *net*, *lib*, *lib_cell*, or *lib_pin*.

-nosplit

Does not split lines if column overflows.

-application

Lists application attributes as well as user-defined attributes.

-compact

Shortens design/object name strings to fit within defined column width.

object_spec

List of objects to report. Each element in the list is either a collection or a pattern which combines with the *class_name* to find the objects.

DESCRIPTION

Generates a report of attributes on the specified objects. By default, only user-defined attributes display. Using the **-application** option adds application attributes to the report. For application attributes which are of the type *collection*, the name first of the first object in the collection will be displayed.

Some application lib_cell, lib_pin, terminal, shape, and layer attributes may be overridden by the user. These overrides are scoped to and stored persistently in the current design. This command prints the string "(override)" next to the attribute value if the value is one of these design-specific overrides.

EXAMPLES

This example defines an attribute 'X' for cells, then sets the value on all cells in this level of the hierarchy, and reports the result.

```
prompt> define_user_attribute -type int -class cell X
prompt> set_user_attribute [get_cells *] X 30
Set attribute 'X' on 'i1'
Set attribute 'X' on 'i2'

prompt> report_attributes [get_cells *]
****************************************
Report : Attribute
Design : my_des
****************************************

Design    Object      Type    Attribute Name   Value
-------------------------------------------------------------
my_des    i1          int     X                30
my_des    i2          int     X                30
```

This example displays application attributes.

```
prompt> report_attributes -application [get_designs my_des]
****************************************
Report : Attribute
Design : my_des
****************************************

Design  Object   Type     Attribute Name    Value
-----------------------------------------------------
my_des  my_des   string   full_name         my_des
my_des  my_des   string   object_class      design
my_des  my_des   float    area              56.000000
my_des  my_des   string   tree_type_max     balanced_case
my_des  my_des   string   tree_type_min     balanced_case
my_des  my_des   float    wire_load_min_block_size
                          0.000000
my_des  my_des   string   wire_load_mode    top
```

This example displays the report with compacted design and object names.

```
prompt> report_attributes -app -compact [get_vias my_long_via_name]
****************************************
Report : Attribute
Design : my_long_design_name
****************************************
```

```
Design        Object        Type      Attribute Name ...
-------------------------------------------------------
my_lon...n_name my_lon...a_name string    array_size    ...
my_lon...n_name my_lon...a_name rect      bbox          ...
my_lon...n_name my_lon...a_name collection bounding_box  ...
```

report_auto_floorplan_constraints

Sets constraints for initializing floorplan implicitly.

SYNTAX

status **report_auto_floorplan_constraints**
[-control_type]
[-core_utilization]
[-shape]
[-orientation]
[-side_ratio]
[-side_length]
[-core_offset]
[-row_core_ratio]
[-coincident_boundary]
[-boundary]
[-flip_first_row]
[-pin_snap]
[-honor_pad_limit]
[-site_def]
[-all]
[-use_site_row]

Data Types

ARGUMENTS

-control_type

Reports the control type of the core or die. The default is ratio.

-core_utilization

Reports the core utilization. The default is 0.7.

-shape

Reports the core boundary shape. The default is rectangular (R).

-orientation

Reports the orientation of the specified core shape.

-side_ratio

Reports the ratio of the edges of the core shape.

-side_length

Reports the length of the edges of the core shape.

-core_offset

Reports the distance between the side of the core and boundary.

-row_core_ratio

Reports the channel ratio between cell rows. The default is 1.0.

-coincident_boundary

Reports whether to keep the same existing boundary.

-boundary

Reports the boundary of the core shape.

-flip_first_row

Reports whether the command flips the first row at the bottom of the core area for horizontally placed cell rows or flips the leftmost row for vertically placed cell rows. By default, this option is enabled.

-pin_snap

Reports whether to snap terminal centers to the center of wire tracks. By default, this setting is disabled.

-honor_pad_limit

Reports whether to adjust the core and die size to honor pad-limited designs.

-site_def

Reports the site def name used.

-all

Reports all the constraint settings used by auto floorplanning.

-use_site_row

Reports whether to create site rows.

DESCRIPTION

This command reports the constraints that create a floorplan with a boundary, core, site arrays (or rows), and wire tracks. Before executing this command, you must open a physical design by using the **open_block** command or create a design by using the **read_verilog** or **read_verilog_outline** command.

EXAMPLES

The following example reports the constraint of utilization to be 0.8.

```
prompt> report_auto_floorplan_constraints -core_utilization
1
```

The following example reports the preferred core shape to be rect (R).

```
prompt> report_auto_floorplan_constraints -shape
1
```

The following example reports the preferred core length to create the floorplan.

```
prompt> report_auto_floorplan_constraints -side_length
1
```

SEE ALSO

report_auto_save

Reports the auto-saved information of a library.

SYNTAX

status **report_auto_save**
[-library library_name | library_path]

Data Types

library_path string
library_name string

ARGUMENTS

-library *library_name* | *library_path*

Specifies the library name or path whose auto-saved information needs to be reported.

DESCRIPTION

This command reports auto-saved information auto-saved library name, version, disk-size, location, the time-stamp of each auto-saved library of the specified library.

By default, the command reports auto-saved information of the current library.

EXAMPLES

```
prompt> report_auto_save
************************************************************
Original Library : r4000

Auto-saved library path              : /slowfs/ndmdisk003/r4000_19142
Auto-saved library timestamp         : Wed Aug 14 00:54:44 2019
Auto-saved library size              : 2912391 bytes
Auto-saved library is_recovery_save  : false
Auto-saved library context           : create_net
```

SEE ALSO

start_auto_save(2)

report_background_jobs

Reports all the completed and running background jobs submitted to run by the **redirect -bg** command.

SYNTAX

status **report_background_jobs**
[-reset]

ARGUMENTS

-reset

Removes the completed jobs from the list of tracked jobs.

DESCRIPTION

This command reports all the jobs that were submitted to run by the **redirect** command with the **-bg** option.

All the completed and running background job are reported.

To omit the completed jobs, use the **-reset** option with the **report_background_jobs** command.

EXAMPLES

The following example shows a **report_background_jobs** run.

```
prompt> redirect -bg -max_cores 1 -file rep.out {source rep.tcl}
prompt> report_background_jobs
```

SEE ALSO

redirect(2)

report_block_pin_constraints

Reports block pin constraints for blocks in the design.

SYNTAX

string **report_block_pin_constraints**
[-cells *cell_collection*]
[-self]
[-pin_spacing_control]

Data Types

cell_collection collection

ARGUMENTS

-cells *cell_collection*

Restricts the block pin constraints report to only the specified collection of cells. By default, the command reports pin constraints on all blocks.

-self

Restricts the block pin constraints report to only the top-level design. By default, the command reports pin constraints for all blocks in the design.

-pin_spacing_control

If this option is specified, the command report the block pin spacing constraints that are set by read_pin_constraints and associated with reference blocks.

DESCRIPTION

This command reports the block pin constraints on every level. If you do not specify any options, the command reports the block pin constraints for all blocks.

EXAMPLES

The following example displays the block pin constraints on cell I_CLOCK_GEN.

```
prompt> report_block_pin_constraints -cells [get_cell I_CLOCK_GEN]
```

SEE ALSO

remove_block_pin_constraints(2)
set_block_pin_constraints(2)

report_block_shaping

Generates a quality of results (QoR) report for block shaping.

SYNTAX

status **report_block_shaping**
[-utilization_from_target]
[-core_area_violations]
[-overlaps]
[-chimney_area]
[-detour_estimate]
[-unaligned_pins_estimate]
[-flyline_crossing]
[-orientation_violations]
[-hierarchical]
[-channel *height*]
[-error_view *view_name*]
[-verbose minimum | low | high]
[-cells *collection_of_blocks*]

Data Types

height distance
view_name string
collection_of_blocks collection of block instances

ARGUMENTS

-utilization_from_target

Reports the difference in utilization between the actual utilization of the block and its target utilization as determined by the target_utilization attribute.

-core_area_violations

Reports blocks that are placed outside the core area.

-overlaps

Reports blocks that overlap.

-chimney_area

Reports the area used by chimneys. Chimneys are long, narrow channels which protrude from blocks (like a bump). Chimneys can create less than optimal placement.

-detour_estimate

Reports the estimated number of net detours caused by blocks, assuming that the blocks do not allow feedthroughs. A net detour is a net that is routed outside of its bounding box. Use this option after top-level placement. If top-level cells are not placed, this report is inaccurate.

-unaligned_pins_estimate

Reports the estimated number of unaligned pins. This estimate is based on an ideal pin assignment result; the estimate is a lower bound on actual number of unaligned pins after pin assignment.

-flyline_crossing

Reports the number of block-to-block flyline crossings. For example, suppose there is a block pair, (block A, block B) and there are 5 flylines between block A and B, and suppose there is another block pair, (block C, block D) and there are 4 flylines between block C and D, then if these flylines cross, the number of block-to-block flyline crossings would be 5x4=20. This report assumes that block flylines originate from the center of each block.

-orientation_violations

Report the orientation violations of blocks in the design. The current orientation of a block is considered as its orientation relative to the orientation of its parent block. When the current orientation of the block is not one of its legal orientations, the report lists the name of the block, its current orientation and legal orientations. The legal orientations can be set by using the **set_attribute -name allowable_orientation** command. The report also shows the number of cells with orientation violation in each design and the total number of violations.

-hierarchical

Reports block shaping information for the current block and for subblocks. By default, the command reports block shaping information only for the current block.

-channel *height*

Reports the area of channels whose height is less than *height*. Only blocks and core area are considered. This is useful to check if when manually shaping an abutted design, no channel was accidentally created.

-error_view *view_name*

Specifies the name of the generated error view. The command saves the error view data to a file in XML format with the specified name. No attachment is created nor saved in to the design database. If the view_name file already exists under the current run directory, the command overwrites the file. If a file extension is specified, it must be ".err", otherwise it is ignored. If no extension is specified, the ".err" extension is appended to the file name.

-verbose minimum | low | high

Controls the number of messages generated by the report. The *minimum* argument generates the least amount of information; *low* generates a one to two page report; *high* generates the longest report. By default, the verbosity level is low.

-cells *collection_of_blocks*

Specifies the blocks to analyze. By default, all blocks are analyzed.

DESCRIPTION

This command reports of the quality of the block shaping result. Most of the options can be used after block shaping, however, the **-detour_estimate** option requires top-level cells to be placed to give an accurate result.

EXAMPLES

The following example generates a QoR report for the current block shaping result.

```
prompt> report_block_shaping -overlaps

****************************************
Report : report_block_shaping
 ...

****************************************

 Block overlap report
 ====================
 Block overlaps in design orca: 0
```

SEE ALSO

create_placement(2)
gui_remove_all_annotations(2)
shape_blocks(2)

report_block_to_top_map

Reports the relationship between top-level mode, corner, and clock objects to other objects at lower levels of hierarchy.

SYNTAX

int **report_block_to_top_map**
[-blocks *cells*]
[-path *hierarchy_name*]
[-waveform]
[-warnings]

Data Types

cells string or collection
hierarchy_name string

ARGUMENTS

-blocks *cells*

Reports only on mapped modes, corners, and clocks in the specified blocks. By default, all mappings are reported.

-path *hierarchy_name*

Reports only on mapped modes, corners, and clocks in the block with the specified path. It is not necessary for the block to be loaded into memory. By default, all mappings are reported.

-waveform

Displays the waveform for the clock together with each block-level clock. By default, waveforms are not displayed. To show the waveform of top-level clocks, use the **report_clocks** command.

-warnings

Reports common problems that can occur in clock mapping. These include:

- Block-level clocks that are not mapped to a top-level clock and are not marked as an unused_clock.
- Block-level clocks that are not electrically connected to their associated top-level clock.
- Block-level clocks that have a different waveform than their associated top-level clock.
- Block-level clocks that are driven by top-level clocks that are declared on the block boundary (boundary clocks). These clocks might have been created with **set_block_to_top_map -auto_clock all**. The top-level boundary clock allows timing analysis to be done, but it is not necessarily correct for signoff. You should consider removing or replacing this clock before signoff.

DESCRIPTION

Reports the relationship between top-level mode, corner, and clock objects to objects inside of instances of lower level designs. These associations are used by commands such as **write_io_constraints**. The associations are set using the **set_block_to_top_map** command. Write out block-to-top mappings by using the **write_script** command, so they can be easily reapplied to new netlists.

This command returns 1 on success, 0 otherwise.

EXAMPLES

The following example reports block-to-top mappings for all modes, corners, and blocks.

```
prompt> report_block_to_top_map
```

The following example reports the block-to-top mappings only for block "CPU". corners, and blocks.

```
prompt> report_block_to_top_map -blocks CPU
```

The following example reports warnings about your mapped clocks.

```
prompt> report_block_to_top_map -warnings
```

SEE ALSO

write_script(2)

report_boundary_cell_rules

Reports the boundary cell placement rules.

SYNTAX

status **report_boundary_cell_rules**

ARGUMENTS

None.

DESCRIPTION

This command is used to report the boundary cell placement rules set by *set_boundary_cell_rules*. For those rules user want to use default value and doesn't specify in *set_boundary_cell_rules*, this command will not report them.

EXAMPLES

The following example reports boundary cell placement rules for left and right boundary cells.

```
prompt> set_boundary_cell_rules -left_boundary_cell myLib/CellLeft \
        -right_boundary_cell myLib/CellRight
prompt> report_boundary_cell_rules
```

SEE ALSO

remove_boundary_cell_rules(2)
compile_boundary_cells(2)
check_boundary_cells(2)
compile_targeted_boundary_cells(2)

check_targeted_boundary_cells(2)

report_boundary_optimization

Reports the boundary_optimization restrictions on pins, cells or modules only for object specific controls and not during global control "compile -no_boundary_optimization". This command is valid for “set_boundary_optimization” and not for “compile -no_boundary_optimization”

SYNTAX

int **report_boundary_optimization**
[object_list]

Data Types

object_list list

ARGUMENTS

object_list

Specifies a list of pins, cells or modules whose boundary optimization restrictions to be reported. Pin, cell or module names in object_list must be from the current design. If more than one object is specified, they must be enclosed in quotation marks ("") or braces ({}).

DESCRIPTION

This command reports the boundary_optimization restriction on objects in object_list. If the object_list is not specified, the command reports boundary optimization restrictions on the objects in the current design. The command reports the information on the objects which are restricted by set_boundary_optimization command.

EXAMPLES

The following example shows how to report previously set boundary optimization restriction on the cells named U0, U1 and on the pin named U2/A.

prompt> report_boundary_optimization { U0 U1 U2/A}

The following example shows how to report all previously set boundary optimization restrictions in the current design.

prompt> report_boundary_optimization

SEE ALSO

compile(2)
set_boundary_optimization(2)
remove_boundary_optimization(2)

report_bounds

Reports bounds in the current design.

SYNTAX

int **report_bounds**
[-verbose]
[-nosplit]
[-significant_digits *digits*]
[*bound_list*]

Data Types

digits int
bound_list list

ARGUMENTS

-verbose

Displays verbose bound information.

-nosplit

Does not split lines if column overflows.

-significant_digits *digits*

Specifies the number of digits to the right of the decimal point that are to be reported. Allowed values are 0-13; the default is determined by the **shell.common.report_default_significant_digits** application option, whose default is 2. Use this option if you want to override the default. Fixed-precision floating-point arithmetics is used for delay calculation; therefore, the actual precision might depend on the platform. For example, on SVR4 UNIX see FLT_DIG in limits.h. The upper bound on a meaningful value of the argument to **-significant_digits** is then FLT_DIG - ceil(log10(fabs(*any_reported_value*))).

bound_list

Specifies a list of bounds to report. The list may contain bound names, patterns, or collections. A collection may be specified by using the **get_bounds** command.

DESCRIPTION

The **report_bounds** command generates a report about the bound constraints in the design. The report includes the bound name and a description of the bound. If **-verbose** is specified, the report also includes bound region coordinates, dimensions, and cells and ports assigned to the bound.

If *bound_list* is specified, those bounds will be reported. If it is not specified, then all bounds in the design will be reported.

EXAMPLES

The following example reports all bounds in the design.

```
prompt> report_bounds *
Bound           Description
------------------------------------------------------------------------
groupBound1     medium effort auto group bound
groupBound2     soft group bound
groupBound3     ultra effort auto group bound
moveBound1      soft move bound
moveBound2      hard move bound
moveBound3      hard exclusive move bound
1
```

The following example reports verbose information for the bound named "groupBound2".

```
prompt> report_bounds -verbose groupBound2*
Bound           Description
------------------------------------------------------------------------
groupBound2     soft group bound
                Dimensions: (1000.00, 2000.00)
                Cells:    inv1
                          inv2
                          inv3
                Ports:    reset
1
```

SEE ALSO

create_bound(2)
get_bounds(2)
add_to_bound(2)
remove_from_bound(2)
remove_bounds(2)

report_budget

Reports timing budget information for the current design.

SYNTAX

int **report_budget**
[-blocks]
[-html *file_name*]
[-html_dir *directory_name*]
[-latency]
[-pins *budget_pin_list*]
[-fanin_segments *fanin_pin*]
[-fanout_segments *fanout_pin*]
[-through *through_pin*]
[-hold_through *through_pin*]
[-busplans *busplans*]
[-input]
[-output]
[-warning_pins]

Data Types

file_name string
directory_name string
budget_pin_list collection of pins
fanin_pin collection of pins
fanout_pin collection of pins
through_pin collection of pins
busplans collection of busplans

ARGUMENTS

-blocks

List the blocks that were selected for budget processing by the **set_budget_options** command. Also, show specific options that were selected for each block.

-html *file_name*

Writes a budget report file in HTML format. You can view the HTML file in an HTML browser such as Internet Explorer, Firefox, or Chrome. The file contains almost every detail about your budget and your circuit's block boundary timing in the current mode. The report includes hyperlinks to help you navigate between the various report sections. For example, the report for a budget pin is linked to the report for its connected budget segments. See the DESCRIPTION section for details about the contents of the report sections. The report sections included in the HTML report are: block summaries, segment lists, clock summaries, path summaries,

pin summaries, and segment summaries.

Specify .html as the file extension for *file_name*, as this is required by most browsers. Note that files produced by *-html* can be very large and most browsers do no perform well on large files. If you encounter problems due to a large report file, try using the *-html_dir* option.

-html_dir *directory_name*

Writes multiple budget report files in HTML format to the specified directory. The output is split across many files in the specified directory to allow easier browsing and to avoid overwhelming the browser with one large file. The command creates the index.html file in the specified directory to contain a table of contents that references the individual files.

The *-html_dir* option outputs budget data for all active modes; the *-html* option processes only the current mode.

-latency

Show a summary of the budgeted clocks in your design and where they cross block boundaries. Each time a clock crosses a block boundary, a new line is generated in the report. The line in the report shows the median clock latency and the fanout for that particular part of the clock tree. This raw information is used to calculate the relative clock latency in each block -- which is needed during budgeting.

The latency report lists clocks in "clock groups". Clocks that have datapaths crossing between them are put in the same group. Clocks that are completely independent are placed in separate groups.

-pins *budget_pin_list*

Prints a pin summary for the given budgeted pins. If the specified pin is not on a budget block, no information is reported. The contents of a pin summary are described in the DESCRIPTION section.

-fanin_segments *fanin_pin*

Prints a segment summary for the budget segment objects that fan into the specified *fanin_pin*. If the specified *fanin_pin* is not on a budget block, no information is reported. The contents of a segment summary are described in the DESCRIPTION section.

-fanout_segments *fanout_pin*

Prints a segment summary for the budget segment objects that fan out from the specified *budget_pin*. If the specified *fanout_pin* pin is not on a budget block, no information is reported. The contents of a segment summary are described in the DESCRIPTION section.

-through *through_pin*

Reports the budget of the worst-slack path through the specified budget pins. If the specified pin is not on a budget block, no information is reported. A worst path is shown for each unique "from clock" and "to clock". There might be other, less critical paths through the pin that are not shown. If you want to look at the less critical paths, you must trace the paths manually. The output of the *-html* option is useful for tracing arbitrary budget paths.

The format of the report output is similar to that of the pin summary and segment summary sections. The contents of a pin summary are described in the DESCRIPTION section.

-hold_through *through_pin*

Reports the hold budget of the worst hold slack path (the fastest path) through the specified budget pin. If the specified pin is not on a budget block, no information is reported. A worst path is shown for each unique "from clock" and "to clock". There might be other, less critical paths through the pin that are not shown. If you want to look at the less critical paths, you must trace the paths manually. The output of the *-html* option is useful for tracing arbitrary budget paths.

The format of the report output is similar to that of the pin summary and segment summary sections. The contents of a pin summary are described in the DESCRIPTION section.

-busplans *busplans*

For each of the given busplans, show the segments in the budget which are covered. The delay shown is the delay that will be applied if you use the *-busplans* option of the **compute_budget_constraints** command. Please refer to the **create_budget_busplan** man page for more details.

-input

Limits the report to information only about input budget pins. This option is also useful when your circuit has "inout" pins and you want to look at the input direction.

-output

Limits the report to information only about output budget pins. This option is also useful when your circuit has "inout" pins and you want to look at the output direction.

-warning_pins

Reports additional detail about potential problems in the design or budget. This option adds information to the report regarding "Budgeted pins with seemingly impossible constraints", "Pins with missing budget constraints", and "Pins with no timing paths".

DESCRIPTION

This command outputs reports that show detail about your budget and your current circuit's block boundary timing. Almost all of the information reported by the **report_budget** command is available by using the **get_budgets** command and **budget_attribute** attributes. Use the **report_budget** command to produce a well-formatted report that contains budget information.

The **report_budget** command reports different information based on the options you specify. Some options show you multiple categories of information as described in the following sections.

Block Report

Budget segments going into and coming out of a budget block are categorized and summarized. The segment categories include groups such as "To input pin of block from top level startpoint", or "From output pin of block to input pin of block B2", or "To input pin of block from output pin of block B3". For each segment category, information includes "worst negative budget slack" (WNS), "total negative budget slack" (TNS), "count" of the budget segments, and "number of segments that violate the budget" (NVIO).

Segment List

For each segment category in the block report, a list shows detail about the member segments of the category. The top 50 worst-slack segments are shown. Each segment has one line of information from the full segment summary report. In the HTML report, a hyperlink directs you to the segment summary.

Clock Summary

A clock summary shows the following information:

- Data for each time one of your system clocks crosses a block boundary
- The current budget settings from the **set_latency_budget_constraints** command
- The current clock latency and fanout downstream from the block crossing
- The latency used by budget process when it calculates datapath lengths

Path Summary

For each set of datapaths that cross from one clock across a budget boundary to another clock, a summary is printed. The report

shows the launch and capture clock, along with any multicycle path exception that might exist. In the HTML report, a hyperlink links to the launch and capture clock summaries.

The path summary also includes details about the budget calculations for data that has this path description, including calculations for: the path delay along paths of this type, the clock_uncertainty applied to paths launching in a block and going to a block output, the clock_uncertainty applied to paths starting at a block input and ending in a block.

Pin Summary

For each budget pin in the design, a summary tells you about the budgets that have been applied to the pin. There is a separate summary for each type of datapath that crosses at the pin. The HTML report contains a link to the "path summary". The pin summary shows the user constraint that has been applied by using the **set_pin_budget_constraints** command or from the **compute_budget_constraints** command.

The pin summary also includes three lines that describe the timing of the "full budget path", the timing of the "fanin budget" (the part of the path before the pin), and the timing of the "fanout budget" (the part of the path that comes after the pin). Each line has the following format:

(S= 1.545 / D= 6.255(2.16) / B= 7.800) 36%

The "D" (6.255) number is the actual timed delay of the path or portion of the path, in nanoseconds. The number in parentheses (2.16) is the portion of the path delay that the budgeter treats as "fixed" delay. The "B" number (7.800) is the amount of time that the budgeter has allocated for the path or portion of the path. If no budget has been set, the report shows "*none*", instead of a number. The S number (1.545) is the budget slack. The budget slack is simply calculated as "B minus D". If a percentage number (36%) is shown, the number indicates the fraction of the whole-path budget that has been assigned to this portion of the path.

The pin summary also shows one line for each budget segment that fans into or out of the pin. In the HTML report, there is a hyperlink to the segment summary.

For hold budgeting, the pin summary simply shows the "hold arrival" time that the budgeter will require in the constraints. For example, the report might show:

Budgeted hold arrival (rise/fall):
0.010/0.010 (Full path: 0.020 corner: min)

This means that the full path must be at least 0.020 ns long in order to meet the top-level hold time constraint. And a budget will be created such that the arrival time at the reported pin must be at least 0.010 ns. You should use the "plan.budget.write_hold_budgets" app option to activate writing of hold constraints in your budget.

Segment Summary

The segment summary describes the budget between one budget pin in a path and the next budget pin in the path. The segment summary shows the input pin and output pin for the segment, along with the path type. In the HTML report, hyperlinks link to the pin summaries and the path summary.

The segment summary also includes the actual circuit delays along the segment, and what portion of the delay is considered to be "fixed". Note that these numbers might not exactly match the numbers of the **report_timing** command. The budget numbers are an aggregate that are used for budget calculations. The number includes timing from all corners, rise and fall delays, assumed clock latency at the launch and capture, and budgeted latch borrowing at the launch and capture.

Next, the summary includes up to three lines that are similar to those in a pin summary. The lines contain "S", "D", and "B" numbers for the portion of the path before the segment (if it exists), the segment, and the portion of the path after the segment (if it exists).

EXAMPLES

The following example summarizes the settings for budget blocks from the **set_budget_options** command.

```
prompt> report_budget -blocks
```

The following example writes pin summaries for the inputs of block1.

```
prompt> report_budget -pins block1/* -input
```

The following example writes all budget information to multiple HTML files in the budget_report directory.

```
prompt> report_budget -html_dir budget_report
```

report_buffer_trees

Reports the buffer tree and its level information at the given driver pin.

SYNTAX

status **report_buffer_trees**
[-from *start_point_list*]
[-depth *max_depth*]
[-connections]
[-hierarchy]
[-physical]

Data Types

start_point_list list
max_depth int

ARGUMENTS

-from *start_point_list*

Specifies the starting point of the buffer tree. The starting point is defined as level 0 of the tree. The *start_point_list* can contain pins, ports and nets.

-depth *max_depth*

Reports only the *max_depth* levels of buffers in the tree. The default is to report the buffer tree until a real load or hierarchical boundary is reached.

-connections

Shows the net connections in the report. By default, the net connections are not shown.

-hierarchy

Shows the buffer tree across the hierarchy. By default, the report terminates at hierarchical boundaries.

-physical

Displays the location for each pin, with the coordinates in microns.

DESCRIPTION

The **report_buffer_trees** command reports a buffer tree at the given driver pins or driver nets. It reports the full name of the driver pin (which includes the name of the cell), the name of the library cell, and the level of the driver relative to the starting point. The starting point is defined as level 0 of the tree.

Reporting terminates at the non-buffer pins, hierarchical boundaries (except when the **-hierarchy** option is used), or when the level reported exceeds the value specified by *max_depth*.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example shows how to report a buffer tree:

```
prompt> report_buffer_trees -from cell1/O
```

The following example shows how to report a buffer tree with net connections:

```
prompt> report_buffer_trees -connections -from cell1/O
```

SEE ALSO

create_buffer_trees(2)

report_bundle_pin_constraints

Reports bundle pin constraints set by the **set_bundle_pin_constraints** command.

SYNTAX

int **report_bundle_pin_constraints**
[-bundles *bundle_collection*]
[-cells *cell_collection*]
[-self]

Data Types

bundle_collection collection
cell_collection collection

ARGUMENTS

-bundles *bundle_collection*

Specifies the net bundles on which the constraints are reported. The bundles must be in the top level of the current design. By default, the command reports all bundles.

-cells *cell_collection*

Specifies the block cells on which the constraints are reported. The cells must be in the top level of the current design. You can specify both the **-cells** and **-self** options. By default, the command reports bundle constraints for all cells if both the **-cells** and **-self** options are omitted.

-self

Reports constraints for the top-level block. You can specify both the **-cells** and **-self** options. By default, the command reports bundle constraints for all cells if both the **-cells** and **-self** options are omitted.

DESCRIPTION

This command reports existing bundle pin constraints. If no options are given, all bundle pin constraints (not include top-level block) in the design are reported.

There are four type of bundle pin constraints. The constraints are listed below from general to specific.

- Global constraints
  Constraint applies to all bundles and all block instances.

- Per-bundle constraints
  Constraint applies to a specific bundle and all block instances.
- Per-cell constraints
  Constraint applies to all bundles and a specific block instance.
- Per-bundle-cell-pair constraints
  Constraint applies to a specific bundle and a specific block instance.

In general, the **report_bundle_pin_constraints** command reports the general constraint and the more specific constraint, if specified. For example, the **report_bundle_pin_constraints -bundles B** command reports both per-bundle constraints that are specific to bundle B and per-bundle-cell-pair constraints that are specific to bundle B and some other cell.

This command returns 1 if some constraints could be reported, 0 otherwise.

EXAMPLES

The following example reports all bundle pin constraints from the design. All four types of constraints are reported.

```
prompt> report_bundle_pin_constraints

****************************************
Report : report_bundle_pin_constraints
 ...

****************************************

Constraints on all cells and bundles
---------------------------------------
Allowed layers:          METAL2 METAL3

Constraints on all cells and bundle(s) B
-------------------------------------------------
Allowed layers:    METAL2 METAL3 METAL4 METAL 5
Bundle order:      increasing
Keep pins together: true

Constraints on cell BLOCK1 and all bundles
--------------------------
Spacing on all layers: 42
Sides:               2 3

Constraints on bundle B2 and cell BLOCK2
-------------------------------------------------
Pin width:  0.1
Pin height: 0.4
```

report_bundles

Report information about the given bundles

SYNTAX

status_value **report_bundles**
bundle_list bundles

Data Types

bundle_list list

ARGUMENTS

bundle_list

Specifies the list of bundles to report information for.

DESCRIPTION

Displays information about the bundle.

EXAMPLES

The following example reports information about a bundle

```
prompt> report_bundles [get_bundles BUNDLE_5]
Reporting bundle {
  Bundle NAME: `  BUNDLE_5`
  Number of objects in bundle 3
  Bundle Type 'net'
  Objects in bundle
     .....
}
1
```

SEE ALSO

create_bundle(2)
get_bundles(2)
remove_bundles(2)
remove_from_bundle(2)

report_busplan_constraints

Write a report about busplan constraints.

SYNTAX

int **report_busplan_constraints**
[buses]

Data Types

buses string

ARGUMENTS

buses

Specifies the names of busplans to report. The buses must have been previously created by the **create_busplans** command.

DESCRIPTION

Report about busplans constraints as previously defined by the **set_busplan_constraints** command.

EXAMPLES

Set a constraint for a busplan named bus1 and show a report giving the constraints for busplan bus1.

```
prompt> set_busplan_constraints -from bus1 -to bus2 -type =
prompt> report_busplan_constraints bus1

****************************************
Report : report_busplan_constraints
Design : TOP
Version: L-2016.03-SP2
Date   : Fri Mar 11 19:41:53 2016
****************************************
From bus  Constraint
---------------------------
```

```
bus1        = bus2
1
```

SEE ALSO

create_busplans(2)
set_busplan_constraints(2)
check_busplan_constraints(2)

report_busplans

Writes out a report about busplans.

SYNTAX

int **report_busplans**
[-start_end_cells]
[-location]
[-mib_compliance]
[-consistency]
[-xml_file *filename*]
[buses]

Data Types

filename string
buses string

ARGUMENTS

-start_end_cells

Includes start cells and end cells in the report. These are the cells that buses can start and end at. By default, all hard macros and top-level blocks can be start cells or end cells. You can also specify start cells and end cells with the **create_busplans** command.

-location

Reports the location of the busplan objects.

-mib_compliance

Reports on the MIB compliance of the busplans. MIB compliance is relevant for the busplans that have MIB feedthroughs. This report will show if the busplan has any issues with other busplans using the same feedthroughs in other MIB instances.

-consistency

Reports on the internal consistency of the busplans. This is important with respect to being able to implement the busplans using the given plan. For the timing of the plan to be correct all the bits of the busplan must have the same clock period. Also the timing of the plan depends on the layers being used given by the net estimation rule. So all the bits should have the min_layer and max_layer constraints which overlap the rule. This report will report if any such consistency issue exists which would cause a problem in implementation.

-xml_file *filename*

Creates an XML document which contains a busplan report for the specified busplans. This report is a less detailed version than the XML data saved with *write_busplans -xml_file*, but may be useful for quick overview of the current busplan planning data.

buses

Specifies the names of busplans to report. The buses must be created with the **create_busplans** command.

DESCRIPTION

This command reports busplans that are previously defined with the **create_busplans** command.

In the report, lbb is an abbreviation for launch block budget, cbb is an abbreviation for capture block budget.

EXAMPLES

The following example creates a busplan named bus1 and reports the details for the busplan.

```
prompt> set_net_estimation_rule fast_rule -parameter ns_per_mm -value 0.5
prompt> create_busplans -name bus1 -rule fast_rule -from B1/OUT1[*]
prompt> report_busplans -start_end_cells bus1

****************************************

report_case_analysis

Reports case analysis entries on ports and pins.

SYNTAX

string **report_case_analysis**
[-mode *mode*]
[-all]
[-nosplit]

Data Types

mode collection

ARGUMENTS

-mode *mode*

A single mode to be used for the report. This can be a collection or the name of a valid mode. If not specified, the current mode will be used.

-all

Reports the pins upon which you have set case analysis values and reports the built-in constant pins of the design that are considered for start points of logic constant propagation. Logic constant propagation is performed by default from the constant pins of the design, unless the **time.disable_case_analysis** application option is set to **true**.

-nosplit

Prevents line splitting and facilitates writing software to extract information from the report output. If you do not use this option, most of the design information is listed in fixed-width columns. If the information for a given field exceeds the column width, the next field begins on a new line starting in the correct column.

DESCRIPTION

Reports case analysis entries on ports and pins that are specified with the **set_case_analysis** command. The report lists all pins and ports on which case analysis is specified. The list does not report where the logic constant values are propagated.

Multicorner-Multimode Support

By default, this command works on the current mode. To specify a different mode, use the **-mode** option.

EXAMPLES

The following example specifies that pins *U1/U2/A* and *U1/U3/CI* are set to a constant logic *1*.

```
prompt> set_case_analysis 1 {U1/U2/A U1/U3/CI}
prompt> report_case_analysis

****************************************
Report : case_analysis
Module : counter
Mode   : m2
Version:

****************************************

Pin name                        User case analysis value
--------------------------------------------------------------------------------
U1/U2/A                         1
U1/U3/CI                        1
```

SEE ALSO

remove_case_analysis(2)
set_case_analysis(2)

report_ccd_timing

Reports CCD timing information of a design. It can be used to report D and Q slacks of critical endpoints (D slack is the worst slack of the paths captured by the flop and Q slack is worst slack of the paths launched by the flop) and analyze slacks of timing paths that precede or succeed the critical timing path. It also provides options to prepone and postpone clock pin delays and annotate delays on nets and cells to analyze possible ways to fix timing slacks on critical endpoints.

SYNTAX

string **report_ccd_timing**
[-type] *report_type*
[-max_paths] *max_path_count*
[-max_stages] *max_stage_count*
[-pins] *pin_list*
[-hold]
[-scenarios] *scenario_list*
[-offset] *value*
[-annotate_cell_delay] *pin_pin_value*
[-annotate_net_delay] *pin_pin_value*
[-significant_digits] *digits*
[-nosplit]

Data Types

report_type string
max_path_count integer
max_stage_count integer
pin_list list
scenario_list list
value float
pin_pin_value string
digits integer

ARGUMENTS

-type stage | **chain** | **fanin** | **fanout**

Specifies the type of report to be generated. Type **stage** reports the timing of previous stage, current stage and post stages. Type **chain** shows the timing of whole chain. Type **fanin** shows the timing of fanin cone. Type **fanout** reports timing of fanout cone. If this option is not specified, the default report will be printed. This will report most critical endpoints in the design along with their D and Q slack values.

-max_paths *max_path_count*

Specifies the number of paths to report. The default value is 1.

-max_stages *max_stage_count*

Specifies the number of stages to report. The default value is 1.

-pins *pin_list*

Specifies the pins to work on. If this option combined with -offset together, the -pins should be clock pins.

-hold

When this option is used while reporting the summary and stage reports, it focusses on the most critical hold violations in the design and prints the D and Q slacks for hold for these endpoints and also prints corresponding setup slacks for the hold violating pins. For fanin and fanout reports, the hold slacks of all the pins in the fanin and fanout of the specified pin are reported. This option is useful while debugging hold violations in a design.

-scenarios *scenario_list*

By default, report_ccd_timing analyzes timing paths across all active scenarios and reports the worst D and Q slacks across scenarios. If user wants to analyze a particular scenario (or a set of scenarios) and report slacks specifically from those scenarios, the scenario list can be specified using the -scenarios option.

-offset *value*

Specifies the incremental value advancing/delaying on the pins, and then reports the timing change on the design as a result of the offset. This option requires option -pins.

-annotate_cell_delay *value*

Reports the timing change with specified annotated cell delay.

-annotate_cell_delay *value*

Reports the timing change with specified annotated net delay.

-significant_digits *digits*

Specifies the number of significant digits to show for reporting of any floating point number field. By default, each field has a particular number of significant digits, intended to communicate the right level of information to the user. This option overrides those default settings.

-nosplit

Writes out wide report lines, even if the line length is greater than 80 columns. If certain fields exceed their fixed column width, then printing can automatically jump to the next line to maintain the formatting. This is done to improve readability of the report. If -nosplit is specified, then one row of data in a tabular report will always be printed on one row. The columns will no longer align, which affects readability of the report. The -nosplit option is useful to simplify parsing or post-processing of a report output file. If the report is not intended to be post-processed, then do not use the nosplit option, in order to get better report readability.

DESCRIPTION

The **report_ccd_timing** command serves the following purposes using appropriate switches:

=== Report Stage Timing ===

This command has ability to generate a report that contains timing information for the sub-netlist that user focuses on. The **-type** and **-pin** report can show the timing slacks of previous/next stage/fanin/fanout timing paths for a particular timing end point or timing slacks of the entire chain using **-type** chain. Using this, user can directly check if there is any opportunity to borrow timing from

adjacent stages. (**-max_stages** is provided to control the number of stages to be printed.)

=== Fanin/Fanout reports ===

Report_ccd_timing can print the D and Q slacks of all the pins in the fanin or fanout of a specified pin in the design. By default it prints 5 timing paths in the fanin/fanout cone. To report more paths, **-max_paths** option can be used. This report prints the setup slacks by default. To print hold slacks, use **-hold** option.

=== Offset ===

This command supports some options where user can apply offset delays on specified clock pins and view the resulting timing change on the design. It quickly calculates the WNS and TNS change with the skew adjustment specified by the user. Now we don't support this feature for the design with ideal clock network.

=== Annotated Delay ===

User can use **-annotate_cell_delay**/**-annotate_net_delay** options to adjust cell delay or net delay to check the resulting timing change. This cell delay/net delay adjustment will be reverted automatically after reporting is done. User can easily specify the annotated cell delay or net delay and the reporting command will reflect resulting WNS/TNS change. Hence, user can figure out whether there is room to get timing improvement and also understand the changes to the timing picture with the specified annotated delay. The specified delay value overrides the internally-estimated cell and net delay value.

Note that the annotated delay values and offset settings will be applied to current scenario by default, and this value will be scaled and applied to other scenarios.

EXAMPLES

The following example can generate a summary of slacks on setup critical endpoints.

```
prompt > report_ccd_timing
```

The following example can generate a summary report of the top 3 setup critical paths.

```
prompt > report_ccd_timing -max_paths 3
```

To report the hold critical endpoints, use the -hold option.

```
prompt > report_ccd_timing -hold
```

In the following example, the command shows the pin slacks of the previous stage, current stage an post stage of the pin PC_reg_9/D.

```
prompt > report_ccd_timing -pin PC_reg_9/D -type stage
```

In the following example, the command shows the pin slacks of the whole chain.

```
prompt > report_ccd_timing -pin I2/d -type chain
```

In this example, the command reports 10 endpoints in the fanout of the pin specified by the user and their respective setup slacks.

```
prompt > report_ccd_timing -type fanout -pin sink1/D -max_paths 10
```

In the following example, the command annotates a net delay of 0.066 units between output pin U1/y and input pin I2/clk in scenario s1.

```
prompt > current_scenario <s1>
prompt > report_ccd_timing -annotate_net_delay {{U1/y I2/clk 0.066}}
```

In the following example, the command annotates a cell delay of 0.12 units between input pin U1/a and output pin U1/y of the same cell instance. And -stage option can be used to print timing changes of previous stage/post stage of the pin specified by the user, l2/d.

```
prompt > current_scenario <s1>
prompt > report_ccd_timing -annotate_cell_delay {{U1/a U1/y 0.12}} -pin l2/d -type stage
```

In this example, we delay the clock by 20ps. We can see the overall timing change when this delay is added.

```
prompt> report_ccd_timing -offset {{l1/clk 0.02}}
```

SEE ALSO

report_clock_qor(2)
report_clock_timing(2)
report_timing(2)

report_cell

Reports cell information.

SYNTAX

string **report_cells**
[-connections]
[-pvt]
[-power]
[-verbose]
[-significant_digits *digits*]
[-nosplit]
[*cell_list*]

list *cell_names*

ARGUMENTS

-connections

Displays the pins and the nets to which they connect.

-verbose

Displays verbose connection information. For each input pin, displays the net and the driver pins on that net. For each output pin, displays the net and the load pins on that net. Use this option in conjunction with **-connections** or the **-pvt** options.

-pvt

Displays the current corner's PVT information related to this cell. By default this includes the early and late process number, process label (if any), default voltage, and temperature. If the **-verbose** option is given, more information will be printed describing each parameter's specifed and effective values, and the file and line number of the constraint (if any) that set the parameter.

-power

Displays the power connections for the cell. For each power pin, a line will be printed giving the pin name, the pin type (power, ground, etc.), the power-type (primary, backup, etc.), the library power rail associated with the pin, the net (if any) connected to the pin, the UPF supply_net connected to the pin, and the early and late voltage of the supply_net. A "*" following the supply_net name means that the supply_net is explicitly connected to the power pin by a UPF **connect_supply_net** statement. A "*" following the early or late voltage value means that the supply_net voltage has been explitly set on the supply_net by a **set_voltage** command. Otherwise, the voltage was derived from some other part of a connected supply_net network.

-nosplit

Does not split lines if column overflows.

-significant_digits ***digits***

Specifies the number of digits to the right of the decimal point that are to be reported. Allowed values are 0-13; the default is determined by the **report_default_significant_digits** variable, whose default value is 2. Use this option if you want to override the default. Fixed-precision floating-point arithmetics is used for delay calculation; therefore, the actual precision might depend on the platform. For example, on SVR4 UNIX see FLT_DIG in limits.h. The upper bound on a meaningful value of the argument to **-significant_digits** is then FLT_DIG - ceil(log10(fabs(*any_reported_value*))).

cell_list

Lists cells to report. If you do not specify this option, all cells in the current instance are listed.

DESCRIPTION

Displays information and statistics about cells in the current instance or current design. If you set for the current instance, the report is generated for the design of that instance. Otherwise, the report is generated for the current design.

Some information, such as whether the cell is in an ideal network or not, is displayed after a timing update (as a result of manually executing an update_timing function or experiencing an implicit timing update as a result of executing other commands). This behavior is intended to help you to obtain information and statistics about cells without incurring the cost of a complete timing update.

EXAMPLES

The following example displays a report of the cells in the current design.

```
prompt> report_cells
****************************************

report_cell_array_patterns

Reports cell array patterns in the current block.

SYNTAX

int **report_cell_array_patterns**
[-design *design*]
[-verbose]
[-nosplit]
[-significant_digits *digits*]
[*cell_array_pattern_list*]

Data Types

design collection
digits int
cell_array_pattern_list collection

ARGUMENTS

-design *design*

Specifies the block for finding cell array patterns. If a design is not specified, the current block is used.

-verbose

Displays verbose cell array pattern information.

-nosplit

Retains long lines and does not split lines if column overflows.

-significant_digits *digits*

Specifies the number of digits to the right of the decimal point to report. Allowed values are 0-13. The default is determined by the **shell.report_default_significant_digits** application option, whose default is 2. Use this option to override the default.

cell_array_pattern_list

Specifies a list of cell array patterns to report. The list can contain cell array pattern names, patterns, or collections. A collection can be specified by using the **get_cell_array_patterns** command.

DESCRIPTION

The **report_cell_array_patterns** command generates a report about the cell array patterns in the design. The report includes the cell array pattern name and a description of the cell array pattern. If **-verbose** is specified, the report also includes additional attributes.

If *cell_array_pattern_list* is specified, those cell array patterns are reported. If it is not specified, then all cell array patterns in the design are reported.

EXAMPLES

The following example reports information for all of the cell_array_patterns in the current block.

```
prompt> report_cell_array_patterns *
Cell Array Pattern Description
--------------------------------------------------------------------------------
pattern0        2 x 3 solid
                lib_cell_name: sysbuf

pattern1        5 x 4 checkerboard
                lib_cell_name: invgate2

report_cell_buses

Reports bussed cells and contained scalar cells in unmapped or mapped designs.

SYNTAX

report_cell_buses
[-hierarchical]
[-nosplit]
[-expand]
[*object_list*]

ARGUMENTS

-hierarchical

Report bussed cells in all sub-modules of the specified designs (or of the top design if nothing was specified in the *object_list*).

-nosplit

Prevents line splitting. Most of the design information is listed in fixed-width columns. If the information for a given field exceeds the column width, the next field begins on a new line, starting in the correct column.

-expand

Report information on scalar cells of a bussed cell in expanded view. If the **-expand** option is not specified, only bussed cells are reported (collapsed view).

DESCRIPTION

The **report_cell_buses** command lists information about bussed cells. It reports the total number of bussed cells in a design, and information on each bussed cell including: the bus width, the total number of cells that implement a bussed cell, the scalar cells references and corresponding technology libraries, attributes and restrictions set by the user that have an impact on multibit mapping and slice preservation.

When the **-hierarchical** option is specified, the command reports the bussed cells information for all sub-modules of the specified designs.

When the **-expand** option is specified, the report details on each contained scalar instance to provide information on mapping and user restrictions.

The optional [*object_list*] may contain individual cells, bussed cells, and/or designs. When not specified, the command reports the bussed cell information for the top design.

EXAMPLES

The following example generates bussed cell report for the top level of a mapped design in collapsed view:

```
prompt> report_cell_buses

report_cell_em

Reports the cell electromigration maximum toggle rate violations or related information.

SYNTAX

status **report_cell_em**
[-pins *pin_object*|*pin_name*]
[-cells *cell_object*|*cell_name*]

Data Types

pin_object	object
pin_name	string
cell_object	object
cell_name	string

ARGUMENTS

-pins *pin_object*|*pin_name*

Specifies the pin instances for which to report cell electromigration information, whether they violate or not. When you use this option, only the information for the specified pins are reported.

-cells *cell_object*|*cell_name*

Specifies the cell instances for which to report cell electromigration information, whether they violate or not. When you use this option, only the information for the pins of the specified cells are reported.

DESCRIPTION

By default, this command reports all pins with cell electromigration maximum toggle rate violations in the current scenario.

You can use the **-pins** or **-cells** option to report cell electromigration information of specific pins or pins of specific cells, whether they violate or not.

Multicorner-Multimode Support

This command works only on the current scenario.

EXAMPLES

The following command reports all the pins with cell electromigration maximum toggle rate violations for the current scenario:

```
prompt> report_cell_em
```

The following command reports cell electromigration information for a specific pin:

```
prompt> report_cell_em -pin BlkB/ff3/Q
```

The following command reports cell electromigration information for all pins of a specific cell:

```
prompt> report_cell_em -cell BlkB/ff3
```

report_cell_em_profiles

Shows information on which cell EM profiles are available and which library they came from.

SYNTAX

string **report_cell_em_profiles**
library

ARGUMENTS

library

Specifies the reference library to report. This can be either the library name or a collection of a single library.

DESCRIPTION

The **report_cell_em_profiles** command displays the cell EM lifetime_profiles available in the specified library and the source DB files where they came from.

Multicorner-Multimode Support

This command has no dependency on scenario-specific, mode-specific, or corner-specific information.

EXAMPLES

The following example reports the cell EM lifetime_profiles information for the currently opened library.

```
prompt> report_cell_em_profiles [get_libs]

SEE ALSO

get_libs(2)

report_cell_feasible_space

Reports feasible spaces for cell placement.

SYNTAX

int **report_cell_feasible_space**
[-voltage_areas *voltage_area_list*]
[-boundary *{ {{llx lly} {urx ury}} | {{x1 y1} {x2 y2} ...} }*]
[-ignore_filler_references *references*]

Data Types

voltage_area_list list
references list

ARGUMENTS

-voltage_areas *voltage_area_list*

Specifies the voltage areas within which to report feasible site spaces. The input list can be names or collections. When specified, only site spaces within these voltage areas are reported. The options **-voltage_areas** and **-boundary** are mutually exclusive.

-boundary *{ {{llx lly} {urx ury}} | {{x1 y1} {x2 y2} ...} }*

Specifies the boundary in which to report feasible site spaces. Only one rectangle or rectilinear polygon is allowed for this option. When specifying this option, only site spaces inside voltage areas within the specified boundary are reported. The options **-voltage_areas** and **-boundary** are mutually exclusive.

-ignore_filler_references *references*

Specifies the references of filler cells which can be ignored when reporting feasible site spaces. The input list can be names or collections. Unfixed filler cells of the specified references will be ignored and the site spaces occupied by them are treated as free spaces. Other filler cells that not of the specified references are still treated as normal cells and cannot not be ignored.

Fixed filler cells are always treated as normal cells and cannot be ignored even if their references are specified.

DESCRIPTION

This command reports feasible site spaces in which to place cells. Feasible site spaces are place-able site areas which subtracts the occupied areas. Occupied areas include areas that contain existing cells (excluding ECO cells) and areas blocked by placement blockages and macros.

By default, this command reports all feasible site spaces in the design. The **-voltage_areas** and **-boundary** options can be used to report spaces within specified voltage areas or boundary.

The feasible site spaces will be grouped by size (width) in the report. And site spaces that smaller than the existing smallest cells are consider as "less than min width".

This command focus on designs in which all cells are legalized except ECO cells. If there are non-ECO cells that are not aligned with sites, they are ignored as free spaces and are added to the collection **$ecoNonLegalCellsForSpaceCheck** and a warning message is issued. ECO cells are also ignored except those whose eco_change_status are **eco_legalized**.

This command supports multiple site defs, and feasible site spaces are classified by different site defs in the report.

EXAMPLES

The following example reports all feasible site spaces in the design.

```
prompt> report_cell_feasible_space
```

The following example reports all feasible site spaces within the specified voltage areas.

```
prompt> report_cell_feasible_space -voltage_areas {pd2 pd3}
```

The following example reports all feasible site spaces within the specified boundary.

```
prompt> report_cell_feasible_space -boundary {{10 10} {40 40}}
```

The following example shows how to ignore fillers of specified references when reporting feasible site spaces.

```
prompt> set references [get_lib_cells {lib1/FILL1 lib1/FILL2}]
prompt> report_cell_feasible_space -ignore_filler_references $references
```

SEE ALSO

report_eco_physical_changes(2)

report_cell_modes

Displays a report of modes for specified cells.

SYNTAX

string **report_cell_modes**
[-nosplit]
[-missing]
[*cell_list*]

Data Types

cell_list list

ARGUMENTS

-nosplit

Writes report information in a single line without splitting wide lines. Most of the mode information is listed in fixed-width columns. If the information for a given field exceeds the column width, the next field begins on a new line, starting in the correct column. This option prevents line-splitting and facilitates writing software to extract information from the report output.

-missing

Writes out cells with mode groups with no **set_cell_mode** setting. If this option is given, only those cells with mode groups, but have no **set_cell_mode** specified will be printed.

cell_list

Specifies a list of cells whose modes are to be reported. By default, the report includes all cells for which modes have been set or changed by the user.

DESCRIPTION

This command reports cell modes. When reporting cell modes, the report specifies whether the cell mode is enabled or disabled. There are two types of cells with modes. Those with mode groups defined in the original .lib source of the library and those with cell modes created by the ETM flow of the library manager. For cell modes included in .lib source of the library, by default, all modes are enabled in a given cell unless a **set_cell_mode** command is requesting a specific mode to be activated. For the cell modes added by the ETM flow of the library manager, no modes will be activated unless a **set_cell_mode** command is issued. The report will show the cell, its various modes and whether or not they are enabled, and the possible condition statement from the library. Condition statement never exists for modes created by the library manager ETM flow. It is only possible for one mode per group to

be ENABLED at one time.

Multicorner-Multimode Support

This command works only on the current mode.

EXAMPLES

The following example reports cell mode information for a cell in its default state (before any **set_cell_mode** command is applied). No modes are currently active so all modes are enabled.

```
prompt> report_cell_modes [get_cells *]
****************************************
Report : cell_mode
 ...
****************************************

Cell          Mode(Group)        Status      Condition
------------------------------------------------------------------------
etm(des_2)     stdby(etm_modes)    ENABLED     desIn[2]
               all_on(etm_modes)   disabled
------------------------------------------------------------------------
```

The following example shows the status of cell ETM after some mode are activated. Cell ETM is set to operate in mode stdby. All timing arcs associated with mode stdby are enabled. All timing arcs associated with mode all_on are disabled.

```
prompt> set_cell_mode stdby etm
prompt> report_cell_modes
****************************************
Report : cell_mode
 ...
****************************************

Cell          Mode(Group)        Status      Condition
------------------------------------------------------------------------
etm(des_2)     stdby(etm_modes)    ENABLED     desIn[2]
               all_on(etm_modes)   disabled
------------------------------------------------------------------------
```

SEE ALSO

reset_cell_mode(2)
set_cell_mode(2)

report_cell_pin_access

Show details of pin access check in NPLDRC

SYNTAX

status **report_cell_pin_access**
-cells *cells*
[-details]
[-fixed]

Data Types

cells	collection
details	boolean
fixed	boolean

ARGUMENTS

-cells *cells*

Specifies the cell instances to analyze for pin access. This is a required option.

-details

Specifies verbosity level of output. Default is false.

-fixed

Specifies whether fixed cells are to be analyzed.

DESCRIPTION

This command tests a collection of instance cells for their routeability as determined by the NPLDRC pin access check. For each cell int the collection, the report lists the types of access checks performed and whether the cell is considered accessible at its current location and orientation. Option "-details" provides detail information about each pin and its access points that were checked.

EXAMPLES

The following example analyzes a specific cell.

```
prompt> report_cell_pin_placement -cells [get_cell cellA] -detail
```

SEE ALSO

legalize_placement(2)
check_legality(2)
analyze_lib_cell_placement(2)

report_cells

Reports cell information.

SYNTAX

string **report_cells**
[-connections]
[-pvt]
[-power]
[-verbose]
[-significant_digits *digits*]
[-nosplit]
[*cell_list*]

list *cell_names*

ARGUMENTS

-connections

Displays the pins and the nets to which they connect.

-verbose

Displays verbose connection information. For each input pin, displays the net and the driver pins on that net. For each output pin, displays the net and the load pins on that net. Use this option in conjunction with **-connections** or the **-pvt** options.

-pvt

Displays the PVT information related to this cell.

-power

Displays the power connections for the cell.

-nosplit

Does not split lines if column overflows.

-significant_digits *digits*

Specifies the number of digits to the right of the decimal point that are to be reported. Allowed values are 0-13; the default is determined by the **shell.common.report_default_significant_digits** application option, whose default is 2. Use this option if you want to override the default. Fixed-precision floating-point arithmetic is used for delay calculation; therefore, the actual precision might depend on the platform. For example, on SVR4 UNIX see FLT_DIG in limits.h. The upper bound on a meaningful value of the argument to **-significant_digits** is then FLT_DIG - ceil(log10(fabs(*any_reported_value*))).

cell_list

Lists cells to report. If you do not specify this option, all cells in the current instance are listed.

DESCRIPTION

Displays information and statistics about cells in the current instance or current design. If you set for the current instance, the report is generated for the design of that instance. Otherwise, the report is generated for the current design.

Some information, such as whether the cell is in an ideal network or not, is displayed after a timing update (as a result of manually executing an update_timing function or experiencing an implicit timing update as a result of executing other commands). This behavior is intended to help you to obtain information and statistics about cells without incurring the cost of a complete timing update.

Multicorner-Multimode Support

This command works only on the current corner.

EXAMPLES

The following example displays a report of the cells in the current design.

```
prompt> report_cells

report_check_design_strategy

This command reports the information related to **user-defined checks**.

SYNTAX

status **report_check_design_strategy**
[-checks names_of_user_defined_checks]

Data Types

names_of_user_defined_checks list

ARGUMENTS

-checks ***names_of_user_defined_checks***

Takes a list of names, of one or more **user-defined checks**. Reporting is done only on these given **user-defined checks**.

DESCRIPTION

See man-page of command **check_design** for definitions of **atomic-check**, **pre-defined check**, **mega-check** and **user-defined check**.

report_check_design_strategy command reports information related to **user-defined checks**. A **user-defined check** is a check created using **create_check_design_strategy** command. By default, without any options specified, this command reports the information related to all **user-defined checks**. If user is interested only in getting information related to some specific **user-defined checks**, then she should use the option **-checks**.

Definition of a check is either an UI command with/without its options OR is a list of **atomic-checks**. This command reports the command used for an atomic-check or a list of atomic-checks for a mega-check.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

(1) In the following example, the user-defined check **my_mv_design** is reported.

```
prompt> create_check_design_strategy -define_check my_mv_design { \
   check_mv_design -voltage_threshold 0.7 }
prompt> report_check_design_strategy -checks my_mv_design

****************************************
Report : check_design_strategy
Design :
 ...
****************************************
Check: mv_design
  Current definition:  { check_mv_design -voltage_threshold 0.7 }
****************************************
1
```

(2) In the following example, mega-check **my_mega_check** is created by the user using **create_check_design_strategy** command.

```
prompt> create_check_design_strategy -define_group my_mega_check { \
   mv_design design_mismatch }
prompt> report_check_design_strategy -checks my_mega_check

****************************************
Report : check_design_strategy
Design :
 ...
****************************************

Group: my_mega_check
   Current definition:  { mv_design design_mismatch }
 Check: mv_design
    Current definition:  { check_mv_design -voltage_threshold 0.7 }
 Check: design_mismatch
    Current definition:  { report_design_mismatch -check_design }
****************************************
1
```

(3) In the following example, 2 new user-defined checks are created.

```
prompt> create_check_design_strategy -define_check my_check1 { check_mv_design }
prompt> create_check_design_strategy -define_check my_check2 { check_legality }
prompt> report_check_design_strategy -checks {my_check1 my_check2}

****************************************
Report : check_design_strategy
Design :
 ...
****************************************
Check: my_check1
  Current definition:  { check_mv_design }

Check: my_check2
  Current definition:  { check_legality }
****************************************
1
```

(4) In the following example, default behavior of the command is shown, where information about all user-defined checks is displayed.

```
prompt> report_check_design_strategy

****************************************
Report : check_design_strategy
Design :
 ...
****************************************
Check: mv_design
  Current definition: { check_mv_design -voltage_threshold 0.7 }

report_checkpoint_options

Reports the parameters set in the chackpoint system.

SYNTAX

integer **report_checkpoint_options**

Data Types

ARGUMENTS

DESCRIPTION

This command reports the configuration of the checkpoint system, set by the set_checkpoint_options command.

EXAMPLES

The following example reports the options set for the checkpoint system.

```
prompt> report_checkpoint_options
```

SEE ALSO

create_checkpoint_action(2)

set_checkpoint_options(2)
eval_checkpoint(2)
get_checkpoint_data(2)

report_clock

Reports clock-related information.

SYNTAX

string **report_clocks**
[-attributes]
[-skew]
[-groups]
[-nosplit]
[-significant_digits *digits*]
[-modes *mode_list*]
[*clock_list*]

Data Types

digits int
mode_list list
clock_list list

ARGUMENTS

-attributes

Shows clock attributes and provides a list of all the clocks in the current design. The information for each clock includes source type, signal rise and fall times, and attributes. This report is shown by default.

-skew

Reports clock latency (source and network latency) and uncertainty information set by the **set_clock_latency** and **set_clock_uncertainty** commands, respectively.

Clock network latency information includes rise latency and fall latency. Clock source latency information includes rise latency and fall latency for early and late arrivals. Clock uncertainty information includes intraclock setup or hold uncertainty and interclock setup or hold uncertainty. This option also reports any fixed clock transition set by using the **set_clock_transition** command.

-groups

Shows the current setting for clock groups, including grouping of exclusive clocks and asynchronous clocks set by using the **set_clock_groups** command.

-nosplit

Retains long lines in the output, even if a column overflows. Most of the design information is listed in fixed-width columns. If the information for a given field exceeds the column width, the next field begins on a new line, starting in the correct column. This

option prevents line-splitting and facilitates writing scripts to extract information from the report output.

-significant_digits *digits*

Specifies the number of digits to the right of the decimal point to report. Allowed values are 0-13; the default is determined by the **shell.common.report_default_significant_digits** application option, whose default is 2. Use this option to override the default.

This option controls only the number of digits displayed, not the precision used internally for analysis. For analysis, the tool uses the full precision of the platform's fixed-precision, floating-point arithmetic capability.

-modes *mode_list*

Specifies the list of modes to be used in the report. A subreport is produced for each clock in the mode when the *mode_list* is specified.

clock_list

Lists the clocks that must be reported. Substitute the list you want for *clock_names*.

DESCRIPTION

Reports clock-related information. Displays all clock-related information on a design. The report contents are controlled by the options used. If you do not specify any options, the command displays the attributes report.

When a clock is created, it is added to the other clocks list if some clocks are defined to be exclusive or asynchronous with any other clocks in the design. When a clock is removed, it is removed from its related lists. To see if a clock is active or not, use the **report_clocks** command with the **-attributes** option.

Some information, such as the waveform of a generated clock or propagated skew, is displayed after a timing update. This can result from manually running **update_timing** or an implicit timing update as a result of executing other commands. This behavior is intended to help you to define all clocks without incurring the cost of a complete timing update.

To obtain a list of all clocks in the design, use the **all_clocks** command.

Multicorner-Multimode Support

By default, this command works on the current mode. To specify a different mode, use the **-modes** option.

EXAMPLES

```
prompt> create_clock -period 20.000000 \
[get_ports {CLK}]

prompt> report_clocks

report_clock_balance_groups

Reports all stored clock balance groups.

SYNTAX

string **report_clock_balance_groups**
[*clock_balance_group_list*]

Data Types

clock_balance_group_list collection

ARGUMENTS

clock_balance_group_list

Specifies a list of clock balance groups.

DESCRIPTION

This command reports clock balance groups.

EXAMPLES

The following example reports all clock balance groups.

prompt> **report_clock_balance_groups**

SEE ALSO

balance_clock_groups(2)
create_clock_balance_group(2)
get_clock_balance_groups(2)
remove_clock_balance_groups(2)

report_clock_balance_points

Shows the user-defined clock tree balance and exclude points for the current mode.

SYNTAX

int **report_clock_balance_points**
[-clock *clock_list*]
[-balance_points *pin_port_list*]
[-significant_digits *digits*]
[-nosplit]

Data Types

clock_list list
pin_port_list list
digits integer

ARGUMENTS

-clock *clock_list*

Specifies the list of clocks for which to report balance and exclude points. Since balance and exclude points can only be specified on non-generated clock, this report also accepts only non-generated clocks. When no clocks are specified then all the clocks of the current mode are considered.

-balance_points *pin_port_list*

Specifies a list of pins or ports for which to report. If no objects are specified, all the objects for which balance/exclude are specified for the given set of clocks are reported.

-significant_digits *digits*

Specifies the number of digits to the right of the decimal point to report. Allowed values are from 0 through 13. The default is 2.

-nosplit

Retains long lines in the output, even if a column overflows. Most of the design information is listed in fixed-width columns. If the information for a given field exceeds the column width, the next field begins on a new line, starting in the correct column. This option prevents line-splitting and facilitates writing software to extract information from the report output.

DESCRIPTION

The **report_clock_balance_points** command generates a subreport for each of the clock specified in the command. Each subreport contains a separate table for balance and exclude points.

Multicorner-Multimode Support

This command works on the current mode.

EXAMPLES

The following example reports all user-defined balance and exclude point information.

```
prompt> report_clock_balance_points
****************************************
Report : clock tree balance points
Module : clock_network1
Mode   : default
****************************************
Balance points for clock 'clk1':
                          Early-   Early-    Late-    Late-
Point                       Rise     Fall     Rise     Rise
--------------------------------------------------------------------------------
gck/CP                      2.00     0.00     0.00     0.00

Exclude points for clock 'clk1':
Point
--------------------------------------------------------------------------------
mux/A

Balance points for clock 'clk2':
                          Early-   Early-    Late-    Late-
Point                       Rise     Fall     Rise     Rise
--------------------------------------------------------------------------------
gck/CP                      0.00     0.00     0.00     0.00

Exclude points for clock 'clk2':
Point
--------------------------------------------------------------------------------
```

SEE ALSO

remove_clock_balance_points(2)
set_clock_balance_points(2)

report_clock_cell_spacings

Reports existing clock cell spacing rules.

SYNTAX

status **report_clock_cell_spacings**
[-clocks *clock_list*]

Data Types

clock_list collection

ARGUMENTS

-clocks *clock_list*

Specifies the clock trees for which the cell spacing settings will be reported.

DESCRIPTION

This command reports all existing clock cell spacing rules,previously defined by **set_clock_cell_spacing** commands. If **-clocks** option is used then it will report cell spacing settings for specified clock networks.

EXAMPLES

The following example reports existing clock cell spacing rules.

prompt> **report_clock_cell_spacings**

SEE ALSO

set_clock_cell_spacing(2)
remove_clock_cell_spacings(2)
cts.placement.cell_spacing_rule_style(3)

report_clock_gate_latency

Reports the details and summary of settings made with **set_clock_gate_latency** command.

SYNTAX

status **report_clock_gate_latency**
[-scenario *scenario_list*]
[-clock *clock*]
[-verbose]
[-nosplit]

Data Types

scenario_list list
clock collection

ARGUMENTS

-scenario *scenario_list*

Reports the clock gate latency settings for all specified scenarios in the list. If you do not specify this option, the report will be generated only for the current scenario.

-clock *clock*

Reports the clock gate latency settings for the given clock in all specified scenarios that have a clock with the same name. All other clocks with different name will be skipped in the report. If you do not specify this option, the report will be generated for all clocks in the specified scenarios.

-verbose

Reports a detailed description of annotated latency values that are inconsistent or missing latency values in clock gates and registers of the design.

-nosplit

Retains long lines in the output, even if a column overflows. Most of the information related with clock gate latency settings is listed in fixed-width columns. If the information for a given field exceeds the column width, the next field begins on a new line, starting in the correct column. This option prevents line-splitting and facilitates writing scripts to extract information from the report output.

DESCRIPTION

This command will report the settings that were made with **set_clock_gate_latency** command. For each specified scenario, the report will generate a table with the following columns:

- The clock object.
- The stage number.
- The list of latency tuples. Each latency tuple consists of a fan-out range and a latency value

For each clock object, its respective stages will be printed out with their list of latency tuples in a different row. If a clock or scenario has no information related to clock gate latency, it will not be printed.

At the end of the report, a summary of inconsistent and missing latency values will be reported. An inconsistent latency value is found when a gated register or gated clock gate has an annotated latency value which is strictly lower than the annotated latency value of its gating cell. A missing latency value (or gap) is found when a register or clock gate has no annotated latency value.

If the **-verbose** option is used, a detailed list of inconsistencies and gaps will be reported after all tables have been printed.

To remove annotated latencies that were specified using the **set_clock_gate_latency** command, use the **reset_clock_gate_latency** command.

To remove the clock gate latency settings that were specified by the **set_clock_gate_latency** command in the current scenario, use the **set_clock_gate_latency -reset** command.

EXAMPLES

The following four examples will use the following settings:

```
prompt> create_clock clk1 -period 0.5
prompt> create_clock clk2 -period 0.4
prompt> set_clock_gate_latency -stage 0 -fanout_latency {{1-inf -6.02e-2}}
prompt> set_clock_gate_latency -clock clk1 -stage 1 \
  -fanout_latency {{1-inf 1.0}}
prompt> set_clock_gate_latency -clock clk1 -stage 2 \
  -fanout_latency {{1-1 0.1} {2-2 0.2} {3-3 0.3} \
                  {4-4 0.4} {5-5 0.5} {6-6 0.6} \
                  {7-7 0.7} {8-8 0.8} {9-9 0.9} \
                  {10-10 1.0} {11-11 1.1} {12-12 1.2} \
                  {13-13 1.3} {14-inf 1.4}}
```

The first example shows a generated report with the **report_clock_gate_latency** command without any option in the default scenario.

```
prompt> report_clock_gate_latency

****************************************

                         11-11 1.1, 12-12 1.2, 13-13 1.3, 14-inf 1.4
--------------+---------+-----------------
clk2          | 0      | 1-inf -0.0602
--------------+---------+-----------------

Warning Summary:

(warning) There are 0 clock latency annotation conflicts. For a full list
of messages use report_clock_gate_latency command with -verbose option

(warning) There are 1 clock latency annotation gaps. For a full list of
messages use report_clock_gate_latency command with -verbose option
```

The fourth example shows a generated report with the **report_clock_gate_latency** command with the **-verbose** option.

```
****************************************
Report : clock_gate_latency
Design : top
Version: 2.75.0
Date   : Fri Jun 30 13:15:27 2017
****************************************

Scenario:  default

Clock Domain  | Stage  | Latency Table
==============|========|=================
clk1          | 0      | 1-inf -0.0602
              | 1      | 1-inf 1
              | 2      | 1-1 0.1, 2-2 0.2, 3-3 0.3, 4-4 0.4, 5-5 0.5,
              |        | 6-6 0.6, 7-7 0.7, 8-8 0.8, 9-9 0.9, 10-10 1,
              |        | 11-11 1.1, 12-12 1.2, 13-13 1.3, 14-inf 1.4
--------------+---------+-----------------
clk2          | 0      | 1-inf -0.0602
--------------+---------+-----------------

In these clock domains these pairs of objects have conflicting latency
constraints:

No annnotation conflicts found.

In these clock domains there are latency value gaps:
 Scenario: default. Clock domain: clk2, on stage 1 for clock_gate_out_reg_3.
```

Now, the next three examples will use the following setting instead for three already existing scenarios sc1, sc2 and sc3:

```
prompt> current_scenario sc1
prompt> create_clock clk1 -period 1.5
prompt> create_clock clk2 -period 1.6
prompt> set_clock_gate_latency -stage 1 -fanout_latency {{1-inf 1.7}}
```

```
prompt> set_clock_gate_latency -stage 2 \
  -fanout_latency {{1-10 0.7} {11-inf 0.2}}

prompt> current_scenario sc2
prompt> create_clock clk1 -period 1.7
prompt> set_clock_gate_latency -stage 0 -fanout_latency {{1-inf 1.7}}
prompt> set_clock_gate_latency -stage 1 -fanout_latency {{1-inf 0.3}}

prompt> current_scenario sc3
prompt> create_clock clk2 -period 2.0
prompt> set_clock_gate_latency -stage 0 -fanout_latency {{1-inf 1.5}}
```

The fifth example shows a generated report with the **report_clock_gate_latency** command without any options for the current scenario sc1.

```
prompt> current_scenario sc1
prompt> report_clock_gate_latency

****************************************
Report : clock_gate_latency
 ...

****************************************

Scenario:  sc1

Clock Domain  |  Stage  |  Latency Table
==============|=========|=================
clk1          |  1      |  1-inf 1.7
              |  2      |  1-10 0.7, 11-inf 0.2

report_clock_gating

Reports the details and summary of clock gating in the design.

SYNTAX

status **report_clock_gating**
[-gating_elements]
[-gated]
[-ungated]
[-type {*clock_gate* | *self_gate*}]
[-origin {*tool_inserted* | *pre_existing*}]

ARGUMENTS

-gating_elements

Reports the names of all clock-gating elements, along with their reference names, connected nets, level and whether they have been inserted automatically by the tool (Tool-Inserted), or manually by the user (Pre-Existing).

-gated

Reports the names of all clock gated sequential elements, along with the names of the corresponding clock-gating elements, level and whether they have been inserted automatically by the tool (Tool-Inserted), or manually by the user (Pre-Existing).

-ungated

Reports the names of all registers that are ungated or gated directly by manual inserted clock gates, and the reason why the tool didn't gate them.

-type {*clock_gate* | *self_gate*}

Specifies the type of the gate cells to be reported when using -gated or -gating_elements. The type can be *clock_gate*, *self_gate*, or both. Notice that regardless of the value passed to the **-type** option, if there are self gates in the current design, the self gating summary will be shown.

-origin {*tool_inserted* | *pre_existing*}

Specifies the origin of the clock gates to be reported. The origin can be *tool_inserted*, *pre_existing*, or both. When using *tool_inserted* combined with **-gating_elements** or **-gated** options, those reports are limited to the clock gates inserted by the tool. The summary report still includes information about all clock gates. When using *pre_existing* combined with **-gating_elements** or **-gated** options, those reports are limited to the clock gates inserted manually by the user. The summary report still includes information about all clock gates. If *tool_inserted* and *pre_existing* are used together, or neither are used, every report will consider all clock gates.

DESCRIPTION

This command reports information about clock-gating cells and gated/ungated registers in the current design.

Irrespective of the use of any option, the command always prints at the end a summary report, including this information:

- The total number of clock gates in the design.
- The number and percentage of Tool-Inserted clock gates.
- The number and percentage of Pre-Existing clock gates.
- The number and percentage of gated registers.
- The number and percentage of registers gated by Tool-Inserted clock gates.
- The number and percentage of registers gated by Pre-Existing clock gates.
- The number and percentage of ungated registers.
- The total number of registers.
- The maximum number of clock gate levels.
- The number of multi-level clock gates.

If the design contains multibit registers, the summary report also includes information about bitwidth and multibit composition for the gated/ungated registers.

If the design contains self gates, the summary report also includes an aditional report with the following information:

- The total number of self gates in the design.
- The number and percentage of self gated registers.
- The number and percentage of not self gated registers.
- The total number of registers.

The clock gate levels are counted from clock source to registers, and only clock gates, buffers and inverters are traversed for purposes of counting. Other cells found in the clock path will reset the level counting applicable to the clock gates and their fan-out.

IDENTIFICATION

Clock gates inserted by the tool are named according to the following pattern:

clock_gate_<bank_name>_<number>

The string <bank_name> tipically will match the name of some of the gated registers, and the <number> at the end is used to prevent name collisions. Clock gates whose name has a similar pattern will be recognized as Tool-Inserted clock gates, otherwise they will be recognized as Pre-Existing.

Note that it is possible that clock gates inserted by the user might be recognized unexpectedly as Tool-Inserted, instead of Pre-Existing.

EXAMPLES

The following example shows a summary report generated with the **report_clock_gating** command issued without any option.

```
prompt> report_clock_gating

****************************************
Report : clock_gating

SEE ALSO

compile_fusion(2)
set_clock_gate_style(2)

report_clock_gating_check

Displays clock gating check information for the specified pins.

SYNTAX

status **report_clock_gating_checks**
[-significant_digits *digits*]
[-nosplit]
[*object_list*]

Data Types

digits int
object_list list

ARGUMENTS

-significant_digits *digits*

Specifies the number of digits to the right of the decimal point to report. Allowed values are 0-13; the default is determined by the **shell.common.report_default_significant_digits** application option, whose default is 2. Use this option if you want to override the default.

-nosplit

Most of the design information is listed in fixed-width columns. If the information for a given field exceeds the width of the column, the next field begins on a new line, starting in the correct column. **-nosplit** prevents line splitting and facilitates writing scripts to extract information from the report output.

object_list

Specifies a list of cells, pins, clocks or design objects for report.

DESCRIPTION

The **report_clock_gating_checks** command generates two tables. The first table displays information about all the clock gating checks, including cell, enable pin, clock pin, level, clock (check w.r.t. a specific clock, or all clocks if none is given), attribute (inferred, or icg), and what user settings have affected its S/H/R/F values and check level. The attribute indicates where the clock gating check was originally defined. It can be either inferred, or defined by library cell.

If there are multiple settings that affect a clock gating check, it is an error condition. The conflicts should be resolved by the user.

The second table displays information about user settings that affect the clock gating checks displayed in the first table, including netlist object of clock it is set on, S/H/R/F check values, level, and file/line where the relevant **set_clock_gating_check** and **remove_clock_gating_check** commands are defined. If there are no effective user settings that affect clock gating checks, the second table will not display.

Multicorner-Multimode Support

This command works only on the current scenario.

EXAMPLES

The following example reports all clock gating check information.

```
prompt> report_clock_gating_checks

The first table displays information about all the clock gating checks, including cell, enable pin, clock pin, level, clock (check w.r.t. a specific clock, or all clocks if none is given), attribute (inferred, or icg), and what user settings have affected its S/H/R/F values and check level. The attribute indicates where the clock gating check was originally defined. It can be either inferred, or defined by library cell.

If there are multiple settings that affect a clock gating check, it is an error condition. The conflicts should be resolved by the user.

The second table displays information about user settings that affect the clock gating checks displayed in the first table, including netlist object of clock it is set on, S/H/R/F check values, level, and file/line where the relevant **set_clock_gating_check** and **remove_clock_gating_check** commands are defined. If there are no effective user settings that affect clock gating checks, the second table will not display.

Multicorner-Multimode Support

This command works only on the current scenario.

EXAMPLES

The following example reports all clock gating check information.

```
prompt> report_clock_gating_checks
****************************************
Report : clock_gating_check

report_clock_gating_enable_condition

Reports clock gate enable signals.

SYNTAX

status **report_clock_gating_enable_condition**
-objects
[-nosplit]
[-flat]

ARGUMENTS

-objects

List of cells to be reported.

-nosplit

Option to display enable conditions on a single line.

-flat

Reports the enable signals of each clock gate through hierarchical ports.

DESCRIPTION

Reports the enable conditions of all clock-gating cells that are connected to registers or to another clock gate. A Boolean equation is used to represent the enable conditions as a sum of products: '&' is the AND operation, '|' is the OR operation and, '!' is the NOT operation. When describing an enable function, you might use reference points (invariant points) that require a Boolean variable. These reference points represent the following:

- Output pins of the register (since Q and QN pins are two different variables)
- Ports
- Output pins of any sequential cell, black box, or unsupported cell
- Hierarchical boundaries

EXAMPLES

The following example shows a report generated with **report_clock_gating** command issued with -objects option

```
prompt> report_clock_gating_enable_condition -objects [get_clock_gates]

--------------------------------------------------------------------------------
                    Enable Conditions Report
--------------------------------------------------------------------------------
Clock Gating Bank               |       Gated Register
 Clock_gate_1                   |       Register[1]
                                |       Register[2]
                                |       Register[3]
Enable condition:

report_clock_gating_objects

Reports the object inclusion options that have been explicitly set for gating with **set_clock_gating_objects**.

SYNTAX

status **report_clock_gating_objects**
[-objects *object_list*]

Data Types

object_list list

ARGUMENTS

-objects *object_list*

Reports all objects in *object_list*, even if they have not been explicitly set for gating with **set_clock_gating_objects**.

DESCRIPTION

This command reports the settings that were explicitly set with the **set_clock_gating_objects** command. The report displays a table with the following columns:

- The action, set with **set_clock_gating_objects** command, the default values or its inherited values when applicable. The possible values are Include, Exclude or Force.
- The enable source option, set with **set_clock_gating_objects** command, the default values or its inherited values when applicable. The possible values are Both, Prefer Enable Pin, Prefer Feedback Loop, Enable Pin Only and Feedback Loop Only and "-".
- The instance for which the setting values are associated.

EXAMPLES

The following examples will use a design with two hierarchies (mid1, mid2), below the top level design, named top, and one hierarchie (bot) below mid2. The four, top, mid1, mid2, and top, have four registers each one.

The following example uses the next settings:

```
prompt> set_clock_gating_objects -include reg_top1 -enable_source enable_pin_only
prompt> set_clock_gating_objects -force reg_top3 -enable_source feedback_loop_only
prompt> set_clock_gating_objects -exclude mid1/reg_mid0
prompt> set_clock_gating_objects -include mid1/reg_mid1 -enable_source prefer_feedback_loop
prompt> set_clock_gating_objects -force mid1/reg_mid2 -enable_source prefer_enable_pin
prompt> set_clock_gating_objects -exclude mid1/reg_mid3
prompt> set_clock_gating_objects -include mid2/reg_mid0 -enable_source prefer_feedback_loop
prompt> set_clock_gating_objects -force mid2/reg_mid1 -enable_source prefer_feedback_loop
prompt> set_clock_gating_objects -exclude mid2/reg_mid2
prompt> set_clock_gating_objects -include mid2/reg_mid3 -enable_source feedback_loop_only
prompt> set_clock_gating_objects -force mid2/bot/reg_mid0 -enable_source prefer_enable_pin
prompt> set_clock_gating_objects -exclude mid2/bot/reg_mid1
prompt> set_clock_gating_objects -force mid2/bot/reg_mid3 -enable_source prefer_feedback_loop
prompt> set_clock_gating_objects -include mid2/bot -enable_source prefer_feedback_loop
prompt> set_clock_gating_objects -force mid2 -enable_source prefer_enable_pin
prompt> set_clock_gating_objects -force top -enable_source prefer_feedback_loop
```

The following example shows the generated report with **report_clock_gating_objects** command. Since the mid1 hierarchy does not have any explicit options set, it is not shown in the report.

```
prompt> report_clock_gating_objects

```

SEE ALSO

set_clock_gating_objects(2)

report_clock_jitter

Reports clock jitter information previously set by the **set_clock_jitter** command.

SYNTAX

status **report_clock_jitter**
[-clock *clock_list*]

Data Types

clock_list list

ARGUMENTS

-clock *clock_list*

Specifies a list of clocks to report. If you do not use this option, the command reports the clock jitter for all the clocks whose master (or itself) has cycle-to-cycle jitter or duty-cycle jitter.

DESCRIPTION

This command reports the cycle-to-cycle jitter and the duty-cycle jitter of the clock. If the clock is a generated clock, it will report the cycle-to-cycle and the duty-cycle jitter of its primary master clock. For example, if the generated clock G2 is created from the generated clock G1 and the generated clock G1 is created from the primary master clock M, the cycle-to-cycle jitter and the duty-cycle jitter reported for G2 is in fact the cycle-to-cycle jitter and the duty-cycle jitter of its primary master clock, M. The command reports the primary master clock of the generated clock as well. In case the clock is primary master clock, it will print the clock itself.

To set the clock jitter use the **set_clock_jitter** command.

EXAMPLES

The following example reports the cycle-to-cycle jitter of 0.5 and duty-cycle jitter of 0.7 specified on the primary master clock mclk, and its generated clock gclk.

```
prompt> set_clock_jitter -clock [get_clocks mclk] -cycle 0.5 -duty_cycle 0.7
prompt> report_clock_jitter
```

```
****************************************

report_clock_power

Reports power information related to clock tree

SYNTAX

string **report_clock_power**
[-clocks *clock_names*]
[-modes *mode_names*]
[-corners *corner_names*]
[-scenarios *scenario_names*]
[-type per_segment | per_subtree]
[-nosplit]
[-significant_digits *digits*]

Data Types

clock_names list
mode_names list
corner_names list
scenario_names list
digits integer

ARGUMENTS

-clocks *clock_names*

Limits the reporting scope to the specified clock or collection of clocks. Clocks can be specified as a Tcl list or as a collection of clocks created by the *get_clocks* command. If specified as a Tcl list, all clock names refer only to clocks in the current mode. *get_clocks* also returns clocks only in the current mode by default. Use *get_clocks* mode to specify clocks for a particular mode other than the current mode.

-modes *mode_names*

Specifies the modes to be used for reporting. If this option is not given, the command reports all active modes for all active scenario. This is mutually exclusive to the **-scenario** option. This option cannot be used together with the **-clocks** option to specify a clock name for a specific mode. Instead, the **-clocks** option filters the output of this command to only the specified clocks, and the **-mode** option filters the output of this command to only the specified modes. To specify a clock name for a particular mode other than the current mode, use **-clocks [get_clocks <clock_name> -mode <mode_name>]**.

-corners *corner_names*

Specifies the corner to report. By default, reports all corners for active scenarios. This is mutually exclusive to the **-scenarios** option.

-scenarios *scenario_names*

Specifies the scenario to report. If the **-scenario** option is used, then **-mode** and **-corner** cannot be used. If none of **-modes**, **-corners**, or **-scenarios** options are specified, then the report is generated for all active scenarios.

-nosplit

By default, tabular reports are formatted to not exceed 80 columns in width. If certain fields exceed their fixed column width, then printing can automatically jump to the next line to maintain the formatting. This is done to improve readability of the report. If **-nosplit** is specified, then one row of data in a tabular report will always be printed on one row. The columns will no longer align, which affects readability of the report. The **-nosplit** option is useful to simplify parsing or post-processing of a report output file. If the report is not intended to be post-processed, then do not use the nosplit option, in order to get better report readability.

-significant_digits *digits*

Specifies the number of significant digits to show for reporting of any floating point number field. By default, each field has a particular number of significant digits, intended to communicate the right level of information to the user. This option overrides those default settings.

-type per_segment | per_subtree

Specifies the type of report to generate. Possible values of the -type argument are:

per_segment - A clock tree segment is defined as the clock buffer tree from a ICG to next ICG in its fanout. This option reports the power numbers per clock tree segments for each clock. Number of repeaters is the number of repeaters (both CTS added and pre-existing) in the clock tree segment. Number of sinks is the number of sinks driven by clock tree segment. Number of non-sink loads is number of non-sink loads driven by this clock tree segment. Total wire cap is sum of wire cap of nets in the clock tree segment. Total pin cap is sum of pin cap of all pins in the clock tree segment. Leakage power is sum of leakage power consumed by cells in this clock tree segment, including the driver, but excluding the segment loads. Net switching power is sum of net switching power of nets in the clock tree segment. Internal power is sum of internal power of pins in the clock tree segment (includes driver pin, and loads pins). The power numbers of macro are not included in the report as of now. Toggle rate of the driver pin will also be reported in a column.

per_subtree - A clock sub-tree is defined as the clock tree from a ICG all the way to sinks. This option reports the power numbers per clock subtree for each clock. Definitions of the column are same as that of per_segment.

DESCRIPTION

The **report_clock_power** command handles reporting of power numbers per clock tree segments and per clock subtree. The clock tree will be divided into segments or into subtree by pre-existing gates such as ICGs and the power numbers will be reported for the segment or subtree. A clock tree segment is defined as the clock buffer tree from a ICG to next ICG in its fanout, while a clock sub-tree is the clock tree from a ICG all the way to sinks. So there will be two kind of reports, one splitting the clock tree into clock segments and other into clock subtree. The user will be switch to per clock subtree reporting using a command option.numbers per clock tree segments and per clock subtree. The clock tree will be divided into segments or into subtree by pre-existing gates such as ICGs and the power numbers will be reported for the segment or subtree. A clock tree segment is defined as the clock buffer tree from a ICG to next ICG in its fanout, while a clock sub-tree is the clock tree from a ICG all the way to sinks. So there will be two kind of reports, one splitting the clock tree into clock segments and other into clock subtree. The user will be switch to per clock subtree reporting using a command option.

EXAMPLES

This example generates a summary report only for clock clk in mode modeA per segment.

```
prompt> report_clock_power -clocks [get_clocks clk -mode modeA] per_segment
```

SEE ALSO

pin_names list
mode_names list
corner_names list
scenario_names list
rpt_type string
filename string
hist_type string
number integer
rcorner_name integer
digits integer

ARGUMENTS

-clocks *clock_names*

Limits the reporting scope to the specified clock or collection of clocks. Clocks can be specified as a Tcl list or as a collection of clocks created by the *get_clocks* command. If specified as a Tcl list, all clock names refer only to clocks in the current mode. *get_clocks* also returns clocks only in the current mode by default. Use *get_clocks* mode to specify clocks for a particular mode other than the current mode.

If a master clock is specified, then reporting is restricted to that clock and skew groups in that clock, no generated clocks are reported. If a generated clock is specified, then only that clock will be reported. No information about skew groups will be reported for the generated clocks, since skew groups belong to the master clock object. **-clocks** is mutually exclusive with the **-mode** and **-scenario** options.

-skew_group *skew_group_names*

Limits the reporting scope to the specified skew_group or collection of skew_groups. skew_groups can be specified as a Tcl list or as a collection of skew_groups created by the *get_clock_skew_groups* command. If specified as a Tcl list, all skew_group names refer only to skew_groups in the current mode. *get_clock_skew_groups* also returns skew_groups only in the current mode by default.

-skew_group option can be used in so many ways to get different results. For example, *-per_clock_root*, *-clocks*, *-corners*, options can be used with skew_group to again restrict the amount of result we get from *report_clock_qor*. **-skew_group** is mutually exclusive with the **-mode** and **-scenario** options.

-from *pin_names*

Limits the reporting scope to the fanout of the specified set of clock pins. This option can be used together with the **-to** and **-through** options. For **-type latency**, the latency of the sink will be reported as the latency calculated starting from the from-pin to the sink. If **-from** option is specified, all ideal clocks will ignored and will not be reported. It can accept hierarchical pins as valid inputs when **-type latency**/**structure**/**summary or -histogram_type latency** option is specified.

-to *pin_names*

Limits the reporting scope to the fanin to the specified set of clock pins. This option can be used together with the **-from** and **-through** options. It can accept hierarchical pins as valid inputs when **-type latency**/**structure**/**summary or -histogram_type latency** option is specified. In the case of **-type latency**/**robustness** and **-histogram_type latency**/**robustness**, the pins specified with this option should be endpoints and the non-endpoint pins specified will be ignored.

-through *pin_names*

Limits the reporting scope to only clock paths passing through the specified pin. This option can be used together with the **-from** and **-to** options. This option is not supported with **-type robustness**/**local_skew**/**balance_groups** and **-histogram_type robustness**/**local_skew**. It can accept hierarchical pins as valid inputs when **-type structure**/**latency**/**summary** and **-histogram_type latency** option is specified.

-modes *mode_names*

Specifies the modes to be used for reporting. If this option is not given, the command reports all active modes for all active scenario. This is mutually exclusive to the **-scenario** option. This option cannot be used together with the **-clocks** option to specify a clock name for a specific mode. Instead, the **-clocks** option filters the output of this command to only the specified clocks, and the **-mode** option filters the output of this command to only the specified modes. To specify a clock name for a particular mode other than the current mode, use **-clocks [get_clocks <clock_name> -mode <mode_name>]**.

-corners *corner_names*

Specifies the corner to report. By default, reports all corners for active scenarios. If more than one corner is specified using corner option, then multiple tables are printed (one each for every specified corners). This is mutually exclusive to the **-scenarios** option.

-scenarios ***scenario_names***

Specifies the scenario to report. If the **-scenario** option is used, then **-mode** and **-corner** cannot be used. If none of **-modes**, **-corners**, or **-scenarios** options are specified, then the report is generated for all active scenarios.

-type ***rpt_type***

Specifies the type of report to generate. Valid values are

- **summary**
  This is the default output if no type option is specified. It prints a summary table organized by clocks and skew groups, and includes basic summary information like area, buffer count, global skew, maximum latency, and logical DRCs. Use other reporting types to get more details about these metrics. For example, **-type summary** will show global skew, but **-type latency** must be used to get other skew information like boundary skew or local skew.

- **balance_groups**
  Reports a summary table of balance_groups in the design. There is no detailed table for this report. This reporting can be restricted to specific modes/corners/scenarios by giving options -corner/-mode/-scenarios. **balance_groups** can have master clocks or skew_groups as it's elements. -type balance_groups reports shows all information regarding balance_groups and it's elements- like target/scaled target offset, actual offset, max_latency, global skew etc.

- **latency**
  Reports a summary table of latency and skew information on all clocks and skew groups, including global / local / boundary skew, minimum / maximum / median latency, and latency and skew targets. The detailed section of the report shows sinks or balance points with their corresponding latencies. In order to see the latency to a hierarchical balance pin, user may specify hierarchical pins as input to **-to** option with this reporting.

- **drc_violators**
  Reports a summary table of transition and capacitance limit violations on the clock network, including total DRC count, cumulative DRC slack, and the DRC limits. The detailed section of the report shows clock pins with their corresponding DRC slacks.

- **robustness**
  Reports information about multicorner robustness of the CTS implementation. Robustness is a measure of how the latency to each clock sink scales between a measured corner and a reference corner. Every corner pair has a scaling factor, which is simply the ratio of the average latency in the measured corner over the average latency in the reference corner. The robustness value for an individual sink is the ratio of its latency in the measured corner over the latency in a reference corner, normalized against the scaling factor for those corners.

  If a clock sink has a robustness value of 1, that means it exhibits typical scaling between the measured and reference corner. A robustness value greater than one indicates a sink has higher than average latency in the measured corner compared to the reference corner. Likewise, a robustness value less than one indicates a sink with less than average latency in the measured corner compared to the reference corner. The largest and smallest robustness value sinks have the worst multicorner robustness, and could cause timing problems in the measured corner. If all clock sinks for a clock or skew group have a similar robustness value, then the clock tree is said to be multicorner robust, and the skew can be maintained across those corners.

  You must specify a robustness corner with the **-robustness_corner** option for this reporting type. The robustness corner represents the reference corner for measuring robustness values. Typically, the reference corner would be the corner that was used to synthesize the clock tree, or some dominant corner if multicorner CTS was used. The measured corners are determined based on the values specified by the corner or scenario arguments. When the measured corner and the reference corner are the same, the robustness value is meaningless and no information will be printed for that measured corner. If more than one corner is specified for the measured corner, then a separate table is printed for each measured corner. The output consists of a summary table for each clock and skew group, with information about the average latency, the scaling factor between the measured and reference corners, and then robustness values representing the extremes for that clock or skew group (minimum robustness value, maximum robustness value, and range). After that, a detailed table is

printed showing individual sinks with their corresponding robustness values.

- **area**
  Reports information about area and cell counts in the clock trees. The command first prints a summary table with a row for each clock and skew group. This table might include duplicate counting of area, for example, when multiple clocks share some of the same clock tree fanout. This section also includes a total area row at the end which provides overall area information for the reported scenario, and does not double-count any cells in the calculation.

  The command reports per-lib_cell area reporting in a separate section. This section analyzes exactly how many of each lib_cell are instantiated in the clock tree, and also organizes the cells by type (buffers, ICGs/muxes, macros vs standard cells). The **-smallest**, **-largest**, **-all**, and **-show_paths** options are incompatible with the area report.

- **power**
  Reports information about power in the clock trees. It is largely modeled on the area report, with some slight changes. There would be three sections to the power report: a per-scenario power table, per-lib_cell power tables for each reported scenario, and a per-hierarchy power table for each reported scenario. A report will be printed for each scenario whose setup/hold and leakage/dynamic power is enabled.

- **structure**
  The structure report is a very detailed representation of the clock tree structure. The entire fanout of the clock tree is represented in this report, with indentation and numbering indicating different levels of the clock tree. Clock balance points and ignore points and also represented in this report. It can accept hierachical pin as input to **-to/-through** options.

  report_clock_qor -type structure will show the balance point values on the pins. On a balance point pin, there can be multiple balance point values. For each corner exist in the design, we can set different values using the command **set_clock_balance_points**. For particular corner, there can exist different balance point values corresponding to early-rise, early-fall, late-rise and late-fall. Out of these four values minimum and maximum are printed. sample: [BALANCE PIN] [Offset values C1: max min C2: max min] where, C1 and C2 are corner names.

  The output of this report can be very large. As a result, it can be useful for parsing or searching for very specific information, but is generally not useful to get a high-level overview of the clock structure. For that purpose, you should use the Abstract Clock Graph feature of the GUI, which gives similar information to this report, but visually instead of textually. The **-smallest**, **-largest**, **-all**, **-show_paths**, and **-show_verbose_paths** options are incompatible with the structure report.

- **local_skew**
  This option prints the setup local skew and hold local skew information. Setup local skew is calculated as "launch flop latency - capture flop latency" and Hold local skew is calculated as "capture flop latency - launch flop latency". Reporting is done based on the scenario configuration. When setup=true, hold=false, only setup local skew is reported, when setup=false, hold=true, only hold local skew is reported and when setup=true, hold=true, both setup and hold local skews are reported.

This option is mutually exclusive with the **-histogram_type** option. The **-clocks**, **-from**, **-to**, **-modes**, **-corners**, and **-scenarios** options can be used to limit the scope of what is reported. The **-nosplit** and **-significant_digits** options affect all of the report output types.

Summary, latency, drc_violators and robustness reporting follows a similar format for the output. First, a summary table is shown with one row of output for each clock or skew group, with relevant QoR data printed. After the summary table, a detailed output section shows information about the worst clock pins, sinks, or balance points related to that metric. The number of items printed in this detailed section can be controlled using the **-largest**, **-smallest**, or **-all** options. The **-show_paths** option can be used to show a third category of output, which is a clock path report for each object reported in the detailed section.

-csv summary | **detail**

This option can be used to save the reports in CSV format. *-output* option should be specified with *-csv* to save the report as a file. This file will be saved in the current working directory. *-histogram_type* is not supported with *-csv* option.

Possible options for *-csv* are:

summary - to print the summary section of the report in CSV format. *details* - to print the details section of the report in CSV

format.

-output \ffilename

Using this option, user can specify the output filename to which the csv report will be dumped. This option can only be used with *-csv* switch. In case, tool can't create the file specified by the user, an error message will be displayed. It is recommended to save the output file with extension '.csv'.

-histogram_type *hist_type*

Specifies the type of histogram report to generate. This option is mutually exclusive with the **-type** option. The **-clocks**, **-from**, **-to**, **-through**, **-modes**, **-corners**, and **-scenarios** options can be used to limit the scope of what is reported. The **-significant_digits** option affects all of the report output types.

There are three additional options that can only be used with the **-histogram_type** option, but not the **-type** option. **-histogram_bins**, **-histogram_min**, and **-histogram_max** control the appearance of the output histograms. Generally, one histogram is printed for each clock or skew group. The output format for the histogram reports shows the histogram itself. The **-smallest**, **-largest**, and all options can be used to control the number of rows of detailed output per histogram. Detailed tables are printed only for the **-histogram_type** latency and robustness.

The possible options for *hist_type* are:

latency - Reports a histogram of clock latencies. The histogram includes one entry for every active clock edge at every clock sink or balance point. Latency can differ depending on whether a clock path to a sink is treated as the launch clock or capture clock. So, generating a latency histogram report actually reports two histograms per clock or skew group, one for launch clock latencies and the other for capture clock latencies.

transition - Reports a histogram of transition values in the clock network. The histogram includes one entry for every net load in the clock network, which could either be a cell input pin or an output port. Transition times for drivers of clock nets are not included in this histogram. Transition times at net sinks will always be greater than or equal to the transition time at the driver.

capacitance - Reports a histogram of total net capacitance values in the clock network. The histogram includes one entry for every clock net.

robustness - Reports a histogram of multicorner skew robustness values. The histogram includes one entry for every active clock edge at every clock sink or balance point. See the description of the **-type** robustness reporting type for more details about how robustness values are calculated. The **-robustness_corner** option must be used with this histogram type to specify a reference corner for calculating multicorner robustness values.

wire_delay_fraction - Reports a histogram of the wire delay fractions in the clock tree. The histogram includes one entry for every active clock edge at every clock sink or balance point. Wire delay fraction is defined as the ratio of the total wire delay over the total overall delay for a given path through the clock tree. Wire delay fraction is a useful metric for understanding the multicorner skew robustness of the clock tree. Typically, clock paths with similar wire delay fractions will have similar latency scaling between corners.

wire_delay - Reports a histogram of the wire delays in the clock tree.

cell_delay - Reports a histogram of the cell delays in the clock tree.

level - Reports a histogram of levels in the clock tree. The histogram includes one entry for every active clock edge at every clock sink or balance point. In a standard CTS flow, the clocks are not level-balanced. So, the level reporting is not a meaningful metric to analyze after CTS, except to look for extreme outliers in level count that could indicate an implementation problem. It might be more meaningful in custom CTS flows like a mesh or multisource. The level count can also be useful to analyze the clock tree before CTS, to understand how many gating or muxing levels are in each clock branch.

fanout - Reports a histogram of fanouts in the clock tree. The histogram includes one entry for every clock net. Fanout information is corner independent. Unlike most **report_clock_qor** reports, separate sets of histograms for each corner are not printed. If you specify both the **-corners** and **-histogram_type fanout** options, the command restricts which scenarios are considered for reporting.

wirelength - Reports a histogram of wirelengths in the clock tree. The histogram includes one entry for every clock net. The wirelength reported is the total wirelength of the net. Wirelength is calculated based on the current routing state of net (virtual, global, or detail routed).

Wirelength information is corner independent. Unlike most **report_clock_qor** reports, separate tables for each corner will not be printed. If you specify both the **-corners** and **-histogram_type wirelength** options, the command restricts which scenarios are considered for reporting.

wire_arc_length - Reports a histogram of wire arc lengths in the clock tree. The histogram includes one entry for every fanout of every clock net. The wire arc length is the wirelength just from the net driver to a particular net sink. Wire arc length is calculated based on the current routing state of net (virtual, global, or detail routed).

Wire arc length information is corner independent. Unlike most **report_clock_qor** reports, separate tables for each corner are not printed. If you specify both the **-corners** and **-histogram_type wire_arc_length** options, the command restricts which scenarios are considered for reporting.

local_skew - This report prints out a histogram of setup local skew and hold local skew distribution. Each entry in the histogram represent one launch and capture flop pair.

-histogram_bins ***number***

Divides the dataset into bins for reporting. This option specifies the number of bins in the histogram to report. The **-histogram_bins**, **-histogram_min** and **-histogram_max** options completely specify the number of bins and the range of values in each bin. The default value for **-histogram_bins** is 10, or the number of datapoints being reported, whichever is less. Although, if **-histogram_min** and/or **-histogram_max** is specified with **-histogram_bins**, we cannot always make bins accordingly. For example- **-histogram_bins** is 10, **-histogram_min** is 4 and **-histogram_max** is 6. This happens in the case of histograms are made with integer data points (for example, -histogram_type level).

-histogram_min ***number***

Specifies the smallest value to be reported in the histogram. Any data below this value is not added to a histogram bin. A total count of datapoints below the **-histogram_min** value is reported. By default, the **-histogram_min** value is equal to the smallest datapoint being reported.

-histogram_max ***number***

Specifies the largest value to be reported in the histogram. Any data above this value is not added to a histogram bin. A total count of datapoints above the **-histogram_max** value is reported. By default, the **-histogram_max** value is equal to the largest datapoint being reported.

-show_paths

Adds an additional section to the report that lists the clock path through the objects listed in the detailed section. This option can be used with the summary, latency, drc_violators, and robustness report types. Each of these reports shows a summary section, followed by a detailed section that reports the value of the metric on individual objects. An optional third reporting section is added by specifying this option. In this section, for every object reported in the detailed section, a clock path is reported through that object.

The path report is shown with the following commonly used columns for debugging clock paths: cell name, lib_cell name, fanout, capacitance, transition, increment, and arrival time.

The **-largest**, **-smallest**, and **-all** options apply to both the detailed section of these reports as well as the path section if the **-show_paths** option is specified. For example, the **report_clock_qor -type latency -largest 2 -show_paths** command shows the two largest latency sinks for each clock or skew group in the detailed section. Then, the paths associated with all those reported sinks will also be shown.

Unlike the **report_timing** report, the paths shown in **report_clock_qor** do not include the logical hierarchy pins, since they are seldom relevant to understanding the CTS implementation.

The path reports in **report_clock_qor** also have a 'Tags' column which annotates pins with useful information relevant to CTS.

The following annotations can be found in the 'Tags' column:

Scope Options
from: Marks from_pins
to : Marks to_pins
thru: Marks through_pins

Significant Clock Pins
clk : Marks master clock source pins
gclk: Marks generated clock source pins
sink: Marks default sink pins
icg : Marks ICG clock input pins
hier: Marks pins at the boundary or inside of physical hierarchy

Clock Exceptions
bal : Marks balance points
e_ign: Marks explicit ignore points
i_ign: Marks implicit ignore points

Clock Convergence
conv : Marks a pin where two or more clocks converge, such as a mux output
reconv: Marks a pin where a clock reconverges with itself

DRC Violations/Metrics
trans : Marks all pins with transition violations in the -type
drc_violators report. Marks the reported pin from the
-histogram_type transition report.

cap : Marks the driver pins of all nets with capacitance
violations in the -type drc_violators report. Marks the
driver pin of the reported net from the -histogram_type
capacitance report.

fanout: Marks the driver pins of all nets with fanout violations in
the -type drc_violators report. Marks the driver pin of the
reported net from the -histogram_type fanout report.

length: Marks the driver pins of all nets with net length violations
in the -type drc_violators report. Marks the driver pin of
the reported net from the -histogram_type wirelength
report. Marks the load pin of the reported wire arc from the
-histogram_type wire_arc_length report.

Dont_touch Constraints
dt_lib : set_dont_touch applied on lib_cell of the instance
dt_cell : set_dont_touch applied on the cell instance
dt_net : set_dont_touch applied on the net
dt_mv_cell: MV derived dont_touch on cell
dt_mv_net : MV derived dont_touch on net
dt_subtree: dont_touch_subtree derived dont_touch on cells and/or nets

If both **-show_paths** and **-show_verbose_paths** are specified, **-show_verbose_paths** takes precedence and more verbose paths are reported.

-show_verbose_paths

This option is similar to the **-show_paths** option, except it enables additional columns of output in the path report to help with

detailed debugging. If both **-show_paths** and **-show_verbose_paths** are specified, **-show_verbose_paths** takes precedence and more verbose paths are reported.

-show_verbose_paths generates path reports with the following columns in addition to the columns generated by **-show_paths**: location, non-default routing rules, and clock routing layer information.

The clock routing layer information is similar to the information provided by **get_attribute $net route_length**, in that it gives a per-layer breakdown of routing length for the net.

-trace_beyond_exception true | false | only

Using this option, how reporting is done beyond the exception pins can be manipulated for -type structure and drc_violators reports. Possible values for -trace_beyond_exception are follows: true : consider the clock tree beyond an exception pin. false: do not consider the clock tree beyond an exception pin. only : consider only the clock tree beyond the exception pin(including the exception pin).

-largest *number*

The latency, drc_violators, and robustness reports, along with robustness and latency histogram reports, show a detailed section where individual objects are reported. Each report type has a default behavior for the objects shown in this section. By using **-largest**, you can explicitly specify the number of objects to report in the detailed section, from the higher side of distribution of the metric. For example, **report_clock_qor -type latency -largest 5** reports the five largest latency sinks for each clock or skew group in the detailed section. **-largest** can be used together with **-smallest** to report objects from both sides of the distribution. If **-largest** and **-all** are specified together, **-all** takes precedence.

-smallest *number*

The latency, drc_violators, and robustness reports show a detailed section where individual objects are reported. Each report type has a default behavior for the objects shown in this section. By using smallest, you can explicitly specify the number of objects to report in the detailed section, from the lower side of the distribution of the metric. For example, **report_clock_qor -type latency -smallest 5** reports the five smallest latency sinks for each clock or skew group in the detailed section. **-smallest** can be used together with **-largest** to report objects from both sides of the distribution. If **-smallest** and **-all** are specified together, **-all** takes precedence.

-all

The latency, drc_violators, and robustness reports, show a detailed section where individual objects are reported. Each report type has a default behavior for the objects shown in this section. By using **-all**, every object will be shown in the detailed report section. For example, **report_clock_qor -type latency -all** reports all sinks or balance points for each clock or skew group in the detailed report section.

-robustness_corner *rcorner_name*

This option specifies a reference corner to measure against for the **-type robustness** and **-histogram_type robustness** reports. This is a mandatory option for both of those reports, as robustness reporting cannot occur without knowing what reference corner to measure against. See the description of the **-type robustness** report for more information about what the robustness number means and how it is calculated.

-per_clock_root

This option splits the reporting of a clock to per clock root, so that the clock trees associated with different root pins are reported separately. This option can be only used with **-type latency** option. The global skew/latency reported will be per clock root and hence will be calculated between sinks in the clock tree of a particular clock root. The longest/shortest path delay from root will be computed to get the global skew/latency for each root.

-nosplit

By default, tabular reports are formatted to not exceed 80 columns in width. If certain fields exceed their fixed column width, then printing can automatically jump to the next line to maintain the formatting. This is done to improve readability of the report. If **-nosplit** is specified, then one row of data in a tabular report will always be printed on one row. The columns will no longer align,

which affects readability of the report. The **-nosplit** option is useful to simplify parsing or post-processing of a report output file. If the report is not intended to be post-processed, then do not use the nosplit option, in order to get better report readability.

-significant_digits *digits*

Specifies the number of significant digits to show for reporting of any floating point number field. By default, each field has a particular number of significant digits, intended to communicate the right level of information to the user. This option overrides those default settings.

DESCRIPTION

=== Overview ===

The **report_clock_qor** command handles reporting of CTS-related QoR. This report has many subtypes, and can be used to get detailed information about area, DRCs, latency, skew, and multicorner robustness. Many histogram reports are also available to get details about metrics like latency, transitions, capacitance, and multicorner robustness. **report_clock_qor** reports the clock metrics for user analysis. No analysis is done by the command itself. See the **check_clock_trees** command which supports analysis regarding possible causes of bad CTS QoR. **report_clock_qor** does not report all clock settings, only a few that are relevant to the metric being reported, such as capacitance limits when reported capacitance DRC violations. For a complete report of clock settings that influence CTS behavior, see **report_clock_settings**.

=== CTS Timer View ===

report_clock_qor uses the CTS timer view, which is the same timer view that **synthesize_clock_trees** uses. In this view, only late mode timing constraints and derates are used for a given corner. This differs from the standard timing view, where for setup timing paths, late derates are applied to the launch clock path and early derates are applied to the capture clock path. The clock timing view applies the late derates only. This is particularly important for skew reporting. If skew is reported with early and late OCV derates applied, skew can appear very high due to the derates alone. For example, very high skew can be seen even at the same sink, due to different late and early derates applied to the path leading to the sink. This same-sink skew is unfixable by any CTS engine, and so it is preferable to run CTS and report CTS QoR with only late derates applied.

In the CTS timer view, timing path slack is not meaningful. It is only useful for analyzing clock paths themselves, rather than full timing paths. For clock related reporting that uses the standard timing view, see the command **report_clock_timing**.

=== Launch vs Capture Clocks ===

Even when the reporting is limited to just late mode constraints as described, it is still possible for the path to a sink for a given clock in a given corner to have differing launch vs capture latency values. This can happen for a variety of reasons, including clock reconvergence, float constraint exceptions applied with the **set_clock_balance_points** command, crosstalk, pin capacitance variation, and conditional delay arcs. These differing launch and capture clock path latencies contribute to the skew that must be minimized during clock optimization, and so need to be reported by **report_clock_qor** as well.

All latency and skew reporting fully considers the differing launch and capture latencies to each clock sink. In the detailed output for any report type that includes latency information, both the launch and capture latency to the sinks are given. Other metrics can also vary depending on whether analysis focuses on launch clocks or capture clocks. These metrics include transition values, pin capacitance, robustness, and wire delay fraction. These metrics are all reported for the launch clock only.

=== Clocks and Skew Groups ===

With the exception of the structure report, every reporting type and histogram type is organized by clocks and skew groups. Clocks can be master clocks created with the **create_clock** command, or generated clocks created with the **create_generated_clock** command. Every generated clock has a master, which creates a sort of hierarchy of clocks in the design.

Clocks define the topological structure of the clock trees synthesized by the CTS engine, but skew groups define the skew balancing behavior for those clocks, or for subsets of those clocks. Every time a **create_clock** statement is issued, a corresponding default skew group for that clock is created with the naming convention *default_<clock_name>*. By default, every sink of a master clock and

all of its generated clocks belong to that default skew group, meaning they will be skew-balanced together during CTS. The default skew group is owned by the master clock, but might contain sinks from other clocks generated from that master. Optionally, individual clock pins can be pulled into a separate user-defined skew group for balancing, by using the **create_clock_skew_group** command.

The clock and skew group information is reported by specifying the appropriate **report_clock_qor** output types. For example, the -type summary | latency | drc_violators | area | robustness reports all begin with a summary table of the same format, shown below:

```
Attributes
==========
M Master Clock
G Generated Clock
D Default Skew Group
U User Skew Group
* Generated Clock Balanced Separately

Clock / Skew Group   Attrs    Sinks <other_metrics>
-----------------------------------------------------
CLK1                 M          5000
  default_CLK1         D          4000
    GCLK1              G           500
    GCLK2              G          2500
      GCLK2_1          G           300
      GCLK2_2          G           200
    GCLK3              G          1000
  group1               U           600
  group2               U           400
CLK2                 M          6010
  GCLK4              G          5000
  GCLK5              G          1000
    GCLK5_1            G           400
```

The summary table shows the clock or skew group names, followed by a sink count, and then the relevant metrics, depending on the report type generated. histogram_type reports are similar, except a histogram is shown for each clock or skew group instead of a summary table.

In the above example, CLK2 is a simple case of a master clock with no user-defined skew groups. For brevity, the CLK2 line represents both the CLK2 clock defined by the **create_clock** command as well as the default skew group for that clock, called default_CLK2. Listed hierarchically under CLK2 is the generated clock structure for that master clock CLK2. CLK2 directly generates GCLK4 and GCLK5. GCLK5 then generates another generated clock GCLK5_1. The indentation indicates these relationships.

The more complex example is CLK1, which has user-defined skew groups. In this case, the sinks of CLK1 are divided among three skew groups: the default skew group default_CLK1, and the two user-defined skew groups group1 and group2. The CLK1 row represents the topological fanout of the master clock CLK1, and each indented skew group row represents the set of sinks balanced for that skew group. As expected, the sink count for CLK1 equals the sum of the sink counts for default_CLK1, group1, and group2 skew groups.

The generated clock structure for CLK1 is shown under the default_CLK1 skew group. This represents the generated clock topology and sinks belonging to the default skew group. Any generated clock sinks that are part of a user defined skew group are reported under that skew group, the same as skew grouped sinks of the master clock. So for example, there are 500 sinks in the fanout of GCLK1 belonging to the default_CLK1 skew group.

=== Cumulative Reporting ===

All metrics are reported cumulatively, meaning that the any metric reported for a given clock or skew group includes all of the generated clocks sourced from that clock. See the example below:

```
Clock/Skew Group  Attrs  Sinks  Latency  DRCs
```

```
-------------------------------------------------
CLK2            M    6010  2.012   104
 GCLK2_1        G    5000  1.293    54
 GCLK2_2        G    1000  0.884    41
  GGCLK2_2      G     400  0.431     9
```

CLK2 shows 6010 sinks. This includes the 5000 sinks of GCLK2_1 and the 1000 sinks of GCLK2_2. These numbers indicate that CLK2 has 10 direct sinks, but the other 6000 sinks are in the fanout of the two generated clocks. Likewise, GCLK2_2 has 1000 sinks, 400 in the fanout of its generated clock GGCLK2_2, and 600 in its direct fanout. All metrics are reported this way. Note that the latency for CLK2 is higher than that for GCLK2_2, which is larger than the latency for GGCLK2_2. This is because each latency value is calculated just from that clock root to its sinks. These numbers show that the source point of GCLK2_2 is (2.012 - 0.884) = 1.128ns deep in the CLK2 tree, and the source point of GGCLK2_2 is (0.884 - 0.431) = 0.453ns deep in the GCLK2_2 tree. Note that in the above example, the longest path is fanout for both GCLK2_2 and GGCLK2_2.

=== Balancing and Topological Metrics ===

The CTS metrics reported by the **report_clock_qor** command can be divided into two categories: balancing metrics and topological metrics. Balancing metrics are those directly related to single-corner or multicorner clock skew balancing: latency, skew, robustness, and wire delay fraction. Topological metrics are those related to the overall clock tree topology and structure. This includes drc violators (transition, capacitance), area and cell counts, transition times in the clock network, and capacitance on clock nets metrics.

Balancing metrics and topological metrics are handled differently by **report_clock_qor**. Balancing metrics are only reported for objects that are balanced, like skew groups. It does not make sense to report skew for objects that are not balanced, such as a master clock divided into several skew groups.

Topological metrics are only reported for clocks, not for skew groups. Skew groups are not guaranteed to have a clear and cohesive topology. There is no restriction on pins that can be added to a skew group, so it might consist of sinks from widely different branches of the clock tree.

See the example below, which is a truncated version of the **report_clock_qor -type summary** ***report.***

```
Clock /     Attrs  Sinks  Levels    Max  Global   DRC
Skew Group                       Latency   Skew  Count
-----------------------------------------------------------------
clk1        M     1450   10      1.548  0.132     3
clk2        M     2300   13       --    --        0
 default_clk2  D     2298   --      1.834  0.138    --
  genclk2     G     1560    7      0.840  0.110     2
 skew_group1   U        2   --      0.232  0.008    --
-----------------------------------------------------------------
All Clocks    --     3750   13       --    --        5
```

There are both balancing and topological metrics in this report. Latency and skew are balancing metrics, levels and DRC count are topological metrics. clk1 is a master clock with no user-defined skew groups, so that row represents both the topology of the clk1 fanout, as well as the default_clk1 skew group. So, both the balancing and topological metrics are reported on that row.

clk2 represents only the master clock fanout of clk2. For balancing, that clock has been divided into the default skew group default_clk2, and the user-defined skew group skew_group1. So, the clk2 row only reports topological metrics, and the default_clk2 and skew_group1 rows only report balancing metrics. genclk2 represents both the topology of the gen clk2 fanout, as well as the genclk2 sinks in the default skew group default_clk2. So, both the balancing and topological metrics are reported on that row.

=== Clock Tree Exceptions ===

Clock tree exceptions are constraints that provide exceptions to the default skew balancing behavior. There are two main categories of exceptions: balance points defined with the **set_clock_balance_points** command, and ignore points set with the **set_clock_balance_points -consider_for_balancing** command. Balance point exceptions force a pin to be balanced that is not normally a sink. Ignore point exceptions prevent a pin from being balanced that normally would have been.

By default, balancing metrics honor clock tree exceptions and topological metrics do not honor clock tree exceptions. Honoring the

exceptions means that the reporting will stop at any exceptions that exist in the middle of the clock tree. Not honoring exceptions means that the reporting will trace beyond exceptions to the original sink pins of the clock network.

It makes sense for balancing metrics to honor the exceptions, because the exceptions were applied in order to guide the balancing behavior during CTS. It makes sense for topological metrics to disregard the exceptions, because the parts of the clock tree beyond exceptions, even though they are not balanced, are still considered to be part of the clock network, and will be synthesized during CTS. Metrics like DRCs and area (and other topological metrics) should consider that part of the clock network during reporting.

You can override the default exception handling by setting the report_beyond_exceptions option to true or false. The default behavior is true, which works as described above.

=== How Clock Metrics Are Calculated ===

report_clock_qor reports on many different CTS related metrics. The method for calculating some of these metrics requires further explanation:

Sinks: Sink count is shown in many **report_clock_qor** sub-reports. This metric is taken to mean 'sink pin' count. In other words, if a cell has multiple clock inputs, it will count as a sink for each clock input. Similarly, some abstracts can have a single physical clock input pin that fans out to multiple check pins inside the abstract. Each of these check pins count as one sink. Also, sink count is calculated while honoring clock exceptions like balance points and ignore points. So, sink count is representative of what is actually balanced during CTS, not the physical leaf sink pins in the clock network.

For example, if a leaf-level register on the clock network has an ignore point constraint on it, it is not reported as a sink in most **report_clock_qor** reports. Likewise, an intermediate pin in the clock network might have a balance point constraint on it, in which case it will be considered a sink, and all downstream physical sinks will not be considered sinks for balancing or reporting.

But, for the area and power reports, sink count has a different meaning. Sink counts in those reports are based on sink instances rather than sink pins. So a cell with multiple inputs would count only one time as a sink in the area or power report.

Additionally, the area and power reports consider sinks to be the physical leaf-level sinks in the clock tree, regardless of any balance point or ignore point constraints on the design. For example, when the power report shows 'Standard Cell Sinks' and 'Macro Sinks', these are referring to the physical leaf-level sinks rather than skew-balancing sinks.

The area report in some cases shows both types. 'Sinks (balanced)' means the sink cells that are balanced by CTS while honoring balance point and ignore point constraints. 'Sinks (physical)' means the physical leaf-level sinks.

Area: The **-type summary** report includes three area related columns: Buffer Count, Buffer Area, and Total Area. Buffer Count and Buffer Area mean the count and area of buffers or inverters inserted by clock tree synthesis. This could be any part of the CTS solution: synthesis, optimization, balance group balancing, multisource synthesis, trunk planning, concurrent clock and data, and so on. If a buffer or inverter is preinstantiated in the netlist, or manually added to the clock tree, or inserted by datapath optimization, it does not count toward the Buffer Count and Buffer Area columns. The Total Area column includes every cell in the clock tree except for the sinks.

The **-type area** report includes much more area information. The per-clock and per-hierarchy sections of the report include the following columns:

- Sinks (balanced): This is the number of sinks and balance points considered for CTS balancing. This is the same as the 'Sinks' column in all of the other **report_clock_qor** types.
- Sinks (physical): This is the number of leaf sink pins in the clock network, disregarding balance point and ignore point constraints. This sink count is more relevant to the area calculation since area reporting normally ignores exceptions.
- Clock Cell Count (non-sink): Total count of all standard cells and macros in the clock network, excluding physical sinks.
- Clock Stdcell Area: The area of standard cells from 'Clock Cell Count (non-sink)'.
- Clock Macro Area: The area of macros from 'Clock Cell Count (non-sink)'.
- Clock Repeater Count: The total count of buffers or inverters in the clock network that were inserted by clock tree synthesis commands. Preexisting repeaters, or those inserted by datapath optimization commands, or those imported from another tool

are not included in this count.

- Clock Repeater Area: The area corresponding to 'Clock Repeater Count'.
- Sink Stdcell Area: The area of standard cells from the 'Sinks (physical)' category.
- Sink Macro Area: The area of macro cells from the 'Sinks (physical)' category.

Levels: Levels are counted from the clock root to the physical sinks of the clock tree, tracing beyond any intermediate balance point or ignore point exceptions. The master clock driver itself does not count as a level (it is level 0), so the number of levels is the number of logic stages traversed in the clock tree plus the sink level. Physical and logical hierarchy pins do not count as levels.

Latency and Skew: Latency is calculated based on the total delay from the clock root to the clock sink. If the clock root has a **set_clock_latency** source latency constraint applied, this value is not included in the latency reported by **report_clock_qor**. Latency can be adjusted for clock balance point offsets applied with the **set_clock_balance_points** command. For example, if the actual delay from the clock root to the sink is 2ns, and there is a +0.5ns offset applied on the sink using **set_clock_balance_points** (meaning that the sink should be tapped 0.5ns early in the clock tree), then the reported latency in **report_clock_qor** will be 2.5ns. By making this adjustment, these intentional balancing offsets will not appear as skew in the report, if CTS has implemented the offsets successfully.

Latency can be different depending on whether a clock sink is used to launch or capture a path. For the **-type latency** and **-type summary** reports, both launch and capture latency are considered for calculating the latency and skew values. The detailed section of the report shows both the launch and capture latency for each reported sink. In the **-histogram_type latency** report, separate histograms can be shown for each clock indicating launch and capture latency.

Robustness: The **-type robustness** and **-histogram_type robustness** reports use a robustness metric that is assigned for every sink. Robustness is a way of evaluating the multicorner robustness of the clock tree, which is important for maintaining low skew in all signoff corners.

Robustness is a measure of how the latency to each clock sink scales between a measured corner and a reference corner. For this reason, a **-robustness_corner** must always be specified when generating a robustness report, to act as the reference corner.

First, an unnormalized robustness value is calculated for every clock sink, which is the ratio of (latency in measured corner) / (latency in reference corner). Additionally, a scaling factor is determined for the corner pair, which is the ratio of (median latency of all sinks in measured corner) / (median latency of all sinks in reference corner). This scaling factor indicates the typical scaling that occurs between those two corners. For example, the scaling factor of holdCorner compared to setupCorner might be 0.5, indicating that the typical clock sink has half the latency in the holdCorner compared to setupCorner.

The robustness numbers for each sink are normalized against this scaling factor. As a result, if a clock sink has a robustness value of one, that means it exhibits typical scaling between the measured and reference corner. A robustness value greater than one indicates a sink has higher than average latency in the measured corner compared to the reference corner. Likewise, a robustness value less than one indicates a sink with less than average latency in the measured corner compared to the reference corner.

When doing multicorner skew analysis, it is useful to look at the sinks that are robustness outliers on either the high or low side. These are the sinks that exhibit atypical scaling between those corners, which can cause higher than expected skew. If all clock sinks for a clock or skew group have a similar robustness value, then the clock tree is said to be multicorner robust, and the skew can be maintained across those corners.

"All Clocks" Reporting: The summary tables generally have an 'All Clocks' row at the end. Likewise, histogram reports typically have an 'All Clocks' histogram reported after all the clock and skew group specific histograms.

"All Clocks" in most cases is self-explanatory. Consider the case of two clocks muxed together with an overlapping sub-tree. The 'All Clocks' row or histogram will consider the full clock trees of both clocks, and calculate metrics across all clocks without double-counting. For example, the area would be calculated in such a way that the common logic of the two clocks is not double-counted. So the total area for "All Clocks" would be less than the individual area of the two clocks summed together. So, "All Clocks" gives a simple overview of your entire clock structure for that particular reported corner.

"All Clocks" data is shown per-corner. So for example, all modes of a given corner would be considered for the "All Clocks" summary table row or histogram.

In a few cases, the meaning of "All Clocks" isn't clear. In other cases, no "All Clocks" metric is shown, because it is not very meaningful. This list describes the "All Clocks" metrics that might not be intuitive:

- DRCs / Transition / Capacitance: If a given pin or net has multiple transition, capacitance, or DRC values due to multiple clocks, then only the largest is selected for "All Clocks".
- Robustness Max: Takes the maximum robustness value from any one clock or skew group
- Robustness Min: Takes the minimum robustness value from any one clock or skew group
- Robustness Range: Shows the difference between Robustness Max and Robustness Min for the "All Clocks" row, rather than showing the largest range for any one skew group.
- Global/Local/Boundary Skew: The largest global/local/boundary skew of one clock or skew group. This does not calculate a new skew value based on the dataset of all sinks in all skew groups. It does not make sense to report a skew value across a dataset that was never skew balanced.
- Target Skew: Shows the global (non-clock-specific) target skew value set with the **set_clock_tree_options** command.
- Target Latency: Shows the global (non-clock-specific) target latency value set with the **set_clock_tree_options** command.

=== Using **report_clock_qor** Options ===

To use **report_clock_qor**, first select the type of report to generate. By default, a summary report is generated, which contains useful summary information about the area, latency, skew, and DRCs in the clock tree. Other reporting types can be generated with the type and histogram_type options.

After selecting the reporting type, consider the scope of the report. By default, all clocks and skew groups in all active CTS scenarios are reported. A CTS scenario is any scenario set true for setup, hold, max_transition, or max_capacitance fixing using the **set_scenario_status** command. Use **-clocks** to limit the reporting to only certain clocks. Use **-modes** and **-corners**, or **-scenarios** to limit reporting to only certain modes, corners, or scenarios. Use **-from**, **-to**, and **-through** to limit reporting only to clock paths from, to, or through certain pins.

If you generate a histogram report, the **-histogram_bins**, **-histogram_min**, and **-histogram_max** options can be used to control the characteristics of the histograms generated.

Many of the reporting types, such as the latency, drc_violators and robustness, have a summary section followed by a detailed section. The summary section shows either a summary table or a set of histograms for the reported metrics. These are partitioned by clock and skew group. The detailed section shows detailed information about the outlier objects for that metric. For example, **report_clock_qor -type drc_violators** would have a detailed section that shows the clock pins or nets that have the highest DRC slack. The number of objects printed in the detailed report section can be controlled with the **-smallest**, **-largest**, and **-all** options.

If the **-smallest**, **-largest**, or **-all** options are not used, every report type has a default behavior. The drc_violators report shows all DRC violations by default. Every other report that has a detailed section shows the five largest and five smallest datapoints for the metric, by default.

For the reports with a detailed section, the **-show_paths** option can be used. This option shows an additional section after the detailed section, with a full clock path report through each object in the detailed section. For example, **report_clock_qor -type latency -largest 1 -show_paths** would show the largest latency sink for each clock and skew group in the detailed section. It would also show the paths to each of those sinks.

For **-type robustness** and **-histogram_type robustness** reports, the **-robustness_corner** option must be specified. This option gives the reference corner against which the robustness value is calculated for each sink in the measured corner. See the description of the type robustness report for more information about how the robustness numbers are calculated and what they mean.

Multicorner-Multimode Support

EXAMPLES

This example generates a summary report only for clock clk in mode modeA.

```
prompt> report_clock_qor -clocks [get_clocks clk -mode modeA]
```

This example uses many scope limiting options to restrict what is returned by the report.

```
prompt> report_clock_qor -clocks clk -scenario scenarioA -through myICG/CK \
  -to sink1/CK
```

This example generates a clock robustness report in cornerA with cornerB used as the reference corner.

```
prompt> report_clock_qor -type robustness -corner cornerA -robustness_corner \
  cornerB
```

In the following example, the **report_clock_qor** command is limited to the scope of only those sinks clocked by clk, and only within the fanout cone of pin *c/Z*.

```
prompt> report_clock_qor -clocks clk -from c/Z -type latency
```

In the following example, the **report_clock_qor** command writes out the 5 largest and 5 smallest latency clock sinks.

```
prompt> report_clock_qor -clocks clk -type latency -largest 5 -smallest 5
```

In the following example, the **report_clock_qor** command shows all the DRC violators.

```
prompt> report_clock_qor -clocks clk -type drc_violators
```

In the following example, the **report_clock_qor** command reports largest and smallest latency sinks.

```
prompt> report_clock_qor -clocks clk -type latency
```

In the following example, the report_clock_qor command reports all latency sinks.

```
prompt> report_clock_qor -clocks clk -type latency -all
```

In the following example, the **report_clock_qor** command reports all latency sinks. The **-largest** and **-smallest** options are ignored.

```
prompt> report_clock_qor -clocks clk -type latency -all -largest 10 \
  -smallest 10
```

report_clock_routing_rules

Reports clock routing rules used in clock tree synthesis.

SYNTAX

status **report_clock_routing_rules**

DESCRIPTION

This command reports routing rules used in clock tree synthesis. The clock routing rules are set by **set_clock_routing_rules** command.

EXAMPLES

The following example assigns a non-default rule named *dblespacing* to the sink level nets of clock clk1. Then it reports the routing rule to confirm the settings.

```
prompt> set_clock_routing_rules -clocks clk1 -net_type sink -rule dblespacing
prompt> report_clock_routing_rules

****************************************
 Report : clock routing rules
 Design : Decoder
 Date   : Thu Nov 29 12:28:00 2012
****************************************
  Clock: clk1 (mode default); Net Type: sink;     Rules: dblespacing
```

SEE ALSO

set_clock_routing_rules(2)
remove_clock_routing_rules(2)

report_clock_settings

Reports existing clock settings and constraints.

SYNTAX

status **report_clock_settings**
[-clocks *clock_list*]
[-type configurations | routing_rules | references | spacing_rules | all]
[-significant_digits *digits*]
[-nosplit]

Data Types

clock_list list
digits integer

ARGUMENTS

-clocks *clock_list*

Reports only the settings on the clocks specified in *clock_list*. By default, the command reports for all currently defined clocks in all active modes.

-type configurations | routing_rules | references | spacing_rules | all

Specifies which type of reporting to generate. There are five types specified by keywords **configurations**, **routing_rules**, **references**, **spacing_rules** and **all**. **configurations** refers to clock tree synthesis configurations, including max transition and max capacitance specified by **set_max_transition** and **set_max_capacitance**; **routing_rules** refers to clock tree routing rules specified by **set_clock_routing_rules**; **references** refers to available buffers and invertors in clock tree synthesis; **spacing_rules** refers to clock cell spacing rules specified by **set_clock_cell_spacing**; **all** refers to all the above types of settings. The default value of this option is **all**.

-significant_digits *digits*

Specifies the number of digits after the decimal point to be displayed for time values in the generated report. Allowed values are 0-13. The default is 3. Use this option if you want to override the default.

-nosplit

Prevents line-splitting and facilitates writing software to extract information from the report output. If this option is not used, most of the design information is listed in fixed-width columns. If the information in a given field exceeds the column width, the next field begins on a new line, starting in the correct column.

DESCRIPTION

The **report_clock_settings** command reports existing clock settings and constraints. By default, the **report_clock_settings** command reports clock configurations, routing rules, and references.

Multicorner-Multimode Support

This command works only on the mode associated with the current scenario.

EXAMPLES

In the following example, the **report_clock_settings** command reports routing rules specified on a clock called clk1.

```
prompt> report_clock_settings -type routing_rules -clocks clk1
```

report_clock_skew_groups

Reports the user-defined skew groups in the design.

SYNTAX

status **report_clock_skew_groups**
[*skew_group_list*]
[-nosplit]

Data Types

skew_group_list collection

ARGUMENTS

skew_group_list

List of skew group names/collections.

-nosplit

Indicates that lines are not to be split when column fields overflow. This is most useful for doing diffs on previous scripts, or for post-processing the script.

DESCRIPTION

The command reports the user-defined skew groups in the design. If you dont specify any skew groups then all of the ones in the current mode are reported.

Multicorner-Multimode Support

This command works only on the current mode.

EXAMPLES

The following example lists all skew groups that are on clock path clk1.

prompt> **report_clock_skew_groups [get_clock_skew_groups -of_objects clk1]**

```
****************************************
Report   : Skew group
Design   : Hier_design

****************************************

==============Skew Group Data================

 1. Skew Group Name : A
   Pin List : 10
      A/B/C/FF4/CLK
      A/B/C/FF3/CLK
   Clock List :
      clk1

 2. Skew Group Name : B
   Pin List : 10
      A/B/C/FF1/CLK
      A/B/C/FF2/CLK
   Clock List :
      clk1

ARGUMENTS

-type *report_type*

Specifies the type of report to be generated. Allowed values are as follows:

transition : Specify a transition time report.

latency : Specify a latency report. Note that only clock paths that reach right trigger edge at endpoint will be reported.

skew : Specify a skew report; you cannot use the *-launch*, *-capture*, *-rise*, *-fall*, and *-lesser_than* options if you specify a skew report, and you can use the *-include_uncertainty_in_skew* option only in a skew, interclock_skew, or summary report.

interclock_skew : Specify an interclock skew report; you cannot use the *-launch*, *-capture*, *-rise*, *-fall*, and *-lesser_than* options if you specify an interclock skew report, and you can use the *-include_uncertainty_in_skew* option only in a skew, interclock_skew or summary report.

summary : Specify a summary report, which shows the worst instances of transition time, latency and skew over the clock networks or subnetworks of interest. If you specify a summary report, you can use only the *-clock*, *-to_list*, *-from_list*, *-include_uncertainty_in_skew*, *-nosplit*, and *-significant_digits* options.

For nonsummary reports, report entries are ordered with respect to the specified attribute of interest (transition time, latency, or skew). Note that all skews reported are "local" skews. For an explanation of local skew, see the DESCRIPTION section.

-modes *mode_list*

Specifies the modes to be used for reporting. If this option is not specified, the command uses the current mode. For each mode, a subreport will print the worst value across all specified scenarios of that mode. It is an error to give this option with the **-scenarios** option.

-corners *corner_list*

Specifies the corners to be used for reporting. For each mode being reported, scenarios (if any) of that mode and the corners specified by the **-corners** option will be used for reporting. If this option is not given, the command uses every active scenario of the specified modes. It is an error to give this option with the **-scenarios** option.

-scenarios *scenario_list*

Specifies the scenarios to be used for reporting. Each mode used by the specified scenarios is reported. It is an error to give this option with the **-modes** or the **-corners** options. If none of the **-modes**, **-corners**, or **-scenarios** options are specified, the report uses all scenarios of the current mode.

-clock *clock_list*

Specifies a list of clocks to be used in the report. A subreport is typically produced for every clock in the *clock_list*, unless you additionally specify the *to_list*, *from_list*, or both options that has no network intersection with a given clock. In that case, the report removes these clocks from the *clock_list* and issues a warning. By default, if you do not specify *clock_list*, all clocks in the design that have associated clock networks are used in the report. If a clock in the list does not belong to the mode being reported, the command instead tries to use a clock from that mode with the same name as the given clock.

-from_clock *from_clock_list*

Specifies a list of clock networks to be used as from-clocks in the current interclock skew report. This option can be used only in an interclock skew report. The report typically considers every clock in *from_clock_list*, unless you additionally specify the *from_list* option that has no network intersection with a given clock. In that case, the report drops these clocks from the *from_clock_list* and also issues a warning. By default, if you do not specify the *from_clock_list* option, all clocks in the design that have associated clock networks are used as from-clocks in the report. If a clock in the list does not belong to the mode being reported, the command will instead try to use a clock from that mode with the same name as the given clock.

-to_clock *to_clock_list*

Specifies a list of clock networks to be used as to-clocks in the current interclock skew report. This option can be used only in an interclock skew report. The report typically considers every clock in *to_clock_list*, unless you additionally specify a *to_list* that has no network intersection with a given clock. In that case, the report removes these clocks from the *to_clock_list* and also issues a warning. By default, if you do not specify the *to_clock_list* option, all clocks in the design that have associated clock networks are used as to-clocks in the report. If a clock in the list does not belong to the mode being reported, the command instead tries to use a clock from that mode with the same name as the given clock.

-to *to_list*

Specifies the list of sequential clock network pins or ports to consider as to-pins in the current report. If any named pin is not the clock pin of a sequential device, such as a sink pin, the report replaces that pin with all sequential clock pins in the transitive fanout of the named pin. If there are no sequential clock pins in the pin's transitive fanout, the pin is dropped from the list with a warning message.

For skew reports, the from-to skew sense is defined by the pins in the *from_list* and *to_list* options respectively; if the *to_list* option is not specified, by default all sink pins in the given clock networks are used. Thus, specifying the *to_list* option reduces the topological scope of the report.

For transition time and latency reports, the *from_list* and *to_list* options are concatenated and treated as a single list; if neither is specified, the *to_list* option is assumed to be populated with all sink pins in the given clock networks.

-from *from_list*

Specifies a list of sequential clock network pins or ports to consider as from-pins in the current report. If any named pin is not the clock pin of a sequential device, the report replaces that pin with all sequential clock pins in the transitive fanout of the named pin. If there are no sequential clock pins in the pin's transitive fanout, the pin is dropped from the list and a warning message is issued.

For skew reports, the from-to skew sense is defined by the pins in the *from_list* and *to_list* options respectively. If the *from_list* option is not specified, by default all sink pins in the given clock networks are used. Thus, specifying the *to_list* option reduces the topological scope of the report.

For transition time and latency reports, the *from_list* and *to_list* options are concatenated and treated as a single list. If neither is specified, the *to_list* option is assumed to be populated with all sink pins in the given clock networks.

-through *through_list*

Reports only clock paths that pass through the named pins, ports, cells, or nets. This option may only be used with **-type latency** and is exclusive with *-nworst* and *-clock_synthesis_view* options. If you specify only one **-through** option, the tool reports only the paths that travel through one or more of the objects in the list. You can specify **-through** multiple times with one **report_clock_timing** command. This option triggers verbose report automatically. The **-through** option may not specify an object on the network between master clock sources and their generated clock sources.

-setup

Specifies that only the setup data path is to be used in the report, and that the skews, latencies or transition times reported must correspond to those used by the **report_timing** command in the verification of setup constraints. The *-setup* and *-hold* options are mutually exclusive. If neither option is specified, the *-setup* option is assumed. You cannot use this option in summary reports.

-hold

Specifies that only the hold data path is to be used in the report, and that the skews, latencies, or transition times reported must correspond to those used by the **report_timing** command in the verification of hold constraints. The *-setup* and *-hold* options are mutually exclusive. If neither option is specified, the *-setup* option is assumed. You cannot use this option in summary reports.

-launch

Specifies that only pins launching data are to be used in the report, and that latencies or transition times reported must correspond to those used by the **report_timing** command for sequential device clock pins that are launching data. In skew reports, the role is implicit from the from-to sense indicated by the *from_list* and *to_list* options. In all other reports, the *-launch* and *-capture* options are mutually exclusive. If neither option is specified, the *-launch* option is assumed. You cannot use this option in summary or skew reports.

-capture

Specifies that only pins capturing data are to be used in the report, and that the latencies or transition times reported must correspond to those used by the **report_timing** command for sequential device clock pins that are capturing data.

In skew reports, the role is implicit from the from-to sense indicated by the *from_list* and *to_list* options. In all other reports, the *-launch* and *-capture* options are mutually exclusive. If neither option is specified, the *-launch* option is assumed. You cannot use this option in summary or skew reports.

-rise

Specifies that the active transition is a rising edge for sequential device clock pins in the current report. The *-rise* and *-fall* options are mutually exclusive; if neither option is specified, the active transition at a latch or flip-flop is deduced from the launch or capture role and the behavior of the sequential device itself. This option enables you to answer "what if" questions regarding latency and transition time at sequential device clock pins. You cannot use this option in summary or skew reports.

-fall

Specifies that the active transition is a falling edge for sequential device clock pins in the current report. *-rise* and *-fall* are mutually exclusive; if neither is specified, the active transition at a latch or flip-flop is deduced from the launch or capture role and the behavior of the sequential device itself. This option enables you to answer "what if" questions regarding latency and transition time at sequential device clock pins. You cannot use this option in summary or skew reports.

-nworst *worst_entries*

Specifies the number of worst report entries to be reported per clock domain; the default is 1. Entries are sorted with respect to the attribute of interest, such as transition time, latency or skew and so on.

The worst entries are those most likely to cause a violation. For example, if you request a latency report using *-setup* and *-capture*, the smallest *worst_entries* are listed, sorted in ascending order, because small capture latencies for setup paths are more likely to lead to a violation than large capture latencies. By contrast, for skew reports, the worst entries always correspond to the largest skews over the specified domain. You cannot use this option in summary reports.

-greater_than *lower_limit*

Specifies that only those entries whose attribute value (latency, transition time or skew) is greater (more positive) than *lower_limit* are to be shown. You cannot use this option in summary reports.

-lesser_than *upper_limit*

Specifies that only those entries whose attribute value (latency, transition time or skew) is less (more negative) than *upper_limit* are to be shown. You cannot use this option in summary or skew reports.

-slack_lesser_than *slack_upper_limit*

Specifies that only those entries whose slack value is less (more negative) than *slack_upper_limit* are to be shown. For skew report entries slack is the worst slack over all paths launched by the from-pin and captured by the to-pin. For transition time or latency report entries, slack is defined as the worst slack of all paths either launched by a transition at the sink pin (if the *-launch* option is used) or captured by a transition at the sink pin (if the *-capture* option is used). Note that this option is exclusive with -

clock_synthesis_view option.

Note that the use of this filter might greatly increase the runtime of this report. However, when used with the *-capture* option the effect on runtime should be small, since the tool can use cached slack values to avoid expensive recomputations. You cannot use this option in summary reports.

-include_uncertainty_in_skew

Specifies that the user-defined uncertainty between the sequential devices in a launch/capture pair is to be considered a component of skew. You cannot use this option in summary or skew reports.

-verbose

Writes additional detail to the clock timing report. Instead of a single line per pin, verbose reports trace the entire source-to-sink path through a clock network to show how the final reported attribute (skew, latency or transition time) was accumulated over the course of the path. You cannot use this option in summary reports.

-nets

Shows nets in verbose path traces. The default is not to show nets. To show the delay for the nets, use the **-input_pins** option. This option is similar to its counterpart in the **report_timing** command.

-physical

Shows the locations of the pins and the capacitive loads for the pins and nets in verbose path traces. The loads are displayed as a pair of values of which the first is the wire capacitance of the net and the second value is the total capacitance driven by the driver. If the pin location cannot be determined, the cell location is displayed, with the coordinates in microns. This option is similar to its counterpart in the **report_timing** command.

-show_clocks

Shows the launching and capturing clocks for every interclock skew entry in the report. This is useful if *from_clock_list* or *to_clock_list* contain more than one clock each. You cannot use this option in interclock skew reports.

-derate

Specifies that derate factors are to be shown in the report. By default derate factors are not displayed. Derate factors are only shown when the *-verbose* option is specified.

-variation

Reports parametric on-chip variation (POCV) information by expanding column "Incr" to columns "Mean", "Sensit", "Corner" and "Value", and expanding column "Path" to columns "Mean", "Sensit" and "Value". This option works only when POCV analysis is enabled.

-clock_crossing

Specifies that only skews between interacting clock domains (i.e. clocks connected by at least one non-false data path) will be included in the report. This option can only be used in interclock_skew reports.

-clock_synthesis_view

Generates the report based on the way clock synthesis processes the clock networks. By default, this option is false. With this option the generated clocks become part of their master clock's network. Thus, subreports only of the master clocks will be shown, with the clock pins clocked by the respective generated clock becoming part of the pins to be reported in the master clock's report. Clock tree exceptions will be taken into account here. Clock source latency will be excluded here. Note that this option is exclusive with *-slack_lesser_than* option.

-nosplit

Prevents line-splitting and facilitates writing software to extract information from the report output. If this option is not used, most of

the design information is listed in fixed-width columns. If the information in a given field exceeds the column width, the next field begins on a new line, starting in the correct column.

-significant_digits *digits*

Specifies the number of digits after the decimal point to be displayed for time values in the generated report. Allowed values are 0-13; the default is determined by the **shell.common.report_default_significant_digits** application option, whose default is 2. Use this option if you want to override the default. This option controls only the number of digits displayed, not the precision used internally for analysis. For analysis, the tool uses the full precision of the platform's fixed-precision, floating-point arithmetic capability.

DESCRIPTION

This command generates a report of clock timing information for the current design.

There are several reporting types provided, which allow you to examine skew, latency and transition time attributes of a given clock network or sub-network at various levels of generality. By default, the report displays the values of these attributes only at sink pins (that is, the clock pins of sequential devices) of the clock network. You use the *-verbose* option to display source-to-sink path traces. If you specify several clock domains, the **report_clock_timing** command generates a separate subreport for each clock domain.

The summary style report is at the highest level of abstraction. This report provides only a list of maxima and minima of the skew, latency, and transition time attributes over the given networks. At a lower level of abstraction are the transition, latency, and skew type reports, called list style reports, in which you can sort, filter and display the worst set of sink pins in the given network with respect to a single attribute of interest. For skew reports, each report entry is a pair of sink pins and their relative skew. For transition time or latency reports, each entry corresponds to a single sink pin. The lowest level of abstraction is provided by verbose mode, which replaces every sink pin in a list style report by a corresponding source-to-sink path trace.

In both summary and list style reports, the rightmost column is an attributed column. Corresponding to each sink pin, the set of character symbols in this column indicates the following:

Symbol	Meaning
r	Rising transition
f	Falling transition
p	Propagated clock to this pin
i	Clock inversion to this pin
-	Launching transition
+	Capturing transition
e	Exception on this pin

In verbose mode, back-annotations on path elements in the timing path are indicated by using a character symbol. For definitions of these character symbols, see the manual page of the **report_timing** command.

Skews reported by **report_clock_timing** are local skews only. Local skew exists from one sink pin to another only as long as their associated sequential devices are connected via a data path in the appropriate from-to sense. Note that even if all data paths between the sequential devices are false because of user-defined exceptions, the skew still qualifies as local skew if the devices are connected topologically.

Multicorner-Multimode Support

By default, this command works on the current scenario. To specify a different scenario, use the **-scenarios** option or the **-corners** and **-modes** options.

EXAMPLES

The following example shows a typical summary style report.

```
prompt> report_clock_timing -type summary
****************************************
Report : clock timing
        -type summary
        -nworst 1
 ...

****************************************

  Clock: CK1
---------------------------------------------------------------------------
  Maximum setup launch latency:
    flop9/CP                              3.08      rp-+

  Minimum setup capture latency:
    or2_3/B                               1.15      fpi-+

  Minimum hold launch latency:
    or2_3/B                               1.15      fpi-+

  Maximum hold capture latency:
    flop9/CP                              3.08      rp-+

  Maximum active transition:
    or2_3/B                               0.20      fpi-+

  Minimum active transition:
    or2_3/B                               0.09      fpi-+

  Maximum setup skew:
    flop9/CP                                        rp-+
    flop10/CP                              0.87     rp-+

  Maximum hold skew:
    flop9/CP                                        rp-+
    flop10/CP                             -0.21     rp-+
---------------------------------------------------------------------------
```

The following example displays the five worst setup skews in the clock network of CLK1, taking uncertainty into account.

```
prompt> report_clock_timing -clock CLK1 -type skew -setup \
  -nworst 5 -include_uncertainty_in_skew

report_clock_tree_options

Reports existing target skew/latency constraints for clock trees.

SYNTAX

status **report_clock_tree_options**

DESCRIPTION

This command reports all existing settings like clock target skew/latency constraints, fanout-based ndr, etc, previously defined by **set_clock_tree_options** commands.

EXAMPLES

The following example reports existing clock clock target skew/latency constraints. prompt> **report_clock_tree_options**

SEE ALSO

set_clock_tree_options(2)
remove_clock_tree_options(2)

report_clock_tree_reference_subset

Reports previously defined reference settings for a clock tree.

SYNTAX

status **report_clock_tree_reference_subset**
[-clocks *clock_list*]

Data Types

clock_list collection

ARGUMENTS

-clocks *clock_list*

Reports reference settings for the specified list of clocks.

DESCRIPTION

Use this command to report the specified references settings for clock trees. If the **-clocks** option is used, reference lists of the specified clocks are reported. If the **-clocks** option is not used, all clock tree reference settings will be reported.

EXAMPLES

The following example reports reference cell settings for clock tree clk1.

prompt> **report_clock_tree_references_subset -clocks clk1**

SEE ALSO

remove_clock_tree_reference_subset(2)
set_clock_tree_reference_subset(2)

report_clock_trunk_endpoints

Reports clock trunk endpoints.

SYNTAX

status **report_clock_trunk_endpoints**
[-clock *clock_list*]
[-corners *corner_list*]
[-script]
[-nosplit]
[-significant_digits *digits*]
[*pins_or_ports*]

Data Types

clock_list list or collection
corner_list list or collection
pins_or_ports list or collection

ARGUMENTS

-clock *clock_list*

Report clock trunk endpoints only for the specified clocks. By default, clock trunk endpoints are reported for all clocks.

-corners *corner_list*

Report clock trunk endpoints only for the specified corners. By default, clock trunk endpoints are reported for all corners.

-script

Write out **set_clock_trunk_endpoints** commands that describe the current clock trunk. The commands are written to the console. The **set_clock_trunk_endpoints** commands can by used to re-create the clock trunk endpoints.

-nosplit

Prevents line splitting. This can useful for scripts that extract information from the report. By default, the report generates a new line when the text cannot fit in the alloted space in a column.

-significant_digits *digits*

Specifies the number of digits after the decimal point displayed for time values in the generated report.

pins_or_ports

Report clock trunk endpoints only for the specified pins or ports. By default, clock trunk endpoints are reported for all pins and

ports.

DESCRIPTION

This command reports the phase_delay annotated on the clock trunk endpoints (pins and ports) for specified clock and corners. All endpoints in the current physical hierarchy and child hierarchies below the current physical hierarchy are reported.

For a given clock and corner, the endpoints are sorted in the decreasing order of annotated phase delay. Dominant clock trunk endpoints are marked with a "*" in a separate column as shown in the EXAMPLES section.

By definition, in case a single clock pin is driving more than one trunk endpoint, the endpoints with the worst downstream phase delay is called the "dominant" endpoint.

The term "dominant" is relative to a single clock port of a block. If a block clock port is driving only one trunk endpoint, it will be marked as dominant endpoint. A block may have more than one "dominant" trunk endpoints.

The worst downstream phase_delay will be different for different corners. So an endpoint that is "dominant" in one corner may not be "dominant" in other corner.

Multicorner-Multimode Support

EXAMPLES

The following example reports all clock trunk endpoints.

```
prompt> report_clock_trunk_endpoints
****************************************
Report : report_clock_trunk_endpoints
Design : TOP_DG
Version:
Date   :
****************************************

Endpoint             Phase Delay  Dominant Pt  Clock   Corner   Block
--------------------------------------------------------------------------------
CPU_011/TOP_ff_U308/CK    0.40        *        clock1  corner0  CPU_011
CPU_011/TOP_1_0_ff/CK     0.30                 clock1  corner0  CPU_011
```

synthesize_clock_trunks(2)

report_clock_trunk_qor

Generates summary of timing information of the design for QoR evaluation of clock trunk planning (CTP).

SYNTAX

status **report_clock_trunk_qor**
[-clock *clocks*]
[-endpoint_limit *endpoint_limit*]
[-from_block *block_instances*]
[-to_block *block_instances*]
[-sort_by wns | wns_ocv]
[-significant_digits *digits*]
[-nosplit]
[-violating_only]

Data Types

clocks list
endpoint_limit integer
block_instances list
digits integer

ARGUMENTS

-clock *clocks*

Specifies the clocks for which the report is to be generated. If you do not specify this option, the command generates report for all clocks of currently active modes.

-endpoint_limit *endpoint_limit*

Specifies the limit for the total number of end-points for specified fanout limit and block fanout limit values. The command exits with an error message if this limit is exceeded; this might be an indication of an issue with driving cell specification for blocks. The default value of this option is 100.

-from_block *block_instances*

Reports only the paths that originate from the specified block instances. By default, the command considers paths originating from all blocks.

-to_block *block_instances*

Reports only the paths that terminate at the specified block instances. By default, the command considers paths terminating at all blocks.

-sort_by wns | wns_ocv

Specifies the criteria for sorting the output report. By default, the output is sorted based on worst negative slack (WNS) without taking into account the degradation due to OCV.

-significant_digits *digits*

Specifies the number of significant digits (digits to the right of the decimal point) to report. Allowed values are from 0 through 13. Using this option overrides the value set by the **shell.common.report_default_significant_digits** application option. By default, the number of significant digits is 2.

-nosplit

Prevents wide report lines from being split. Most of the information is listed in fixed-width columns. The **-nosplit** option prevents line-splitting and facilitates writing scripts to extract information from the report output. By default, if the information in a given field exceeds the column width, the next field begins on a new line, starting in the correct column.

-violating_only

Indicates that only violating paths are to be reported in the output.

DESCRIPTION

This command generates a summary report of timing information for clock trunk planning (CTP). Use the report to evaluate the QoR for specific clocks or all clocks.

The first time you run **report_clock_trunk_qor**, the command might trigger a full or an incremental timing update if required. Subsequent runs of this command will not trigger a timing update if there are no netlist changes or a changes in timing constraints.

EXAMPLES

The following example reports endpoint, WNS, TNS, and other information for all clocks that belong to the active modes of the design.

```
prompt> report_clock_trunk_qor
****************************************
Report : report_clock_trunk_qor
Design :
Version:
Date   :
****************************************

Clock    Trunk End Point (Launch)  Trunk End Point (Capture)  Divergence Point
  WNS (Ideal Clock)  OCV       CRP       WNS       TNS
    Number of Paths   Violating Paths  Timing Start Point  Timing End Point
-------------------------------------------------------------------------------
CLK      instD/clk1              instE/clk              b11/Y
  1.22          0.06      0.02      1.18      0.00
                2             0  instD/f1/D [D]     instE/f2/D [E]
CLK      instC/clk              instD/b1/A             b12/Y
  1.41          0.07      0.02      1.36      0.00
                1             0  instC/f1/D [C]     instD/f1/D [D]
```

The following example reports paths - launch and captured by clock CLK and originating from block B1

```
prompt> report_clock_trunk_qor -clock [get_clocks CLK] \
  -from_block [get_cells B1]
```

SEE ALSO

synthesize_clock_trunks(2)
shell.common.report_default_significant_digits(3)

report_clocks

Reports clock-related information.

SYNTAX

string **report_clocks**
[-attributes]
[-skew]
[-groups]
[-nosplit]
[-significant_digits *digits*]
[-modes *mode_list*]
[*clock_list*]

Data Types

digits int
mode_list list
clock_list list

ARGUMENTS

-attributes

Shows clock attributes and provides a list of all the clocks in the current design. The information for each clock includes source type, signal rise and fall times, and attributes. This report is shown by default.

-skew

Reports clock latency (source and network latency) and uncertainty information set by the **set_clock_latency** and **set_clock_uncertainty** commands, respectively.

Clock network latency information includes rise latency and fall latency. Clock source latency information includes rise latency and fall latency for early and late arrivals. Clock uncertainty information includes intraclock setup or hold uncertainty and interclock setup or hold uncertainty. This option also reports any fixed clock transition set by using the **set_clock_transition** command.

-groups

Shows the current setting for clock groups, including grouping of exclusive clocks and asynchronous clocks set by using the **set_clock_groups** command.

-nosplit

Retains long lines in the output, even if a column overflows. Most of the design information is listed in fixed-width columns. If the information for a given field exceeds the column width, the next field begins on a new line, starting in the correct column. This

option prevents line-splitting and facilitates writing scripts to extract information from the report output.

-significant_digits *digits*

Specifies the number of digits to the right of the decimal point to report. Allowed values are 0-13; the default is determined by the **shell.common.report_default_significant_digits** application option, whose default is 2. Use this option to override the default.

This option controls only the number of digits displayed, not the precision used internally for analysis. For analysis, the tool uses the full precision of the platform's fixed-precision, floating-point arithmetic capability.

-modes *mode_list*

Specifies the list of modes to be used in the report. A subreport is produced for each clock in the mode when the *mode_list* is specified.

clock_list

Lists the clocks that must be reported. Substitute the list you want for *clock_names*.

DESCRIPTION

Reports clock-related information. Displays all clock-related information on a design. The report contents are controlled by the options used. If you do not specify any options, the command displays the attributes report.

When a clock is created, it is added to the other clocks list if some clocks are defined to be exclusive or asynchronous with any other clocks in the design. When a clock is removed, it is removed from its related lists. To see if a clock is active or not, use the **report_clocks** command with the **-attributes** option.

Some information, such as the waveform of a generated clock or propagated skew, is displayed after a timing update. This can result from manually running **update_timing** or an implicit timing update as a result of executing other commands. This behavior is intended to help you to define all clocks without incurring the cost of a complete timing update.

To obtain a list of all clocks in the design, use the **all_clocks** command.

Multicorner-Multimode Support

By default, this command works on the current mode. To specify a different mode, use the **-modes** option.

EXAMPLES

```

report_collection

Output a tabular report of attribute values for elements in a collection.

SYNTAX

report_collection
collection
[-type *report_type*]
[-header *header_type*]
[-max_rows *value_count*]
[-nopslit]
[-columns *column_specification*]

string *collection*
list *report_type (*
string *header_type*
int *value_count*
list *column_specificaton*

ARGUMENTS

collection

Specifies the collection on which to report. The collection may be homogeneous or heterogeneous. The report comprises a header with information about the report such as the application name and version and the date and a tabular report on attribute values for elements of the collection. The tabular report content is determined by the of report requested with the *-type* option. The attributes on which the report is generated is determined by the argument to the *-columns* option.

-type *report_type*

This option accepts an argument of a list of valid report type names. A report type is one of the following values: "values" | "statistics" | "distribution". If the option is omitted, the default report type is "values". The report types may be combined in a list to output multiple reports in one run. Each invocation of the command produces a single report header output unless it is suppressed with the *-header* option.

The "values" report is a tabular output of attribute values for the collection elements, with one row of values per collection element. The report columns comprises formatted attribute values for the objects.

The "statistics" report type outputs the following statistical data about the attribute values

* Minimum, lower quartile, median upper quartile, and maximum values for numeric attributes. * The mean and standard deviation for numeric attributes. * Number of null attribute values for each attribute. * Number of valid attribute values for each attribute. * Number of unique attribute values for each attribute.

The "distribution" report type outputs a header section with information about the report, followed by the following statistical values about the data.

* Number of null attribute values for each attribute. * Number of valid attribute values for each attribute. * Number of unique attribute values for each attribute. * Distribution of values with number of occurrences of each attribute value..

If both "statistics" and "distribution" reports are requested, the overlapping portion of the two reports is output only once.

All report types begin with a line displaying the collection composition including the size of the input collection followed by object count by object class type. When "statistcs" or "distribution" type report is included, the object count breakdown by object class type is always provided regardless of the size of the input collection. In a "values" only report, however, breakdown of object count by object class type is provided for a heterogeneous collection only when the collection contains one hundred or fewer items.

-header *header_type*

This option accepts one of the following valid argument values: "standard" | "none". If the option is omitted, the default header type is "standard". The "standard" header consists of the report name, command arguments, product name, product version, and the report date.

-max_rows *value_count*

This option indicates how many rows of data to include in the values and the value distribution tables. If the **collection** is very large, you may want to use the **-max_rows** option to limit the size of your report output. Number of text lines in the report may be greater than the *-max_rows* argument value if some data rows require multiple lines to output. This option value has no impact on the distribution and statistics calculations, for which the entire collection is processed. However, the **-max_rows** value, if given will limit the number of rows output for the value distribution table. If **-max_rows** value is given and truncates either the values or the distribution table output, a line is added to show the number of remaining items that were not shown.

-nosplit

This option indicates that the default column formatting used for a value is that is too long for the column width is "none", rather than the default "split". See the -columns option description below for more details.

-columns *column_specification*

Indicates the set of attributes on which to report and their order in the report. At a minimum, *column_specification* is a list of attribute names of elements of the collection.

The special attribute name "object_class" may be used to include the element object class names, such as "cell" or "net", in the report output.

If the option is omitted, then the object full names and object class (or type) names are output by default.

Each attribute name may be followed by a list of token-value pairs to indicate report column formatting directives. The value tokens for formatting are *width*, *precision*, *justify*, *label*, and *fit*. All column formatting specifications are optional.

width token is followed by a positive integer to value indicate the desired width of the column in number of characters. If not given, then the attribute value is queried for the first 100 elements of the collection and the longest value string determines the width of the column.

precision token is followed by a positive integer to value indicate the desired precision used to display floating point values (digits after the decimal point). If not given then the default precision for the attribute is used. This is ignored for non floating point attributes.

justify is followed by one of "left" or "right" to indicate the value's alignment in the column. If not given, then numeric attributes are justified right and other attributes are justified left.

By default, the column headers show the name of the attribute. *label* is followed a string to display in the report column header in place of the attribute name.

fit is followed by one of the following valid argument values: "split" | "none" | "truncate" | "wrap" | "elide_left" | "elide_center" | "elide_right". This option indicates how to format an attribute value that is too long to fit in the column's width. If option is omitted, the default formatting is "split". However, if the option *-nosplit* is given, then the default formatting becomes "none". Explicit *fit* values given in a column specification overrides the default set by *-noSplit*.

The "split" formatting inserts a newline after the value which is too long and continues the tabular row on the next line, justifying the next value to the correct column.

The "none" formatting does nothing to reformat a value that is too long, continuing with the next column value. Therefore, the remainder of the tabular row will not be aligned with column headers.

The "truncate" formatting truncates the value to the width of the column, discarding the remainder of the value.

The "wrap" formatting truncates the value to the column and continues the rest of the tabular row on the same row. The remainder of the value is output on the following line(s), taking as many lines as is needed to finish outputting the rest of the value.

The "elide_left" formatting truncates the beginning of the value and adds the elision string "..." at the beginning of the value.

The "elide_center" formatting omits the middle of the value and inserts the elision string "..." at the center of the value.

The "elide_right" formatting truncates the end of the value and adds the elision string "..." at the end of the value.

DESCRIPTION

This command outputs a tabular report of attribute values for elements of the given collection. The attribute values in the report are determined by the list of attributes given as the **-columns** option argument. The columns in the tabular report will be ordered by order of attributes in the list. The command **list_attributes** may be called to see a list of attributes defined for an object class.

The **-column** option also accepts additional optional column formatting specifications in the attribute list. You may specify the header label and the width for each column, how to justify the value, and how to fit a value in a column when the value is too long to fit within the column width.

If the collection is large, the report size may be limited by indicating a **-max_rows** value. The commands **filter_collection** and **sort_collection** may be called to filter and sort a collection based on some criteria prior to creating a report for the collection elements.

Statistical and value distribution reports on the collection elements may be produced using the *-type* option arguments "statistics" and "distribution", respectively. Report types may be combined in a list.

The report header is followed by a line of report with collection size and object count by object data types. Precise object counts by types are always shown for "statistics" and "distribution" type reports. For "values" report, it is shown if the collection is homogenous or small. If the collection is heterogeneous and large, the object type shown for "values" report is "heterogeneous".

EXAMPLES

The following example from IC Compiler II creates a statistical report on a collection of cells along with a value distribution output.

```
icc2_shell> set cells [get_cells -hierarchical *]
icc2_shell> report_collection $cells -type {statistics distribution}
```

The following example, also from IC Compiler II, creates a report on a collection of cells with the full_name, area, and number_of_pins attribute values.

```
icc2_shell> set cells [get_cells U*]
icc2_shell> report_collection $cells -columns {full_name area number_of_pins}
```

The next example creates the same report but limits the width of the full_name column to 26 characters, designating "elide_center" formatting for full_name values that are longer than 26 characters.

```
icc2_shell> report_collection $cells -columns \
                    {{full_name {width 26} {fit elide_center}} \
                     area number_of_pins}
```

The next examples limits the output to the first 10 objects in the collection.

```
icc2_shell> report_collection $cells -columns \
                    {{full_name {width 26} {fit elide_center}} \
                     area number_of_pins} -max_rows 10
```

The next example first sorts the original collection of cells by the area attribute value in descending order, limiting the resulting collection to the top 10 area values. The example then careates a report for the resulting collection.

```
icc2_shell> set sorted_cells [sort_collection -dictionary \
                   $cells {area- full_name} -limit 10]
icc2_shell> report_collection $sorted_cells -columns \
                    {{full_name {width 26} {fit elide_center}} \
                     area number_of_pins}
```

The next example reports on a sorted collection as in the above example but further limits the report to the first 10 objects in the collection. Note that this command may produce a report that is different from the above example. Limiting the sort to the first 10 values may have produced a collection with more than 10 objects since multiple objects may share the same area value.

```
icc2_shell> set sorted_cells [sort_collection -dictionary \
                   $cells {area- full_name} -limit 10]
icc2_shell> report_collection $sorted_cells -columns \
                    {{full_name {width 26} {fit elide_center}} \
                     area number_of_pins} -max_rows 10
```

report_congestion

Reports the congestion statistics.

SYNTAX

status **report_congestion**
[-mode summary | global_route_cell_edge_based]
[-boundary *bbox* | *bbox_list*]
[-layers *collection_of_layers*]
[-rerun_global_router]
[-overflow_threshold *threshold*]
[-include_soft_congestion_maps]
[-snap_cells]
[-nosplit]
[-significant_digits *digits*]

Data Types

bbox rectangle
bbox_list list of rectangles
collection_of_layers collection of layers
threshold int
digits int

ARGUMENTS

-mode summary | global_route_cell_edge_based

Specifies the mode for reporting the congestion map.

The following values are valid:

- **summary**
  Generates a global route congestion summary report that provides information about total overflow, max overflow, number of global route cells with overflow, and number of global route cells with max overflow.
- **global_route_cell_edge_based**
  Generates a global route cell edge based congestion report that provides information about all queried global route cells in terms of layer name, bounding box, demand, and capacity.

-boundary *bbox* | *bbox_list*

Generates a congestion report for only the specified region.

If you do not specify this option, the tool generates a congestion report for the entire block.

-layers *collection_of_layers*

Generates a congestion report for only the specified layers.

If you do not specify this option, the tool generates a congestion report for all routing layers.

-rerun_global_router

Rerun congestion map only mode global router to generate latest congestion information.

If you do not specify this option, the tool reports the congestion information got from the database.

-overflow_threshold *threshold*

Reports global route cells with overflow larger than or equal to this threshold. The threshold is checked against each global route cells per layer. This option must be used with **-mode global_route_cell_edge_based**.

If you do not specify this option, the tool reports global route cells regardless of the overflow value.

-include_soft_congestion_maps

Includes existed soft congestion maps in the report. To specify if the tool exports the soft congestion maps into the database, refer to application option **route.global.export_soft_congestion_maps**.

If you do not specify this option, the tool skips the soft congestion map reporting.

-snap_cells

Snaps cells to closest cell row before running global router and restores the original placement afterward.

-nosplit

Does not split lines if column overflows.

-significant_digits *digits*

Specifies the number of digits to the right of the decimal point to report. Allowed values are 0-13; the default is determined by the **shell.report_default_significant_digits** application option, whose default is 2. Use this option to override the default.

DESCRIPTION

This command reports the congestion statistics for the current block.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example runs the **report_congestion** command:

```
prompt> report_congestion
****************************************
Report : congestion
```

```
Design : r4000
Version:
Date   : Tue Jul  7 01:47:18 2015
****************************************

Layer    |   overflow    |           # GRCs has
Name     | total  |  max  | overflow (%)     | max overflow
-----------------------------------------------------------------
Both Dirs |      1 |    1 |      1  ( 0.03%) |      1

route_global(2)
route.global.export_soft_congestion_maps(3)

report_constant_registers

Reports registers that were removed because their values were not used.

SYNTAX

string **report_constant_registers**

DESCRIPTION

Displays a list of registers that were removed from the design by the **compile** command because they could be implemented as a constant. Constant register removal is controlled by the **compile.seqmap.remove_constant_registers** application variable. A register may be reported as implemented using constant 0, constant 1, or X.

EXAMPLES

The following example shows a sample report:

```
****************************************
Report : constant_registers
 ...

****************************************

Register                                  Value
------------------------------------------------------------------------ ------
z0_reg                                    0
z1_reg                                    1
z2_reg                                    X
1
```

SEE ALSO

compile(2)
compile.seqmap.remove_constant_registers(3)

report_constraint

Displays constraint-related information about a design.

SYNTAX

status **report_constraints**
[-modes *mode_list*]
[-corners *corner_list*]
[-scenarios *scenario_list*]
[-all_violators]
[-verbose]
[-max_capacitance]
[-min_capacitance]
[-max_transition]
[-max_delay]
[-min_delay]
[-min_pulse_width]
[-min_period]
[-nosplit]
[-significant_digits *digits*]

Data Types

mode_list collection
corner_list collection
scenario_list collection
digits integer

ARGUMENTS

-modes *mode_list*

Specifies the modes to be reported. Each active scenario of the modes specified by the **-modes** option and the corners specified by the **-corners** option is reported separately. If this option is not given, the command reports scenarios of the current mode. If none of the **-modes**, **-corners**, or **-scenarios** options are given, the command uses the current scenario (if any). It is an error to give this option with the **-scenarios** option.

-corners *corner_list*

Specifies the corners to be reported. Each active scenario of the modes specified by the **-modes** option and the corners specified by the **-corners** option is reported separately. If this option is not given, the command reports scenarios of the current corner. If none of the **-modes**, **-corners**, or **-scenarios** options are given, the command uses the current scenario (if any). It is an error to give this option with the **-scenarios** option.

-scenarios *scenario_list*

Specifies the scenarios to be reported. Each of the given active scenarios is reported. It is an error to give this option with the **-modes** or **-corners** options. If none of the **-modes**, **-corners**, or **-scenarios** options are given, the command uses the current scenario (if any).

-all_violators

Displays a summary of all of the optimization and design rule constraints with violations in the current design. The **-verbose** option provides detailed information about constraint violations. Multiple violations for a given constraint are listed from the most violations to the least violations.

-verbose

Displays more detail about constraint calculations.

-significant_digits *digits*

Specifies the number of digits to the right of the decimal point that are to be reported. The *digits* value must be between 0 and 13. The default value is 2. This option overrides the value set by the **shell.common.report_default_significant_digits** application option.

-max_capacitance

Displays only the max_capacitance constraint information. The max_capacitance constraint is a design rule used to limit total capacitance on a net. The default is to display all optimization and design rule constraints.

-min_capacitance

Displays only the min_capacitance constraint information. The min_capacitance constraint is a design rule used to limit total capacitance on a net. The default is to display all optimization and design rule constraints.

-max_transition

Displays only the max_transition constraint information. The max_transition constraint is a design rule used to limit transition time on a net. The default is to display all optimization and design rule constraints. If the library uses the cmos2 delay model, this option shows the max_edge_rate information.

-max_delay

Indicates that only maximum delay and setup information is to be displayed.

-min_delay

Indicates that only minimum delay and hold information is to be displayed.

-min_pulse_width

Indicates that only minimum pulse width constraint information is to be displayed. similar to the **report_min_pulse_width** command. Using this option will trigger additional timing update and may have some runtime penalty.

-min_period

Indicates that only minimum period constraint information is to be displayed. similar to the **report_min_period** command. Using this option will trigger additional timing update and may have some runtime penalty.

-nosplit

Prevents line splitting and facilitates writing software to extract information from the report output. Most of the design information is listed in fixed-width columns. If the information for a given field exceeds its column's width, the next field begins on a new line, starting in the correct column.

DESCRIPTION

The **report_constraints** command displays the following information for the constraints on the current design:

- Whether the constraint was violated or met
- By how much the constraint value was violated or met
- The design object that was the worst violator.

Multicorner-Multimode Support

By default, this command works on the current scenario. To specify a different scenario, use the **-scenarios** option or the **-corners** and **-modes** options.

EXAMPLES

The following example shows brief constraint information for the current design:

```
prompt> report_constraints

****************************************
Report : constraint
Design : counter
****************************************

                                  Weighted

1
```

SEE ALSO

report_timing(2)
report_min_pulse_width(2)
report_min_period(2)

report_constraint_groups

Reports the constraint groups in the design.

SYNTAX

status **report_constraint_groups**
[-type *constraint_type*]
[-count]
[-nosplit]
[*constraint_group_list*]

Data Types

constraint_type string
constraint_group_list string or collection

ARGUMENTS

-type *constraint_type*

Specifies the type of constraint groups to be reported. The *constraint_type* argument is one of the following keywords:

- bus_style
- differential_group
- differential_pair
- matched_wire
- net_priority
- reliability_verification
- resistance_limit
- river_style
- shielding
- wire_length_limit

By default, all constraint types are reported.

-count

Displays only the count of constituent objects for a constraint group. If not specified, then all constituent objects are reported.

-nosplit

Does not split lines if column overflows.

constraint_group_list

Specifies a list of constraint groups to report. The list can contain constraint group names, patterns, or collections. A collection can be specified by using the **get_constraint_groups** command.

DESCRIPTION

This command reports the user-specified constraint groups in the design, as specified by the *create_wire_matching*, *create_length_limit*, *create_differential_group*, *create_net_shielding*, *create_net_priority* and *create_bus_routing_style* commands. By default this command reports all constraint groups but it can be controlled with *-type* or passing appropriate constraint groups collection.

The report includes constraint group name, its type and constituent objects. If *-count* is used then only the count of constituent objects is reported.

EXAMPLES

The following example reports the constraint group *bus_style_7*:

```
prompt> report_constraint_groups bus_style_7

****************************************
Report : report_constraint_groups
Design : ORCA
Version:
Date   :
****************************************

------------------------------------------------------------
Name               Type            Objects
------------------------------------------------------------
bus_style_7          bus_style         prst_n preq_n
```

The following example reports the bus_style type of constraint groups:

```
prompt> report_constraint_groups -type bus_style

****************************************
Report : report_constraint_groups
Design : ORCA
Version:
Date   :
****************************************

------------------------------------------------------------
Name               Type            Objects
------------------------------------------------------------
```

```
bus_style_7          bus_style        prst_n preq_n
bus_style_8          bus_style        prst_n preq_n
```

The following example reports all constraint groups:

```
prompt> report_constraint_groups

****************************************
Report : report_constraint_groups
Design : ORCA
Version:
Date   :
****************************************

------------------------------------------------------------
Name                 Type             Objects
------------------------------------------------------------
matched_wire_0         matched_wire       prst_n preq_n
matched_wire_1         matched_wire       prst_n preq_n
matched_wire_2         matched_wire       prst_n preq_n
matched_wire_3         matched_wire       prst_n preq_n
differential_pair_4     differential_pair   prst_n preq_n
shielding_5           shielding          prst_n preq_n
net_priority_6         net_priority       prst_n preq_n
bus_style_7           bus_style          prst_n preq_n
bus_style_8           bus_style          prst_n preq_n
```

The following example reports all constraint groups but only the count of constituent objects:

```
prompt> report_constraint_groups -count

****************************************
Report : report_constraint_groups
Design : ORCA
Version:
Date   :
****************************************

-----------------------------------------------------
Name                 Type             Count
-----------------------------------------------------
matched_wire_0         matched_wire       2
matched_wire_1         matched_wire       2
matched_wire_2         matched_wire       2
matched_wire_3         matched_wire       2
differential_pair_4     differential_pair   2
shielding_5           shielding          2
net_priority_6         net_priority       2
bus_style_7           bus_style          2
bus_style_8           bus_style          2
```

report_constraint_mapping_file

Reports the constraint file map for blocks in the design.

SYNTAX

status **report_constraint_mapping_file**
[-design *design*]
[-constraint_type *type*]

Data Types

design design object
type string

ARGUMENTS

-design *design*

Specifies the design which to report. When this option is used together with **-constraint_type**, the command returns the full path to the constraint file of the specified constraint type for the specified design. If **-constraint_type** is not specified, the tool reports all constraint types for the specified design.

-constraint_type *type*

Specifies the type of constraint to report. When this option is used together with **-design**, the command returns the full path to the constraint file of specified type for the specified design. If **-design** is not specified, the tool reports the specified constraint types for all designs.

DESCRIPTION

This command reports the constraint mapping that was read by the *set_constraint_mapping_file* command. Each line of the report shows a specific type of constraint file for a particular block as follows:

block_design_name constraint_type file_name

block_design_name is the reference block name for either the top-level design or a block-level module.

constraint_type is one of the following keywords: **DEF**, **UPF**, **ETM_UPF**, **SDC**, **BUDGET**, **CLKNET**, **PG_CONSTRAINT**, **COMPILE_PG**, **CTS_CONSTRAINT**, **BTM**, or **FLOORPLAN**, **SCANDEF**.

file_name is the constraint file name with its UNIX path.

When no arguments are specified, the tool reports the entire constraint mapping information in the design.

When only the **-design** argument is specified, the tool reports all the constraint files for this design.

When only the **-constraint_type** argument is specified, the tool reports the constraints files for all the designs for the specified type of constraint.

When both the **-design** and **-constraint_type** arguments are specified, the tool reports and returns the full path name to the constraint file that corresponds to the specified design and constraint type.

EXAMPLES

The following example specifies the DEF and UPF constraint files. The files are used in the hierarchical flow from Verilog input to block shaping. The design has a top-level and two child blocks: BLK_A and BLK_B. The content of the constraint mapping file *./map_file.1* is:

```
BLK_A  DEF ./constraints/BLK_A.def
BLK_A  UPF ./constraints/BLK_A.upf
BLK_B  DEF ./constraints/BLK_B.def
BLK_B  UPF ./constraints/BLK_B.upf
TOP    DEF ./constraints/TOP.def
TOP    UPF ./constraints/TOP.upf
```

The following example specifies a constraint mapping file and reports the settings with *report_constraint_mapping_file*.

```
prompt> set_constraint_mapping_file ./map_file.1
prompt> report_constraint_mapping_file
BLK_A DEF /disk1/constraints/BLK_A.def
BLK_A UPF /disk1/constraints/BLK_A.upf
BLK_B DEF /disk1/constraints/BLK_B.def
BLK_B UPF /disk1/constraints/BLK_B.upf
TOP DEF /disk1/constraints/TOP.def
TOP UPF /disk1/constraints/TOP.upf
```

The following example returns the UPF file name for BLK_A.

```
prompt> set UPF_for_A [report_constraint_mapping_file -design BLK_A -constraint_type UPF]
prompt> echo $UPF_for_A
/disk1/constraints/BLK_A.upf
```

SEE ALSO

set_constraint_mapping_file(2)
update_constraint_mapping_file(2)

report_constraints

Displays constraint-related information about a design.

SYNTAX

status **report_constraints**
[-modes *mode_list*]
[-corners *corner_list*]
[-scenarios *scenario_list*]
[-all_violators]
[-verbose]
[-max_capacitance]
[-min_capacitance]
[-max_transition]
[-max_delay]
[-min_delay]
[-min_pulse_width]
[-min_period]
[-nosplit]
[-significant_digits *digits*]

Data Types

mode_list collection
corner_list collection
scenario_list collection
digits integer

ARGUMENTS

-modes *mode_list*

Specifies the modes to be reported. Each active scenario of the modes specified by the **-modes** option and the corners specified by the **-corners** option is reported separately. If this option is not given, the command reports scenarios of the current mode. If none of the **-modes**, **-corners**, or **-scenarios** options are given, the command uses the current scenario (if any). It is an error to give this option with the **-scenarios** option.

-corners *corner_list*

Specifies the corners to be reported. Each active scenario of the modes specified by the **-modes** option and the corners specified by the **-corners** option is reported separately. If this option is not given, the command reports scenarios of the current corner. If none of the **-modes**, **-corners**, or **-scenarios** options are given, the command uses the current scenario (if any). It is an error to give this option with the **-scenarios** option.

-scenarios *scenario_list*

Specifies the scenarios to be reported. Each of the given active scenarios is reported. It is an error to give this option with the **-modes** or **-corners** options. If none of the **-modes**, **-corners**, or **-scenarios** options are given, the command uses the current scenario (if any).

-all_violators

Displays a summary of all of the optimization and design rule constraints with violations in the current design. The **-verbose** option provides detailed information about constraint violations. Multiple violations for a given constraint are listed from the most violations to the least violations.

-verbose

Displays more detail about constraint calculations.

-significant_digits *digits*

Specifies the number of digits to the right of the decimal point that are to be reported. The *digits* value must be between 0 and 13. The default value is 2. This option overrides the value set by the **shell.common.report_default_significant_digits** application option.

-max_capacitance

Displays only the max_capacitance constraint information. The max_capacitance constraint is a design rule used to limit total capacitance on a net. The default is to display all optimization and design rule constraints.

-min_capacitance

Displays only the min_capacitance constraint information. The min_capacitance constraint is a design rule used to limit total capacitance on a net. The default is to display all optimization and design rule constraints.

-max_transition

Displays only the max_transition constraint information. The max_transition constraint is a design rule used to limit transition time on a net. The default is to display all optimization and design rule constraints. If the library uses the cmos2 delay model, this option shows the max_edge_rate information.

-max_delay

Indicates that only maximum delay and setup information is to be displayed.

-min_delay

Indicates that only minimum delay and hold information is to be displayed.

-min_pulse_width

Indicates that only minimum pulse width constraint information is to be displayed. similar to the **report_min_pulse_width** command. Using this option will trigger additional timing update and may have some runtime penalty.

-min_period

Indicates that only minimum period constraint information is to be displayed. similar to the **report_min_period** command. Using this option will trigger additional timing update and may have some runtime penalty.

-nosplit

Prevents line splitting and facilitates writing software to extract information from the report output. Most of the design information is listed in fixed-width columns. If the information for a given field exceeds its column's width, the next field begins on a new line, starting in the correct column.

DESCRIPTION

The **report_constraints** command displays the following information for the constraints on the current design:

- Whether the constraint was violated or met
- By how much the constraint value was violated or met
- The design object that was the worst violator.

Multicorner-Multimode Support

By default, this command works on the current scenario. To specify a different scenario, use the **-scenarios** option or the **-corners** and **-modes** options.

EXAMPLES

The following example shows brief constraint information for the current design:

```
prompt> report_constraints

****************************************

```

SEE ALSO

report_timing(2)
report_min_pulse_width(2)
report_min_period(2)

report_corners

Reports corner information.

SYNTAX

string **report_corners**
[-verbose]
[-significant_digits *digits*]
[*corner_names*]

Data Types

digits integer
corner_names list

ARGUMENTS

corner_names

Lists of corners to report. If you do not specify this option, all corners in the current design are reported.

-verbose

Prints additional information about explicit PVT settings on individual cells and ports.

-significant_digits *digits*

Specifies the number of digits after the decimal point to be displayed for time values in the generated report. Allowed values are 0-13; the default is determined by the **shell.common.report_default_significant_digits** global app option, whose default value is 2. Use this option if you want to override the default. This option controls only the number of digits displayed, not the precision used internally for analysis. For analysis, the tool uses the full precision of the platform's fixed-precision, floating-point arithmetic capability.

DESCRIPTION

This command displays information about corners in the current design, including the modes that each corner is activated with.

Multicorner-Multimode Support

This command works on all corners.

SEE ALSO

create_corner(2)
current_corner(2)
report_modes(2)
report_scenarios(2)
shell.common.report_default_significant_digits(3)

report_cross_probing

Reports cross-probing data for specified cells, ports, modules and blocks.

SYNTAX

status **report_cross_probing**
[-nosplit]
[-original_hierarchy]
objects

Data Types

objects collection

ARGUMENTS

-nosplit

Prevents line splitting in the cross-probing report. Most of the design information is listed in fixed-width columns. In the absence of this option, if the information in a given field exceeds the column width, the next field begins on a new line, starting in the correct column.

-original_hierarchy

Changes the format of the report by adding an additional line per object to display an object's original RTL hierarchy. Some- times a cell undergoes a series of operations, such as ungroup- ing, name changes, and optimization that collapses the hierarchy and renames the cell. The -original_hierarchy option displays the RTL hierarchical name by which the cell was originally cre- ated and helps to identify where the cell originated.

NOTE : '-original_hierarchy' argument displays original RTL hierarchy only for cell objects and not for port or module/block objects.

objects

Specifies the cell, port, module and block objects to show in the report.

DESCRIPTION

This command displays cross-probing information about specified cells, ports and modules and blocks in a report format.

You must have a design that was analyzed, elaborated and linked or synthesized using this tool. The tool provides information about where the cell or port or module or block was created, specifying which file and line number the object came from. If the object

was tool generated, the file and line number are not applicable and are represented by a hyphen (-). In this case, the report specifies whether the origin of the object comes from UPF, the DFT engine, or another source.

Objects in the design that were merged can result in an object with multiple source locations in the report. Objects with multiple source positions will be shown in the table with multiple filenames, lines and origins separated by comma.

The tool reports the following information for each specified object:

- Type : The type of design object, either a cell or port or module or block.
- Reference : For cells, this is the library reference cell. For ports, this is either IN, OUT, or INOUT. This column will be empty for module & block objects.
- Filename : The base name of the file. If this information is not available, the tool displays a hyphen (-).
- Line : The line number associated with the file. If this information is not available, the tool displays a hyphen (-).
- Origin : The origin associated with the object. For example, this value can be rtl, datapath, upf, clock_gating, self_gating, or dft. If this information is not available, the tool displays a hyphen (-).
- Object : The object name.
- Object / Original Hierarchy : If the -original_hierarchy option is used, you will see this column instead of the Object column.

  For each object, the first row in this column shows the object name.

  For each object, the second row in this column shows the object's original hierarchy if applicable.

At the end of the report, mapping from the base name to the absolute file name is provided. You need to verify the existence of the file because the design or original source files might have been moved or deleted after the design was read in.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example shows a **report_cross_probing** report:

```
prompt> set objects [get_ports]
{top_i top_o}
prompt> set objects [add_to_collection $objects [get_cells -hierarchical]]
{top_i top_o mid1/bot1/c1 mid1/bot1/c2 mid1/bot2/c1 mid1/bot2/c2 mid1/foo1/c2
mid1/bot1 mid1/bot2 mid1/foo1 mid1}
prompt> report_cross_probing $objects

SEE ALSO

get_cross_probing_info(2)
cross_probing_filter(2)

report_cross_probing_files

Shows a list of cross-probing files and their status.

SYNTAX

status **report_cross_probing_files**
[-errors_only]

ARGUMENTS

-errors_only

Reports files whose status are not OK.

DESCRIPTION

This command prints out a list of the cross-probing files that are stored in the database and the status of each file. The file status can be one of the following:

Status:

OK - No issues found
Missing - File is missing
No directory permissions - User has no execute permission on the directory in which file exists
No file permissions - User has no read permissions on file
Modified - File contents have been modified

If the status of a file is marked as Modified, the file content has been modified since the file was read. The Missing status might also indicate that the path exists, but it is a directory.

You can use this command to determine if the set of cross-probing file paths stored in the database are valid before using the GUI for cross-referencing. You can also list which RTL files need to be copied to the destination site if the design is being moved to a new location.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following is an example of the **report_cross_probing_files** command:

```
prompt> report_cross_probing_files

****************************************
Report : cross_probing_files
Design : top
Version: ....
Date   : ....
****************************************

 Status:
              OK - No issues found
          Missing - File is missing
No directory permissions - User has no execute permission on the directory in which file exists
   No file permissions - User has no read permissions on file
         Modified - File contents have been modified

Filename                    Status
------------------------------------------
/common/rtl/bot.v           OK
/usrsite/joe/designs/mid.v  OK
/usrsite/joe/designs/top.v  OK
```

update_cross_probing_files(2)

report_crpr

Reports the clock reconvergence pessimism calculated between specified register clock pins or ports.

SYNTAX

status **report_crpr**
[-modes *mode_list*]
[-corners *corner_list*]
[-scenarios *scenario_list*]
-from *from_clock_pin*
-to *to_clock_pin*
[-from_clock *from_clock*]
[-to_clock *to_clock*]
[-setup | -hold]
[-significant_digits *digits*]

Data Types

mode_list	list
corner_list	list
scenario_list	list
from_clock_pin	string
to_clock_pin	string
from_clock	string
to_clock	string
digits	integer

ARGUMENTS

-modes *mode_list*

Specifies the modes to be used for reporting. If this option is not given, the command uses the current mode. For each mode, a separate subreport will be printed. It is an error to give this option with the **-scenarios** option.

-corners *corner_list*

Specifies the corners to be used for reporting. For each mode being reported, scenarios (if any) of that mode and the corners specified by the **-corners** option will be used for reporting. If this option is not given, the command uses every active scenario of the specified modes. It is an error to give this option with the **-scenarios** option.

-scenarios *scenario_list*

Specifies the scenarios to be used for reporting. Each mode used by the specified scenarios is reported. It is an error to give this option with the **-modes** or the **-corners** options. If none of the **-modes**, **-corners**, or **-scenarios** options are specified, the report will use all scenarios of the current mode.

-from ***from_clock_pin***

Specifies the clock pin of the launching sequential device or clock-gating check to be reported. A constrained input port can also be used.

-to ***to_clock_pin***

Specifies the clock pin of the capturing sequential device or clock-gating check to be reported. A constrained output port may also be used.

-from_clock ***from_clock***

Specifies the clock that fans out to the launching sequential device.

-to_clock ***to_clock***

Specifies the clock that fans out to the capturing sequential device.

-setup

Reports the clock reconvergence pessimism for a setup data path. The **-setup** and **-hold** options are mutually exclusive. If neither option is specified, **-setup** is assumed.

-hold

Reports the clock reconvergence pessimism for a hold data path. The **-setup** and **-hold** options are mutually exclusive. If neither option is specified, **-setup** is assumed.

-significant_digits ***digits***

Specifies the number of digits to the right of the decimal point that are to be reported. Allowed values are 0 through 13. If this option is not specified, the number of significant digits is determined by the **shell.common.report_default_significant_digits** global app option, which has a default value of 2.

DESCRIPTION

This command reports the clock reconvergence pessimism calculated between specified register clock pins or ports. The command displays the following information about the calculation of the clock reconvergence pessimism between the two specified sequential elements:

- The name of the common pin in the clock network
- The clock edges (rising or falling) that propagate through the common point to the launching and capturing registers
- A tabulation of the arrival times for both clock edges at the common point and their associated clock reconvergence pessimism (crp_rise and crp_fall). Separate values are reported for each scenario of the mode.
- The clock reconvergence pessimism used along with the reasoning behind the selection of crp_rise or crp_fall used for that report
- The value of the CRPR threshold.

If the design's **time.remove_clock_reconvergence_pessimism** app option is set to **false**, clock reconvergence pessimism removal is inactive and no report can be generated.

The **-from_clock** and **-to_clock** options allow you to generate a report for only the specified clocks. By default, a report is issued for all clocks that fanout to each sequential device.

Two clock reconvergence pessimism values can be calculated for each potential common point in the design. Only one value is reported, if both values are not needed for timing.

- The crp_rise value is calculated from rising arrival times at the common point.
- The crp_fall value is calculated from falling arrival times at the common point.

The value of clock reconvergence pessimism used in the report depends upon what clock edges propagate through the common point to the clock pins of the launching and capturing devices.

For example, if a rising edge through the common point triggers the launching device and also triggers the capturing device, then a rising clock reconvergence pessimism value (crp_rise) is used. Similar reasoning applies for a falling edge propagating through the common point and subsequently launching and capturing data leading to a falling clock reconvergence pessimism value being used (crp_fall). If a rising edge through the common point launches the data and a falling edge through the common point captures it, then a mismatch in sense occurs.

If a mismatch occurs and the design's **time.clock_reconvergence_pessimism** app option is set to **normal**, then the minimum of crp_rise and crp_fall is used. If a mismatch occurs and the app option is set to **same_transition**, then the clock reconvergence pessimism is reported as 0. This selection process is reported in the selection details section of the report.

When the capturing sequential device is a level-sensitive latch, 2 clock reconvergence pessimism values are reported. The first value corresponds to the opening edge of the latch and appears in the timing report. The second value corresponds to the closing edge of the device. The selection details section also reports the decision-making process behind both clock reconvergence pessimism values. In this case, since the opening and closing clock edges at the latch will always be different for setup, there will always be a mismatch in clock edges for one of them.

With SI enabled, the report prints two types of arrivals for the common point, static and dynamic. Static arrivals exclude dynamic source latency on clocks and SI delta delays. Dynamic arrivals include dynamic latency and SI effects. The CRP calculation uses one of these arrivals and reports in the selection details. For zero-cycle paths with same edge triggering launch and capture, at the common point, dynamic arrivals are used. For all other checks static arrivals are used.

Multicorner-Multimode Support

By default, this command works on the current scenario. To specify a different scenario, use the **-scenarios** option or the **-corners** and **-modes** options.

EXAMPLES

The following example reports the clock reconvergence pessimism between the sequential elements, F02 and F01, for a setup data path. The report shows details for each mode and the arrival times at the common point for all the corners (scenarios) of the mode. In the following case, it reports only rise arrival times because only rise is used.

```
prompt> report_crpr -from F02/CP -to F01/CP -modes mode1

report_datapath_architecture_options

Displays datapath strategies available to the current design.

SYNTAX

status **report_datapath_architecture_options**
[**-nosplit**]

ARGUMENTS

-nosplit

Does not split lines if column overflows.

DESCRIPTION

This command lists the customized datapath strategies available to the current design. These strategies provide control over some of the optimizations performed by datapath generators. You can use the **set_datapath_architecture_options** command to set the strategies on specific modules, specific cells, or the whole design.

EXAMPLES

The following is an example of a report generated by **report_datapath_architecture_options**:

```
prompt> report_datapath_architecture_options
****************************************
Report : report_datapath_architecture_options

set_datapath_architecture_options(2)

report_delay_calculation

Displays the actual calculation of a timing arc delay value for cell, net, or library cell timing arcs.

SYNTAX

status **report_delay_calculation**
[-from *pin_port_list*]
[-to *pin_port_list*]
[-mode *mode*]
[-corner *corner*]
[-scenario *scenario*]
[-transition *time*]
[-load *capacitance*]
[-voltage *voltage*]
[-temperature *temperature*]
[-clock *clock*]
[-source_rise]
[-source_fall]
[-pvt]
[-significant_digits *digits*]
[-process_number *number*]
[-process_label *process*]
[-min]
[-crosstalk]
[-derate]
[*arc_list*]

Data Types

pin_port_list	collection
mode	collection
corner	collection
scenario	collection
time	float
capacitance	float
voltage	float
temperature	float
clock	collection
digits	integer
number	float
process	string
arc_list	collection

ARGUMENTS

-from *pin_port_list*

Specifies the starting point of timing arcs within the block. You cannot specify a hierarchical pin.

This option must be used with the **-to** option and is mutually exclusive with the *arc_list* argument.

-to *pin_port_list*

Specifies the ending point of timing arcs within the block. You cannot specify a hierarchical pin.

This option must be used with the **-from** option and is mutually exclusive with the *arc_list* argument.

-mode *mode*

Specifies the mode to use for reporting.

The command uses the scenario (if any) of the specified mode and the corner specified by the **-corner** option for reporting.

If you do not specify any of the **-mode**, **-corner**, or **-scenario** options, the command uses data from the current scenario to generate the report.

It is an error to specify this option with the **-scenario** option.

-corner *corner*

Specifies the corner to use for reporting.

The command uses the scenario (if any) of the specified corner and the mode specified by the **-mode** option for reporting.

If you do not specify any of the **-mode**, **-corner**, or **-scenario** options, the command uses data from the current scenario to generate the report.

It is an error to specify this option with the **-scenario** option.

-scenario *scenario*

Specifies the scenario to use for reporting.

If you do not specify any of the **-mode**, **-corner**, or **-scenario** options, the command uses data from the current scenario to generate the report.

It is an error to specify this option with the **-mode** or the **-corner** options.

-transition *time*

Specifies an override for the rising and falling input transition value used for delay calculations. The specified value is in main library units.

For Arnoldi calculation, the specified input transition is always applied to the input pin of the driving cell. For Elmore calculation, the specified input transition is applied to the from pin of the given arc.

If you do not specify this option, the transition time calculated by the timer is used for cell and net arcs and zero is used for library cell arcs.

-load *capacitance*

Specifies an override for the load capacitance of the arcs. The specified value is in main library units.

This option allows you to analyze the behavior of a cell with different values of load capacitance.

If you do not specify this option, the timer-calculated load capacitance is used for cell and net arcs and zero is used for library cell arcs.

This option does not work with Arnoldi delay calculation.

-voltage *voltage*

Specifies an override for the supply voltage used to calculate the delay of a cell or library cell arc. The specified value is in main library units.

This option allows you to analyze the behavior of a cell with different values of supply voltage. For this option to be effective, the cell's library data must contain characterization data for multiple values of supply voltage.

If you do not specify this option, the block's top-level primary voltage is used for library cell arcs.

-temperature *temperature*

Specifies an override for the temperature used to calculate the delay of a cell or library cell arc. The specified value is in main library units.

This option allows you to analyze the behavior of a cell with different values of temperature. For this option to be effective, the cell's library data must contain characterization data for multiple temperatures.

If you do not specify this option, the block's top-level temperature is used for library cell arcs.

-clock *clock*

Uses existing transition data for the specified clock and clock timing derate values (if any) to calculate delays.

If the cell or net arcs being reported are not part of the clock's network, the command issues a warning message. If the clock does not belong to the mode being reported, the command tries to use a clock of the same name from the correct mode.

If you do not specify this option, the command uses data transitions and derate values.

When you specify this option, you must also use either the **-source_rise** or **-source_fall** option.

-source_rise

Uses the rising clock source edge to determine the transition time at the source node of the timing arc.

This option is valid only when you specify the **-clock** option.

-source_fall

Uses the falling clock source edge to determine the transition time at the source node of the timing arc.

This option is valid only when you specify the **-clock** option.

-pvt

Reports details of the specified and effective PVT parameters of the from- and to-pins.

-significant_digits *digits*

Specifies the number of digits to the right of the decimal point to report. Allowed values are from 0 through 13. The default is 2.

This option overrides the value set by the **shell.common.report_default_significant_digits** application option.

-process_number *number*

Overrides the operating process number.

-process_label *process*

Attaches a process label to the libraries that are read.

By default, the process label is the name of the default operating condition. Process labels are a means of grouping libraries together for scaling.

-min

Reports the minimum delay values instead of maximum values if the report does not print both.

-crosstalk

Reports details related to crosstalk calculation.

You should not use this option with override options, such as **-voltage** and **-temperature**, that change uncoupled delays. This option reports crosstalk calculation results based only on the actual uncoupled delay shown in the **report_timing** report.

-derate

Reports derating components and derated delay.

arc_list

Specifies the cell, net, or library cell timing arcs to report. This option cannot be used with the **-from** and **-to** options.

DESCRIPTION

This command provides detailed timing calculation information about the specified cell, net, or library cell timing arcs. You can use this information to debug or verify timing data in a reference library. For cells and library cells, you can report on both check and delay arcs.

Operating conditions (process, voltage, and temperature values) are considered when making delay calculations. The calculations are based on the PVT and timing data of the specified scenario. For library cell arcs, the command uses the block's top-level PVT parameters.

If you specify pin/port lists with the **-from** and **-to** options, the command reports all cell or net arcs between any of the **-from** and **-to** pins/ports. If the same input pin is specified as both the **-from** and **-to** pin, the command reports the pin's driving_cell (or **set_drive**) calculations. You can specify a collection of cell, net, or library cell timing arcs instead of the **-from** and **-to** options. To create a collection of timing arcs, use the **get_timing_arcs** command.

If you specify the **-clock** option, the command uses the clock transition data and uses timing derate values (if any) for the calculations. If you do not specify this option, the command uses the data transitions and derate values. If the cell or net arcs being reported are not part of the specified clock's network, the command issues a warning message. The command also issues a warning message if you use the **-clock** option with library cell arcs or check arcs (which are never part of a clock network). If you specify the **-clock** option, you must also specify either the **-source_rise** or **-source_fall** option. This option specifies which clock source edge to use to determine the transition time at the source node of the timing arc.

You can use the **-transition**, **-load**, **-voltage**, and **-temperature** options to override the values normally used by the timer. This allows you to investigate how a cell's behavior is affected by changes to these parameters.

For Elmore delay calculation, the report includes both early and late calculations. For Arnoldi delay calculation, the report includes either early or late calculation based on the **-min** option.

The generated timing report includes values for stored delay and output slew in addition to the delay and output slew values. The stored delay and output slew values are the values that would be seen in a timing report through the specified stage. If a timing arc has annotations or derating factors applied to it, its stored delay value might differ from its delay value. If multiple timing arcs arrive at an output pin, the stored output slew value is the slowest transition to the output pin. A value of "..." in the stored delay or stored output slew column indicates that there is no stored data because setup, hold, or maximum transition is disabled for the scenario for which the stage is reported.

Multicorner-Multimode Support

By default, this command works on the current scenario. To specify a different scenario, use the **-scenario** option or the **-corner** and **-mode** options.

EXAMPLES

The following example shows a cell arc's derating information with **-derate** option when it honors side file table. The "POCVM coefficient" indicates that it is using side file table for POCV annotation. "Cell delay" is the delay before applying derates, and "Cell delay derated" is the delay after applying derates.

```
prompt> report_delay_calculation -from U5/A -to U5/Z -sig 4 -derate
                          Rise        Fall
---------------------------------------------------------------------------
Cell delay                = 0.0492      0.0497
POCVM coefficient         = 0.1000      0.1000
POCVM coef scale factor   = 1.0000      1.0000
POCVM distance derate     = 1.0000      1.0000
POCVM guardband           = 1.0000      1.0000
Incremental derate        = 0.0000      0.0000
Cell delay derated        = 0.0492      0.0497
Cell delay sigma          = 0.0049      0.0050

Cell delay derated = "Cell delay" *
( "POCVM guardband" * "POCVM distance derate" + "Incremental derate" )
Cell delay sigma = "Cell delay" *
( "POCVM guardband" * "POCVM coefficient" * "POCVM coef scale factor" )
```

The following example shows a cell arc's derating information with **-derate** option when it honors LVF library data. The "POCVM delay sigma" indicates that it is using LVF library for POCV annotation.

```
prompt> report_delay_calculation -from U5/A -to U5/Z -sig 4 -derate
                          Rise        Fall
---------------------------------------------------------------------------
Cell delay                = 0.0492      0.0497
POCVM delay sigma         = 0.0492      0.0497
POCVM coef scale factor   = 1.1000      1.1500
POCVM distance derate     = 1.0000      1.0000
POCVM guardband           = 1.2000      1.2000
Incremental derate        = 0.1000      0.0500
Cell delay derated        = 0.0640      0.0621
Cell delay sigma          = 0.0650      0.0685

Cell delay derated = "Cell delay" *
( "POCVM guardband" * "POCVM distance derate" + "Incremental derate" )
Cell delay sigma = "POCVM delay sigma" *
( "POCVM guardband" * "POCVM coef scale factor" )
```

The following example shows a cell arc's derating information with **-derate** option when it honors LVF library data and slew variation is on. "POCVM delay sigma" and "POCVM output transition sigma" are the intrinsic delay sigma and intrinsic transition sigma. Slew induced variation includes "POCVM delay sigma induced by input transition variation" and "POCVM output transition sigma induced by input transition variation". "POCVM combined delay sigma" is the combination of "POCVM delay sigma" and "POCVM delay sigma induced by input transition variation", which is the final delay sigma before applying derates. "POCVM combined output

transition sigma" has the similar rule.

```
prompt> report_delay_calculation -from U5/A -to U5/Z -sig 4 -derate
                          Rise        Fall
---------------------------------------------------------------------------
Cell delay                = 0.0492      0.0497
POCVM delay sigma         = 0.0492      0.0497
POCVM delay sigma induced by input transition variation = 0.0055 0.0099
POCVM combined delay sigma      = 0.0556      0.0576
POCVM output transition sigma   = 0.0423      0.0300
POCVM output transition sigma induced by input transition variation = 0.0026 0.0027
POCVM combined output transition sigma = 0.0424   0.0301
POCVM input transition sigma    = 0.0928      0.0614
POCVM coef scale factor         = 1.1000      1.1500
POCVM distance derate           = 1.0000      1.0000
POCVM guardband           = 1.2000      1.2000
Incremental derate        = 0.1000      0.0500
Cell delay derated        = 0.0640      0.0621
Cell delay sigma          = 0.0733      0.0795

Cell delay derated = "Cell delay" *
( "POCVM guardband" * "POCVM distance derate" + "Incremental derate" )
Cell delay sigma = "POCVM combined delay sigma" *
( "POCVM guardband" * "POCVM coef scale factor" )
```

The following example shows a cell arc's derate information with **-derate** option when it honors regular derates.

```
prompt> report_delay_calculation -from U5/A -to U5/Z -sig 4 -derate
                          Rise        Fall
---------------------------------------------------------------------------
Cell delay                = 0.0492      0.0497
Cell derate               = 1.2000      1.2000
Incremental derate        = 0.1000      0.0500
Cell delay derated        = 0.0640      0.0621

Cell delay derated = "Cell delay" * ( "Cell derate" + "Incremental derate" )
```

The following example shows a net arc's derate information with **-derate** option when it honors regular derate and SI analysis is enabled.

```
prompt> report_delay_calculation -from BlkA/U7/Z -to U5/A -derate -sig 4
                          Rise        Fall
---------------------------------------------------------------------------
Net delay                 = 0.0068      0.0068
Net derate                = 1.0000      1.0000
Incremental derate        = 0.1000      0.0500
Net delay derated         = 0.0075      0.0071

Net delay derated = "Net delay" * ( "Net derate" + "Incremental derate" )

Dynamic derate            = 1.1000      1.0500
Delta delay               = 0.0260      0.0076
Delta delay derated       = 0.0286      0.0080

Delta delay derated = "Dynamic derate" * "Delta delay"
```

The following example shows a net arc's derate information with **-derate** option when it honors side file. Note that net arc only

honors side file for POCV annotation.

```
prompt> report_delay_calculation -from BlkA/U7/Z -to U5/A -derate -sig 4
                          Rise         Fall
---------------------------------------------------------------------------
Net delay                 = 0.0068       0.0068
POCVM coefficient         = 0.1000       0.1000
POCVM coef scale factor   = 1.1000       1.1500
POCVM distance derate     = 1.0000       1.0000
POCVM guardband           = 1.2000       1.2000
Incremental derate        = 0.1000       0.0500
Net delay derated         = 0.0088       0.0085
Net delay sigma           = 0.0009       0.0009

Net delay derated = "Net delay" *
( "POCVM guardband" * "POCVM distance derate" + "Incremental derate" )
Net delay sigma   = "Net delay" *
( "POCVM guardband" * "POCVM coefficient" * "POCVM coef scale factor" )
```

report_density_gradient_options

Reports information for the **report_placement -hard_macro_density_gradient_violations** command.

SYNTAX

status **report_density_gradient_options**

DESCRIPTION

This command reports the options set by the **set_density_gradient_options** command. If an option is not specified, the default value is reported. Both the **set_density_gradient_options** and **report_density_gradient_options** commands support the **report_placement -hard_macro_density_gradient_violations** command.

EXAMPLES

The following example sets density gradient options with the **set_density_gradient_options** command and reports the settings with the **report_density_gradient_options** command.

```
prompt> set_density_gradient_options -white_space_density {M1 0 M2 0.6} \
      -edge_zone_width {M1 50 M2 60} \
      -outer_zone_width {M1 50 M2 60} \
      -gradient_tolerance {M1 0.3 M2 0.5} \
      -min_macro_size 600 \
      -cluster_threshold 4

prompt> report_density_gradient_options
****************************************
Report : report_density_gradient_options
 ...

****************************************
------------------------------------------------------------
White Space Density Report:
      Layer                  White space density

SEE ALSO

set_density_gradient_options(2)
report_placement(2)

report_design

Reports netlist, floorplan, routing, and library information for the current block. By default, the command reports the number of standard cells, macro cells, and other elements in the design.

SYNTAX

status **report_design**
[-library]
[-netlist]
[-floorplan]
[-routing]
[-all]
[-nosplit]
[-hierarchical]

ARGUMENTS

-library

Reports information about the reference libraries for the current block. The report includes the search path, units, technology file, number of scenarios in the design, standard cell information and statistics, and some details of the reference libraries.

The report is divided into sections for search path, units, scenarios, and library details. The search path section prints value of the **search_path** variable.

The units section prints the units from the main reference library. Note that the command does not consider user-defined units.

The technology file section prints the technology file that was used to build the current block.

The scenario section reports the number of active and inactive scenarios. If the block has only one scenario, the number of active scenarios is 1 and number of inactive scenarios is 0.

The next section reports information about the standard cells in tall reference libraries. The command considers only those library cells that have a timing view and whose **design_type** attribute is set to **lib_cell**.

The library details section reports details for each standard cell library. The command prints the full path to each library, along with the list of db files that were used to build this library and the full path to these logic library (.db) files.

The **-hierarchical** option has no effect on this option.

-netlist

Reports information about the library cells and the number of instances in the netlist. The report includes the number of cell instances, library cells, flat nets, ports, and pins. When you use this option with the **-all** option, the command also generates a netlist report.

The report is divided into sections for cell instances, reference designs, nets, fanout, and port and pin information. In the cell instance section, the report includes the gate count, percentage of total leaf cells and of total cell area, and the projected cell area in both square microns and sites. If a cell instance does not have a site definition, the command calculates site area based on a cell instance with minimum site height.

The report also reports cells with various design types (as determined by the **design_type** attribute); cells with special types such as level shifter, isolation, switch, always on, retention, and tie off; high, low, and normal threshold voltage cells; netlist and physical-only cells; fixed and movable cells; combinational and sequential cells; buffers and inverters; spare cells; integrated clock-gating (ICG) cells; flip-flops; latches; antenna cells; multiplexer logic; and multiheight cells. The calculations are based on the height of the cell with respect to the site height of the cell instance.

In the reference design section, the command reports the design type, instance count, width, height, area, pin density, site name, and site area for each library cell. Pin density is the ratio of the pins and the area of the library cell. Site name and site area are reported if the library cell has a site definition.

In the flat net section, the command reports the count, floating nets, total vias, and the ratio of net counts to total cell counts. The report also contains pin count and fanout statistics for different ranges of fanout and pin count. A net is considered floating when the pin count is less than or equal to one or when the pin count is same as the fanout and there are no inout pins.

In the leaf pins and ports section, the command reports the counts of power and ground pins and ports. The counts are based on the direction of the pin or port.

To report hierarchical netlist information, use the **-hierarchical** option with this option.

-floorplan

Displays the floorplan information for the design.

The floorplan information includes the following sections:

- Core and chip area : Reports information about the core area and chip area.
- Site row : Reports the name, width, height, number of rows, number of tiles, and area for each site definition.
- Blockage : Reports the name, count, and area for each blockage type.
- Power domain : Reports the name, voltage area name, primary power net, and primary ground net for each power domain.
- Voltage area : Reports the name, number of shapes, area, target utilization, and bounding box coordinates for each voltage area.
- Group bound : Reports the number of group bounds in the design.
- Exclusive move bound : Reports the name, area, utilization, and bounding box coordinates for each exclusive move bound in the design.
- Hard and soft move bound: Reports the name, area, utilization, bounding box coordinates, and type for each move bound in the design.
- Routing guide : Reports the type, count, and area for each routing guide in the design.
- Multibit register : Reports the count of different multibit registers in the design and the multibit banking ratio.
- Relative placement group : Reports the number of top-level relative placement (RP) groups in the design, the total number of RP cells, and the RP cell area as a percentage of total leaf cell area of design.
- Layer : Reports the details of layers with known routing directions. For each layer, the command reports the layer name, routing direction, whether the layer is ignored, pitch, default width, minimum width, minimum spacing, and same net minimum spacing. If there is a routing direction override for a specific layer, the command reports the override direction.

To report hierarchical floorplan information, use the **-hierarchical** option with this option.

-routing

Reports information and statistics related to routing. The report includes signal wiring, clock wiring and PG wiring statistics, as well as via instances and the double via conversion rates. The command reports the details of the final routing state.

By default, the command reports the routing information only for the top-level of the physical hierarchy. To aggregate the information across all levels of the physical hierarchy, use the **-hierarchical** option.

The summary section reports the total number of all wires across all layers and their total length. It also reports the total number of contacts (vias) across all the layers, including simple vias, simple array vias, and custom vias.

In the final wiring statistics table, the command reports the following information for each layer: the total number of wires on the layer, its percentage with respect to the total wire count for the layer, the total length of wires on the layer, and its percentage with respect to the total wire length.

In the PG wiring section, for each layer, the command reports the power and ground wiring statistics. In this section, the command reports only those wires whose **net_type** attribute is set to **power** or **ground**.

In the shape pattern wiring statistics table, the command reports the shape pattern wiring statistics for each layer. This command only reports the path pattern type in this wiring statistics table.

In the horizontal and vertical wire distribution section, the command reports the total length of horizontal wires or horizontal segments of wires and its percentage with respect to the total horizontal wire length. Vertical routing distribution is reported similarly.

Except for PG wiring statistics, all other wiring statistics in this report consider only signal wires.

The final via statistics section reports via information for each via layer. All simple via definitions and simple array via definitions associated with a particular via layer are listed. The report also includes the number of instances of that via definition and the percentage of that number with respect to the total number of vias on that via layer.

The character string "(rot)" is appended to the via definition name for rotated instances of simple via definitions. A rotated via is a via with an orientation other than R0, R180, MX, or MY. The character string "mXn" is appended to the via definition name for simple via arrays, which denotes a via array with m rows and n columns. All such vias are counted as "double vias". For simple vias (one row and one column), the via definition name is reported without a suffix. The double via conversion rate is reported for each via layer. The rate is the ratio of the total number of instances of "double vias" (as explained above) to the total number of all vias in this layer, expressed as a percentage. Note that this calculation considers only double vias; other types of optimized vias are not considered.

The overall double via conversion rate is the ratio of the total number of double via instances to the total number of vias, expressed as a percentage. The command reports the conversion rate both considering all vias (both PG and detail routing) and considering only detail routing vias. If the design contains custom vias, the command reports them separately in the custom via statistics section. For custom vias, the command reports only the via definition name and the total number of instances of this custom via. Custom vias might have more than one cut layers associated with the via, so this information is not classified by layer.

DRC summary information is also reported if this information is stored in the design when the routing is done.

To report hierarchical routing information, use the **-hierarchical** option with this option.

-all

Reports floorplan, netlist, routing, and library information. The output of the **report_design -all** command is equivalent to running **report_design -floorplan -netlist -routing -library**.

-nosplit

Retains long lines, even if the lines are longer than 80 columns. Most of the design information is listed in fixed-width columns. If the information for a given field exceeds the column width, the next field begins on a new line, starting in the correct column. This option prevents line-splitting and facilitates writing scripts to extract information from the report output.

-hierarchical

Includes all objects of the physical hierarchies in the report. This option applies to reports generated by the **-netlist**, **-floorplan**, and **-routing** options, as well as the default summary.

DESCRIPTION

This command lists information and statistics about various netlist, floorplan, library, and routing objects in the current block. When you run the command with no options, the command performs a statistical analysis of various aspects of the design, such as cells, nets, and area, and generates a table with the results.

This command supports hierarchical reporting, which is enabled by the **-hierarchical** option. When you specify this option, reporting includes the objects of the physical hierarchies beneath the top level.

EXAMPLES

The **report_design** command displays the following information when no options are specified.

```
prompt> report_design
****************************************
Report : design
Design : my_design
****************************************

Total number of std cells in library : 536
Total number of dont_use lib cells   : 22
Total number of dont_touch lib cells : 22
Total number of buffers              : 26
Total number of inverters            : 13
Total number of flip-flops           : 120
Total number of latches              : 60
Total number of ICGs                 : 20

Cell Instance Type  Count       Area
---------------------------------------
TOTAL LEAF CELLS    35211  3869717.457
Standard cells      34620   716005.644
Hard macro cells       41   557965.758

SEE ALSO

report_clocks(2)
report_ports(2)

report_design_mismatch

Reports mismatch summary for the specified designs and reference libraries. By default reports information from current design and its reference library. More detailed information of 'any specific design[s]', 'any specific library[ies]' or 'all designs from current library and its reference libraries' can be reported through various available options. By default reports all mismatches except accepted.

SYNTAX

status **report_design_mismatch**
[-mismatch_type *type*]
[-verbose]
[-repair_status repaired | not_repaired | accepted | deleted | ignored]
[-nosplit]
[objects]

Data Types

type list

ARGUMENTS

-mismatch_type

Specifies the list of mismatch types to report mismatches. Specify one or more of the following values: **bus_bit_naming**, **lib_missing_logical_port**, **lib_missing_physical_port**, **lib_missing_physical_reference**, **lib_port_name_case**, **lib_cell_name_case**, **lib_port_direction**, **lib_port_name_synonym**, **lib_port_type**, **lib_missing_rail_pg**, **lib_port_missing_via_region**, **lib_port_missing_access_edge**, **missing_logical_reference**, **missing_port**, **port_name_case**, **reference_name_case**, **port_name_synonym**, **macro_cell_contain_too_many_obs**, **exceed_ndr_limitation**, **layer_missing_prefer_direction**, and **empty_logic_module**.

-verbose

Displays detailed information about each mismatch type.

-repair_status

Specifies the list of mismatch states to report mismatches.

-nosplit

Does not split lines if column overflows.

objects

List of designs/libs/lib_cells/mismatch_objects to report mismatches.These objects can be output from get_designs, get_libs, get_lib_cells and get_mismatch_objects command .

DESCRIPTION

This command reports mismatch summary for the current design and its reference libraries. The summarized report will have count of mismatch objects under each mismatch type. The report contains all mismatches except those having repair state as accepted. Accepted mismatches are considered differently than the other mismatches, and thus are not reported by default. They can be reported using **repair_status** option. Specific libraries/designs/library cells/mismatch objects can also be specified explicitly to report mismatches upon. List of libraries/designs/library cells/mismatch objects can be supplied via get_libs/get_designs/get_lib_cells/get_mismatch_objects commands respectively. When **verbose** option is used, this will report detailed information for each mismatch object under each mismatch type for the current design. When **repair_status** option is used, this command will only report mismatches with specified mismatch repair status. Valid values for mismatch repair status are: repaired, accepted, ignored, deleted and not_repaired. When **mismatch_type** option is used, this command will report mismatches for specified mismatch type.

EXAMPLES

The following example reports mismatches:

```

report_design_rules

Displays design_rule's information from the current library's technology.

SYNTAX

string **report_design_rules**
[-tech *tech_object*]
[-library *library*]
[-verbose]
[-nosplit]
[-all]
[*pattern*]

Data Types

tech	collection
library	string or collection
patterns	string or collection

ARGUMENTS

-tech *tech_object*

Specifies the technology object from which to report the design rules.

The **-tech** and **-library** options are mutually exclusive; you can specify only one. If you do not specify either option, the rules are reported from the technology object of the current library.

-library *library*

Specifies the library from which to report the design rules. The command reports the rules from the technology object associated with the specified library. In an implementation tool, the library is a design library. In the library manager, the library is a cell library. You can specify the library using the library's name or a collection that contains the library.

The **-tech** and **-library** options are mutually exclusive; you can specify only one. If you do not specify either option, the rules are reported from the technology object of the current library.

-verbose

Display all the properties of design rule. Without **-verbose**, only layer1, layer2 and min_spacing properties will be displayed.

-nosplit

Prevents line splitting if the column overflows. Most information is listed in fixed-width columns. If the information for a given field exceeds the column width, the next field begins on a new line, starting in the correct column. This option prevents line-splitting

and facilitates writing software to extract information from the report output.

-all

Report all design rules.

patterns

Displays information only on the specified design_rule objects. *patterns* contains either a collection of design_rules or a pattern that matches the design_rule names.

DESCRIPTION

This command displays information about design_rules in the current libray's technology.

EXAMPLES

Below example outputs the report for all design_rule objects.

```
prompt> report_design_rules -all
****************************************
Report : report_design_rules
Version: M-2016.12-SP4-BETA
Date   : Mon Apr  3 05:48:28 2017
****************************************
Name            Property Name          Value
------------------------------------------------------------------------------
DESIGN_RULE_0     layer1               via1Blockage
                  layer2               VIA1
                  min_spacing          0

DESIGN_RULE_1     layer1               via2Blockage
                  layer2               VIA2
                  min_spacing          0

1
```

Below example outputs the design_rule named DESIGN_RULE_0

```
prompt> report_design_rules DESIGN_RULE_0

report_references(2)

report_device_group

Reports statistics on cell count and area by device group names.

SYNTAX

int **report_device_group**
[-verbose]
[-significant_digits *digits*]
[-nosplit]
[-detailed *cell_type*]
[-datapath_cells_only]
[-standard_cells_only]
[-hierarchy]
[-hier_device_groups *group_list*]
[-hier_threshold *digits*]
[*cell_list*]

Data Types

digits int
cell_type list
cell_list list
group_list list

ARGUMENTS

-verbose

Lists all of the cells belonging to each device group. If this option is omitted, the default report shows only the number and percentage of cells.

-significant_digits *digits*

Specifies the number of digits to the right of the decimal point to report. Allowed values are from 0 through 13. The default is 2. Using this option overrides the value set by the **report_default_significant_digits** variable.

-nosplit

Prevents line splitting and facilitates writing scripts to extract information from the report output. Most of the design information is listed in fixed-width columns. If the information in a given field exceeds the column width, the next field begins on a new line, starting in the correct column.

-detailed *cell_type*

Specifies the cell types for which detailed report is to be generated. Acceptable types are repeater, register and clock_network.

-datapath_cells_only

Reports only for cells in the data path excluding clock_network, macros and blackboxes

-standard_cells_only

Reports only for cells in data path and clock network

-hierarchy

Prints the hierarchical report for all device groups present in the design

-hier_device_groups *group_list*

Prints the hierarchical report for user specified device groups in the design.

hier_threshold *digits*

Limits the report to hierarchical cells that has leaf cells more than the specified threshold

cell_list

Specifies a list of cells on which to report the device groups. If not specified, all cells in the **current_design** are considered.

DESCRIPTION

This command reports the number, area, and percentage of cells in each device group for the specified list of cells or designs. The report also shows separately, the number, area, and percentage of repeater, combinational, register, sequential, clock_network, macro and physical_only cells in each group.

The device group is defined in the technology libraries with the **device_group** attribute on the cell. You can also set the attributes on the objects using the **set_attribute** command. The attributes can be any string values, but the values must be related to the device group of the cell to be meaningful. Any cells in the design that have no device group attribute are included in the "undefined" group. Cells in the abstract block will not be reported.

EXAMPLES

This command generates a summary of cells in each device group:

```
prompt> report_device_group

set_attribute(2)

report_dff_connections

Reports connections found using **compute_dff_connections**.

SYNTAX

status **report_dff_connections**
[-max_reg *register_count*]
[-max_gate *gate_count*]
[-min_connections *connection_count*]
[-inst_to_inst_min *connection_count*]
[-port_to_port_min *connection_count*]
[-inst_to_port_min *connection_count*]
[-port_to_inst_min *connection_count*]

[-from_blocks *list_of_designs*]
[-to_blocks *list_of_designs*]
[-from_macros *list_of_macros*]
[-to_macros *list_of_macros*]
[-from_bounds *list_of_bounds*]
[-to_bounds *list_of_bounds*]
[-from_ports *list_of_ports*]
[-to_ports *list_of_ports*]

[-format text | html | csv] (default: text)
[-filename *output_file*]
[-overwrite]

[-no_blocks]
[-all_macros]
[-all_bounds]
[-all_ports]
[-same_types_only]
[-no_legend]
[-reduce_width]
[-include_empty]

Data Types

register_count int
gate_count int
connection_count int
list_of_designs collection or list of names of designs (blocks or macros)
list_of_bounds collection or list of names of module boundaries
list_of_ports collection or list of names of ports
output_file string

ARGUMENTS

-max_reg *register_count*

Specifies the maximum number of registers a path can contain and still be reported. It is an error to specify a larger value than used during **compute_dff_connections**.

-max_gate *gate_count*

Specifies the maximum number of gates a path can contain and still be reported. It is an error to specify a larger value than used during **compute_dff_connections**.

-min_connections *connection_count*

Only include blocks/macros/bounds/ports in the report with this many or more connections to another block/macro/bound or port. Specifying a large value will report less total connections. By default, this value is 0 (i.e. report all connection counts).

-inst_to_inst_min *connection_count*

A subset of **-min_connections** - only applies to the reporting of inst to inst connections (blocks/bounds/macros to blocks/bounds/macros).

-inst_to_port_min *connection_count*

A subset of **-min_connections** - only applies to the reporting of inst to port connections (blocks/bounds/macros to ports).

-port_to_inst_min *connection_count*

A subset of **-min_connections** - only applies to the reporting of port to inst connections (ports to blocks/bounds/macros).

-port_to_port_min *connection_count*

A subset of **-min_connections** - only applies to the reporting of port to port connections (ports to ports).

-no_blocks

Do not report on any blocks. **Note: Default is to report on all blocks, as if -all_blocks was specified, although this is not an actual parameter.**

-from_blocks *list_of_designs*

Only report block connections starting at these blocks. Cannot be specified together with **-no_blocks** and **-to_blocks**. If not specified, connections from all blocks will be reported.

-to_blocks *list_of_designs*

Only report block connections ending at these blocks. Cannot be specified together with **-no_blocks** and **-from_blocks**. If not specified, connections to all blocks will be reported.

-all_bounds

Report to/from all bounds (module boundaries). Default is no bounds included in report.

-from_bounds *list_of_designs*

Only report bound (module boundary) connections starting at these bounds. Cannot be specified with **-all_bounds** and **-**

to_bounds.

-to_bounds ***list_of_designs***

Only report bound (module boundary) connections ending at these bounds. Cannot be specified with **-all_bounds** and **-from_bounds**.

-all_macros

Report to/from all macros. Default is no macros included in report.

-from_macros ***list_of_macros***

Only report macro connections starting at these macros. Cannot be specified with **-all_macros** and **-to_macros**.

-to_macros ***list_of_macros***

Only report macro connections ending at these macros. Cannot be specified with **-all_macros** and **-from_macros**.

-all_ports

Report to/from all ports. Default is no ports included in report.

-from_ports ***list_of_ports***

Only report port connections starting at these ports. Cannot be specified with **-all_ports** and **-to_ports**.

-to_ports ***list_of_ports***

Only report port connections ending at these ports. Cannot be specified with **-all_ports** and **-from_ports**.

-format text | **html** | **csv**

Produce report in this output format. Default is text (ASCII). HTML = Hypertext Markup Language. CSV = Comma Separated Values.

-filename ***output_file***

Write report to this file. Default is to the console/terminal.

-overwrite

If specified, overwrite an existing report file.

-same_types_only

Only report between identical types. I.e. block-to-block, macro-to-macro, bound-to-bound and port-to-port. Which sub-reports are actually produced is influenced by other settings.

-no_legend

Instead of a legend, use full names in the report row/column headings. Will result in much longer rows (wider columns), but may be preferable for parsing the output.

-reduce_width

Try to produce as little whitespace as possible in report columns. This will result in columns of differing widths (especially if used with **-no_legend**). Useful for viewing of the report, but may make parsing the report more difficult.

-include_empty

Include instances and ports with no to/from connections in the report. This will report the connections between all blocks, for example, not only those that actually have connections.

DESCRIPTION

This command reports the results from the Data Flow Flylines (DFF) tracer (**compute_dff_connections**). A GUI visualization tool is available for viewing DFF results. This command allows for reporting the data in a structured manner. This command can report connections between blocks, macros, bounds and ports. It can produce output in text format (ASCII), HTML or CSV and display it to the console or save it to a file. Various options are available to limit output to the desired subset of DFF data.

By default, connections to/from all blocks are shown. This can be altered using **-no_blocks**, **-from_blocks** and **-to_blocks**, although all three parameters may not be specified together. If only **-from_blocks** is specified, then the "to blocks" list defaults to all blocks. If **-from_blocks** and **-no_blocks** is specified, then only connections from the given list of blocks is reported, and no connections to blocks are reported.

The other parameter combinations work similarly. **-all_macros** by itself reports to/from all macros. **-all_macros** and **-from_macros** reports from the given macros and to all macros. **-all_macros** and **-to_macros** reports from all macros and to the given macros. All three macro parameters may not be specified together.

NOTES

Specifying **-min_connections** (or the other connection count restrictions) will often show connections with a lower value than the specified value. For example, if block A has 10 connections to block B and 20 connections to block C, **-min_connections 15** is required to include block A. If block D has 25 connections to block B, block B may be included in the overall "TO" column, even though it only has 10 connections from block A. The choice is either to show - (no connections) from A to B, which would be incorrect, or "X" (not shown), or 10. For the sake of accuracy, 10 is shown.

EXAMPLES

The following example traces the current design using default constraints, and then reports the results of all block-to-block connections to the screen using default settings.

```
prompt> compute_dff_connections
prompt> report_dff_connections
```

SEE ALSO

compute_dff_connections(2)

report_dft

Reports DFT configuration for the current session.

SYNTAX

string **report_dft**
[-scan_configuration]
[-dft_signal]
[-dft_drc_configuration]
[-scan_compression_configuration]
[-logicbist_configuration]
[-partitions]
[-wrapper_specification]
[-clock_controller]
[-testability]
[-scan_path]
[-pipeline]
[-serialize]
[-test_assume]
[-clock_gating_pin]
[-scan_group]
[-location]
[-dft_configuration]
[-ieee_1500_configuration]
[-dft_clock_gating_configuration]
[-nosplit]

ARGUMENTS

-scan_configuration

Displays the current scan configuration settings. Use the **set_scan_configuration** command to modify them.

-dft_signal

Displays port, signal type, active state, hookup pin usage, and timing information for all DFT signals. Use the **set_dft_signal** command to modify them.

-dft_drc_configuration

Displays the current DFT DRC settings. Use the **set_dft_drc_configuration** command to modify them.

-scan_compression_configuration

Displays the current scan compression configuration settings. Use the **set_scan_compression_configuration** command to

modify them.

-logicbist_configuration

Displays the current LogicBIST self-test configuration settings. Use the **set_logicbist_configuration** command to modify them.

-partitions

Displays the current DFT partition settings. Use the **define_dft_partition** command to specify them.

-wrapper_specification

Displays the current core wrapping settings. Use the **set_wrapper_configuration** command to modify them.

-clock_controller

Displays the current on-chip clocking (OCC) controller settings. Use the **set_dft_clock_controller_configuration** command to modify them.

-testability

Displays the current automatically inserted test point settings. Use the **set_testability_configuration** command to modify them.

-scan_path

Displays the current user-defined scan path settings. Use the **set_scan_path** command to modify them.

-pipeline

Displays the current pipelined scan data settings. Use the **set_pipeline_scan_data_configuration** command to modify them.

-serialize

Displays the current serializer settings. Use the **set_serialize_configuration** command to modify them.

-test_assume

Displays the current DRC assumed-constant settings. Use the **set_test_assume** command to modify them.

-clock_gating_pin

Displays the current user-identified clock-gating test pin settings. Use the **set_dft_clock_gating_pin** command to modify them.

-scan_group

Displays the current scan group settings. Use the **set_scan_group** command to modify them.

-location

Displays the current DFT insertion location settings. Use the **set_dft_location** command to modify them.

-dft_configuration

Displays the current DFT client-enable settings. Use the **set_dft_configuration** command to modify them.

-ieee_1500_configuration

Displays the current IEEE 1500 settings. Use the **set_ieee_1500_configuration** command to modify them.

-dft_clock_gating_configuration

Displays the current DFT clock-gating settings. Use the **set_dft_clock_gating_configuration** command to specify them.

-nosplit

Does not split lines if column overflows.

DESCRIPTION

This command displays information about the DFT features that have been set in the current session. You can generate specific reports by using the command's options. By default, all reports are displayed.

EXAMPLES

The following example displays a report for the scan configuration in the current session.

```
prompt> report_dft -scan_configuration

report_dft_clock_controller

Reports the on-chip clocking controller specification for the current design.

SYNTAX

status **report_dft_clock_controller**

ARGUMENTS

The **report_dft_clock_controller** command has no arguments.

DESCRIPTION

This command displays the current on-chip clocking controller specification applied to the current design.

Use the **set_dft_clock_controller** command to specify an on-chip clocking controller specification.

For more information, see the man page for the **set_dft_clock_controller** command.

EXAMPLES

The following command reports the clock_controller controller specification for the current design.

```
prompt> report_dft_clock_controller

```

SEE ALSO

set_dft_clock_gating_configuration(2)

report_dft_clock_gating_pin

Displays the specification specified by the **set_dft_clock_gating_pin** command.

SYNTAX

status **report_dft_clock_gating_pin**

ARGUMENTS

This command takes no arguments.

DESCRIPTION

This command displays the options that were specified with the **set_dft_clock_gating_pin** command on the current design.

When the reported test pin of a clock-gating cell is active low and controlled by a ScanEnable or TestMode signal, the control signal is reported as ScanEnable_inverted or TestMode_inverted, respectively.

EXAMPLES

The following example shows the report generated by the **report_dft_clock_gating_pin** command. Consider a set of **set_dft_clock_gating_pin** commands as follows:

```
set_dft_clock_gating_pin {sub1/clk_gate_out1_reg} -pin_name TE \
  -control_signal ScanEnable -active_state 1

set_dft_clock_gating_pin {sub2/clk_gate_out1_reg} -pin_name TE \
  -control_signal ScanEnable -active_state 0

set_dft_clock_gating_pin {sub3/clk_gate_out1_reg} -pin_name TE \
  -control_signal TestMode -active_state 1

set_dft_clock_gating_pin {sub4/clk_gate_out1_reg} -pin_name TE \
  -control_signal TestMode -active_state 0
```

The output of the **report_dft_clock_gating_pin** command for these commands is:

```
prompt> report_dft_clock_gating_pin
****************************************
Report : DFT Clock gating pin configuration

report_dft_drc_violations

Reports DFT DRC violations for the current design.

SYNTAX

string **report_dft_drc_violations**
[-test_mode test_mode_label]
[-rule *rule_list*]
[-summary]

Data Types

test_mode_label string
rule_list list

ARGUMENTS

-test_mode

Specifies the mode in which we are reporting DFT DRC violations. Argument examples are Internal_scan and ScanCompression_mode.

-rule

Specifies the collection of rule or rule type or rule category for which the DFT DRC violations must be reported.

-summary

Show a summary of the violations at the end of the report.

DESCRIPTION

This command reports DFT DRC violations on the current design against the test design rules specified by the **report_drc_violations -rule** for the mode specified by the **report_drc_violations -test_mode**.

EXAMPLES

The following example displays DFT DRC violations report on the current design aganist the specified rule category for the specified

test mode.

```
prompt> report_dft_drc_violations -rule B -test_mode all_dft
--------------------------------------------------------------------------------
 Report : DFT DRC Violations
     Mode   : all_dft
--------------------------------------------------------------------------------
 Warning: Unconnected module internal net ( des_decrypt/n1459 ). (B10-1)
 Warning: Unconnected module internal net ( des_decrypt/n1458 ). (B10-2)
 Warning: Undriven instance input pin ( /des_c_0/state_reg/CP ). (B12-1)
 Warning: Unconnected module input pin ( des_decrypt/i_key[64] ). (B8-1)
 Warning: Unconnected module input pin ( des_encrypt/i_key[64] ). (B8-2)
 Warning: Undriven module internal net ( des_decrypt/round[0] ). (B9-1)
```

The following example displays DFT DRC violations report on the current design aganist the specified rule type for the specified test mode.

```
prompt> report_dft_drc_violations -rule B10 -test_mode all_dft
--------------------------------------------------------------------------------
 Report : DFT DRC Violations
     Mode   : all_dft
--------------------------------------------------------------------------------
 Warning: Unconnected module internal net ( des_decrypt/n1459 ). (B10-1)
 Warning: Unconnected module internal net ( des_decrypt/n1458 ). (B10-2)
```

The following example displays DFT DRC violations report on the current design aganist the specified rule for the specified test mode.

```
prompt> report_dft_drc_violations -rule B10-2 -test_mode all_dft
--------------------------------------------------------------------------------
 Report : DFT DRC Violations
     Mode   : all_dft

SEE ALSO

set_dft_insertion_configuration(2)

report_dft_isolation

Report the UPF isolation strategies specified by set_dft_isolation command.

SYNTAX

status **report_dft_isolation**
-ref_domain *power_domain*
[-dft_target_domain *target_power_domain*]
[-type *type_list*]

Data Types

power_domain string
target_power_domain *string*
type_list list

ARGUMENTS

-ref_domain *power_domain*

Specify the domain where **-ref_strategy** is defined.

-dft_target_domain *target_power_domain*

Specify the target power domain of the connection.

-type *type_list*

Specify the connection types.

DESCRIPTION

This command reports the strategies that were specified by set_dft_isolation commands.

EXAMPLES

The following example reports isolation strategies on domain pd1 for type scan_in.

```
prompt> report_dft_isolation iso1 -ref_domain pd1 -type scan_in
iso1 : pd1(domain), scan_in(type)
```

SEE ALSO

set_isolation(2)
set_dft_isolation(2)

report_dft_location

Reports the DFT hierarchy location specifications for the current design.

SYNTAX

status **report_dft_location**

ARGUMENTS

The **report_dft_location** command has no arguments.

DESCRIPTION

The **report_dft_location** command is used to report the DFT hierarchy location specification that have been applied to the current design by the **set_dft_location** command.

User-defined locations are reported. Default locations are not reported.

EXAMPLES

The following example shows how two user-defined DFT locations are reported:

```
prompt> set_dft_location -include {CODEC} UDFTSTUFF
Accepted DFT location specification
1
prompt> set_dft_location -include {PLL} UCLKGEN
Accepted DFT location specification
1
prompt> report_dft_location

SEE ALSO

add_tie_cells(2)
set_disable_tie_insert(2)
reset_disable_tie_insert(2)

report_disable_timing

Reports disabled timing arcs in the current design.

SYNTAX

string **report_disable_timing**
[-mode *mode*]
[-nosplit]
[*object_spec*]

Data Types

mode collection
object_spec collection

ARGUMENTS

-mode *mode*

A single mode to be used for the report. This can be a collection or the name of a valid mode. If not specified, the current mode will be used.

-nosplit

Prevents line splitting and facilitates writing scripts to extract information from the report output. If you do not use this option, most of the design information is listed in fixed-width columns. If the information for a given field exceeds the column width, the next field begins on a new line starting in the correct column.

object_spec

Limits disabled arc reporting to the specified list of cells or ports. Provide the list or collection of cells or ports as an argument to the command.

DESCRIPTION

Reports disabled timing arcs in the current design. Timing arcs can be disabled in several ways. You can disable a timing arc by using the **set_disable_timing** command. The following symbols are used to explain why a timing arc is disabled:

c : The propagation of case-analysis values

C : The presence of conditional arcs (arcs that have a when statement defined in the library)

d : The presence of default arcs (when the **time.disable_cond_default_arcs** application option is set to **true**)

f : Disabling of false net-arcs

l : Loop breaking

L : db inherited loop breaking

p : The propagation of constant values

u : Arcs disabled by using the **set_disable_timing** command.

Multicorner-Multimode Support

By default, this command works on the current mode. To specify a different mode, use the **-mode** option.

EXAMPLES

The following example shows that the timing arc of a cell named *U1/U2* from pin *A* to pin *Z* is disabled.

```
prompt> set_disable_timing {n2_i} -from A -to Z
prompt> report_disable_timing

1
```

The following example specifies that the timing arc of cell *ff4* from pin *CP* to pin *TE* and *TI* are disabled as a result of a case-analysis constant of *0* propagated to pin *TE* of cell *ff4*. Note that the actual case value is set on another pin *A* and the propagation path to *ff4/TE* is inverting.

```
prompt> set_case_analysis 0 {p_in in0}
prompt> report_disable_timing

****************************************
Report : disable_timing
```

```
Module : counter
Mode   : m2
Version:
Date   : Thu Jan  5 19:39:17 2017
****************************************

Flags :    c  case-analysis
           C  Conditional arc
           d  default conditional arc
           f  false net-arc
           l  loop breaking
           L  db inherited loop breaking
           p  propagated constant
           u  user-defined

Cell or Port  From  To  Sense          Flag  Reason
-------------------------------------------------------------
o_reg4        CP    D   hold_clk_rise   c     D = 0
o_reg4        CP    D   setup_clk_rise  c     D = 0
o_reg4        CP    CD  recovery_rise_clk_rise
                            c     D = 0

report_dont_touch

Reports dont_touch information for design objects.

SYNTAX

string **report_dont_touch**
  [-all]
  [*cell_net_list*]

list *cell_net_list*

ARGUMENTS

-all

Reports for all dont_touch cells, and nets.

cell_net_list

Lists cells or nets to report. If you do not specify this or the **-all** option, a summary report will be printed, listing the total number of dont_touch cells and nets.

DESCRIPTION

Displays dont_touch information for cells and nets in the current design. For each dont_touch object, the reasons for the dont_touch status will be listed.

EXAMPLES

The following example shows a summary report:

```
prompt> report_dont_touch

Report : dont_touch
0 of 251 instances are dont_touch
4 of 275 nets are dont_touch
1
```

The following example shows a report for one cell that has had **set_dont_touch** applied to it:

```
prompt> report_dont_touch cell_3/ABO_CELL_19

Report : dont_touch

Instance cell_3/ABO_CELL_19 (ND2D1BWP)
 user
1 of 1 instances are dont_touch
0 of 0 instances are dont_touch
```

The following example lists all dont_touch objects and the reasons for the dont_touch status:

```
prompt> report_dont_touch -all

Report : dont_touch

Instance cell_3/ABO_CELL_19 (ND2D1BWP)
 user

1 of 251 instances are dont_touch
0 of 275 nets are dont_touch
1
```

SEE ALSO

set_dont_touch(2)
report_cell(2)

report_drc_errors

Writes out an error report of physical DRC errors from the specified error data. The **report_drc_error** command supports different reporting styles.

SYNTAX

status **report_drc_error**
-error_data *drc_error_data*
[-error_type *drc_error_types*]
[-layers *drc_error_layers*]
[-ignore_type *drc_error_types*]
[-ignore_layers *drc_error_layers*]
[-of_objects *drc_error_objects*]
[-report_type error_type | error_layer | detailed | matrix]
[-nosplit]

Data Types

drc_error_data collection
drc_error_types collection
drc_error_layers collection or string
drc_error_objects collection

ARGUMENTS

-error_data *drc_error_data*

Specifies the error data for finding objects.

-error_type *drc_error_types*

Reports errors within the specified *drc_error_types*. An error is included in the output if it matches any one of the *drc_error_types*. Use the **get_drc_error_types** command to specify *drc_error_types*.

-layers *drc_error_layers*

Reports errors within the specified *drc_error_layers*. An error is included in the output if it matches any one of the *drc_error_layers*. The command accepts strings or **[get_layers]** result as an argument to the **-layers** option.

-ignore_type *drc_error_types*

Reports errors exclude the specified *drc_error_types*. An error is excluded in the output if it matches any one of the *drc_error_types*. Use the **get_drc_error_types** command to specify *drc_error_types*.

-ignore_layers *drc_error_layers*

Reports errors exclude the specified *drc_error_layers*. An error is excluded in the output if it matches any one of the *drc_error_layers*. The command accepts strings or **[get_layers]** result as an argument to the **-layers** option.

-of_objects *drc_error_objects*

Reports errors with the specified *drc_error_objects*. In this case, the *drc_error_objects* are error instances. Use the **get_drc_errors** command to specify *drc_error_objects*.

-report_type error_type | error_layer | detailed | matrix

Writes out the specified report type. Three types are supported: *error_type*, *error_layer*, *detailed* and *matrix*. You can specify only one report type. By default, if no *report_type* is specified, the report type is *error_type*.

-nosplit

Write out the report without splitting long lines. Most of the design information is listed in fixed-width columns. If the information in a given field exceeds the column width, the next field begins on a new line, starting in the correct column. The **-nosplit** option prevents line splitting and facilitates writing software to extract information from the report output.

DESCRIPTION

The **report_drc_error** command prints a collection or summary of physical DRC errors in the specified error data that match certain criteria. The command returns true if any physical DRC errors match the criteria and successfully reported. If no objects match the criteria, the error status will be reported.

There are four types of report supported by the command: *error_type*, *error_layer*, *detailed* and \fmatrix. Use the **-report_type** option to specify the report type. The *error_type* report type writes out a summary of error information in type order. The *error_layer* report type writes out a summary of error information in layer order. The *detailed* report writes out each error instance information one-by-one. The information includes the ID, type, layer, number of errors in this type, description, status and bbox. The *matrix* report writes out a table format for all the error information.

The **-error_type** option filters the errors by the specified types. You can specify more than one **error_type** here by enclosing each error type in curly braces: *{{$errType1} {$errType2}}*

The **-layers** option filters the errors by the specified layers. You can specify more than one layer by enclosing each layer in curly braces: *{{$errLayer1} {$errLayer2}}*

The **-ignore_type** option filters out the errors by the specified types. You can specify more than one **error_type** here by enclosing each error type in curly braces: *{{$errType1} {$errType2}}*

The **-ignore_layers** option filters out the errors by the specified layers. You can specify more than one layer by enclosing each layer in curly braces: *{{$errLayer1} {$errLayer2}}*

The **-of_objects** option filters the errors by the specified error instances. Use the **get_drc_errors** command to specify the instances.

You can specify one or more filtering options to customize the report. If you specify *"Short"* and *"Net"* error type with *"METAL"* and *"METAL2"* layers, you can get errors with *"Short"* and *"METAL"*, with *"Short"* and *"METAL2"*, with *"Net"* and *"METAL"*, with *"Net"* and *"METAL2"*. If you specify the **-of_objects** option, the command writes out only the errors for the specified objects.

For long reports you do not want to write to the console, use the **redirect** command to write the output to a file.

EXAMPLES

The following example displays an error_type report of the errors with error type 'Net'.

```
prompt> set type [get_drc_error_types -error_data $data {Net}]
prompt> report_drc_error -error_data $data -error_type $type -report_type error_type

min_cell_number_in_cluster_value	int
min_displacement_threshold_for_cluster_value	float
max_displacement_threshold_for_cluster_value	float

ARGUMENTS

-type *type_list*

Specifies the types of additional data reported, aside from a global summary. Without this option, the command reports only the

global summary.

The valid values are one of "**cell_displacement**," "**estimated_cell_displacement**," "**net_length**," "**cluster**," and "**all**."

Specify "**cell_displacement**" to report the cell displacement. This report shows the original cell location, the current cell location, and the displacement. The original location is where cell is inserted or sized, but if the cell is placed by the **place_eco_cells** command, the original location is placement location before legalization. An asterisk after the displacement means that the cell is out of its connection boundary box.

Specify "**estimated_cell_displacement**" to identify ECO cells (newly added buffers, inverter pairs, sized cells) that would be ineffective to fix timing QoR and could have negative impact of timing QoR on non-ECO part of the design. To identify the targeted ECO cells to be reverted, we use placement resource feasibility analysis (PRFA) to check if an ECO cell could have placement resource legalized within a certain threshold specified by the **-min_estimated_displacement** option.

The reverting candidate ECO cells are ECO cells that could only have resource greater than or equal to the given threshold. The tool creates a collection called eco_estimated_large_displacement_cells for such ECO cells. For ECO cells in collection above, report the current cell location, the estimated cell location, and the displacement to the nearest unoccupied placement area. And report estimated cell displacement summary. The summary is irrelevant to the threshold.

It does not guarantee the location will be legal, so the prediction of placement is very optimistic. If the unoccupied placement area legalization were performed, the real displacement could be larger than the predicted displacement. User can decide to use **revert_eco_changes** to revert ECO cells with large displacement.

Specify "**net_length**" to report the lengths of individual nets affected by ECO changes, including the estimated route length, actual route length, and ratio of real to estimated route length.

Specify "**cluster**" to report cell clusters. The report shows cluster id and number of cells in this cluster.

Specify "**all**" to generate both the cell displacement and net length reports.

-min_displacement ***min_displacement_value***

Filters out cells whose displacements are less than a specified amount, in microns. This can be used only when "**cell_displacement**" or "**all**" is specified in the **-type** option. This option does not affect the global summary. The default is 5.0 times of site height.

-min_estimated_displacement ***min_estimated_displacement_value***

Specify a user-defined displacement threshold for estimated cell displacement. The option can only be used when "estimated_cell_displacement" or "all" is specified in the **-type** option. The default is infinity. If not specified, the collection eco_estimated_large_displacement_cells is empty but the estimated cell displacement summary is reported. This option does not affect the global summary and estimated cell displacement.

-min_net_length_ratio ***min_net_length_ratio_value***

Filters out individual nets whose length ratios are less than a specified number. This can be used only when "**net_length**" or "**all**" is specified in the **-type** option. This option does not affect the global summary. The default is 1.1, corresponding to a real-to-estimated length ratio of 110 percent.

-min_estimated_length ***min_estimated_length_value***

Filters out individual nets whose estimated lengths are less than a specified number of microns. This can be used only when "**net_length**" or "**all**" is specified in the **-type** option. It works together with the **-min_net_length_ratio** option to control the reporting of individual net lengths. This option does not affect the global summary.

-cells ***specified_cells***

Reports the cell displacement and individual net lengths only for the specified cells. This option can be used together with the other options.

-ignore_filler_references ***references***

Specify the references of filler cells which can be ignored when calculating estimated cell location by PRFA. Unfixed filler cells of the specified references will be ignored and the site spaces occupied by them are treated as free spaces by PRFA. Other filler cells that not of the specified references are still treated as normal cells and cannot not be ignored. The option can only be used when "estimated_cell_displacement" or "all" is specified in the **-type** option.

-min_estimated_routing_length_ratio ***ratio***

Specify the threshold for ratio of estimated routing length to optimal one, 1 by default if no specified. This options helps to predict and report ECO cells with estimated location out of driver-load bounding box. When specified, collect ECO cells which ratio is greater than the specified ratio. The tool creates a collection called eco_estimated_cells_outside_driver_load_bbox for such ECO cells. The option can only be used when "estimated_cell_displacement" or "all" is specified in the **-type** option.

-min_optimal_routing_length ***min_optimal_routing_length_value***

Specify the minimal optimal routing length from driver to load. The option can only be used with the **-min_estimated_routing_length_ratio** option. When specified, only if the optimal routing length for an ECO cell from its driver to load is greater than the specified minimal optimal routing length, the tool calculates the estimated routing length ratio and collects ECO cells which ratio is greater than the specified ratio as option **-min_estimated_routing_length_ratio** described. Otherwise, collect ECO cells which ratio is greater than the specified ratio. This option is to help you filter out the ECO cell which drive and load are too close to make the estimated routing length ratio large but actually the ECO cell is not far away from its driver-load bounding box.

-min_cluster_cell_distance ***min_cluster_cell_distance_value***

Specify min distance between cells in a cluster, this option can be only used when "cluster" is specified **-type**.

-min_cell_number_in_cluster ***min_cell_number_in_cluster_value***

Specify minimal number of cells in a cluster to report, this option can be only used when "cluster" is specified **-type**. The default value for this option is 2.

-min_displacement_threshold_for_cluster ***min_displacement_threshold_for_cluster_value***

Specify minimal displacement threshold for each cell in cluster, this option can be only used when "cluster" is specified **-type**. Number of cells in a cluster with displacement over this threshold will be reported.

-max_displacement_threshold_for_cluster ***max_displacement_threshold_for_cluster_value***

Specify maximal displacement threshold for each cell in cluster, this option can be only used when "cluster" is specified **-type**. Number of cells in a cluster with displacement over this threshold will be reported.

DESCRIPTION

This command reports the physical changes to the current design or to specified cells after an ECO change list has been applied. The generated report includes a global summary, and optionally, the individual cell displacements and changed net lengths.

In a report of cell displacements, the individual cells are sorted by amount of displacement, in descending order, in two groups: first the cells moved out of their connection boundary box (these are marked with an asterisk), followed by cells that remain inside their connection boundary box.

In a report of changed net lengths, the individual nets are sorted by real-to-estimated length ratios in descending order.

The following editing commands are supported in the change list. Changes caused by other ECO editing commands are not reported.

add_buffer
size_cell

add_buffer_on_route

It is recommended that you generate the ECO report after ECO legalization or ECO routing.

EXAMPLES

The following example generates a global summary report.

```
prompt> report_eco_physical_changes
****************************
Report : eco physical change
 ...

****************************
Summary
========
Cell Displacement
------------------------------------------------------------
Total eco cell number                  : 430
Max displacement                       : 20 micron
Avg  displacement                      : 5 micron
Cells outside connection bbox          : 10

eco net route length vs estimated length ratio
------------------------------------------------------------
Total eco net number                   : 400
Max ratio                              : 150%
Avg ratio                              : 120%
```

The following example generates a cell displacement report.

```
prompt> report_eco_physical_changes -type cell_displacement -min_displacement 5

(The global summary section is shown in the previous example)

Report cell location legalization displacement (meaningful after eco legalization):
============================================================
cell name      before legalization   after legalization  displacement(micron)
------------------------------------------------------------------------------
eco_cell_0     (82.64, 98.32)       (82.80, 108.96)     10.80 *
eco_cell       (99.14, 92.58)       (102.60, 97.76)     8.64
------------------------------------------------------------------------------
Total 2 cells reported.
Max displacement: 10.80 micron
Avg displacement: 9.74 micron
Min displacement threshold: 5.00 micron
Cells outside connection bbox (Marked by *): 1
```

The following example generates a report of individual net lengths.

```
prompt> report_eco_physical_changes -type net_length \
  -min_net_length_ratio 1.02 -min_estimated_length 10.23

(The global summary section is shown in the first example)
```

```
Report individual net index and name:
==============================

index                    name
-------------------------------------------------------
net_1                    UPC_DATA[2]
net_2                    eco_net
net_3                    UPC_DATA[10]
net_4                    eco_net_0
-------------------------------------------------------
Total 4 individual nets reported.

Report individual net length (meaningful after eco route):
==========================================

index      estimated(micron)    real(micron)      ratio(real/estimated)
-------------------------------------------------------------------------------
net_3      10.52                19.22             183.34%
net_1      30.09                36.27             121.50%
net_2      56.10                65.48             117.98%
net_4      34.22                35.21             103.31%
-------------------------------------------------------------------------------
Total 4 individual nets reported.
Max ratio: 183.34%
Avg ratio: 131.53%
Min ratio threshold: 102%
Min estimated length threshold: 10.23 micron
```

The following example reports estimated cell displacement.

```
prompt> set references [get_lib_cells {lib1/FILL1 lib1/FILL2}]
prompt> report_eco_physical_changes \
  -type estimated_cell_displacement -min_estimated_displacement 1 \
  -ignore_filler_references $references

Report estimated cell displacement to nearest free site:
=============================================================================================
cell name     current location       estimated location      displacement(micron)
---------------------------------------------------------------------------------
mult_26/U4751  (24.82, 21.94)        (32.88, 31.20)        12.28
mult_26/U4754  (23.08, 23.09)        (33.69, 23.14)        10.61
mult_26/U4753  (23.11, 21.36)        (30.27, 14.50)        9.92
mult_26/U4755  (24.57, 22.95)        (33.69, 23.14)        9.12
mult_26/U4752  (22.09, 23.23)        (27.21, 21.98)        5.27
---------------------------------------------------------------------------------
Total 5 eco cells may have large displacement (threshold 1.00 micron).
Note: You can use revert_eco_changes -cells to revert eco cells with large displacement.
Max displacement:                12.28 micron
Avg displacement:                9.44 micron
Std deviation:                   2.33 micron
Number of cell moved (estimated):          5 cells (out of 5 cells)

prompt> get_cells $eco_estimated_large_displacement_cells
```

The following example reports estimated cell displacement and collects ECO cells with estimated location outside the driver-load bounding box.

```
prompt> report_eco_physical_changes \
  -type estimated_cell_displacement -min_estimated_displacement 1 \
  -min_estimated_routing_length_ratio 5 \
  -min_optimal_routing_length 2.5
prompt> get_cells $eco_estimated_cells_outside_driver_load_bbox
```

The following example reports cell clusters.

```
prompt> report_eco_physical_changes \
  -type cluster -min_displacement_threshold_for_cluster 1 \
  -min_cell_number_in_cluster 5 \
  -min_cluster_cell_distance 2
```

```
Report cell cluster detail information:
========================================
eco_cluster_id        number of cells       number of cells > min displacement
                                            number of cells > max displacement
-------------------------------------------------------------------------------------------------------
eco_cluster_id 0      10                    3                    0
eco_cluster_id 1      6                     0                    0
eco_cluster_id 2      5                     0                    0
-------------------------------------------------------------------------------------------------------
Total number of clusters is 3, minimum number of cells in a cluster is 5,
minimum distance between two cells in a cluster is 2.
Note: You can use command like: get_cells -hier -filter "eco_cluster_id==1" to
get cell collection with attribute eco_cluster_id = 1.
```

report_eco_placement_net_weight

Report user specified net weight.

SYNTAX

status **report_eco_placement_net_weight**
[*-nets collection_of_net*]
[*-output file_name*]

Data Types

collection_of_net list or collection
file_name string

ARGUMENTS

-nets *collection_of_net*

Report net weight for given nets. The option *-nets* can not be used with *-output*. They are mutually exclusive. *Output format: "$n1 $w1".* If no option is used, the command reports all net weight setting.

-output *file_name*

Write out the internal net weight mapping table with the format below. User can load it when needed. *Output format: "set_eco_placement_net_weight -nets $n1 -weight $w1".*

DESCRIPTION

This command report user specified net weight setting. Please refer to the man page of place_eco_cells for the flow usage about user-defined net weight based coarse placement.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example reports all net weight setting.

```
prompt> report_eco_placement_net_weight
```

The following example reports specified net weight setting.

```
prompt> report_eco_placement_net_weight \
    -nets $netList
```

The following example writes out net weight setting with tcl format.

```
prompt> report_eco_placement_net_weight -output $file_name
```

SEE ALSO

place_eco_cells(2)
set_eco_placement_net_weight(2)

report_edit_groups

report_edit_groups

Reports edit groups in the current design.

SYNTAX

int **report_edit_groups**
[-verbose]
[-nosplit]
[-significant_digits *digits*]
[*edit_group_list*]

Data Types

digits int
edit_group_list list

ARGUMENTS

-verbose

Displays verbose edit group information.

-nosplit

Retains long lines and does not split lines if column overflows.

-significant_digits *digits*

Specifies the number of digits to the right of the decimal point to report. Allowed values are 0-13. The default is determined by the **shell.common.report_default_significant_digits** application option, whose default is 2. Use this option to override the default.

edit_group_list

Specifies a list of edit groups to report. The list can contain edit group names, patterns, or collections. A collection can be specified by using the **get_edit_groups** command.

DESCRIPTION

The **report_edit_groups** command generates a report about the edit groups in the design. The report includes the edit group name and a description of the edit group. If **-verbose** is specified, the report also includes additional attributes and a list of objects contained in the edit group.

If *edit_group_list* is specified, those edit groups are reported. If it is not specified, then all edit groups in the design are reported.

EXAMPLES

The following example reports all edit groups in the design.

```
prompt> report_edit_groups *
Edit Group        Description
---------------------------------------------------------------------------
EDIT_GROUP_1      Contains 5 objects   ungroup_on_remove: never
EDIT_GROUP_2      Contains 1 object    ungroup_on_remove: last
EDIT_GROUP_3      Contains 8 objects   ungroup_on_remove: second-to-last
1
```

The following example reports verbose information for the edit group named "EDIT_GROUP_1".

```
prompt> report_edit_groups -verbose EDIT_GROUP_1
Edit Group        Description
---------------------------------------------------------------------------
EDIT_GROUP_1      Contains 5 objects   ungroup_on_remove: never
            status:       unplaced
            in_edit_group:  false
            can_transform:  true
            objects:      blkg
                        I_ORCA_TOP/I_PARSER/U176
                        d0
                        mypgr
                        EDIT_GROUP_3

1
```

report_editability

Reports the hierarchical edit control of specified blocks.

SYNTAX

int **report_editability**
[-blocks *list_of_blocks*]
[-nosplit]

Data Types

list_of_blocks	string or collection

ARGUMENTS

-blocks *list_of_blocks*

The hierarchical edit control of specified blocks would be reported with respect to the current top-level context. If this option is not specified, the default behavior shall report the hierarchical editability of only the current_block.

-nosplit

Retains long lines and does not split lines if column overflows.

DESCRIPTION

This command reports the true/false value of hierarchical edit controls corresponding to each of the specified blocks. A true value means the block is editable and false value means the block is uneditable.

Returns an integer indicating number of reported blocks with hierarchical edit controls.

EXAMPLES

The following example reports the hierarchical edit control of a single block:

```
prompt> report_editability -blocks blk1
****************************************
Report : report_editability
```

```
Top Design: lib:top.design
Version: M-2016.12-SP4-BETA
Date   : Wed Feb  8 06:20:36 2017
****************************************
Block      Is_editable
--------------------------------------------------------------------------------
blk1       false
1
```

The following example reports the hierarchical edit control of multiple blocks:

```
prompt> report_editability -blocks [get_blocks {blk1 blk2 blk3}]
****************************************
Report : report_editability
Top Design: lib:top.design
Version: M-2016.12-SP4-BETA
Date   : Wed Feb  8 06:20:36 2017
****************************************
Block      Is_editable
--------------------------------------------------------------------------------
blk1       false
blk2       true
blk3       false
3
```

SEE ALSO

get_editability(2)
set_editability(2)

report_ems_database

Reports the messages of an EMS database as text messages onto the standard output.

SYNTAX

bool **report_ems_database**
[-name *ems_database_name*]

Data Types

ems_database_name string

ARGUMENTS

-name *ems_database_name*

Specifies the name of the EMS database, whose contents are to be reported.

DESCRIPTION

This command reports the messages of an EMS database onto standard output. If option **-name** is not provided then the messages of the **current** EMS database are reported. If **current** EMS database does not exist, then the command errors out.

Option **-name** takes name of an EMS database as the argument. If the EMS database exists, then EMS messages present in it are reported out as text messages. The EMS database name specified, needs to obey EMS database naming convention, such as: EMS database should have .ems suffix. For example, cts.ems, test.ems etc.

EXAMPLES

The following example shows reporting ems messages from both current EMS database and also from an EMS database on disk. Then two files generated are compared to show that they are identical.

```
prompt> create_ems_database abc.ems
{abc.ems}
prompt> check_mv_design
1
prompt> report_ems_database > check_mv_design_curr_ems.txt
```

```
1
prompt> save_ems_database
prompt> close_ems_databases
prompt> report_ems_database -name abc.ems > check_mv_design_disk_ems.txt
prompt> sh diff -s check_mv_design_curr_ems.txt  check_mv_design_disk_ems.txt
Files check_mv_design_curr_ems.txt and check_mv_design_disk_ems.txt are identical.
```

SEE ALSO

close_ems_databases(2)
save_ems_database(2)

report_ems_rules

Reports information about user-defined EMS rules.

SYNTAX

report_ems_rules
[pattern]
[-all]

Data Types

pattern Collection of EMS rules

ARGUMENTS

pattern

This is an optional argument.It can be the name of a rule or a pattern capturing names of multiple rules or a collection of EMS rules. EMS rules by given name or matching given pattern or part of collection, should be already available in EMS memory; otherwise the command will fail with an error message. Option -all and argument "pattern" are mutually exclusive.

-all

This is an optional option. This is mutually exclusive with argument "pattern". This option reports information related to all user-defined rules in current EMS memory. This is also the default behavior of the command, when run without any options or arguments.

DESCRIPTION

Command **report_ems_rules** reports information related to one or more user-defined EMS rules. The information related to rule reported is name, severity, message and parameters.

EXAMPLES

```
prompt> create_ems_rule -name "TEMP-001" -severity "Info" -message "Pin:%pin has capacitance:%cap"
prompt> edit_ems_rule -name "TEMP-001" -parameters "name:pin type:string command:get_pins"
prompt> edit_ems_rule -name "TEMP-001" -parameters "name:cap type:double"
```

```
prompt> create_ems_rule -name "TMP-002" -severity "Error" -message "Cell %cell is not placed"
prompt> edit_ems_rule -name "TMP-002" -severity "Info"
prompt> edit_ems_rule -name "TMP-002" -message "The Cell %cell is not placed."
prompt> edit_ems_rule -name "TMP-002"-parameters "name:cell type:string command:get_cells"
prompt> report_ems_rules TEMP.*

Rule: TEMP-001
  Severity: Info
  Message: Pin:%pin has capacitance:%cap
  Parameter name: cap type: double command: NA
  Parameter name: pin type: string command: get_pins
prompt> report_ems_rules

Rule: TEMP-001
  Severity: Info
  Message: Pin:%pin has capacitance:%cap
  Parameter name: cap type: double command: NA
  Parameter name: pin type: string command: get_pins

Rule: TMP-002
  Severity: Info
  Message: The Cell %cell is not placed.
  Parameter name: cell type: string command: get_cells
```

SEE ALSO

create_ems_rule(2)
report_ems_rules(2)

report_essential_points

Reports the essential points that influence a specified set of objects.

SYNTAX

int **report_essential_points**
[*object_list*]
[-modes *mode_list*]
[-corners *corner_list*]
[-scenarios *scenario_list*]
[-list_scis]

Data Types

object_list list
mode_list list
corner_list list
scenario_list list

ARGUMENTS

-objects *object_list*

List of objects - pins/ports/nets/cells - for which to report the activity influencing essential points. For a net, we consider any essential point in its fanin. For pins/ports, we consider any essential point in the fanin; if the pin/port happens to be an essential point, we report/apply activity for the pin/port itself. For cells, we consider any essential point that is in the fanin of its input pins.

-modes *mode_list*

Specifies the mode filter on the set of scenarios to be considered. A scenario is considered if its mode is present in *mode_list*. If this option is not specified, no filtering on modes occurs.

-corners *corner_list*

Specifies the corner filter on the set of scenarios to be considered. A scenario is considered if its corner is present in *corner_list*. If this option is not specified, no filtering occurs on corners.

-scenarios *scenario_list*

Specifies the scenarios to be considered. If this option is not specified, then only those scenarios are considered which contain the modes and corners specified through **-modes** and **-corners** options. Output of the command is generated separately for each scenario. If none of the **-modes**, **-corners**, or **-scenarios** options is specified, the command reports for the current scenario in the design.

-list_scis

Reports detailed information for each SCI (Special Control Input pins, such as clock pins, set/reset pins, scan enables, isolation cell control pins, power switch control pins etc) in the fanout of each selected essential point.

DESCRIPTION

This command takes a set of objects and for each specified scenario, generates a report of the essential points that influence these objects. To filter for scenarios, the *-modes*, *-corners* and *-scenarios* options can be used. The *-list_scis* option provides detailed information on the SCIs in the fanout of the reported essential points.

EXAMPLES

The following example shows the report generated by the **report_essential_points** command.

```
prompt> report_essential_points [get_nets {test_in1 clksel}]
Information: Activity for scenario scenario1 was cached, no propagation required. (POW-005)
****************************************
Report : report_essential_points
Design : ChipTop
Version: O-2018.06-SP2-BETA
Date   : Wed Jun 20 02:53:00 2018
****************************************
Inferring activity for the scenario: scenario1
Mode        : func
Corner      : max_corner
Time Unit   : 1ns

```

SEE ALSO

infer_switching_activity(2)
get_essential_points(2)
report_switching_activity(2)
report_activity(2)

report_exceptions

Generates a report of timing exceptions.

SYNTAX

```
status report_exceptions
  [-from from_list
    | -rise_from rise_from_list
    | -fall_from fall_from_list]
  [-through through_list]*
  [-rise_through rise_through_list]*
  [-fall_through fall_through_list]*
  [-to to_list
    | -rise_to rise_to_list
    | -fall_to fall_to_list]
  [-ignored]
  [-dominant]
  [-nosplit]
```

Data Types

from_list	list
rise_from_list	list
fall_from_list	list
through_list	list
rise_through_list	list
fall_through_list	list
to_list	list
rise_to_list	list
fall_to_list	list

ARGUMENTS

Note: Options marked with asterisks (*) in the SYNTAX can be used multiple times in the same command.

-from *from_list*

Specifies a list of clocks, ports, cells, and pins in the current mode. The report includes only exceptions that have the specified objects in the *from_list*. This option limits the report to information that was set using a path-based command (for example, **set_multicycle_path**) with the **-from** option. The **-from**, **-rise_from**, and **-fall_from** options are mutually exclusive.

-rise_from *rise_from_list*

Same as the **-from** option, except that the path must rise from the objects specified. If a clock object is specified, this option selects startpoints clocked by the named clock, but only the paths launched by rising edge of the clock at the clock source, taking

into account any logical inversions along the clock path. You can use only one of **-from**, **-rise_from**, and **-fall_from**.

-fall_from ***fall_from_list***

Same as the **-from** option, except that the path must fall from the objects specified. If a clock object is specified, this option selects startpoints clocked by the named clock, but only the paths launched by falling edge of the clock at the clock source, taking into account any logical inversions along the clock path. You can use only one of **-from**, **-rise_from**, and **-fall_from**.

-through ***through_list***

Specifies a list of pins or ports. The report includes only paths that go through the pins or ports in *through_list*. This option limits the report to information that was set using a path-based command (for example, **set_multicycle_path**) with the **-through** option. You can use this option multiple times in the same command.

-rise_through ***rise_through_list***

Specifies a list of pins or ports (the same as the **-through** option) except that the paths must have a rising transition at the through points. You can use this option multiple times in the same command.

-fall_through ***fall_through_list***

Specifies a list of pins or ports (the same as the **-through** option) except that the paths must have a falling transition at the through points. You can use this option multiple times in the same command.

-to ***to_list***

Specifies a list of clocks, ports, cells, and pins in the current mode. The report includes only paths that end at the objects in the *to_list* objects. Using this option limits the report to information that was set by using a path-based command (for example, **set_multicycle_path**) with the **-to** option. The **-to**, **-rise_to**, and **-fall_to** options are mutually exclusive.

-rise_to ***rise_to_list***

Same as the **-to** option, but applies only to paths rising at the endpoint. If a clock object is specified, this option selects endpoints clocked by the named clock, but only the paths captured by rising edge of the clock at clock source, taking into account any logical inversions along the clock path. You can use only one of **-to**, **-rise_to**, and **-fall_to**.

-fall_to ***fall_to_list***

Same as the **-to** option,but applies only to paths falling at the endpoint. If a clock object is specified, this option selects endpoints clocked by the named clock, but only the paths launched by falling edge of the clock at the clock source, taking into account any logical inversions along the clock path. You can use only one of **-to**, **-rise_to**, and **-fall_to**.

-ignored

Lists path timing exceptions that are set on the current mode, but are completely ignored. For example, a false path might be specified from port A to port Z1, but if there is no timing path between those points, the path is ignored. Use **-from** or **-to** to limit the report to certain paths.

-dominant

Lists path timing exceptions that are set on the current mode and are dominant for at least one path. This option can be used with the **-ignored** option to see all exceptions. If neither the **-ignored** or **-dominant** option are given all exceptions are printed whether they affect the paths or not.

-nosplit

Retain long lines, even if they are longer than 80 columns. This is most useful for doing diffs on previous scripts, or for post-processing the script.

DESCRIPTION

This command writes a report showing information about timing exceptions for the current mode. A timing exception is considered dominant if it alters the constraints of a path. If path constraints are different in the absence of a timing exception, the exception alters or dominants the path constraint.

The **report_exceptions** command attempts to identify the reasons an exception is ignored, and classifies these into one of the following: invalid startpoints, invalid endpoints, non-existent paths, or overridden paths. This is reported as separate sections of the report. When **-ignored** is used, the sections show why an exception was ignored.

If a path is unconstrained (that is, if it has a required time of infinity), timing exceptions do not change the path constraints. Applying a timing exception to an unconstrained path does not change the path constraint. A path is unconstrained if it has an infinite required time.

To remove timing exceptions from specified paths, use **reset_path**. **reset_design** removes all attributes from the design, including timing exceptions.

To report only those exceptions that are dominant, use the **-dominant** option. If neither the **-ignored** or **-dominant** option are specified, then all exceptions matching the **-from**, **-through**, or **-to** options are reported and not categorized into ignored and dominant sections.

Multicorner-Multimode Support

This command works only on the current mode.

EXAMPLES

The following example lists all timing exceptions set in the current mode.

```
prompt> report_exceptions

****************************************
Report : exceptions
 ...

****************************************

#  e8.tcl, line 9; e8.tcl, line 10
set_multicycle_path 2  -hold -from [get_clocks {clk1}] -to [get_clocks {clk2}]
set_multicycle_path 5  -setup -from [get_clocks {clk1}] -to [get_clocks {clk2}]

#  e8.tcl, line 11
set_false_path -from [get_clocks {clk1}] -to [get_clocks {clk2}]

#  e8.tcl, line 13
set_multicycle_path 2 -through [get_pins {t/Z}]

#  e8.tcl, line 14
set_false_path -through [get_pins {t/A}]

#  e8.tcl, line 16
set_multicycle_path 2 -through [get_pins {u/Z}] -through [get_pins {u/B}]
```

```
#  e8.tcl, line 21
set_false_path -through [get_pins {t/Z}]
```

The following example lists all ignored timing exceptions set in the current mode.

```
prompt> report_exceptions -ignored

****************************************
Report : exceptions
Scenario: default
 ...

****************************************

###############################################################################
## Redundant exceptions (totally overridden by other exceptions):

#  e8.tcl, line 9; e8.tcl, line 10
set_multicycle_path 2  -hold -from [get_clocks {clk1}] -to [get_clocks {clk2}]
set_multicycle_path 5  -setup -from [get_clocks {clk1}] -to [get_clocks {clk2}]

###############################################################################
## Exceptions that do not cover any constrained paths:

#  e8.tcl, line 16
set_multicycle_path 2 -through [get_pins {u/Z}] -through [get_pins {u/B}]

###############################################################################
## Exceptions with no valid -from objects:

#  e8.tcl, line 24
set_false_path -from [get_pins {u/B}]
```

The following example lists all dominant timing exceptions set in the current mode.

```
prompt> report_exceptions -dominant

****************************************
Report : exceptions
Design : counter
Scenario: default
 ...

****************************************

###############################################################################
## Exceptions that are dominant for at least one path:

#  e8.tcl, line 11
set_false_path -from [get_clocks {clk1}] -to [get_clocks {clk2}]

#  e8.tcl, line 13
set_multicycle_path 2 -through [get_pins {t/Z}]

#  e8.tcl, line 14
set_false_path -through [get_pins {t/A}]
```

report_extraction_options

Report parasitic extraction options

SYNTAX

string **report_extraction_options**
[-corners]
[-all]

Data Types

list *corners*

ARGUMENTS

-corners

report parasitic extraction options of list of constraint corners

-all

report all parasitic extraction options including default values

DESCRIPTION

Report parasitic extraction options used by rc extraction. By default, it will report user defined extraction options of all constraint corners.

Multicorner-Multimode Support

EXAMPLES

In the following example, the command will print extraction option of current corner

prompt> **report_extraction_options -corners [current_corner]**
1

SEE ALSO

set_parasitic_parameters(2)
report_parasitic_parameters(2)

report_feedthroughs

Creates a report of all feedthrough nets, including the blocks and pins that the nets pass through.

SYNTAX

status **report_feedthroughs**
[-nets *nets*]
[-include_original_feedthroughs]
[-file_name_prefix *prefix_string*]
[-include_buffered]
[-self]
-reporting_style {net_based block_based}

Data Types

nets collection
prefix_string string

ARGUMENTS

-nets *nets*

Specifies the nets for which to report feedthrough pins. For a specified net, the command reports the feedthrough pins that are on the physical net and also within the boundaries of the cell the net belongs to (including the cells in lower hierarchy within the cell). By default, the command reports feedthroughs for all nets.

-include_original_feedthroughs

Reports both the original feedthrough pin and the feedthrough pin inserted by the **place_pins** or **push_down_objects** command. An original feedthrough is any port in a block that is currently on a feedthrough net in the block (where there are 2 or more ports on the net) where that port was not created by any design-planning command (**place_pins** or **push_down_objects**). An original feedthrough port could exist on a pure feedthrough (no logic involved) where 2 or more ports existed because they were included in the Verilog netlist. An original feedthrough port could also exist on a mixed feedthrough net, in which case one of the feedthrough ports on the now feedthrough net was an original port, and the rest were all added by a hierarchical design planning command.

-file_name_prefix *prefix_string*

Prefixes the output file name with *prefix_string*. This option can be used together with the **-reporting_style {block_based}** option to create a common prefix for the individual feedthrough reports. If this option is not specified, the command does not insert a prefix string into the report file name.

-include_buffered

Skips over repeaters and buffers, include buffered feedthroughs when reporting. Without this option, buffered feedthroughs will

be skipped by default.

-self

Reports only current top-level feedthroughs. Without this option, the command reports feedthroughs in all planning-enabled blocks.

-reporting_style ***{net_based block_based}***

Specifies the type of feedthrough report to generate. The **-reporting_style net_based** option generates a single file that contains feedthrough net and block information for all feedthroughs. The **-reporting_style block_based** option generates one file for each block, and each file contains a list of feedthroughs for the block. Default style is **block_based**.

DESCRIPTION

This command reports feedthrough nets and associated block pins for feedthroughs in the design. By default, the command reports all feedthrough nets and pins inserted by the **place_pins** command, but does not include original pins.

By default, the command looks for and reports feedthroughs at multiple levels of physical hierarchy (MPH support).The **set_editability** command can be used to enable/disable reporting on individual reference-blocks or levels of physical hierarchy. For net constraint, the command reports feedthroughs on all nets that originate/begin in an enabled instance/block.

This command supports two types of reports: 1) a net_based report which writes all nets and corresponding block pins to a single file and 2) a block_based report which writes out a separate file for each block with feedthrough pins.

If you specify the **-include_original_feedthroughs** option, the command reports all feedthroughs. To report feedthroughs for only a subset of nets in the design, use the **-nets** option to specify a collection of nets.

Use the **-include_original_feedthroughs** option to include feedthrough nets and pins from the original netlist, in addition to feedthrough nets and pins added by the **place_pins** command. This option is off by default.

The **-file_name_prefix prefix_string** can be used to customize the output file names by prefixing the file name with the specified *prefix_string*. The command inserts a period (.) after the prefix string when creating the file name. This option is off by default. When you specify this option, the command issues a message if the file exists and overwrites the file.

The **-reporting_style** option is a required argument, which consists of 2 choices: *net_based* and *block_based*. **You must choose at least one of these or the command issues a warning message and exits**.

The *net_based* style writes out a single file named *prefix_string*.feedthrough_nets which includes all nets with feedthrough pins. Each feedthrough net record contains a net name and one or more block port names. The feedthrough record is enclosed with curly braces {}.

The *block_based* style writes a single file for each block that contains feedthrough pins. The file name convention is *prefix_string.block_instance_name*.feedthrough_ports, and includes all feedthrough pins that are on the block instance. If the block instance name contains forward slashes (because the path name includes slashes), the forward slashes are replaced with underscore (_) characters to avoid creating unwanted directories.

EXAMPLES

The following example reports feedthrough nets and pins on all nets, and reports using both net_based and block_based styles:

```
prompt> report_feedthroughs -include_original_feedthroughs \
```

-reporting_style {net_based block_based}

The following example reports inserted feedthrough nets and pins on net rstn and reports using the net_based style:

prompt> **report_feedthroughs -reporting_style {net_based} -nets [get_nets rstn]**

report_first_track_line

Report the name of the track, offset value relative to core area or block boundary and mask constraint of the first trackline for a specified layer and direction of tracks.

SYNTAX

int **report_first_track_line**
-layer *layer*
-dir X | Y
[-relative_to core_area | block_boundary]

Data Types

digits int
layer string

ARGUMENTS

-layer *layer*

Specifies the routing layer to fetch the routing tracks. You can use layer name, layer number, or a collection containing one layer object.

-dir X | Y

Specifies the direction of routing tracks which will be considered for reporting first trackline. The valid values are **X** and **Y**; specify either.

-relative_to core_area | block_boundary

Specifies whether details of first trackline will be reported with respect to core area or block boundary. The valid values are **core_area** and **block_boundary**; specify either. The default is to report first trackline relative to core area.

DESCRIPTION

This command reports name of the track, offset value of first trackline and mask constraint of first trackline relative to core area or block boundary for a specified layer and direction of tracks. For calculation, lower left of core area or block boundary bounding box will be considered.

EXAMPLES

The following example reports detail of first trackline.

```
prompt> report_first_track_line -layer M1 -dir Y
Track name:                  TRACK_1
Track line relative to core_area: 0.0000
Track line mask:              mask_one
1
prompt> report_first_track_line -layer M2 -dir X -relative_to core_area
Track name:                  TRACK_2
Track line relative to core_area: 0.0200
Track line mask:              no_mask
1
prompt> report_first_track_line -layer M1 -dir X -relative_to block_boundary
Track name:                  TRACK_1
Track line relative to block_boundary: 0.0240
Track line mask:              mask_one
1
prompt> report_first_track_line -layer M1 -dir Y
No track line exists as per search criteria
1
```

report_floorplan_rules

Reports the floorplan rules in the design.

SYNTAX

status **report_floorplan_rules**
[-object_types *type_list*]
[-lib_cells *lib_cells*]
[*rule_list*]

Data Types

type_list list
lib_cells collection
rule_list list

ARGUMENTS

-object_types *type_list*

Specifies the list of object types for which some floorplan rules are defined. Floorplan rules that have specified object types in their *-from_object_types* or *-to_object_types* or *-object_types* will be reported. Valid values for this option are *block_boundary*, *core_area*, *hard_macro*, *placement_blockage*, *routing_blockage*, *shape*, *soft_macro* and *std_cell_area*. This option is mutually exclusive with *rule_list*.

-lib_cells *lib_cells*

Specifies the collection of library cells for which some floorplan rules are defined. Floorplan rules that have specified library cells in their *-from_lib_cells* or *-to_lib_cells* or *-lib_cells* options are reported. This option is mutually exclusive with the *rule_list* option.

rule_list

Specifies the list of floorplan rule names to report. This option is mutually exclusive with the *-object_types* and *-lib_cells* options.

DESCRIPTION

The **report_floorplan_rules** command generates a report of existing floorplan rules in a design based on specified input parameters. For a matching floorplan rule, the command reports all applicable parameters of that rule in a tabular format. It will not report those parameters that are not applicable for that rule. On successful reporting the command returns a status of 1.

The *rule_list* option is mutually exclusive with other options *-object_types* and *-lib_cells*. If a named rule in *rule_list* does not exist or

no rule exists for the specified object types or library cells, the tool issues a warning message.

EXAMPLES

The following example tries to report two floorplan rules named e2 and ab out of which ab does not exist.

```
prompt> report_floorplan_rules {e2 ab}

Warning: Floorplan rule 'ab' does not exist.
****************************************
Report : report_floorplan_rules

report_frame_properties

Reports the frame view properties previously extracted and annotated by the **create_frame** command.

SYNTAX

status **report_frame_properties**
-library *library_name*
-output *file_name*
[-block *block_name*]
[-implant_width true | false]
[-diffusion_width_height true | false]
[-source_drain_annotation true | false]

Data Types

lib_name string
file_name string
block_name string

ARGUMENTS

-library *library_name*

Specifies name of the library containing the frame views.

-output *file_name*

Writes the report to the specified file.

-block *block_name*

Specifies the name of the frame block from which to report the properties, with the ".frame" extension. If this option is omitted, report the properties from all frame blocks in the specified library.

-implant_width *true* | *false*

Reports the implant width property. The value is true by default.

-diffusion_width_height *true* | *false*

Reports the diffusion width/height property. The value is true by default.

-source_drain_annotation *true* | *false*

Reports source-drain annotation property. The value is true by default.

If you omit all three property type options from the command, it reports all three properties.

DESCRIPTION

This command reports the properties previously extracted by the **create_frame** command and annotated on the frame views in a specified library. You must specify the library to be reported. To report a specific frame view in the library, use -block for the block name. If no -block option specified, reports all blocks frame view in the library.

You can set any one or more of the options **-implant_width**, **-diffusion_width_height**, and **-source_drain_annotation** to **false** to turn off their respective reports, or omit any of the three options from the command to report the property respectively.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following command reports the properties of the "OAI" block in the "io" library:

```
prompt> report_frame_properties -library io -block OAI.frame

****************************************
Report : frame properties
Library: io
 ...
*************************
Design : OAI
*************************
 Total number of row: 1.

***** implant_width property *****
    ---------------------------------------------------
    Position              Layer          Width
    ---------------------------------------------------
    Row(1) Lower-left     VTL_N(10)      1.6000
    Row(1) Upper-left     VTL_P(11)      1.6000
    Row(1) Lower-right    VTL_N(10)      1.6000
    Row(1) Upper-right    VTL_P(11)      1.6000

***** diffusion_width_height property *****
    ---------------------------------------------------
    Position              Width          Height
    ---------------------------------------------------
    Row(1) Lower-left     0.2000         0.1100
    Row(1) Upper-left     0.2000         0.1100
    Row(1) Lower-right    0.2000         0.1100
    Row(1) Upper-right    0.2000         0.1100

***** source_drain annotation ******
    ----------------------------------------
    Position                annotation
    ----------------------------------------
```

```
    Row(1) Lower-left       Source
    Row(1) Upper-left       Source
    Row(1) Lower-right      Drain
    Row(1) Upper-right      Drain
```

If no properties were previously annotated on the frame view by the **create_frame** command, the report looks like this:

```
***** implant_width property *****
    No implant width property on this block.

***** diffusion_width_height property *****
    No diffusion width height property on this block.

***** source_drain annotation ******
    No source drain annotation on this block.
```

SEE ALSO

create_frame(2)

report_freeze_ports

Reports on the **freeze_clock_ports** and **freeze_data_ports** attributes on cells which prevent synthesis from modifying their port signature during optimization.

SYNTAX

string **report_freeze_ports** [-all] [*cell_list*]

list *cell_list*

ARGUMENTS

-all

When given, all cells with either clock or data port-freeze specifications is listed.

cell_list

Specifies a list of cells on which to report the **freeze_clock_ports** and **freeze_data_ports** attributes.

DESCRIPTION

Reports on the **freeze_clock_ports** and **freeze_data_ports** attributes on cells in the current design which prevent these cells from having ports of the given class added or removed during optimization.

EXAMPLES

The following command reports on the freeze_ports settings of the "block1" and "analog1" cells for use during synthesis.

```
prompt> report_freeze_ports -data [get_cells {block1 analog1}]
Corner default:
  0 process number, 0 process label, 0 voltage, and 0 temperature mismatches.
  0 cells affected for early, 0 for late.
  0 voltage and 0 temperature extrapolations.

Report : freeze_ports

Instance u_block1 (block1)
```

```
 data clock

Instance u_analog1 (analog1)
 data clock
2 of 24 instances are freeze_ports
1

1
```

SEE ALSO

get_attribute(2)

report_fsm

Report failsafe FSM related information. By default it would be: Header Design:FSM, Encoding, State Vector(bus name), Attribute

SYNTAX

string **report_fsm**
[-all]
[-design *module*]
[-verbose]
[-show_error_states]
[-state_transitions]

module *string*

ARGUMENTS

-all

If -all is provided, print all available FSM modules in design. It will overwrite -design option.

-design *string*

If module name is provided with -design, report information on the module. Either -all or -design needs to be provided.

-verbose

Print additional following messages. Design: Name of the module the FSM is identified in; FSM Name: Name of the FSM; Filename: Corresponding filename and FSM line number; Clock: Name of the signal connected to the SEQGEN clock pins; Async Reset: Name of the signal(s) connected to the SEQGEN async reset pins. Put "unspecified" if there isn't any; Encoding: Number of bits in the identified state register and show current encoding style; State Vector: List of register names in order of the state vector including state bits and parity bits; Synchronizer: Name for synchronizer used in Hamming2; FSM_COMPLETE: True / False (could the RTL or TCL setting); Re-Encoding: If re-encoding is set either from RTL or TCL, display the target(h2/h3); otherwise, None; State Encodings: show enumerated state names and state encodings (show parity bits also if FSM is encoded); Default Next State: Show the name of the default next state per the names in the State Encodings section; Default States: Print states that is not in state vector if FSM is not fully enumerated; Tool Inferred Error: Show all other possible states that are illegal under the current encoding;

-show_error_states

Optional flag to show illegal encoding and behavior. In case of hamming2/hamming3, show state name, current encoding, original encoding and all possible 1-bit error for each enumerated state.

-state_transitions

Print all possible state vector transitions.

attributes

fc - FSM_COMPLETE
h2 - Hamming2 reencoding
h3 - Hamming3 reencoding
notfusa - Not fully enumerated & no fsm_complete

DESCRIPTION

The command **report_fsm** can be run throughout the Synopsys Automotive Flow and reports failsafe FSM related information.

EXAMPLES

The following are examples of the textual report generated by **report_fsm**:

```
prompt> report_fsm
FSM_RTL:state   hamming2    state_reg[2:0]    fc, h2

prompt> report_fsm -verbose
Design    : FSM_RTL
FSM Name  : state
Filename  :
Clock   : clk
Async Set : unspecified
Async Reset : r
Current Encoding(length / style): 3 / hamming2
State Vector  : { state_reg[0] state_reg[1] state_reg[2] }
Synchronizer Register :
FSM_COMPLETE    : True
Re-Encoding   : hamming2
State Encodings and Order
fsm_state_0   : 1001
fsm_state_1   : 0000
fsm_state_2   : 1111
fsm_state_3   : 1010
fsm_state_4   : 0101
fsm_state_5   : 0011
Default Next State  : fsm_state_5

Tool Inferred States (Mapping: State Encoding)
Default States  : 0110, 1100
Tool Inferred Error : 0001, 0010, 0100, 0111, 1000, 1011, 1101, 1110

prompt> report_fsm -show_error_states
FSM_RTL:state   hamming2    state_reg[2:0]    fc, h2
State Encodings and Order (Original Encoding) (Error Encoding):
fsm_state_0 : 1001  (100)   (0001, 1101, 1011, 1000)
fsm_state_1 : 0000  (000)   (1000, 0100, 0010, 0001)
fsm_state_2 : 1111  (111)   (0111, 1011, 1101, 1110)
fsm_state_3 : 1010  (101)   (0010, 1110, 1000, 1011)
```

```
fsm_state_4 : 0101  (010)   (1101, 0001, 0111, 0100)
fsm_state_5 : 0011  (001)   (1011, 0111, 0001, 0010)
```

SEE ALSO

report_global_timing

Reports a top-level summary of the design timing.

SYNTAX

status **report_global_timing**
[-delay_type max | min]
[-groups *group_list*]
[-include *include_list*]
[-format *format_spec*]
[-output *file_name*]
[-separate_non_standard_groups]
[-separate_all_groups]
[-modes *mode_list*]
[-corners *corner_list*]
[-scenarios *scenario_list*]
[-significant_digits *digits*]
[-pba_mode none | path | exhaustive]

Data Types

group_list	list
include_list	list
format_spec	string
file_name	string
mode_list	list
corner_list	list
scenario_list	list
digits	integer

ARGUMENTS

-delay_type max | min

Specifies the type of timing delays for which violations are to be reported. By default, both setup (max) or hold (min) violations are reported.

-groups *group_list*

Reports only the specified path groups.

-include *include_list*

Specifies a list of additional reporting options. *include_list* is a list that includes one or more of the following reporting options.

- **inter_clock** - Shows the breakdown of violations for combinations of launching and capturing clocks.
- **non_violated** - Shows clock combinations that have no violations. By default, only the worst violating timing path to each endpoint is considered in the report.
- **per_clock_violations** - Takes into account other paths to the same endpoint differentiated by launching, capturing clocks and path groups.
- **scenario_details** - In multi-scenario analysis, shows the breakdown of violations shown in the merged report by scenario.

-format *format_spec*

Specifies the reporting format. *format_spec* follows the format {[narrow | wide] [csv]} The following values are allowed:

- **narrow** (default) - Generates a narrow report.
- **wide** - Generates a wide report.
- **csv** - Generates a CSV report. When using this option, specify the output file name with the **-output** option.

-output *file_name*

Specifies the output file name for CSV report.

-separate_non_standard_groups

Divides the report into subreports separating data for standard path groups and for the following nonstandard path groups: **default**, **async_default**, **clock_gating_default**.

-separate_all_groups

Divides the report into subreports showing data for all path groups which have violations separately.

-modes *mode_list*

Specifies the modes to be used when generating the report. Data from each active scenario of the modes specified by the **-modes** option and the corners specified by the **-corners** option will be included in the report. If this option is not given, the report will include data from scenarios of all modes. If none of the **-modes**, **-corners**, or **-scenarios** options are given, the report will include data from every active scenario of the design. It is an error to give this option with the **-scenarios** option.

-corners *corner_list*

Specifies the corners to be used when generating the report. Data from each active scenario of the modes specified by the **-modes** option and the corners specified by the **-corners** option will be included in the report. If this option is not given, the report will include data from each scenario that is active with the specified mode(s). It is an error to give this option with the **-scenarios** option.

-scenarios *scenario_list*

Specifies the scenarios to be used when generating the report. Data from each of the specified scenarios is included in the report. It is an error to give this option with the **-modes** or the **-corners** options. If none of the **-modes**, **-corners**, or **-scenarios** options are specified, the report will include data from every scenario of the design.

-significant_digits digits

Specifies the number of reported digits to the right of the decimal point. Allowed values are 0-13. If you do not use this option, the number of digits is specified by the **shell.common.report_default_significant_digits** application option, which defaults to 2. Use this option if you want to override the default.

-pba_mode none | path | exhaustive

Controls path-based analysis with the following modes:

- **none** (the default) - Path-based analysis is not applied.
- **path** - Path-based analysis is applied over the paths that gave the worst graph-based analysis violation. There is no guarantee that the reported path-based analysis slack over every endpoint is the worst one.
- **exhaustive** - An exhaustive path-based analysis path search algorithm is applied to determine the worst path-based analysis slack violations.

DESCRIPTION

The **report_global_timing** command generates a top-level summary of the timing for the design. The report shows the worst negative slack per endpoint, the sum of all worst negative slacks per endpoint, and a number of violating endpoints. By default, each violating endpoint is only counted one time and only one worst slack at each violating endpoint contributes to TNS and WNS. With the **-groups** option, each endpoint contributes to the worst negative slack and total negative slack of each group in which it has a violating slack.

The summary information is broken down into several columns, showing violations for register-to-register, input-to-register, input-to-output, and register-to-output timing paths. WNS doesn't report the worst slack for each category, it reports the worst slack per endpoint and categorize those worst slacks by reg2reg, in2reg, reg2out and in2out. This behavior aligns with PT report.

Multicorner-Multimode Support

EXAMPLES

The following example generates a report of violations in the current design for path groups whose name starts with 'clk'.

```
prompt> report_global_timing -groups [get_path_group CLK*]
****************************************
Report : global_timing
        -groups CLK1 CLK0
 ...
****************************************

Setup violations
-------------------------------------------------------------
        Total  reg->reg   in->reg  reg->out   in->out
-------------------------------------------------------------
WNS     -20.34    -20.34      0.00     -1.19     -0.98
TNS   -6887.98  -6882.84      0.00     -3.17     -1.96
NUM       398       392         0         4         2
-------------------------------------------------------------

Hold violations
-------------------------------------------------------------
        Total  reg->reg   in->reg  reg->out   in->out
-------------------------------------------------------------
WNS      -3.55     -3.55      0.00      0.00      0.00
TNS    -561.17   -561.17      0.00      0.00      0.00
NUM       418       418         0         0         0
-------------------------------------------------------------
```

The second example shows a (truncated) report subdivided into subreports for all launching clock and capturing clock combinations. Each subreport shows a C2C line identifying the clock combination. The launching clock name is shown first, followed by '->' and the name of the capturing clock. The symbol "*" means any clock.

```
prompt> report_global_timing -include {inter_clock}
****************************************
Report : global_timing
        -include {inter_clock}
 ...
****************************************

Setup violations
------------------------------------------------------------
         Total  reg->reg   in->reg  reg->out   in->out
------------------------------------------------------------
C2C * -> *
WNS     -26.57    -26.57      0.00     -1.72     -0.98
TNS  -33377.09 -33369.93      0.00     -5.19     -1.96
NUM       1958      1950         0         6         2
------------------------------------------------------------
C2C * -> CLK0
WNS     -20.34    -20.34      0.00     -1.19     -0.98
TNS   -6889.55  -6884.41      0.00     -3.17     -1.96
NUM        403       397         0         4         2
------------------------------------------------------------
C2C CLK0 -> CLK0
WNS     -20.34    -20.34      0.00      0.00      0.00
TNS   -6884.25  -6884.25      0.00      0.00      0.00
NUM        396       396         0         0         0
------------------------------------------------------------
C2C AUDIO_SCLK_IN -> CLK0
WNS      -1.10      0.00      0.00     -1.10     -0.98
TNS      -3.06      0.00      0.00     -1.10     -1.96
NUM          3         0         0         1         2
------------------------------------------------------------
 ...
```

In the third example, **-include {per_clock_violations}** is added. Comparing the report output from the second example, more violations are reported because more violating paths to the same endpoint are taking into account.

```
prompt> report_global_timing -include {inter_cl per_cl}
****************************************
Report : global_timing
        -include { inter_clock per_clock_violations }
 ...
****************************************

-------------------------------------------------------------
WNS    -23.71   -23.71     0.00     0.00     0.00
TNS  -1010.10 -1010.10     0.00     0.00     0.00
NUM       186      186        0        0        0
-------------------------------------------------------------
```

If you specify the **-pba_mode exhaustive** option, path-based analysis is used to calculate the violating slack values. This option requires that a path search be performed to ensure that the returned slack values are truly the worst. The additional runtime required for this option depends on the amount of timing improvement resulting from path-based analysis. As the timing improvement from path-based analysis increases, the runtime for the path search increases.

SEE ALSO

report_timing(2)

report_grids

Reports step, offset, allowed orientations, and other information for the currently defined grids in the design.

SYNTAX

status **report_grids**
[-ref_blocks *design_list*]
[-type block | user | finfet]
[*grid*]

Data Types

design_list collection
grid collection

ARGUMENTS

-ref_blocks *design_list*

Specifies the block reference designs to report block grid information. This option is applicable only to block grids.

-type block | **user** | **finfet**

Specifies the type of grid to report. Specify *block*, for block grids or *user*, for user grids or *finfet* for finfet grid defined in the technology section.

grid

Specify the name of the grid to report. You can specify a single object or a collection of grid names. By default, the command reports all grids.

DESCRIPTION

This command reports the grid information for the specified grid or the specified block design references. By default, all grids in the current design are reported. For block grids, their association with block design references are reported and if any block cell instance is off the associated block grid, an error would be reported.

EXAMPLES

The following example reports all grids in the current design:

```
prompt> report_grids
```

The following example reports all block grids in the current design:

```
prompt> report_grids -type block
```

The following example reports all user grids in the current design:

```
prompt> report_grids -type user
```

The following example uses the *grid* argument to report all grids with name matching gr:

```
prompt> report_grids [get_grids gr*]
```

report_groups

Reports groups in the current design.

SYNTAX

int **report_groups**
[-verbose]
[-nosplit]
[-hdl_of_module *module*]
[*group_list*]

Data Types

module	string
group_list	list

ARGUMENTS

-verbose

Displays verbose group information.

-nosplit

Retains long lines and does not split lines if column overflows.

-hdl_of_module

Reports the HDL groups contained in the specified module.

group_list

Specifies a list of groups to report. The list can contain group names, patterns, or collections. A collection can be specified by using the **get_groups** command. Support hierarchical pattern when **-hdl_of_module** option is specified.

DESCRIPTION

The **report_groups** command generates a report about the groups in the design. The report includes the group name and a description of the group. If **-verbose** is specified, the report also includes additional attributes and a list of objects contained in the group.

If *group_list* is specified, those groups are reported. If it is not specified, then all groups in the design are reported.

EXAMPLES

The following example reports all groups in the design.

```
prompt> report_groups
Group           Description
--------------------------------------------------------------------------------
GROUP_0         Contains 3 objects   type: set
MY_GROUP          Contains 2 objects   type: set
1
```

The following example reports HDL group named blk2 inside blk1 in the module ORCA.

```
prompt> report_groups -hdl_of_module ORCA blk1/blk2
Group           Description
--------------------------------------------------------------------------------
blk1/blk2        Contains 4 objects   type: set
1
```

The following example reports verbose information for the group named "GROUP_0".

```
prompt> report_groups -verbose GROUP_0
Group           Description
--------------------------------------------------------------------------------
GROUP_0         Contains 3 objects   type: set
                remove_when:          no_auto_removal
                allow_duplicate_name:   false
                objects:              n13
                                      n12
                                      POLYGON_14_1
1
```

The following example reports verbose information HDL group named blk2 inside blk1 in the module ORCA.

```
prompt> report_groups -verbose -hdl_of_module ORCA blk1/blk2
Group           Description
--------------------------------------------------------------------------------

report_gui_stroke_bindings

Print a report on the dictionaries and the stroke-command bindings they contain..

SYNTAX

report_gui_stroke_bindings
[-dictionary *dictionary_name*]

ARGUMENTS

-dictionary *dictionary_name*

Specify which dictionary should have its bindings reported. If not specified then all dictionaries will be reported.

DESCRIPTION

This command takes the data returned by get_gui_stroke_bindings and formats it into a report that is human-readable. The report prints out the stroke-to-command bindings for all dictionaries.

This command is defined as a part of the strokes Tcl package, and the command is automatically imported into the global namespace when the package is loaded.

EXAMPLES

```
ca_shell> report_gui_stroke_bindings

Dictionary: Graphics

stroke      cmdType      cmd
------      -------      ---
5           builtin      Pan_Center_Rect
852         builtin      Zoom_Full
258         builtin      Zoom_Full
159         builtin      Zoom_Out_Rect
357         builtin      Zoom_Out_Rect
753         builtin      Zoom_In_Rect
951         builtin      Zoom_In_Rect
```

```
654         builtin     Pan_Center_Rect
456         builtin     Pan_Center_Rect
123698741   builtin     Zoom_In_Rect
147896321   builtin     Zoom_In_Rect
s:14789     tcl_cmd     myTclCmd
14789       tcl_cmd     myTclCmd %rect
```

SEE ALSO

set_gui_stroke_preferences(2)
set_gui_stroke_binding(2)
report_gui_stroke_builtins(2)

report_gui_stroke_builtins

Print a report on the non-Tcl commands available for stroke bindings..

SYNTAX

report_gui_stroke_builtinss
[-dictionary *dictionary_name*]

ARGUMENTS

-dictionary *dictionary_name*

Specify which dictionary should have its builtins reported. If not specified then only the global builtins will be printed.

DESCRIPTION

This command takes the data returned by get_gui_stroke_bindings and formats it into a report that is human-readable. The report prints out the non-Tcl commands that can be used in stroke bindings.

This command is defined as a part of the strokes Tcl package, and the command is automatically imported into the global namespace when the package is loaded.

EXAMPLES

ca_shell> report_gui_stroke_builtins

Built-In Commands:

name

Zoom_In_Rect
Zoom_Out
Pan_Center_Rect
Zoom_Out_Rect
Zoom_Full
Zoom_In

report_hdl_libraries

Lists HDL (RTL) libraries and their directory locations.

SYNTAX

status **report_hdl_libraries**
[-nosplit]
[*library_list*]

Data Types

library_list list

ARGUMENTS

library_list

Specifies a list of HDL library names whose mappings are to be displayed. The default is to display all HDL libraries.

DESCRIPTION

The **report_hdl_libraries** command lists the directory locations of specified libraries.

An HDL library is where the tool places the intermediate files created by the **analyze** RTL analysis command.

EXAMPLES

The following example reports the location of the "WORK" HDL library.

```
prompt> report_hdl_libraries
****************************************
Report : hdl libraries
Version: P-2019.03-SP4
Date   : Mon Aug 26 06:59:52 2019
****************************************
WORK
   (/home/user/HDL_LIBRARIES/WORK)
```

SEE ALSO

analyze(2)
define_hdl_library(2)
elaborate(2)

report_hierarchy

Displays logical and physical reference hierarchy for a block.

SYNTAX

string **report_hierarchy**
[-block block_name]
[-physical_context]
[-nosplit]
[-hierarchical]
[-no_leaf]

Data Types

block_name string formatted [libName:]designName[/labelName][.viewName]

ARGUMENTS

-block

Specifies a block to generate the report on. If argument is not provided, the report is generated for the current block.

-physical_context

Indicates report should only be generated on physical blocks and leaf modules. By default, the report also displays internal module references.

Because internal modules are not shown, references of internal modules are displayed as references of their enclosing block.

-nosplit

Prevents line splitting when a field overflows.

-hierarchical

Displays the unfolded hierarchy. By default, multiply instantiated blocks or modules are reported only once.

-no_leaf

Indicates leaf modules are to be excluded from the report.

DESCRIPTION

The **report_hierarchy** command generates a report which displays all reference blocks and internal modules for a block. The command's default behavior is to generate a report for the current block displaying both the physical and logical reference hierarchy to the leaf module level. Multiple occurrences of a block or module are folded unless they are bound to different views. To differentiate blocks from internal modules, the full block name ([libName:]designName[/labelName][.viewName]) is printed. Leaf modules are displayed with their corresponding library name to their right.

EXAMPLES

```
prompt> report_hierarchy
****************************************
Report : hierarchy
 ...

report_host_options

Reports settings for multi-threaded and distributed processing created by **set_host_options**.

SYNTAX

status **report_host_options**
[-nosplit]

ARGUMENTS

-nosplit

Retains long lines in the output, even if the line is longer than 80 columns. By default, the command inserts line continuation characters (\) to break long lines.

DESCRIPTION

This command reports the distributed computing options set by the **set_host_options** command.

EXAMPLES

The following example creates a host option named block_script, then reports the settings for the host option.

```
prompt> set_host_options -name block_script localhost
1

prompt> report_host_options
****************************************
Report : host_options
 ...

****************************************

Max_cores: 1

Global Host Options:
Attribute        Value
```

```
----------------------------------------

num_processes     1
submit_command    rsh
work_dir          ./work_dir
target            ALL

Host Options 'block_script':
Attribute         Value
----------------------------------------
name              block_script
submit_command    rsh
work_dir          ./work_dir
target            ALL
host_names        localhost
1
```

SEE ALSO

set_host_options(2)
remove_host_options(2)

report_hot_spots

Reports voltage drop related cell attributes in the columnized format for a hot spot grid box, so it is easy for users to identify root causes. This command has to be invoked after the **generate_hot_spots** command.

SYNTAX

status **report_hot_spots**
[-index *index*]
[-summary]
[-object *cell_instance_object*]
[-verbose]

Data Types

net_name integer
object collection

ARGUMENTS

-index *index*

Specifies the grid hot spot index for which voltage drop related attributes are reported. This option is mutually exclusive with the -summary or -object option.

-summary

Displays a summary of the report for grid boxes, such as the number of grids, the number of instances, and the number of grids over the percentage threshold. This option is mutually exclusive with -index or -object option.

-object *cell_instance_object*

Reports on the hot spot grid which contains the specified cell instance object. This option is mutually exclusive with the -index or -summary option.

The **report_hot_spots** command reports voltage drop and relevant attributes which are useful to identify voltage drop root causes, such as current, overlap current, effective resistance, timing window, slack, output load and static power. Those attributes are reported in columnized format, so it is easy to allow users to identify voltage drop root causes. This command has to be invoked after the **generate_hot_spots** command. For an instance in a grid box, the overlap current is estimated by accumulating timing-window-based current cross its neighboring cells.

EXAMPLES

The following is an example of a verbose report:

```
prompt> generate_hot_spots -net VDD
prompt> report_hot_spots -index 3 -verbose
Voltage drop hot spot index: 3
Grid BBox: [2.57e+03 1.23e+03][2.58e+03 1.23e+03]
Number of instances: 4
Max effective voltage drop: 0.076524 Grid Rank 4/328323

SEE ALSO

report_hot_spots(2)
remove_hot_spots(2)

report_ideal_network

Displays information about ports, pins, nets, and cells on ideal networks in the current design.

SYNTAX

status **report_ideal_network**
[-modes *mode_list*]
[-corners *corner_list*]
[-scenarios *scenario_list*]
[-net]
[-cell]
[-load_pin]
[-timing]
[*object_list*]

Data Types

object_list list

ARGUMENTS

-modes *mode_list*

Specifies the modes to be reported. Each active scenario of the modes specified by the **-modes** option and the corners specified by the **-corners** option is reported separately. If this option is not given, the command reports scenarios of the current mode. If none of the **-modes**, **-corners**, or **-scenarios** options are given, the command uses the current scenario (if any). It is an error to give this option with the **-scenarios** option.

-corners *corner_list*

Specifies the corners to be reported. Each active scenario of the modes specified by the **-modes** option and the corners specified by the **-corners** option is reported separately. If this option is not given, the command reports scenarios of the current corner. If none of the **-modes**, **-corners**, or **-scenarios** options are given, the command uses the current scenario (if any). It is an error to give this option with the **-scenarios** option.

-scenarios *scenario_list*

Specifies the scenarios to be reported. Each of the given active scenarios is reported. It is an error to give this option with the **-modes** or **-corners** options. If none of the **-modes**, **-corners**, or **-scenarios** options are given, the command uses the current scenario (if any).

-net

Displays all nets in the specified ideal networks. By default, nets are displayed for all ideal networks.

-cell

Displays all cells in the specified ideal networks. By default, cells are displayed for all ideal networks.

-load_pin

Specifies to display load pins (boundary pins) of the specified ideal networks along with any ideal timing set on them using the **set_ideal_latency** and **set_ideal_transition** commands. By default, load pins are displayed for all ideal networks.

-timing

Specifies to display all internal pins (non-source and non-boundary pins) in the specified ideal networks that have ideal timing set on them using the **set_ideal_latency** and **set_ideal_transition** commands. By default, internal pins with timing are displayed for all ideal networks.

object_list

Defines a list of source ports or source pins of the specified ideal networks to be displayed. By default, the source pins and source ports for all ideal networks in the current design are displayed.

DESCRIPTION

Displays information about the ideal networks in the current design. If no arguments are specified, all ideal network sources in the current design are displayed. If you specify a list of source pins or ports, the command displays information about the ideal networks emanating from these objects.

The "Latency" and "Transition" columns show the minimum and maximum values set for both rising and falling edges. Set these values with the **set_ideal_latency** and **set_ideal_transition** commands.

Multicorner-Multimode Support

This command applies only to the current scenario by default, but **-modes**, **-corners**, **-scenarios** lists are accepted.

EXAMPLES

The following example sets up an ideal network, applies ideal latency and ideal transition values and shows the output of the ideal network report.

```
prompt> set_ideal_network {p_in in1}
prompt> set_ideal_latency    -min  1.12 in1
prompt> set_ideal_transition -max  9.87 in1
prompt> set_ideal_latency    -min  1.34 n0_i/Z
prompt> set_ideal_transition -rise 5.62 n3_i/B
prompt> report_ideal_network -timing -load_pin -cell -net

report_ieee_1500_configuration

Displays the options specified by the **set_ieee_1500_configuration** command.

SYNTAX

status **report_ieee_1500_configuration**

ARGUMENTS

The **report_ieee_1500_configuration** command has no arguments.

DESCRIPTION

This command displays options applied by the **set_ieee_1500_configuration** command to the current design.

EXAMPLES

The following is an example of the report generated by the **report_ieee_1500_configuration** command:

```
prompt> report_ieee_1500_configuration
****************************************
Report : IEEE 1500 Configuration
Design : top
Version: P-2019.03
Date   : Thu Feb  7 07:01:03 2019
****************************************

IEEE 1500 Structures              Status
------------------              --------
WIR Width:                         1
WBY Width:                         1
```

SEE ALSO

set_ieee_1500_configuration(2)

report_ignored_layers

Reports the routing layers that are ignored during congestion analysis and RC estimation. If you have set the minimum and maximum routing layers for the design, they are also reported.

SYNTAX

status **report_ignored_layers**
[-verbose]
[-nosplit]
[-significant_digits *digits*]

Data Types

digits int

ARGUMENTS

-verbose

Displays verbose ignored layer information.

-nosplit

Does not split lines if column overflows.

-significant_digits *digits*

Specifies the number of digits to the right of the decimal point that are to be reported. Allowed values are 0-13; the default is determined by the **shell.common.report_default_significant_digits** application option, whose default is 2. Use this option if you want to override the default. Fixed-precision floating-point arithmetics is used for delay calculation; therefore, the actual precision might depend on the platform. For example, on SVR4 UNIX see FLT_DIG in limits.h. The upper bound on a meaningful value of the argument to **-significant_digits** is then FLT_DIG - ceil(log10(fabs(*any_reported_value*))).

DESCRIPTION

During congestion analysis and RC estimation, the tool can ignore some routing layers. Use this command to report the ignored layers. If you have specified the minimum and maximum routing layers for the design, these are also reported.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example shows the **report_ignored_layers** command:

```
prompt> report_ignored_layers
```

SEE ALSO

remove_ignored_layers(2)
report_lib(2)
set_ignored_layers(2)

report_incomplete_upf

Displays information about the original UPF errors and actions incomplete_upf support has handled.

SYNTAX

status **report_incomplete_upf**
[-max_message_count *message_count*]

Data Types

message_count integer

ARGUMENTS

-max_message_count *message_count*

Set the maximum number of occurrences for each message type. If you set it to zero or 'all', that means the number of occurrences of the message is unlimited. If this option is not specified, the limit is 20 by default.

DESCRIPTION

The **report_incomplete_upf** command displays information about original UPF errors and actions incomplete_upf support has handled.

EXAMPLE

The following command reports the original UPF errors and actions incomplete_upf support has handled:

```
prompt> report_incomplete_upf
report_incomplete_upf

report_individual_pin_constraints

Reports existing pin constraints on individual pins or nets.

SYNTAX

string **report_individual_pin_constraints**
[-pins *pins*]
[-ports *ports*]
[-nets *nets*]
[-constraint_type feedthrough | physical]

Data Types

pins	collection
ports	collection
nets	collection

ARGUMENTS

-pins *pin_collection*

Limits the constraint report to only the specified pins. By default, the command reports constraints on all pins.

-ports *port_collection*

Limits the constraint report to only the specified ports. By default, the command reports constraints on all ports.

-nets *net_collection*

Limits the constraint report to only the specified nets. By default, the command reports constraints on all nets.

-constraint_type *feedthrough* | *physical*

Limits the report to the specified constraint type. By default, the command reports both feedthrough and physical constraints.

DESCRIPTION

This command reports the individual pin constraints on every level. Also it reports order constraint associated with that pin constraints.

If you do not specify any options, the command reports the feedthroughs and physical pin constraints for all pins and nets.

EXAMPLES

The following example displays the pin physical constraints for pin I_ALU/Optr.

```
prompt> report_individual_pin_constraints -constraint_type physical \
  -pins [get_pins I_ALU/Optr]
```

SEE ALSO

remove_individual_pin_constraints(2)
set_individual_pin_constraints(2)

report_io_guides

Reports I/O guides in the current design.

SYNTAX

int **report_io_guides**
[-verbose]
[-nosplit]
[-significant_digits *digits*]
[*io_guide_list*]

Data Types

digits int
io_guide_list list

ARGUMENTS

-verbose

Displays additional information about the I/O guides.

-nosplit

Retains long lines and does not split lines if the column overflows.

-significant_digits *digits*

Specifies the number of digits to the right of the decimal point to report. Allowed values are 0-13; the default is determined by the **shell.common.report_default_significant_digits** application option, whose default is 2. Use this option to override the default.

io_guide_list

Specifies a list of I/O guides to report. The list can contain I/O guide names, patterns, or collections. A collection can be specified by using the **get_io_guides** command.

DESCRIPTION

The **report_io_guides** command generates a report about the I/O guide constraints in the design. The report includes the I/O guide name and a description of the I/O guide. If **-verbose** is specified, the report also includes I/O guide line coordinates, associated side, whether the spacing is origin or neighbor relative, and pad cells with offset/spacing contained within the I/O guide.

If *io_guide_list* is specified, those I/O guides are reported. If it is not specified, then all I/O guides in the design are reported.

EXAMPLES

The following example reports all I/O guides in the design.

```
prompt> report_io_guides *
Io_guide        Description
-------------------------------------------------------------------------
ioGuide1        left with 4 pads origin_relative
ioGuide2        left with 8 pads neighbor_relative
ioGuide3        top with 8 pads neighbor_relative
ioGuide4        right with 8 pads neighbor_relative
ioGuide5        bottom with 8 pads neighbor_relative
1
```

The following example reports verbose information for the I/O guide named "ioGuide2".

```
prompt> report_io_guides -verbose ioGuide2*
Io_guide        Description
-------------------------------------------------------------------------
ioGuide2        left with 3 pads origin_relative
                line: ((0, 0) (0, 1000))
                pads:  pad1   5 / 100
                       pad2   3 / 200
                       pad3  -1 / 400
1
```

report_io_rings

Reports I/O rings in the current design.

SYNTAX

int **report_io_rings**
[-verbose]
[-nosplit]
[-significant_digits *digits*]
[*io_ring_list*]

Data Types

digits int
io_ring_list list

ARGUMENTS

-verbose

Displays verbose I/O ring information.

-nosplit

Does not split lines if column overflows.

-significant_digits *digits*

Specifies the number of digits to the right of the decimal point to report. Allowed values are 0-13; the default is determined by the **shell.common.report_default_significant_digits** application option, whose default is 2. Use this option if you want to override the default.

io_ring_list

Specifies a list of I/O rings to report. The list can contain I/O ring names, patterns, or collections. A collection can be specified by using the **get_io_rings** command.

DESCRIPTION

The **report_io_rings** command generates a report about the I/O ring constraints in the design. The report includes the I/O ring name and a description of the I/O ring. If **-verbose** is specified, the report also includes I/O ring related (outer) ring, inter-ring/boundary offset, and details of the guides.

If *io_ring_list* is specified, those I/O rings are reported. If it is not specified, then all I/O rings in the design are reported.

EXAMPLES

The following example reports I/O rings named "io_ring1".

```
prompt> report_io_rings { io_ring1 }
Io_ring         Description
-------------------------------------------------------------------------
io_ring1        io_guides: io_ring1.left
                   side: left
                   line: {{100 900} {100 100}}
                   number of pad cells: 0

                   io_ring1.bottom
                   side: bottom
                   line: {{100 100} {900 100}}
                   number of pad cells: 0

                   io_ring1.right
                   side: right
                   line: {{900 100} {900 900}}
                   number of pad cells: 0

                   io_ring1.top
                   side: top
                   line: {{900 900} {100 900}}
                   number of pad cells: 0
```

report_isolate_ports

Reports the input and output ports enabled for port isolation in the current block.

SYNTAX

string **report_isolate_ports**
[-all]
[*port_list*]

Data Types

port_list collection

ARGUMENTS

-all

Reports all the ports that are enabled for port isolation.

This option is mutually exclusive with the *port_list* argument.

port_list

Reports whether the specified ports are enabled for port isolation.

This argument is mutually exclusive with the **-all** option.

DESCRIPTION

This command reports the ports that are enabled for port isolation and the reason why port isolation is enabled. Currently the command reports only those ports enabled for port isolation with the **set_isolate_ports** command, which is indicated by the **user** reason.

Note that the command does not report the buffers added to the ports to implement the port isolation.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example enables port isolation on all ports for a block that has two ports, port1 and port2.

```
prompt> set_isolate_ports [get_ports *]
prompt> report_isolate_ports -all
Report : isolate_ports

Port port1
 user

Port port2
 user

2 of 2 ports are isolate_ports
1
```

The following example enables port isolation only on the port1 port.

```
prompt> set_isolate_ports [get_ports port1]
prompt> report_isolate_ports -all
Report : isolate_ports

Port port1
 user

1 of 2 ports are isolate_ports
1

prompt> report_isolate_ports [get_ports port2]
Report : isolate_ports

Port port2 is not isolate ports

0 of 1 ports are isolate_ports
1

prompt> report_isolate_ports [get_ports port1]
Report : isolate_ports

Port port1
 user

1 of 1 ports are isolate_ports
1
```

SEE ALSO

set_isolate_ports(2)

report_ivm

Reports via variation for current desgin.

SYNTAX

status **report_ivm**
[-corners *corners*]

Data Types

corners list

ARGUMENTS

-corners *corners*

Specifies the list of corners for which to apply the extraction options. If corners are not specified then the ivm file will be applied to all corners.

DESCRIPTION

This command reports via variation content sfor the current design.

EXAMPLES

The following example reports via variation for specified two corners.

```
prompt> report_ivm -corners {c1}
Report IVM Corner : c1
Layer Name: *
area          : 1.000000
table_min_sigma : 0.280000
table_max_sigma : 0.420000
table_meanshift : 0.000000
table_stdev     : 0.000000

Layer Name: VIA1
```

```
area          : 3.000000 4.000000 5.000000 6.000000
table_min_sigma : 0.700000 0.700000 0.700000 0.700000
table_max_sigma : 1.300000 1.300000 1.300000 1.300000
table_meanshift : 0.000000 0.000000 0.000000 0.000000
table_stdev     : 0.000000 0.000000 0.000000 0.000000

Layer Name: VIA2
area          : 3.000000 4.000000 5.000000 6.000000
table_min_sigma : 0.700000 0.700000 0.700000 0.700000
table_max_sigma : 1.300000 1.300000 1.300000 1.300000
table_meanshift : 0.000000 0.000000 0.000000 0.000000
table_stdev     : 0.000000 0.000000 0.000000 0.000000
```

report_keepout_margins

Reports the keepout margins

SYNTAX

status **report_keepout_margin**
[keepout_list]

Data Types

keepout_list Collection

ARGUMENTS

keepout_list

Specifies the keepout margin object to be reported. It could be a single object or a collection of keepout margins.

DESCRIPTION

The command reports the keepout margins on designs, partitions and cells. If the *keepout_list* is not specified, then the keepout margins of the current design are reported.

EXAMPLES

The following example reports all the keepouts in the current design:

prompt> **report_keepout_margin**

The following example reports all the keepouts associated with the cell 'U280':

prompt> **report_keepout_margin [get_keepout_margins -of {U280}]**

SEE ALSO

create_keepout_margin(2)
get_keepout_margins(2)
remove_keepout_margins(2)

report_latch_loop_groups

Reports on latch data pins involved in loops of transparent latches.

SYNTAX

string **report_latch_loop_groups**
[-of_objects *pin_list*]
[-loop_breakers_only]
[-path_breakers_only]
[-nosplit]

Data Types

pin_list list

ARGUMENTS

-of_objects *pin_list*

Specifies a collection of data pins of transparent latches. Only pins of loop groups containing the specified pins are reported. By default, the command reports on all latch data pins involved with transparent latch loops, as well as other latch data pins outside loops with the **is_latch_loop_breaker** pin attribute set to **true**.

-loop_breakers_only

Specifies that the report should contain only pins that are loop breaker latch data pins and should be pins truly contained in transparent latch loops. By default, all transparent latch data pins within the loop group are reported, along with other latch data pins with the **is_latch_loop_breaker** pin attribute set to **true**.

-path_breakers_only

Specifies that the report should contain only pins with the **is_latch_loop_breaker** pin attribute set to **true**. By default, all transparent latch data pins within the loop group are returned in the collections.

-nosplit

Most of the design information is listed in fixed-width columns. If the information in a given field exceeds the column width, the next field begins on a new line, starting in the correct column. The **-nosplit** option prevents line-splitting and facilitates writing software to extract information from the report output.

DESCRIPTION

When sequential loops of transparent latches exist in a design, a loop group containing all the latch data pins of intersecting loops is formed. The **report_latch_loop_groups** command analyzes the design and reports on latch data pins involved with loops. The report also includes some latch data pins outside loops. Combinational pins are not included in the results.

Latch data pins outside loops can be reported if the latch is being treated by the tool as a latch loop breaker data pin, even if it is not inside a latch loop. This can happen when either the user requests the pin to be treated this way using the **set_latch_loop_breaker** command, or the tool has selected the pin to be treated as a loop breaker data pin to save runtime. For more information about how this can happen, see the man page of the **time.through_path_max_segments** application option.

The report lists the name of the latch data pin, a number identifying which latch loop group the pin is part of, and attributes describing if the pin is a loop breaker latch, and why.

The number identifying which latch loop group the pin is part of is an arbitrary number, except that within a report, the latch data pins that are part of the same loop group have the same number. For latch data pins that are not part of a loop group, "NA" is shown instead of a loop group number.

Multicorner-Multimode Support

This command works only on the current mode.

EXAMPLES

The following example uses the **report_latch_loop_groups** command to report latch loops in the design:

```
prompt> report_latch_loop_groups
****************************************
Report : latch loop groups
 ...
****************************************
Attributes
  b - loop breaker d pin
  s - self loop d pin
  p - long path breaker d pin, but not in a loop
  u - user requested to be a loop breaker using set_latch_loop_breaker
  a - user requested to avoid with set_latch_loop_breaker -avoid

 Latch                  Latch Loop   Attributes
 D pin                  Group
-------------------------------------------------------------
DUT/Latch1/D                NA          pu
DUT/Latch2/D                1           b
DUT/Latch3/D                1
DUT/Latch4/D                2           bu
DUT/Latch5/D                2           a
```

SEE ALSO

get_latch_loop_groups(2)
set_latch_loop_breaker(2)

report_lib

Displays information about the specified library, which can be either a design library or a reference library.

SYNTAX

status **report_lib**
[-nosplit]
[-timing_arcs]
[-parasitic_tech]
[-physical]
[-antenna]
[-routability]
[-min_pin_layer layer_name]
[-pattern_must_join_pin]
[-pattern_must_join_pin_exclusion_list lib_pin_list]
[-placement_constraints]
[-wire_tracks]
[-wire_track_colors]
[-technology_lib library_name]
[-verbose]
[-include_db_mapping]
[-cell_summary]
[-user_defined_cell_attributes cell_attribute_list]
[-user_defined_pin_attributes pin_attribute_list]
[-char_model]
library

Data Types

library collection
library_name Library name in simple, relative, or absolute path.
layer_name string
lib_pin_list collection of lib_pins
cell_attribute_list collection of cell attributes
pin_attribute_list collection of pin attributes

ARGUMENTS

-nosplit

Most of the library information is listed in fixed-width columns. If the information for a given field exceeds the column width, the next field begins on a new line, starting in the correct column. This option prevents line-splitting and facilitates writing software to extract information from the report output.

-timing_arcs

Reports all cell timing arcs from the library.

-parasitic_tech

Reports the parasitic technology information from the library.

-physical

Reports the physical characteristics of the library.

-antenna

Reports missing antenna properties of cells only in frame view in the specified library.

-routability

Reports routability related items.

-min_pin_layer

Specifies the minimum layer pin layer name. Pins on layers lower than this layer will be reported. This option needs to go with **-routability**.

-pattern_must_join_pin

Report pattern must-join related items.

-pattern_must_join_pin_exclusion_list

Specifies the collection of lib_pins that don't need the pattern must-join report. This option needs to go with **-pattern_must_join_pin**.

-placement_constraints

Reports placement related constraints status.

-wire_tracks

Reports the via regions that are on wire tracks.

-wire_track_colors

Reports the terminals that are on improper color tracks.

-technology_lib

Specifies the technology library in which the wire track information is stored. This option needs to go with **-wire_tracks** or **-color_wire_tracks**.

-verbose

Set the detail reporting mode. This option is for **-routability**, **-placement_constraints, -wire_tracks and -color_wire_tracks only.**

-include_db_mapping

Includes the DB mapping information in the report.

-cell_summary

Reports a Library Cell Summary.

-user_defined_cell_attributes

Specifies cell level user defined attributes to be appended to Library Cell Summary. This option needs to go with **-cell_summary**.

-user_defined_pin_attributes

Specifies pin level user defined attributes to be appended to Library Cell Summary. This option needs to go with **-cell_summary**.

-char_model

Reports Data Model Existence information.

library

Specifies the reference library to report. This can be either the library name or a collection of a single library.

DESCRIPTION

The **report_lib** command displays information about the specified design library or reference library. By default, the command reports the full name, file name, and timing data, if any, for the library. To report the associated parasitic technology files, use the **-parasitic_tech** option.

In general, design libraries will not have timing data, but reference libraries will. The default timing data includes the power rails, the details for each timing pane, the constituent logic libraries, and the operating conditions. You can also include the cell timing arcs by using the **-timing_arcs** option.

The **-physical** option reports information about sites, layers, the path, source files, cell details and pin details in the library.

The **-antenna** option will display antenna property report table which lists the names of the cells only in frame view and mostly 10 pins in module/macro/pad cells at once to be printed that are missing an antenna property and shows the missing property type.

The specified library must be loaded into memory. To display the libraries that are currently loaded in memory, use the **get_libs** command.

To report routability related items which will affect routing runtime and QoR, use the **-routability** option. These items include:

- Physical pin accessibility for via region and access edge.
  Missing via region or access edge might cause routing QoR issue. The cells which miss via region or access edge are listed in the report. Please note that for a port of which all the physical pins are deep pins and are accessible from upper layer, then this port is count as accessible even if there are no access edges on all physical pins.
  - Design type for checking via region: diode, end cap, fill, filler, lib cell, physical only, well tap
  - Design type for checking access edge: abstract, analog, block box, corner, cover, flip-chip driver, flip-chip pad, macro, module, pad, pad spacer
- The total number of obstructions exceed 100K which will cause long runtime issue during routing.
- Irregular cut shapes or irregular routing blockages on the cut layers.
  A cut layer shape or regular routing blockage which does not meet any of the following conditions is considered as irregular:
  - is not rectangular
  - the width and height attributes does not match any of the following values
    - the minimum width of the layer
    - the default width of the layer

    - the values in cutHeightTbl and cutWidthTbl of the layer
    - the values of cut size of any simple via definitions of the layer

  These shapes or blockages may cause unpredictable design rule violations and long runtime issue during routing.

- Improper frame options setting
  For the following design type: diode, end cap, fill, filler, lib cell, physical only, well tap
    - The value of 'trim_metal_blockage_around_pin' option should not be set as 'all'.
    - The value of 'block_all' option should not be set as 'true'
- The terminal short violations.
  The physical geometry of ports should not short with others.
- Routing port without geometry.
  All routing ports should have physical geometry except the device-bias ports or internal ports.
- Summary table of cell objects.
  Please use the **-verbose** option together.
- Terminals blocked by blockages or metal shapes.
  The terminals should not be blocked by any blockages or metal shapes.
- Inconsistent routing attributes between timing view and frame view
  If the attribute 'is_secondary_pg' or 'is_diode' is defined in timing view, then it should be also defined in frame view.
- Improper internal port settings.
  The ports with attributes 'direction = internal' and 'is_physical = false' will not be treated as a real metal by router. Thus such settings is reported as improper internal port settings.
- Terminals on layers lower than minimum pin layer.
  The terminals might be on layers lower than minimum pin layer, for example M0. The minimum pin layer is given by the option **-min_pin_layer**.
- Terminals, shapes, and regular routing blockages with end of preferred grid issue.
  Terminals, shapes, or regular routing blockages which end in between low end grid and high end grid will cause issue when router tries to do metal extension. The end of preferred grid need to be pre-defined by command **create_track_pattern -end_grid_low_offset {VALUE} -end_grid_high_offset {VALUE} -end_grid_low_steps {VALUE} -end_grid_high_steps {VALUE}**. Different end of preferred grid patterns can be created for different site definitions, and the actual position of the low end grids and high end grids will be calculated using the patterns of the cell associated site definition. Use **create_track_pattern -site SITE** option to create the patterns for non-default site definitions.

To report the incorrect pattern-must-join setting on lib_pins, use the **-pattern_must_join_pin** option. Only the pattern-must-join settings saved in frame can be checked when reporting. Design-level lib_pin attribute override value is not considered for the report. For skipping the report for specific lib_pins, please specify them using the option **-pattern_must_join_pin_exclusion_list**.

To report the missing geometry on tech-file defined device layers and improper site definition, use the **-placement_constraints** option. Tech-file defined device layers includes implant, diffusion, and so on. Missing geometry on these layers might cause placement QoR issue.

- Design type for checking geometry: diode, end cap, fill, filler, lib cell, physical only, well tap

To report the via regions which are not on wire tracks, use the **-wire_tracks** option. If the **-technology_lib** is specified, then tool will get the wire track information from the specified technology library. Otherwise, the wire track information will come from the target library. If there are no wire track information set in the library, then tool calculates the wire tracks by the pitch, offset, and routing direction attributes on layer. For reporting the detail via region on wire tracks status, use the **-verbose** option together.

To report the terminals which are on improper color wire tracks, use the **-wire_track_colors** option. The color tracks need to be pre-defined by command **create_track_pattern -mask_pattern {PATTERN} -site SITE**. Different patterns can be created for different

site definitions, and the color tracks will be calculated using the patterns of the cell associated site definition. If the **-technology_lib** is specified, then tool will get the wire track information from the specified technology library. Otherwise, the wire track information will come from the target library. This part of report is available only in the library manager.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLE

The following command generates a default report for the my_lib_fast reference library.

```
prompt> report_lib -include_db_mapping my_lib_fast

****************************************
Report : library

report_lib_cells

Reports information about lib_cell objects

SYNTAX

status **report_lib_cells**
-objects *objects*]
[-columns *column_specs*]

Data Types

objects list
column_specs list

ARGUMENTS

-objects *objects*

Specifies the objects to include in the report. Each object will be printed as a separate row. For this command, each object must be of class "lib_cell".

-columns *column_specs*

Specifies the columns to include in the report, their order, and optionally column width and number of significant digits for each column. Each entry is a column spec, which can take the following forms. If just a column name is specified, such as "area", it will use report-specific default column width and significant digits. A column spec such as "area:10" means to use a column width of 10. A column spec such as "area:10.4" means to use a column width of 10 and 4 significant digits. The significant digits information only applies to floating point values. If any column spec is "all", all valid columns will be included for this report.

The following column names are valid for this report: area dont_touch full_name design_type is_combinational is_isolation is_level_shifter is_memory_cell is_sequential is_three_state name pad_cell pin_count valid_purposes view_name

DESCRIPTION

This command prints a tabular report with information on a list of lib_cell objects.

EXAMPLES

The following example prints a report for all lib_cells in library "tech_lib", using the default report configuration.

```
prompt> report_lib_cells -objects [get_lib_cells -of_objects tech_lib]
```

This example reports on all lib_cells matching "XOR*" in library "tech_lib", with a specific column configuration.

```
prompt> report_lib_cells -objects [get_lib_cells tech_lib/XOR*] \
 -columns {full_name:20 area:10.4 pin_count}
```

SEE ALSO

set_report_configuration(2)

report_lib_pins

Reports information about lib_pin objects

SYNTAX

status **report_lib_pins**
-objects *objects*]
[-columns *column_specs*]

Data Types

objects list
column_specs list

ARGUMENTS

-objects *objects*

Specifies the objects to include in the report. Each object will be printed as a separate row. For this command, each object must be of class "lib_pin".

-columns *column_specs*

Specifies the columns to include in the report, their order, and optionally column width and number of significant digits for each column. Each entry is a column spec, which can take the following forms. If just a column name is specified, such as "full_name", it will use report-specific default column width and significant digits. A column spec such as "full_name:10" means to use a column width of 10. A column spec such as "length:10.4" means to use a column width of 10 and 4 significant digits. The significant digits information only applies to floating point values. If any column spec is "all", all valid columns will be included for this report.

The following column names are valid for this report: direction disable_timing full_name function is_async_pin is_clock_pin is_data_pin is_pad is_preset_pin is_three_state is_three_state_enable_pin is_three_state_output_pin name pin_number port_type rail_name signal_type three_state_function

If **-columns** is not specified, the report will use the current columns specification which is either the tool default for this report, or the user-specified value from **set_report_configuration**.

DESCRIPTION

This command prints a tabular report with information on a list of lib_pin objects.

EXAMPLES

The following example prints a report for all lib_pins in library "tech_lib", using the default report configuration.

```
prompt> report_lib_pins -objects [get_lib_pins tech_lib/*/*]
```

This example reports on all lib_pins matching "XOR*/Y" in library "tech_lib", with a specific column configuration.

```
prompt> report_lib_pins -objects [get_lib_pins tech_lib/XOR*/Y] \
 -columns {name:10 direction function}
```

SEE ALSO

set_report_configuration(2)

report_lib_timing_arcs

Reports information about lib_timing_arc objects

SYNTAX

status **report_lib_timing_arcs**
-objects *objects*]
[-columns *column_specs*]

Data Types

objects list
column_specs list

ARGUMENTS

-objects *objects*

Specifies the objects to include in the report. Each object will be printed as a separate row. For this command, each object must be of class "lib_timing_arc".

-columns *column_specs*

Specifies the columns to include in the report, their order, and optionally column width and number of significant digits for each column. Each entry is a column spec, which can take the following forms. If just a column name is specified, such as "sdf_cond", it will use report-specific default column width and significant digits. A column spec such as "sdf_cond:10" means to use a column width of 10. A column spec such as "length:10.4" means to use a column width of 10 and 4 significant digits. The significant digits information only applies to floating point values. If any column spec is "all", all valid columns will be included for this report.

The following column names are valid for this report: direction disable_timing full_name function is_async_pin is_clock_pin is_data_pin is_pad is_preset_pin is_three_state is_three_state_enable_pin is_three_state_output_pin name pin_number port_type rail_name signal_type three_state_function

If **-columns** is not specified, the report will use the current columns specification which is either the tool default for this report, or the user-specified value from **set_report_configuration**.

DESCRIPTION

This command prints a tabular report with information on a list of lib_timing_arc objects.

EXAMPLES

The following example prints a report for all lib_timing_arcs in library "tech_lib", using the current configuration for this report.

```
prompt> report_lib_timing_arcs -objects [get_lib_timing_arcs -of_objects tech_lib/*/*]
```

This example reports on all lib_timing_arcs on lib_cell "XOR2" in library "tech_lib", with a specific column configuration.

```
prompt> report_lib_timing_arcs -objects [get_lib_timing_arcs -of_objects tech_lib/XOR2] \
 -columns {from:10 to:10 sense:15 when is_disabled }
```

SEE ALSO

set_report_configuration(2)

report_libcell_subset

Reports the library cell subset family specified on sequential and instantiated combinational cells.

SYNTAX

status **report_libcell_subset**
[-object_list *cells*]
[-nosplit]

Data Types

cells list

ARGUMENTS

-object_list *cells*

Specifies the cells for which to report the library cell subset family.

-nosplit

Specifies not to split lines when column fields overflow.

DESCRIPTION

This command reports information about the library cell subset subset that is specified on the cells.

Note that the command only reports the library subset information that is explicitly user-defined.

EXAMPLES

The following example reports the library cell subset family for the u1 sequential cell:

```
prompt> report_libcell_subset -object_list [get_cells u1]

Libcell Family     Libcells
-------------------------------------------------------------------------------
special_flops      sff0 sff1 sff2
```

```
--------------------------------------------------------------------------------
Object          Reference    Libcell Family
--------------------------------------------------------------------------------

ARGUMENTS

-from *from_list*

Reports only the paths that originate from the named pins, ports, cells, or clocks. If you do not specify this option, the command reports the longest path to an output port if the design has no timing constraints. If the design has timing constraints, the command reports the path with the worst slack within each path group if **-group** is not present. If **-group** is given, the command reports the path with the worst slack within the group specified by **-group**.

-rise_from *rise_from_list*

Reports only the paths with a rising edge from the named pins, ports, cells, or clocks. If a clock object is specified, this option selects startpoints clocked by the named clock, if the paths are launched by the rising edge of the clock at the clock source. The command considers logical inversions along the clock path.

-fall_from *fall_from_list*

Reports only the paths with a falling edge from the named pins, ports, cells, or clocks. If a clock object is specified, this option selects startpoints clocked by the named clock, if the paths are launched by the falling edge of the clock at the clock source. The command considers logical inversions along the clock path.

-to *to_list*

Reports only the paths that connect to the named pins, ports, cells, or clocks. If you do not specify this option, the command reports the longest path to an output port if the design has no timing constraints. If the design has timing constraints, the command reports the path with the worst slack within each path group if **-group** is not present. If **-group** is given, the command reports the path with the worst slack within the group specified by **-group**.

-rise_to *rise_to_list*

Reports only the paths with a rising edge at the endpoint that connect to the named pins, ports, cells, or clocks. If a clock object is specified, this option selects endpoints clocked by the named clock, if the capturing edge is the rising edge of the clock at the clock source. The command considers logical inversions along the clock path.

-fall_to *fall_to_list*

Reports only the paths with a falling edge at the endpoint that connect to the named pins, ports, cells, or clocks. If a clock object is

specified, this option selects endpoints clocked by the named clock, if the capturing edge is the falling edge of the clock at the clock source. The command considers logical inversions along the clock path.

-through ***through_list***

Reports only paths that pass through the named pins, ports, cells, or nets. If you specify only one **-through** option, the tool reports only the paths that travel through one or more of the objects in the list. You can specify **-through** multiple times with one **report_logic_levels** command.

-rise_through ***rise_through_list***

Reports only paths that pass through the named pins, ports, cells, or nets and have a rising transition at those objects. If you specify only one **-through** option, the tool reports only the paths that travel through one or more of the objects in the list. You can specify **-rise_through** multiple times with one **report_logic_levels** command.

-fall_through ***fall_through_list***

Reports only paths that pass through the named pins, ports, cells, or nets and have a falling transition at those objects. If you specify only one **-through** option, the tool reports only the paths that travel through one or more of the objects in the list. You can specify **-fall_through** multiple times with one **report_logic_levels** command.

-exclude ***exclude_list***

Prevents the reporting of data paths that contain the specified pins, ports, nets, and cell instances. Reporting excludes all data paths from, through, or to the named pins, ports, nets, and cell instances. If a cell instance is specified, all pins of the cell are excluded. The **-exclude** option

o Takes precedence over the **-from**, **-through**, and **-to** options.

o Is exclusive with the **-rise_exclude** and **-fall_exclude** options.

o Does not apply to clock pins.

Note that this option is intended for use in conjunction with **-from**, **-through** and **-to** options and can lead to long runtime when used on its own, i.e. without other such topological options.

-rise_exclude ***rise_exclude_list***

Same as the **-exclude** option, but applies only to paths rising at the named pins, ports, nets, and cell instances.

-fall_exclude ***fall_exclude_list***

Same as the **-exclude** option, but applies only to paths falling at the named pins, ports, nets, and cell instances.

-delay_type max | **min** | **max_rise** | **max_fall** | **min_rise** | **min_fall**

Specifies the type of path delay. Valid values are **max** (the default), **min**, **max_rise**, **max_fall**, **min_rise**, or **min_fall**. The "rise" or "fall" suffix in the delay type refers to a rising or falling transition at the path endpoint.

-path_type all | **single_clock** | **cross_clock** | **multicycle_paths** | **infeasible_paths**

Specifies the type of path to be considered for logic level analysis. By default, the all paths are considered.

-sort_paths_by wns | **logic_level_violation** | **logic_level**

Specifies the criterion on which to sort the paths which will be displayed in the logic level path report section. Only the top paths specified by option -max_paths_to_report will be reported after sorting.

-nworst ***paths_per_endpoint***

Specifies the maximum number of paths to get per endpoint. The default is 1, which gets only the single worst path ending at a given endpoint.

-max_paths ***max_path_count***

Specifies the maximum number of paths to analyze per path group. The default is 100.

-num_bins number_of_bins

Specifies the number of bins to be used in the Logic level dis- tribution section. If this option is not specified, the tool uses default value of 10.

-bin_width bin_width_number

Specifies the width of the bin to be used in the Logic level distribution section. If both **-num_bins** & **-bin_width** options are specified, then only **-num_bins** is used. When **-bin_width** option is specified, the tool computes the number of bins based on this width value.

-max_paths_to_report max_path_report_count

Specifies the number of paths to be reported in the logic level path report section.

-slack_lesser_than ***lesser_slack_limit***

Selects only those paths with a slack less than lesser_slack_limit. The **-slack_greater_than option** can be com- bined with the **-slack_lesser_than** option to select only those paths inside or outside of a given slack range. The specified value is in main library units. The default value for this option is 0.0. Be default, the command will analyze only the -ve slack paths due to this default setting.

-slack_greater_than ***greater_slack_limit***

Selects only those paths with a slack greater than **greater_slack_limit**. The **-slack_greater_than** option can be com- bined with the **-slack_lesser_than** option to select only those paths inside or outside of a given slack range. The specified value is in main library units.

-start_end_pair

Reports paths for each pair of startpoint and endpoint based on connectivity. This option can lead to long runtime and can lead to generating a huge number of paths depending on the design. By default, this option searches only for paths that are violating. This default can be changed by having an explicit -slack_lesser_than option. The options that do not work with this option are -nworst and -max_paths.

-export_csv_file output_csv_file_name

Specifies the file name for the csv file. The entire contents of the report will be exported to the specified csv file in csv (comma separated values) format.

-summary_only

If this option is specified, then only the summary section is printed. Logic level distribution section & Logic level path report for each of the path groups are not reported.

-nosplit

Writes out wide report lines, even if the line length is greater tha 80 columns. Use this option to simplify post-processing of the output files or when comparing the output files with the UNIX **diff** command. Most of the design information is listed in fixed-width columns. If the information in a given field exceeds the column width, the next field begins on a new line, starting in the correct column.

-modes ***mode_list***

Specifies the modes for which to generate the report. Each active scenario of the modes specified by the **-modes** option and the corners specified by the **-corners** option is reported separately, with up to **-max_paths** paths reported for each path group of each scenario. If this option is not given, the command reports scenarios of all modes. If none of the **-modes**, **-corners**, or **-**

scenarios options are given, the command reports every active scenario of the design. It is an error to give this option with the **-scenarios** option.

-corners ***corner_list***

Specifies the corners for which to generate the report. Each active scenario of the modes specified by the **-modes** option and the corners specified by the **-corners** option is reported separately, with up to **-max_paths** paths reported for each path group of each scenario. If this option is not given, the command reports every scenario that is active with the specified mode(s). It is an error to give this option with the **-scenarios** option.

-scenarios ***scenario_list***

Specifies the scenarios for which to generate the report. Each of the specified scenarios is reported. It is an error to give this option with the **-modes** or the **-corners** options. If none of the **-modes**, **-corners**, or **-scenarios** options are specified, the command will report every scenario of the design.

-groups ***group_list***

Specify the list of path group names for reporting paths. Default is all path groups.

DESCRIPTION

This command reports the logic levels information about the design.

By default, the command analyses only -ve slack paths for each scenarios from all path groups with a maximum of 100 paths for each path group.

The command collects the paths according to the user specifications and calculates the logic levels in those paths. Logic levels are the number of mapped cells in the path excluding buffers and invertors. It then compares it against the threshold specified by the user before or auto- matically computed one and determines whether it violates the threshold or not. It also collects other information about the path such as WNS, start and end point, start and end clocks and reports them.

The report has three sections.

Summary section

In this section, logic level and timing information are reported
for cumulative and each of the path groups. The cumulative
information is reported as "All path groups".
The columns in this section can be customized using
shell.synthesis.logic_level_report_summary_format of **set_app_options**.

GROUP	REQUIRED PERIOD	WNS	NUM OF PATHS	MAX LEVEL
All Path Groups	n/a	n/a	2310	13
CLOCK	0.0100	-2.3289	1600	13
custom_group1	0.0100	-2.3174	166	12
custom_group2	0.0100	-2.3006	544	13

Summary section is followed by Logic level distribution section & Logic level path report section for cumulative and each of the path groups. The cumulative information is reported under the path group name "All path groups".

Logic level distribution section

In this section, logic level distribution of paths for the particular path group are reported. The columns in this section are not customizable and are fixed.

LOGIC LEVELS	NUMBER OF PATHS	PERCENTAGE OF PATHS
0 to 1	4	0%
2 to 3	22	1%
4 to 5	1017	44%
6 to 7	908	39%
8 to 9	47	2%
10 to 11	205	9%
12 to 13	107	5%

Logic level path report

In this section, logic level & timing information for the top paths for the particular path group are reported. The columns in this section are customizable through setting an option **shell.synthesis.logic_level_report_group_format** using **set_app_options**.

WNS	LOGIC LEVELS	THRESHOLD	START POINT	END POINT
-1.3106	13	4	REG_BLK/DATA_OUT_reg[0]/CK	UPC_BLK/DATA_OUT_reg[7]/D
-1.3072	11	4	REG_BLK/DATA_OUT_reg[0]/CK	UPC_BLK/DATA_OUT_reg[3]/D
-1.2999	10	4	REG_BLK/DATA_OUT_reg[0]/CK	UPC_BLK/DATA_OUT_reg[3]/D
-1.2991	11	4	REG_BLK/DATA_OUT_reg[0]/CK	UPC_BLK/DATA_OUT_reg[9]/D
-1.2979	12	4	REG_BLK/DATA_OUT_reg[0]/CK	UPC_BLK/DATA_OUT_reg[5]/D

EXAMPLES

The following example sets the global logic level threshold to 5 and then runs logic level report for path group "CLOCK"

```
prompt> set_analyze_rtl_logic_level_threshold 5
prompt> report_logic_levels -group CLOCK
```

The following example invokes the reporting command with csv file option.

```
prompt> report_logic_levels -export_csv_file  ll.csv
```

SEE ALSO

report_logicbist_configuration

Displays options specified by the **set_logicbist_configuration** command.

SYNTAX

status **report_logicbist_configuration**

ARGUMENTS

The **report_logicbist_command** has no arguments.

DESCRIPTION

This command displays options specified by the **set_logicbist_configuration** command on the current design.

EXAMPLES

The following is an example of a LogicBIST compression configuration report:

```
prompt> report_logicbist_configuration
****************************************
Report : Logic Bist Configuration
Design : top
Version: P-2019.03
Date   : Thu Feb  7 07:06:30 2019

```

SEE ALSO

set_logicbist_configuration(2)

report_macro_constraints

Reports macro placement constraints.

SYNTAX

status **report_macro_constraints**
[-allowed_orientations]
[-preferred_location]
[-alignment_grid]
[-align_pins_to_tracks]
[*hard_macro_list*]

Data Types

hard_macro_list list of hard macros

ARGUMENTS

-allowed_orientations

Reports allowed orientation constraints and legal orientation only.

-preferred_location

Reports preferred macro location constraints only.

-alignment_grid

Reports alignment grid and alignment point information only.

-align_pins_to_tracks

Reports the align_pins_to_tracks setting only.

hard_macro_list

Specifies the list of hard macros for which report constraint settings. By default, all hard macros are reported.

DESCRIPTION

This command reports on various options set by the **set_macro_constraints** command. You can use any combination of the **-allowed_orientations**, **-preferred_location -align_pins_to_tracks**, **-align_pins_to_tracks** options to generate the report. The

command also reports the legal macro orientations from the reference library.

EXAMPLES

The following example reports the macro constraint settings for all hard macros.

```
prompt> report_macro_constraints
****************************************
Report : report_macro_constraints
 ...

****************************************

Macro               allowed       legal
Name                orientations   orientations

report_macro_relative_location

Reports the previously set constraints which place hard macros or macro array relative to anchor objects.

SYNTAX

status **report_macro_relative_location**
[*target_list*]
[-hierarchical]
[-nosplit]

Data Types

target_list list

ARGUMENTS

target_list

Specifies the list of hard macros or macro arrays on which to report relative location constraints. By default is reporting constraints on all hard macros and macro arrays.

-hierarchical

Report macro relative location constraints and violation checking results in current block and child block. Default only report constraints in current block.

-nosplit

Report macro relative location constraints and violation checking results with nosplit line format. Default will split the constraint's object name if it is too long.

DESCRIPTION

This command reports hard macro or macro array relative location constraints set by the **set_macro_relative_location** command.

EXAMPLES

The following command reports the relative location constraint set on hard macro A1.

```
prompt> report_macro_relative_location [get_cells "A1"]
```

SEE ALSO

report_matching_types

Reports matching_types in the current block.

SYNTAX

int **report_matching_types**
[-nosplit]
[*matching_type_list*]

Data Types

matching_type_list list

ARGUMENTS

-nosplit

Does not split lines if column overflows.

matching_type_list

Specifies a list of matching types to report. The list may contain matching type names, patterns, or collections. A collection may be specified by using the **get_matching_types** command.

DESCRIPTION

The **report_matching_types** command generates a report about the matching types in the design. The report includes the matching type name, its uniquify number, and its list of containing objects.

If *matching_type_list* is specified, those matching types will be reported. If it is not specified, then all matching types in the block will be reported.

EXAMPLES

The following example reports all matching types in the design.

prompt> **report_matching_types** *

1

The following example reports verbose information for the matching type named "myMatchingType1".

```
prompt> report_matching_types myMatchingType1
```

report_mibs

Generates a report of the multiply instantiated blocks (MIBs) for physical block cells in the design.

SYNTAX

string **report_mibs**
  [-ignore_read_only_mibs]

ARGUMENTS

-ignore_read_only_mibs

Reports multiply instantiated blocks (MIBs) for physical block cells in the design. You can specify the **-ignore_read_only_mibs** options. By default, the command reports all multiple instantiated blocks(MIBs) for physical block cells in the design. If **-ignore_read_only_mibs** options are specified, then the command will skips read only blocks.

DESCRIPTION

This command write out a report for all multiple instantiated blocks (MIBs) for physical block cells in the design. This report describes which references have multiple instances plus additional information on their status such as view name, design name and placement status, editability, and so on. The orientation reported for the physical block cells is with respect to the top block. The command reports all MIBs across every level of physical hierarchy in the design.

EXAMPLES

The following example reports MIBs in the design

```
prompt> report_mibs
report_mibs
****************************************
Report : report_mibs
 ...

****************************************

Reference   View   Hierarchy  Count  Instance      Orientation  Status  Editability

report_min_period

Displays minimum period check information about specified sequential device clock pins.

SYNTAX

status **report_min_period**
[-modes *mode_list*]
[-corners *corner_list*]
[-scenarios *scenario_list*]
[-path_type *path_type*]
[-all_violators]
[-significant_digits *digits*]
[-nosplit]
[*port_pin_list*]
[-input_pins]
[-derate]
[-capacitance]
[-transition_time]
[-variation]
[-crosstalk_delta]
[-nets]

Data Types

mode_list collection
corner_list collection
scenario_list collection
path_type collection
digits int
port_pin_list list

ARGUMENTS

-modes *mode_list*

Specifies the modes to be reported. Each active scenario of the modes specified by the **-modes** option and the corners specified by the **-corners** option is reported separately. If this option is not given, the command reports scenarios of the current mode. If none of the **-modes**, **-corners**, or **-scenarios** options are given, the command uses the current scenario (if any). It is an error to give this option with the **-scenarios** option.

-corners *corner_list*

Specifies the corners to be reported. Each active scenario of the modes specified by the **-modes** option and the corners specified by the **-corners** option is reported separately. If this option is not given, the command reports scenarios of the current corner. If

none of the **-modes**, **-corners**, or **-scenarios** options are given, the command uses the current scenario (if any). It is an error to give this option with the **-scenarios** option.

-scenarios ***scenario_list***

Specifies the scenarios to be reported. Each of the given active scenarios is reported. It is an error to give this option with the **-modes** or **-corners** options. If none of the **-modes**, **-corners**, or **-scenarios** options are given, the command uses the current scenario (if any).

-all_violators

Reports violated min period only.

-path_type

Specifies the format of the path report and how the clock path is displayed. Allowed values are: summary(the default), which generates a report with a column format that shows one line for each path and shows only the required period, actual period and slack. short, which displays only start-points and endpoints in the clock path.full_clock, which displays full clock paths. full_clock_expanded, which displays full clock paths including all master clocks of a generated clock.

-significant_digits ***digits***

Specifies the number of reported digits to the right of the decimal point. Allowed values are 0-13. the default is determined by the **shell.common.report_default_significant_digits** application option, whose default is 2. Use this option if you want to override the default.

-nosplit

Most of the design information is listed in fixed-width columns. If the information for a given field exceeds the width of the column, the next field begins on a new line, starting in the correct column. The *-nosplit* option prevents line splitting and facilitates writing software to extract information from the report output.

port_pin_list

Specifies a list of pins to report. If no pin is given, by default, the command reports all clock pins in the current design. If no min_pulse_width constraints found on pins or they are not on clock network, they will be ignored.

-input_pins

Reports input pins of cell as well as output pins.

-derate

Indicates that derate factors are shown in the path report. The default is to show no derate factors. This also shows the derate factor specified on the required min_period if one has been specified by the set_timing_derate command. Note that this option applies only when the -path_type option is set to either full_clock or full_clock_expanded options.

-variation

Includes parametric on-chip variation (POCV) information in the report in columns labeled "Mean" and "Sensit". POCV analysis is enabled by setting the timer.pocvm_enable_analysis variable to true.

-nets

Reports nets. The default is not to show nets.

-crosstalk_delta

Reports the annotated delta delay and delta transition time. The deltas are computed during crosstalk signal integrity analysi. Note that only deltas on input pins are shown. Delta transition time is shown only with the -transition_time option. The -crosstalk_delta option automatically sets the -input_pins option.

-transition_time

Reports the transition time (slew). The default is not to show time. For each driver pin or load pin the transition time is displayed in a column preceding incremental path delay.

-capacitance

Reports the total (lump) capacitance. The default is not to show capacitance. When the -nets option is specified, the capacitance is printed on the lines with nets instead of the lines with driver pins. Note that the -capacitance option is used with -nets option.

DESCRIPTION

The **report_min_period** command displays the following information for the minimum period check: required minimum period, actual period, and by how much the constraint is violated or met (slack). This information is listed in order of decreasing slack starting with the worst violator. This command displays information for the current scenario.

This command will trigger additional timing update and may have some runtime penalty.

Multicorner-Multimode Support

By default, this command works on the current scenario. To specify a different scenario, use the **-scenarios** option or the **-corners** and **-modes** options.

EXAMPLES

The following example generates a report of all minimum period violated or met in the current design.

```
prompt> report_min_period
```

****
Report : min_period -path_type summary -significant_digits
Design : Decoder
Version: Q-2019.12-ALPHA

report_min_pulse_width

Displays minimum pulse width check information about specified sequential device clock pins.

SYNTAX

status **report_min_pulse_width**
[-modes *mode_list*]
[-corners *corner_list*]
[-scenarios *scenario_list*]
[-all_violators]
[-significant_digits *digits*]
[-nosplit]
[*pin_list*]

Data Types

mode_list collection
corner_list collection
scenario_list collection
digits int
pin_list list

ARGUMENTS

-modes *mode_list*

Specifies the modes to be reported. Each active scenario of the modes specified by the **-modes** option and the corners specified by the **-corners** option is reported separately. If this option is not given, the command reports scenarios of the current mode. If none of the **-modes**, **-corners**, or **-scenarios** options are given, the command uses the current scenario (if any). It is an error to give this option with the **-scenarios** option.

-corners *corner_list*

Specifies the corners to be reported. Each active scenario of the modes specified by the **-modes** option and the corners specified by the **-corners** option is reported separately. If this option is not given, the command reports scenarios of the current corner. If none of the **-modes**, **-corners**, or **-scenarios** options are given, the command uses the current scenario (if any). It is an error to give this option with the **-scenarios** option.

-scenarios *scenario_list*

Specifies the scenarios to be reported. Each of the given active scenarios is reported. It is an error to give this option with the **-modes** or **-corners** options. If none of the **-modes**, **-corners**, or **-scenarios** options are given, the command uses the current scenario (if any).

-all_violators

Reports violated min pulse width only.

-significant_digits *digits*

Specifies the number of reported digits to the right of the decimal point. Allowed values are 0-13; the default is determined by the **shell.common.report_default_significant_digits** application option, whose default is 2. Use this option if you want to override the default.

-nosplit

Most of the design information is listed in fixed-width columns. If the information for a given field exceeds the width of the column, the next field begins on a new line, starting in the correct column. The *-nosplit* option prevents line splitting and facilitates writing software to extract information from the report output.

pin_list

Specifies a list of pins to report. If no pin is given, by default, the command reports all clock pins in the current design. If no min_pulse_width constraints found on pins or they are not on clock network, they will be ignored.

DESCRIPTION

The **report_min_pulse_width** command displays the following information for the minimum pulse width check: required pulse width, actual pulse width, and by how much the constraint is violated or met (slack). This information is listed in order of decreasing slack starting with the worst violator. This command displays information for the current scenario.

Minimum pulse width violations can also be reported with the **report_constraint** command.

This command will trigger additional timing update and may have some runtime penalty.

Multicorner-Multimode Support

By default, this command works on the current scenario. To specify a different scenario, use the **-scenarios** option or the **-corners** and **-modes** options.

EXAMPLES

The following example generates a report of all minimum pulse width violations in the current design.

report_mismatch_configs

Reports the available mismatch configs.

SYNTAX

status **report_mismatch_configs**
[-config_list *config_names*]
[-all]
[-nosplit]

Data Types

config_names list

ARGUMENTS

-config_list

List of the config names to be reported.

-all

Reports detailed information about all the existing configs.

-nosplit

Does not split lines if column overflows.

DESCRIPTION

The **report_mismatch_configs** command reports the named config. If no config is passed, then this command gives detailed information of current config of the session. If option -all is given, this command reports detailed information about all the configs, including pre-defined as well as user-defined configs.

EXAMPLES

The following example reports the detailed information about current config:

report_missing_via_check_options

Reports missing via check options for the RedHawk Analysis Fusion check missing via analysis flow that were previously defined with the **set_missing_via_check_options** command.

SYNTAX

status **report_missing_via_check_options**

EXAMPLES

The following example reports the current settings for the missing via check.

prompt> **report_missing_via_check_options**

SEE ALSO

analyze_rail(2)
set_missing_via_check_options(2)
remove_missing_via_check_options(2)
set_app_options(2)

report_modes

Reports mode information.

SYNTAX

string **report_modes**
[-significant_digits *digits*]
[-nosplit]
  [*mode_list*]

list *mode_list*

ARGUMENTS

mode_list

Lists modes to report. If you do not specify this option, all modes in the current design are reported.

-significant_digits *digits*

Specifies the number of digits after the decimal point to be displayed for time values in the generated report. Allowed values are 0-13; the default is determined by the **shell.common.report_default_significant_digits** application option, whose default is 2. Use this option if you want to override the default. This option controls only the number of digits displayed, not the precision used internally for analysis. For analysis, the tool uses the full precision of the platform's fixed-precision, floating-point arithmetic capability.

-nosplit

Writes out wide report lines, even if the line length is greater than 80 columns. Use this option to simplify post-processing of the output files or when comparing the output files with the UNIX **diff** command. Most of the design information is listed in fixed-width columns. If the information in a given field exceeds the column width, the next field begins on a new line, starting in the correct column.

DESCRIPTION

Displays information about modes in the current design, including the corners that each mode is activated with.

Multicorner-Multimode Support

SEE ALSO

create_mode(2)
current_mode(2)

report_msg

Returns a list of matching messages

SYNTAX

integer **report_msg**
[msgTag]
[-level *msgLevel*]
[-format msgFormat]
[-printed]
[-triggered]
[-suppressed]
[-limit_set]
[-downgraded]
[-upgraded]
[-full_format]
[-silent]
[-filter]
[-summary]

Data Types

msgLevel string
msgTag string

ARGUMENTS

msgTag

Prints only messages of which the tag matches *msgTag* .

-level *msgLevel*

Prints only messages of which the level is msgLevel. Valid types are *fatal*, *serror*, *error*, *warning*, *info*, *verbose* or *off*.

-printed

Prints only messages that were printed since program start. This option is implicit in case no msgTag is supplied.

-triggered

Prints only messages that were triggered (encountered) since program start. Not all triggered messages are printed, but all printed messages are triggered.

-suppressed

Prints only messages that were printed fewer times than triggered.

-limit_set

Prints only messages that have a print limit set.

-downgraded

Prints only messages that are downgraded to a level that lower than their default level. Often these messages are not printed.

-upgraded

Prints only messages that were upgraded to a higher level than their default level. These are verbose messages that were made printable, messages that are upgraded to SEVERE_ERROR.

-full_format

Prints the entire format string, rather than a truncated one.

-silent

Prints nothing. Use this to have the command return the number of matching messages.

-filter

Prints the list of output filter strings currently active. (see set_msg -add_filter)

-summary

Returns the message summary report of the last command run

DESCRIPTION

The **report_message** command lists any message in the system. Messages are identified by their tag in the form 'ABC-1234' or 'ABC-123'.

EXAMPLES

The following example lists all messages that were printed:

prompt> **report_msg**

The following example lists all messages that match CMD:

prompt> **report_msg CMD***

The following example lists all suppressed messages:

prompt> **report_msg -suppressed**

SEE ALSO

set_msg(2)
get_msg(2)

report_multi_input_switching_coefficient

Reports delay coefficient for multi-input switching (MIS) analysis.

SYNTAX

int **report_multi_input_switching_coefficient**
[-nosplit]
[-significant_digits *num_digits*]
[*object_list*]

Data Types

num_digits integer
object_list list

ARGUMENTS

-significant_digits *digits*

Specifies the number of digits to the right of the decimal point to report. Allowed values are 0-13; the default is determined by the **shell.report_default_significant_digits** application option, whose default is 2. Use this option to override the default.

-nosplit

Retains long lines in the output, even if a column overflows. Most of the design information is listed in fixed-width columns. If the information for a given field exceeds the column width, the next field begins on a new line, starting in the correct column. This option prevents line-splitting and facilitates writing software to extract information from the report output.

object_list

Specifies a list of library cells.

DESCRIPTION

This command reports delay coefficient for multi-input switching (MIS) analysis for the specified list of library cells. If you do not specify a list of library cells, the tool reports the coefficients for all library cells if set.

EXAMPLES

The following example reports all coefficients set by set_multi_input_switching_coefficient command:

```
pt_shell> report_multi_input_switching_coefficient
```

SEE ALSO

set_multi_input_switching_coefficient(2)
reset_multi_input_switching_coefficient(2)
enable_multi_input_switching_analysis(3)
enable_multi_input_switching_timing_window_filter(3)

report_multi_vth_constraint

Reports percentage vth enable/disable status, low vth percentage limit and cost type

SYNTAX

report_multi_vth_constraint

DESCRIPTION

This command reports percentage vth constraint, including enable/disable status, low vth percentage limit and cost type. These settings are persistent across shell sessions.

If percentage vth flow is enabled, optimization commands including **place_opt**, **clock_opt** and **route_opt** will honor the low vth percentage limit based on cost type. Low vth percentage limit is a floating-point number in range [0.0, 100.0]. Supported cost types are **cell_cout** and **area**.

EXAMPLES

```
prompt> report_multi_vth_constraint
Percentage vth flow  : disabled
Percentage vth limit : 100.000 (%)
Percentage vth cost  : cell_count
```

SEE ALSO

set_multi_vth_constraint(2)
reset_multi_vth_constraint(2)
report_threshold_voltage_group(2)
set_vth_threshold_controls(2)

report_multibit

Reports all multibit registers and multi-voltage cells in a design and the banking ratio.

SYNTAX

status **report_multibit**
[-nosplit]
[-hierarchical]
[-mv_cell iso | ls | els | all]
[-ignored_cells]

ARGUMENTS

-nosplit

Prevents line splitting. Most of the design information is listed in fixed-width columns. If the information for a given field exceeds the column width, the next field begins on a new line, starting in the correct column.

-hierarchical

Reports all applicable multibit cells, the total number of cells, and the banking ratio in each of the submodules across the design hierarchy.

-mv_cell iso | **ls** | **els** | **all**

Specifies the multi-voltage cells to be included in the report. By default, these cells are not included, and only registers are reported.

A value of iso includes isolation cells; a value of ls includes level shifter cells; a value of els includes enable level shifter cells. A value of all includes isolation, level shifter, and enable level shifter cells.

Registers are always reported regardless of the value or presence of this option.

-ignored_cells

Reports all the ignored cells during physical banking along with the reason.

DESCRIPTION

This command lists information about multibit registers and multi- voltage cells in the design. The report includes the total number of single-bit and multibit sequential cells, the single-bit equivalent of these sequential cells, the sequential cell and flip-flop banking ratio, and the multibit register decomposition. If multi-voltage cells have been included using the -mv_cell option, the report will also

contain the total number of single-bit and multibit cells, the banking ratio, and the multibit cell decomposition for the specified multi-voltage cells.

The sequential cells only include leaf cells. Clock-gating latches are excluded in this report. Therefore, the sequential cell count reported here can differ from what is reported by the report_qor and report_area commands.

The multibit cell decomposition section reports the information about multibit cell references used in the design. See the example section for more details.

When you specify the -hierarchical option, the number of single-bit and multibit cells and the banking ratio are reported for each subdesign.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example generates a multibit banking report

```
prompt> report_multibit

****************************************
Report : report_multibit
Design : create_placement
Version: O-2018.06-SP2-BETA
Date   : Fri Jul 20 01:10:38 2018

****************************************

Total number of sequential cells:                4020
  Number of single-bit flip-flops:               3149
  Number of single-bit latches:                  29
  Number of multi-bit flip-flops:                842
  Number of multi-bit latches:                   0

Total number of single-bit equivalent cells:     8530
  (A)  Single-bit flip-flops:                    3149
  (B)  Single-bit latches:                       29
  (C)  Multi-bit flip-flops:                     5352
  (D)  Multi-bit latches:                        0

Sequential cells banking ratio ((C+D)/(A+B+C+D)):    62.74%

report_multisource_clock_sink_groups

Report sink groups defined for multisource clock tap assignment

SYNTAX

status **report_multisource_clock_sink_groups**
[*sink_groups*]

Data Types

sink_groups collection

ARGUMENTS

sink_groups

Specifies a list of sink groups to be reported. Sink groups are defined using the **create_multisource_clock_sink_group** command. This option is optional. By default, the command will report all defined sink groups.

DESCRIPTION

The **report_multisource_clock_sink_group** command is used to report sink groups defined for multisource clock tap assignment. It will print the name, the type, the driver object as well as the list of sinks of a sink group.

The argument **sink_groups** can be used to restrict reporting to the given list of sink groups.

Multicorner-Multimode Support

This command has no dependency on scenario-specific, mode-specific, or corner-specific information.

EXAMPLES

This example reports all defined sink groups.

```
report_multisource_clock_sink_groups
```

This example reports the details of sink group sink_group1.

```
report_multisource_clock_sink_groups sink_group1
```

This example reports a collection of sink groups.

```
report_multisource_clock_sink_groups [get_multisource_clock_Sink_groups sink_group*]
```

report_multisource_clock_subtree_constraints

Reports constraints on cell and pins for structural synthesis of multisource clock tree synthesis (CTS) subtrees.

SYNTAX

status **report_multisource_clock_subtree_constraints**
[-names *name_list*]
[-clocks *clock_list*]

Data Types

name_list list of names
clock_list collection of clocks

ARGUMENTS

-names *name_list*

Specifies the subtree sets for which to report constraints on pin or cells. If neither this option nor the **-clocks** option are specified, all constraints are reported for all subtree option sets.

-clocks *clock_list*

Specifies the clocks for which to report constraints on pin or cells. If neither this option nor the **-names** option are specified, then all constraints are reported for all subtree option sets.

DESCRIPTION

The **report_multisource_clock_subtree_constraints** command reports constraints on cells or pins. Use this command in addition to the **report_multisource_clock_subtree_options** command for reporting cell- or pin-specific options or constraints.

Use the **set_multisource_clock_subtree_constraints** command to set constraints which can be cleared with this command. Use the **remove_multisource_clock_subtree_constraints** command to remove constraints. Use the **synthesize_multisource_clock_subtrees** command to synthesize the subtrees, as per the constraints.

Multicorner-Multimode Support

This command has no dependency on scenario-specific, mode-specific, or corner-specific information.

EXAMPLES

This example reports all constraints:

prompt> **report_multisource_clock_subtree_constraints**

This example reports clock-specific constraints:

prompt> **report_multisource_clock_subtree_constraints -clocks [get_clock clk]**

This example reports name-specific constraints:

prompt> **report_multisource_clock_subtree_constraints -names clk**

SEE ALSO

set_multisource_clock_subtree_constraints(2)
set_multisource_clock_subtree_options(2)
synthesize_multisource_clock_subtrees(2)

report_multisource_clock_subtree_options

Reports the settings defined by set_multisource_clock_subtree_options.

SYNTAX

string **report_multisource_clock_subtree_options**
[-names *string_list*]
[-clocks *clock_list*]

Data Types

string_list list
clock_list collection

ARGUMENTS

-names *string_list*

Restricts the command to report the subtree options only for the specified subtree sets. By default, all sets are reported.

-clocks *clock_list*

Restricts the command to report the subtree sets only for the specified clocks. By default, all subtree sets are reported.

DESCRIPTION

The **report_multisource_clock_subtree_options** command is used to report the subtree synthesis constraints applied by the **set_multisource_clock_subtree_options** command.

This report includes the following information for every subtree set: The name, the clock to be balanced in that set, the driver objects of that set, and any *max_total_wire_delay* constraint applied for the set, along with the corner or corners for which that *max_total_wire_delay* constraint applies.

By default, this command reports the constraints for all defined subtree sets. If the -names option is used, then only the specified sets will be reported. If the -clocks option is used, then all subtree sets defined on the given clocks are reported. You can apply -names together with -clocks.

Multicorner-Multimode Support

This command has no dependency on scenario-specific, mode-specific, or corner-specific information.

EXAMPLES

This example reports the constraints for all subtree sets:

```
report_multisource_clock_subtree_options
```

This example reports the constraints for only subtree sets *clock_set1* and *clock_set2*:

```
report_multisource_clock_subtree_options -names "clock_set1 clock_set2"
```

This example reports the constraints only for clock *clk*:

```
report_multisource_clock_subtree_options -clocks [get_clock clk]
```

SEE ALSO

set_multisource_clock_subtree_options(2)
remove_multisource_clock_subtree_options(2)
synthesize_multisource_clock_subtrees(2)

report_multisource_clock_tap_options

Reports the settings defined by **set_multisource_clock_tap_options**.

SYNTAX

string **report_multisource_clock_tap_options**
[-names *string_list*]
[-clocks *clock_list*]

Data Types

string_list list
clock_list collection

ARGUMENTS

-names *string_list*

Restricts the command to report the tap assignment options only for the specified names. The default name of an option set is the name of the clock of that set. By default, all option sets are reported.

-clocks *clock_list*

Restricts the command to report the options only for the specified clocks. By default, all option sets are reported.

DESCRIPTION

The **report_multisource_clock_tap_options** command is used to report the tap assignment settings applied by the **set_multisource_clock_tap_options** command.

This report includes the following information for every option set: The name, the clock, the tap driver objects, and the number of tap drivers of that group.

By default, this command reports the constraints for all defined option sets. If the **-names** option is used, then only the specified option sets will be reported. If the **-clocks** option is used, then all tap assignment option sets defined on the given clocks are reported. You can apply **-names** together with **-clocks**. In this case all option sets with the given names or that have one of the specified clocks are reported.

Multicorner-Multimode Support

This command has no dependency on scenario-specific, mode-specific, or corner-specific information.

EXAMPLES

This example reports the constraints for all tap assignment options:

```
prompt> report_multisource_clock_tap_options
```

This example reports the constraints for only option sets clock_set1 and clock_set2:

```
prompt> report_multisource_clock_tap_options -names "clock_set1 \
  clock_set2"
```

This example reports the constraints only for clock *clk*:

```
prompt> report_multisource_clock_tap_options -clocks [get_clock clk]
```

SEE ALSO

remove_multisource_clock_tap_options(2)
set_multisource_clock_tap_options(2)
synthesize_multisource_clock_taps(2)

report_multistage_timing

Reports timing information for stages preceding and following the specified timing endpoints.

SYNTAX

status **report_multistage_timing**
[-scenarios scenario_list]
[-groups group_list]
[-through endpoint_list]
[-max_paths max_path_count]
[-max_stages max_stage_count]
[-pba_mode none | path | exhaustive]
[-significant_digits digits]
[-physical]
[-verbose]

scenario_list list *group_list* list *endpoint_list* list *max_path_count* integer *max_stage_count* integer

ARGUMENTS

-scenarios scenario_list

Specifies the scenarios for which to generate the timing report. Each of the specified scenarios is evaluated by the report. If the **-scenarios** option is not specified, the report considers every active scenario of the design.

-groups group_list

Specify the list of path group names for reporting paths. Default is all path groups.

-max_paths max_path_count

Specifies the number of paths to report. The default value is 1.

-max_stages max_stage_count

Specifies the number of stages to report before and after the specified stage endpoints. The default is 3, meaning that the report includes 3+1 stages before and 3 stages after the specified timing endpoints.

-pba_mode none | path | exhaustive

Controls path-based analysis. See the report_timing command man page for more details.

-significant_digits digits

Specifies the number of significant digits (digits to the right of the decimal point) to report. Allowed values are from 0 through 13. Using this option overrides the value set by the **shell.common.report_default_significant_digits** application option.

-physical

Adds cell location information to the report. The **Manhattan Distance** column reports the half-perimeter distance between the startpoint and endpoint of the reported timing path. The report also reports the summation of the half-perimeter distance between all ports and cells on the datapath of the reported timing path.

-verbose

Additional information will be displayed, causing the report to become wider.

DESCRIPTION

The report_multistage_timing command generates a report that contains timing information for the current design. By default, the report_multistage_timing command reports for the single worst slack path in the design.

Command options let you specify the number of paths to report and the number of stages to report before and after the specified stages. Since the timing endpoint of a stage is also the timing startpoint of the subsequent stage, an additional stage is reported before the requested number of stages, giving the start point of the first requested stage. If a timing loop is detected, the report will be truncated at that stage.

Column Descriptions

Stage : The number of stages either preceding (negative value) or following (postive value) the specified stage.
Path Delay: The maximum delay value of the timing path.
Repeaters : A count of the number of repeater cells (buffers or inverters) in the timing path.
EP Latency: The capture clock latency to the timing endpoint (the launch clock latency would be shown as the EP Latency in the pri
CRP : Common path pessimism between the launch and capture clock paths.
Skew : Difference between the capture clock latency and the launch clock latency.
Slack : Worst timing slack at the timing endpoint
Levels : Number of two-input equivalent gates in the timing path.
Scenario : Timing Scenario of the timing path.

Multicorner-Multimode Support

By default, this command considers information from all active scenarios.

EXAMPLES

The following example reports multistage timing information for three stages ahead of and beyond the stage to the worst timing endpoint in the design.

```
prompt> report_multistage_timing -significant_digits 6 -verbose
****************************************
Report : multistage_timing
    -max_paths 1

report_mv_cells

Report information related to multi-voltage cells in the design.

SYNTAX

status **report_mv_cells**
[*cell_list*]
[-all]
[-enable_level_shifter]
[-level_shifter]
[-isolation]
[-repeater]
[-retention]
[-retention_clamp]
[-always_on]
[-verbose]
[-output <*output_file*>]
[-html]
[-csv]
[-nosplit]
[-power_domain <*power_domain_list*>]
[-power_strategy <*power_strategy_list*>]

Data Types

cell_list list
output_file string
power_domain_list list
power_strategy_list list

ARGUMENT

cell_list

Specify a list of library cells to report.

-all

Report enable level shifter, level shifter, isolation, repeater, retention register, retention clamp, always-on buffer/inverter/tie, and power switch cells. This is the default setting.

-enable_level_shifter

Report enable level shifter cells only.

-level_shifter

Report level shifter cells only.

-isolation

Report isolation cells only.

-repeater

Report repeater cells only.

-retention

Report retention register cells only.

-retention_clamp

Report retention clamp cells only.

-always_on

Report always-on buffers, inverters, and tie lib cells only.

-switch

Report power switch lib cells only.

-verbose

Report detailed information about a cell's attributes.

-output <*output_file*>

Print report into <*output_file*>.

-html

Print report in HTML format.

-csv

Print report in CSV (Comma-Separated Value) format. *-output* option is required when using this option and cannot be used in conjuntion with the *-html* option

-nosplit

Most of the reported data is listed in fixed-width columns. If the data for a given column exceeds the column width, the next field begins on a new line, starting in the right column. The *-nosplit* option prevents this behavior, allowing all the data to be written on a single line.

-power_domain *<power_domain_list>*

Specify a list of power domain elements to use for filtering. When issued, only cells that reside inside any of the power domains listed in *<power_domain_list>* will be reported.

-power_strategy *<power_strategy_list>*

Specify a list of power strategy elements to use for filtering. When issued, only cells that are associated to any of the strategies listed in *<power_strategy_list>* will be reported. This filter only applies to cell instances that can be associated to a power strategy

DESCRIPTION

This command reports multi-voltage related cell information. It includes power management attributes defined on special cells, such as level shifter, enable level shifter, isolation, repeater, retention, retention clamp, and always on cells. In verbose mode, more detailed information about about the cells will be provided.

EXAMPLES

The following example reports all the repeater cells in the design:

```
prompt> report_mv_cells -repeater

report_mv_design

Reports a summary of power management cells.

SYNTAX

status **report_mv_design**

ARGUMENTS

This command has no arguments.

DESCRIPTION

This command will print a summary of power management cells in the design. The summary includes the following:

- Number of power domains
- Number of supply nets/sets
- Number and details of voltage areas
- Number of power management cells inserted for each type
- Status of UPF commit

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example prints a summary of power management cells in the design:

prompt> **report_mv_design**

SEE ALSO

check_mv_design(2)
compile(2)

report_mv_lib_cells

Report information related to multi-voltage library cells in the design.

SYNTAX

status **report_mv_lib_cells**
[*lib_cell_list*]
[-all]
[-enable_level_shifter]
[-level_shifter]
[-isolation]
[-retention]
[-always_on]
[-switch]
[-macro]
[-io_pad]
[-standard]
[-diode]
[-buffer]
[-output *output_file*]
[-html]
[-csv]
[-example]
[-verbose]

ARGUMENT

libcell_list

Specifies a list of library cells to report.

-all

Report enable level shifter, level shifter, isolation, retention register, always-on buffer/inverter/tie, and power switch lib cells. This is the default setting.

-enable_level_shifter

Report enable level shifter lib cells only.

-level_shifter

Report level shifter lib cells only.

-isolation

Report isolation lib cells only.

-retention

Report retention register lib cells only.

-always_on

Report always-on buffers, inverters, and tie lib cells only.

-switch

Report power switch only.

-macro

Report macro lib cells only.

-io_pad

Report IO pad lib cells only.

-standard

Report Standard lib cells only. Standard cells are not included in -all option.

-diode

Report diode lib cells only.

-buffer

Report single-rail and dual-rail buffer and inverter lib cells only. Single-rail buffer and inverter lib cells are not included in -all option.

-verbose

Report detailed information about lib cell attributes and pins.

-output <*output_file*>

Print report into <*output_file*>.

-html

Print report in HTML format.

-csv

Print report in CSV (Comma-Separated Value) format.

-example

Display a list of typical example usages of this command.

-verbose

Displays all attributes and pins of each library cell.

DESCRIPTION

This command reports multivoltage-related library cell information. It includes power management attributes defined on special cells, such as level shifter, enable level shifter, isolation, retention, switch, always-on buffer, always-on inverter, always-on tie, macro, I/O pad, and standard library cells.

In verbose mode, it also displays detailed information about the data, power, and ground pins.

EXAMPLES

The following example reports all the retention cells in the design:

```
prompt> report_mv_lib_cells -retention

[-cell *cell*]
[-all_not_associated]
[-all_heterogeneous_paths]
[-name]

Data Types

pin string
net string
cell string

ARGUMENTS

-isolation

Reports the path or isolation cell with isolation constraints. This is the default option.

-level_shifter

Reports the path or level shifter cell with level shifter constraints.

-repeater

Reports the path or repeater cell with repeater constraints.

-all_path

Reports all paths in the design.

-pin *pin*

Reports the path which the pin is included.

-net ***net***

Reports the path which the net segment is included.

-shifting

Reports the path voltage shifting situation with level shifter constraints.

-full_path

Reports full isolation path information, including skipped buffers and inverters in the path. You must also specify the **-isolation** option.

-applied_strategy_only

Reports applied strategy on boundary port only

-cell ***cell***

Reports cell isolation or level shifter related information for the specified *cell*.

-all_not_associated

Reports all unassociated isolation or level shifter cells in the design.

-all_heterogeneous_paths

Report all heterogeneous path only with multiple supplies details, homogeneous paths are not reported. This option cannot be combined with any other option, all other options will be ignored. The report will only include all heterogeneous path information.

-name

Reports name based match information on isolation path.

DESCRIPTION

This command reports the path with multivoltage constraints and all details related to multivoltage cell insertion and association. This command helps you analyze the path situation if there is isolation and voltage shifting violation reported by **check_mv_design**.

The command reports either isolation path, level shifter path or repeater path constraints. You can report situations where the driving and loading conditions are different between isolation, level shifter or repeater paths. Only one type of constraints is reported, the default is **-isolation**. To report all types, run the command multiple times with different options.

EXAMPLES

The following example reports a level shifter cell in the design which is associated with UPF strategy.

```
prompt> report_mv_path -cell h1/CLK_UPF_LS
****************************************
Analysis : MV Path
 ...
```

```
****************************************
MV Cells Condition :

----------------------------------------
Cell Name              : h1/CLK_UPF_LS
Cell Type              : Level Shifter Cell
Power Domain           : h1/PD
Library Cell           : LVLHLX8M
Associated Strategy    : PD_LS_strategy_1(h1/PD)

Power Supplies             -- Input --              -- Output --
                     VDD90(Domain Default)      VDD90(Domain Default)

 Input Driver          : CLK
   Power Supply        : VDD108
 Output Loads          : h1/reg_2_/CK; h1/reg_1_/CK;
   Power Supply        : h1/VDD90
 Output Loads          : h1/h2/reg_2_/CK; h1/h2/reg_1_/CK;
   Power Supply        : h1/h2/VDD90
----------------------------------------
1
```

The following example reports a level shifter cell which cannot be associated with any UPF strategy. The reason for failure is also listed.

```
prompt> commit_upf
Information: Power intent has been successfully committed. (UPF-072)
Information: Total 0 isolation cell in the design. (MV-021)
Information: Total 5 out of 6 level shifter cells have been associated with strategy. (MV-081)
Information: Total 0 enable level shifter cell in the design. (MV-021)
Information: Total 0 retention cell in the design. (MV-021)
Error: Power cell h1/CLK_UPF_LS is not associated
 with any power strategies or supply net connections. (UPF-097)
Error: problem in commit_upf
       Use error_info for more info. (CMD-013)
```

The **commit_upf** command reports a UPF-097 failure during level shifter cell association. You can use the **report_mv_path** command to check the path and cell MV constraints and failure reason:

```
prompt> report_mv_path -cell h1/CLK_UPF_LS
****************************************
Analysis : MV Path
 ...

****************************************
MV Cells Condition :

----------------------------------------
Cell Name              : h1/CLK_UPF_LS
Cell Type              : Level Shifter Cell

```

The following example skips buffers and inverters along the isolation path. By default, **report_mv_path** will not report those buffers

and inverters that are skipped. The **-full_path** option includes all buffers and inverters in the isolation path.

The first example does not use **-full_path**, the second example uses **-full_path**.

```

report_name_rules

Reports the defined name rules.

SYNTAX

status **report_name_rules**
[*name_rules*]

Data Types

name_rules string

ARGUMENTS

name_rules

Specifies the name of the rules to be reported. If the *name_rules* argument is not specified, all currently defined name rules are reported. *name_rules* can be a GLOB style pattern also.

DESCRIPTION

This command reports the values of a set of name rules, that are created or modified by the *define_name_rules* command. This command generates a report for all the name rules matching the name pattern given as *name_rules* argument. When the *name_rules* argument is not specified, all the name rules are reported.

The report also contains the predefined special Verilog name rules. The Verilog name rules are predefined and can be modified using *define_name_rules* command. See the *define_name_rules* man page for more details on special rules.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example uses the report_name_rules command to report the values of the name rules called EXAMPLE:

```
prompt> report_name_rules
****************************************
```

```
 Report     : name_rules
...

SEE ALSO

change_names(2)
define_name_rules(2)
report_names(2)

report_names

Reports the potential name changes if the specified rule is applied.

SYNTAX

status **report_names**
-rules *name_rules*
[-hierarchy]
[-include_sub_blocks]
[-skip_physical_only_cells]

Data Types

name_rules string

ARGUMENTS

-rules *name_rules*

Specifies a name rule set that details the rules for modifying names to which the object names conform. A name rule set is defined by using the **define_name_rules** command.

-hierarchy

Specifies that objects of all the logical hierarchies of the design are to be considered. By default, objects of top logical hierarchy are considered. This will not consider sub-blocks.

-include_sub_blocks

By default, objects of top logical hierarchy are considered. When *-hierarchy* option is used then all objects within current physical hierarchy is considered and it doesn't cross over into other physical hierarchies or sub-blocks. With this option specified, it will cross over into other physical hierarchies also and in doing so it will consider only the bound views. If an instance in top level is bound to non-design view of a sub-block like for example, abstract, then the command will error out. This is because design view can't be derived from a non-design view and changing non-design view will cause it to go out of sync with its design view. In order to consistently rename all the design data and associated timing constraints, only design views should be used for linking. This option can't be used independently and has to be used along with *-hierarchy*. If any of the sub-blocks is not yet linked then using this option will first link those sub-blocks and then change the names.

-skip_physical_only_cells

Specifies that physical-only cells should not be considered for name changes. This is applicable for nets and ports of these type of cells as well.

DESCRIPTION

The **report_names** command reports the names of ports, cells, and nets that would be changed to conform to the specified name rules. This command may not report all of the name changes that would occur by the **change_names** command.

The **report_names** command is normally run before the **change_names** command.

Use the **report_name_rules** command to display a list of name rules currently available. See the **define_name_rules** man page for information about naming rules that can be affected when running **report_names**.

With no options specified, **report_names** operates on ports, cells, and nets in the current design. When **-hierarchy** is specified, the report is expanded to include all design objects within the current design object hierarchy.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example reports port, cell, and net names in the current design that conform to the rules defined in default_name_rules:

```
prompt> report_names
****************************************
Report    : names - rules EXAMPLE
Version   : v 1.0
Date      : Fri Jul 31 20:30:42 2015
****************************************

Design   Type   Object          New Name
--------------------------------------------------------
TOP      port   sys_clk         SYS_CLK
TOP      port   sys_2x_clk       SYS_2X_CLK
TOP      cell   bufbda_G1B2I2    BUFBDA_G1B2I2
TOP      cell   bufbda_G1B1I8_2  BUFBDA_G1B1I8_2
TOP      cell   bufbda_G1B1I7    BUFBDA_G1B1I7
TOP      net    sdram_clk       SDRAM_CLK
TOP      net    scan_en         SCAN_EN
```

SEE ALSO

change_names(2)
define_name_rules(2)
report_name_rules(2)

report_net

Generates a report of net information.

SYNTAX

string **report_nets**
[-connections [-verbose]]
[-significant_digits *digits*]
[-segments]
[-physical]
[-nosplit]
[*net_list*]

list *net_names*

ARGUMENTS

-connections

Indicates that the report is to show net connection information.

-verbose

Must be used with the **-connections** option. Indicates that the report is to show verbose connection information.

-significant_digits *digits*

Specifies the number of digits to the right of the decimal point that are to be reported. Allowed values are 0-13; the default is determined by the **shell.common.report_default_significant_digits** application option, whose default is 2. Use this option if you want to override the default. Fixed-precision floating-point arithmetics is used for delay calculation; therefore, the actual precision might depend on the platform. For example, on SVR4 UNIX see FLT_DIG in limits.h. The upper bound on a meaningful value of the argument to **-significant_digits** is then FLT_DIG - ceil(log10(fabs(*any_reported_value*))).

-segments

Indicates that the report is to show all global segments for each net requested. Global net segments are all those physically connected across all hierarchical boundaries.

-physical

Indicates that the report is to show the physical attributes and routing information for the net.

-nosplit

Most of the design information is listed in fixed-width columns. If the information in a given field exceeds the column width, the next field begins on a new line, starting in the correct column. The **-nosplit** option prevents line-splitting and facilitates writing

software to extract information from the report output.

net_list

Specifies a list of nets to be reported. The default is to report all nets in the current instance or current design.

DESCRIPTION

The command displays information about the nets in the design of the current instance, or in the current design. If **current_instance** is set, the report is generated for the design of that instance; otherwise, the report is generated for the current design. Attributes, such as annotated resistance and annotated capacitance, are displayed.

If **-connections** is used, the report lists the leaf cell pins connected to each net.

If **-physical** is used, the report will list the physical attributes and routing information for the net.

EXAMPLES

The following example reports all nets in the design.

```
prompt> report_nets

****************************************
Report : net
 ...

****************************************

Attributes:
   c - annotated capacitance
   r - annotated resistance

report_design(2)

report_net_buses

Displays net bus information within the design.

SYNTAX

string **report_net_buses**
[-verbose]
[-nosplit]
[*port_bus_list*]

Data Types

net_bus_list string or collection

ARGUMENTS

-verbose

Includes in the output the name of each member net. By default, a summary section is displayed that lists all net buses, their start bit, end bit, and bit order.

-nosplit

Prevents line splitting if the column overflows. Most design information is listed in fixed-width columns. If the information for a given field exceeds the column width, the next field begins on a new line, starting in the correct column. This option prevents line-splitting and facilitates writing software to extract information from the report output.

net_bus_list

Displays information only on the specified nets buses in the current design. *net_bus_list* contains either a collection of net buses or a pattern that matches the net buses names.

DESCRIPTION

This command displays information about net buses in the current design. By default, the command produces a brief report including all net buses in the current design, their start bit, end bit, and bit order.

EXAMPLES

This example outputs the default net bus report.

```
prompt> report_net_buses

****************************************
Report : report_net_buses
Design : ORCA
Version:
Date   :
****************************************
Name          Start  End  Bit order
----------------------------------------
pad           15     0    down
sd_DQ         15     0    down
pc_be         3      0    down
sd_A          9      0    down
sd_BWS        1      0    down

report_net_estimation_rules

Writes out a report with information about net estimation rules.

SYNTAX

int **report_net_estimation_rules**
[-cell *cell*]
[*rules*]
cell collection

Data Types

rules string or list

ARGUMENTS

rules

Specifies one or more net estimation rules to report. The net estimation rule be previously define by the **set_net_estimation_rule** command. If no rule is specified, then the default rule is reported.

-cell *cell*

Specifies the physical cell from which to find the net estimation rule.

By default, the current block is searched for the specified net estimation rule(s)..

DESCRIPTION

This command reports net estimation rules as previously defined by the **set_net_estimation_rule** command.

NET ESTIMATION RULES AND HIERARCHY

Net estimation rules can be created in any physical block at any level of the hierarchy and multiple blocks can have different rules with the same name. However, rules are often stored/retrieved by name, and doing this can cause confusion as to which rule is being used by a given command. Generally, the "current" (top) block's list of rules is searched by commands such as *estimate_timing*. This means that if you define rule R1 in "top" and rule R1 in block "B1", if you make block B1 the current block, commands will use B1's R1. When you go back to top, top's R1 is used. To avoid confusion, use globally unique rule names and define them at the top - they will be propagated to child blocks during distributed commands as necessary. Rules in child blocks that have the same name as rules in top may also be overwritten during distributed commands.

EXAMPLES

The following example sets the register_spacing parameter and writes out a report for the default net estimation rule.

```
prompt> set_net_estimation_rule -parameter register_spacing -value 10 default
prompt> report_net_estimation_rules
****************************************
Report : report_net_estimation_rules
 ...

****************************************

rule name: default

 launch_block_budget    N/A
 capture_block_budget   N/A
1
```

The following example writes out a net estimation rule report for rules *rule1* and *rule2*.

```
prompt> report_net_estimation_rules {rule1 rule2}
```

SEE ALSO

get_net_estimation_rules(2)
remove_net_estimation_rules(2)
set_net_estimation_rule(2)

report_net_fanout

Displays net fanout or buffer-tree information for the current design.

SYNTAX

status **report_net_fanout**
[-nosplit]
[-high_fanout]
[-threshold *lower*]
[-upper_bound *upper*]
[-connections]
[-physical]
[-tree [-depth *level*]]
[-hierarchical]
[*net_list*]

Data Types

lower integer
upper integer
level integer
net_list list

ARGUMENTS

-nosplit

Prevents line splitting and facilitates writing software to extract information from the report output. Most of the design information is listed in fixed-width columns. If the information for a given field exceeds its column's width, the next field begins on a new line in the same column.

-high_fanout

Specifies to show high fanout nets only. A high fanout net is a net with more fanouts than **500**. A high fanout buffer tree is a buffer tree with more leaf loads than the specified value. The fanouts cross hierarchies.

This option is mutually exclusive with the **-threshold** option.

-threshold *lower*

Specifies to only show nets with more fanout than *lower*. The fanouts cross hierarchies.

This option is mutually exclusive with the **-high_fanout** option.

-upper_bound *upper*

Specifies to only show nets with fanout less than or equal to *upper*. The fanouts cross hierarchies.

-connections

Displays information about pins connected to the nets.

-physical

Displays location information when applicable.

-tree

Indicates to treat a buffer tree as transparent. The leaf loads of the buffer tree are treated as the fanouts of the net. Hierarchical boundaries are not considered as leaf loads.

This option is mutually exclusive with the *net_list* argument.

-depth *level*

Displays only buffer trees with more levels than *level*. This option can only be used with the **-tree** option.

-hierarchical

Report fanout across physical hierarchies. If this option is not turned on, only the fanout in current physical hierarchy will be reported.

net_list

Specifies to process only those nets on the *net_list*. If *net_list* is not specified, all nets in the current instance are processed.

This argument is mutually exclusive with the **-tree** option.

DESCRIPTION

The **report_net_fanout** command displays net fanout or buffer-tree information in the current design. If a *net_list* is specified, the report is generated only for the specified nets.

All reports cross hierarchical boundaries as if the nets were flattened. This is consistent with the **report_net** command.

The **report_net_fanout** command can be used to find high-fanout nets, buffer trees, or long buffer chains in the current design or the current instance.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example shows how to find high-fanout nets:

```
prompt> report_net_fanout -high_fanout
```

The following example shows how to find high-fanout nets in a particular set of nets:

prompt> **report_net_fanout -high_fanout [get_nets scan*]**

The following example shows buffer trees with 10 leaf pins:

prompt> **report_net_fanout -tree -threshold 9 -upper_bound 10**

The following example shows how to find long buffer chains:

prompt> **report_net_fanout -tree -depth 8 -upper_bound 1**

report_net_weight_effort

Report net weight effort for coarse placement.

SYNTAX

status **report_net_weight_effort**
[-nets *collection of nets*]

ARGUMENTS

-nets *collection of nets*

Reports the net weight effort for all nets, or for the nets specified.

DESCRIPTION

The **report_net_weight_effort** command reports the net weight effort on nets for coarse placement. If no nets are specified, the net weight effort is reported for all nets.

EXAMPLES

The following example reports the net weight effort for the nets matching n12*.

```
prompt> report_net_weight_effort -nets [get_nets n12*]
Net          WeightEffort
n123          medium
n1238          high
n1239          none
n1236          medium
n1237          medium
n122          (default low)
n120          (default low)
n121          (default low)
```

SEE ALSO

set_net_weight_effort(2)
report_net_weight_effort(2)

report_nets

Generates a report of net information.

SYNTAX

string **report_nets**
[-connections [-verbose]]
[-significant_digits *digits*]
[-segments]
[-physical]
[-nosplit]
[*net_list*]

list *net_names*

ARGUMENTS

-connections

Indicates that the report is to show net connection information.

-verbose

Must be used with the **-connections** option. Indicates that the report is to show verbose connection information.

-significant_digits *digits*

Specifies the number of digits to the right of the decimal point that are to be reported. Allowed values are 0-13; the default is determined by the **shell.common.report_default_significant_digits** application option, whose default is 2. Use this option if you want to override the default. Fixed-precision floating-point arithmetics is used for delay calculation; therefore, the actual precision might depend on the platform. For example, on SVR4 UNIX see FLT_DIG in limits.h. The upper bound on a meaningful value of the argument to **-significant_digits** is then FLT_DIG - ceil(log10(fabs(*any_reported_value*))).

-segments

Indicates that the report is to show all global segments for each net requested. Global net segments are all those physically connected across all hierarchical boundaries.

-physical

Indicates that the report is to show the physical attributes and routing information for the net.

-nosplit

Most of the design information is listed in fixed-width columns. If the information in a given field exceeds the column width, the next field begins on a new line, starting in the correct column. The **-nosplit** option prevents line-splitting and facilitates writing

software to extract information from the report output.

net_list

Specifies a list of nets to be reported. The default is to report all nets in the current instance or current design.

DESCRIPTION

The command displays information about the nets in the design of the current instance, or in the current design. If **current_instance** is set, the report is generated for the design of that instance; otherwise, the report is generated for the current design. Attributes, such as annotated resistance and annotated capacitance, are displayed.

If **-connections** is used, the report lists the leaf cell pins connected to each net.

If **-physical** is used, the report will list the physical attributes and routing information for the net.

EXAMPLES

The following example reports all nets in the design.

```
prompt> report_nets

****************************************
Report : net
 ...

****************************************

Attributes:
   c - annotated capacitance
   r - annotated resistance

Net             Fanout    Fanin      Cap   Resistance    Pins   Attributes

SEE ALSO

current_design(2)
current_instance(2)
report_cell(2)

report_design(2)

report_noise

Displays static noise information for the worst pins, or the specified pins, or all violators.

SYNTAX

status **report_noise**
[-mode *mode*]
[-corner *corner*]
[-scenario *scenario*]
[-nworst *worst_pin_count*]
[-all_violators]
[-significant_digits *digits*]
[-nosplit]
[*pin_list*]

Data Types

mode	collection
corner	collection
scenario	collection
worst_pin_count	int
digits	int
pin_list	list

ARGUMENTS

-mode *mode*

Specifies the mode to use for reporting. The command uses the scenario (if any) of the specified mode and the corner specified by the **-corner** option for reporting. If you do not specify any of the **-mode**, **-corner**, or **-scenario** options, the command uses data from the current scenario to generate the report. It is an error to specify this option with the **-scenario** option.

-corner *corner*

Specifies the corner to use for reporting. The command uses the scenario (if any) of the specified corner and the mode specified by the **-mode** option for reporting. If you do not specify any of the **-mode**, **-corner**, or **-scenario** options, the command uses data from the current scenario to generate the report. It is an error to specify this option with the **-scenario** option.

-scenario *scenario*

Specifies the scenario to use for reporting. If you do not specify any of the **-mode**, **-corner**, or **-scenario** options, the command uses data from the current scenario to generate the report. It is an error to specify this option with the **-mode** or the **-corner** options.

-nworst *worst_pin_count*

Specifies the number of load pins to be reported. The default value is 1.

-all_violators

Indicates that only violating pins (negative slack) are to be shown. If this option is used with the -nworst option, the number of violating pins will be limited by that value.

-significant_digits *digits*

Specifies the number of reported digits to the right of the decimal point. Allowed values are 0-13; the default is determined by the **shell.common.report_default_significant_digits** application option, whose default is 2. Use this option if you want to override the default.

-nosplit

Most of the design information is listed in fixed-width columns. If the information for a given field exceeds the width of the column, the next field begins on a new line, starting in the correct column. The *-nosplit* option prevents line splitting and facilitates writing software to extract information from the report output.

pin_list

Specifies a list of pins to report noise.

DESCRIPTION

The **report_noise** command displays the static noise information (width, height, and slack) for the worst pins or the specified list of pins. It computes "between rail noise," which is above low and below high noise. It uses slack type height. The si analysis should be enabled.

EXAMPLES

The following example reports the static noise values for the 5 worst pins.

prompt> **report_noise -nw 5 -sign 3**

****
Report : noise
Design : r4000

[-list_annotated]
[-list_not_annotated]
[-coefficient]
[-corner_sigma]
[-lib_cell]
[-min_depth]
[-nosplit]
[-significant_digits]
{-type aocvm|pocvm}
[*object_list*]

Data Types

mode	collection
corner	collection
scenario	collection
object_list	list

ARGUMENTS

-mode *mode*

Specifies the mode to use for reporting.

The command uses the scenario (if any) of the specified mode and the corner specified by the **-corner** option for reporting.

If you do not specify any of the **-mode**, **-corner**, or **-scenario** options, the command uses data from the current scenario to generate the report.

It is an error to specify this option with the **-scenario** option.

-corner ***corner***

Specifies the corner to use for reporting.

The command uses the scenario (if any) of the specified corner and the mode specified by the **-mode** option for reporting.

If you do not specify any of the **-mode**, **-corner**, or **-scenario** options, the command uses data from the current scenario to generate the report.

It is an error to specify this option with the **-scenario** option.

-scenario ***scenario***

Specifies the scenario to use for reporting.

If you do not specify any of the **-mode**, **-corner**, or **-scenario** options, the command uses data from the current scenario to generate the report.

It is an error to specify this option with the **-mode** or the **-corner** options.

-early

Indicates that only early AOCV/POCV derate tables are shown on the objects specified in the *object_list*.

-late

Indicates that only late AOCV/POCV derate tables are shown on the objects specified in the *object_list*.

-rise

Indicates that only rise AOCV/POCV derate tables are shown on the objects specified in the *object_list*.

-fall

Indicates that only fall AOCV/POCV derate tables are shown on the objects specified in the *object_list*.

-clock

Indicates that only clock AOCV/POCV derate tables are shown on the objects specified in the *object_list*.

-data

Indicates that only data AOCV/POCV derate tables are shown on the objects specified in the *object_list*.

-cell_delay

Indicates that only cell delay AOCV/POCV derate tables are shown on the objects specified in the *object_list*.

-net_delay

Indicates that only net delay AOCV/POCV derate tables are shown on the objects specified in the *object_list*.

-list_annotated

Indicates that leaf cells and global nets that are annotated with AOCV/POCV derate tables are listed.

-list_not_annotated

Indicates that leaf cells and global nets that are not annotated with AOCV/POCV derate tables are listed.

-coefficient

Shows the AOCV coefficients. You can specify a collection of lib_cell and leaf cell objects in the object_list to display coefficients annotated only on those objects.

-corner_sigma

Shows the POCV corner sigma value and POCV global sigma value(**time.pocvm_corner_sigma**).

-lib_cell

This option can be used with either the **-list_annotated** or **-list_not_annotated** options to report the library cell name instead of the instance name. Note that this report is design level which includes all corners.

-min_depth

Shows the AOCVM minimum depth.

-nosplit

Do not split lines when columns overflow.

-significant_digits *digits*

Specifies the number of significant digits (digits to the right of the decimal point) to report. Allowed values are from 0 through 13. The default is 2. Using this option overrides the value set by the **shell.common.report_default_significant_digits** application option.

-type aocvm|pocvm

Indicates the type of the analysis, and this is a required argument.

object_list

The object_list can be cells/nets/design/lib_cell objects and the command will report the corresponding AOCV/POCV derate tables for these objects. If a timing arc object is provided, the corresponding AOCV metrics and associated derates are printed for that arc. If the object_list is empty, a summary of the number of cells/nets that have AOCV/POCV derates is printed. For POCV, if a cell/lib_cell is provided, the command will report both POCV coefficients and whether LVF(slew/load) tables exist for related panes. Note that LVF tables for cells are corner level, and LVF tables for lib_cells are design level. When both POCV coefficients and LVF tables exist, the **time.pocvm_precedence** app option determines the precedence.

DESCRIPTION

This command reports user-specified information about advanced on-chip variation (AOCV) or parametric on-chip variation (POCV) analysis.

If the design has been annotated with AOCV/POCV derate tables using the **read_ocvm** command, the **report_ocvm** command outputs a summary showing the numbers of leaf cells and global nets annotated with AOCV/POCV derate tables. Lists of fully annotated, partially annotated, and non annotated leaf cells and global nets can be displayed using the **-list_annotated** and **-list_not_annotated** options.

EXAMPLES

In the following example, the design has been annotated with AOCV derate factors using the **read_ocvm** command.

```

report_optimization_history

Report design optimization history.

SYNTAX

status **report_optimization_history**

DESCRIPTION

This command reports the history of the optimization steps applied to the design:

Current State: is mapped; is placed; Events: - initial_map 08/16/19 10:53 --> 0.001111 hours - logic_opto 08/16/19 10:53 --> 0.016667 hours - initial_place 08/16/19 10:54 --> 0.000833 hours - insert_dft 08/16/19 10:54 --> 0.000833 hours - initial_drc 08/16/19 10:54 --> 0.000833 hours

SEE ALSO

read_optimization_history(2)
write_optimization_history(2)

report_parasitic_parameters

Reports parasitic parameters for all constraint corners, or for only the specified corners.

SYNTAX

string **report_parasitic_parameters**
[-corners *corners*]

Data Types

corners list

ARGUMENTS

-corners *corners*

Specifies the corners for reporting parasitic parameters. If this option is not specified, the command reports parasitic parameters for all corners.

DESCRIPTION

This command reports parasitic parameters required by extraction for all corners. If you use the **-corners** option, the command reports only the specified corners.

Multicorner-Multimode Support

EXAMPLES

The following example reports the parasitic parameters for the current corner.

```
prompt> report_parasitic_parameters -corners [current_corner]
1
```

SEE ALSO

all_corners(2)
create_corner(2)
create_mode(2)
current_corner(2)
get_corners(2)
remove_corner(2)
report_extraction_options(2)
set_extraction_options(2)
set_parasitic_parameters(2)

report_parasitics

Displays the Arnoldi and/or Elmore delay calculations for an entire stage.

SYNTAX

status **report_parasitics**
[-mode *mode*]
[-corner *corner*]
[-scenario *scenario*]
[-early]
[-late]
[-rise]
[-fall]
[-xcap]
[-percentile]
[-significant_digits *digits*]
[*object_list*]

Data Types

mode collection
corner collection
scenario collection
digits integer
object_list collection

ARGUMENTS

-mode ***mode***

Specifies the mode for to be used for reporting. The scenario (if any) of the mode given by the **-mode** option and the corner specified by the **-corner** option will be used. If none of the **-mode**, **-corner**, or **-scenario** options are specified, the command reports using data from the current scenario. It is an error to give this option with the **-scenario** option.

-corner ***corner***

Specifies the corner for to be used for reporting. The scenario (if any) of the corner given by the **-corner** option and the mode specified by the **-mode** option will be used. If none of the **-corner**, **-mode**, or **-scenario** options are specified, the command reports using data from the current scenario. It is an error to give this option with the **-scenario** option.

-scenario ***scenario***

Specifies the scenario for to be used for reporting It is an error to give this option with the **-mode** or the **-corner** options. If none of the **-corner**, **-mode**, or **-scenario** options are specified, the command reports using data from the current scenario.

-late

Report using data for max (late) operating condition. If neither of the **-late** or **-early** options are given, max data will be reported. If both of these options are given, each will be reported separately.

-early

Report using data for min (early) operating condition. If neither of the **-late** or **-early** options are given, max data will be reported. If both of these options are given, each will be reported separately.

-rise

Report using pin capacitance data for rising signal transitions. If neither of the **-rise** or **-fall** options are given, rise data will be reported. If both of these options are given, each will be reported separately.

-fall

Report using pin capacitance data for falling signal transitions. If neither of the **-rise** or **-fall** options are given, rise data will be reported. If both of these options are given, each will be reported separately.

-xcap

Report details of cross-capacitance (if available).

-percentile

Print percentile instead of histogram statistics in the summary report.

-significant_digits ***digits***

Specifies the number of digits to the right of the decimal point to report. Allowed values are from 0 through 13. The default is 2. This option overrides the value set by the **shell.common.report_default_significant_digits** application option.

object_list

Report the parasitics of the given nets, or the nets of the given pins or ports.

DESCRIPTION

The **report_parasitics** command provides a summary report of the parasitic RC networks, as well as a detailed description of the RC networks of the given objects.

The summary report includes information of the total and per-net average R and C values, as well as the statistical distribution of RC network size and total R/C.

The per-net detailed reports include the net's total parasitic resistance and capacitance, its total capacitance, and a detailed description of its RC network and each associated pin capacitance. If the **-xcap** option is given, cross-capacitors (if available) will be listed.

The **-early**, **-late**, **-rise**, and **-fall** options control which types of parasitics and pin capacitance are reported. Note that each specified min/max/rise/fall combination will be reported separately.

Multicorner-Multimode Support

By default, this command works on the current scenario. To specify a different scenario, use the **-scenario** option or the **-corner** and **-mode** options.

SEE ALSO

report_delay_calculation(2)
report_parasitic_parameters(2)
report_stage(2)

report_parasitics_derate

Resets parasitic derating factors that influence extraction for DR/GR/CTO/RDE.

SYNTAX

string **report_parasitics_derate**
[-corners *corners*]

Data Types

corners	list

ARGUMENTS

-corners *corners*

Specifies the list of corners for which to apply the extraction options. Reporting derating factors will for all corners without -corners.

DESCRIPTION

This command reports derating factors used during RC extraction. The derating options will be associated with default constraint corner, or each list of constraint corners.

Multicorner-Multimode Support

EXAMPLES

```
prompt> report_parasitics_derate

Global factors:
---------------

Corner: default
* max
  Cap factor(Data,Clock)        : {1.1, 1.3}
```

```
    Res factor(Data,Clock)        : {1.01, 1.02}
    Coupling factor(Data,Clock)   : {1.05, 1.1}

    Layer based scale
    -----------------
      Cap scale
        M3        : 0.98
        M5        : 1.01
        M1        : 0.99
  * min

    Layer based scale
    -----------------
      Cap scale
        M5        : 1.01
        M1        : 0.99
        M3        : 0.98
  1
```

report_path_group

Reports path_group information.

SYNTAX

string **report_path_groups**
[-modes *mode_list*]
[-nosplit]
[*path_group_list*]

Data Types

mode_list list
path_group_list list

ARGUMENTS

-modes *mode_list*

Displays only the path groups associated with the *mode_list* modes.

-nosplit

Specifies not to split lines if a column overflows. Most of the information is displayed in fixed-width columns. If the information for a given field exceeds the column width, the next field begins on a new line, starting in the correct column. This option prevents line splitting and facilitates writing scripts to extract information from the report output.

path_group_list

Displays the path group information for the *path_group_list* that is specified.

DESCRIPTION

Produces a report showing information about path groups in the **current_design** command. The report includes path groups automatically created by the **create_clock** command and those manually created with the **group_path** command. Path groups are used to affect the calculation of the Maximum Delay cost during optimization. If no mode is specified on the command line, the path groups are reported for the **current_mode** command only; otherwise all path groups associated with the list of requested modes are displayed. If *path_group_list* is specified but contains an invalid group name, all path groups for the current mode will be displayed. The arguments *mode_list* and *path_group_list* cannot be used together.

Multicorner-Multimode Support

By default, this command works on the current mode. To specify a different mode, use the **-modes** option.

EXAMPLES

```
prompt> report_path_groups

****************************************
Report : path_group
 ...
****************************************

Path groups for mode 'M1':

Path_Group    Weight    From/Through/To

group_path(2)

report_path_groups

Reports path_group information.

SYNTAX

string **report_path_groups**
[-modes *mode_list*]
[-nosplit]
[*path_group_list*]

Data Types

mode_list list
path_group_list list

ARGUMENTS

-modes *mode_list*

Displays only the path groups associated with the *mode_list* modes.

-nosplit

Specifies not to split lines if a column overflows. Most of the information is displayed in fixed-width columns. If the information for a given field exceeds the column width, the next field begins on a new line, starting in the correct column. This option prevents line splitting and facilitates writing scripts to extract information from the report output.

path_group_list

Displays the path group information for the *path_group_list* that is specified.

DESCRIPTION

Produces a report showing information about path groups in the **current_design** command. The report includes path groups automatically created by the **create_clock** command and those manually created with the **group_path** command. Path groups are used to affect the calculation of the Maximum Delay cost during optimization. If no mode is specified on the command line, the path groups are reported for the **current_mode** command only; otherwise all path groups associated with the list of requested modes are displayed. If *path_group_list* is specified but contains an invalid group name, all path groups for the current mode will be displayed. The arguments *mode_list* and *path_group_list* cannot be used together.

Multicorner-Multimode Support

By default, this command works on the current mode. To specify a different mode, use the **-modes** option.

EXAMPLES

```
prompt> report_path_groups

****************************************
Report : path_group
 ...
****************************************

Path groups for mode 'M1':

report_pg_mask_constraints

Reports PG mask constraints. Specify a constraint name to limit the report to one PG mask constraint.

SYNTAX

status **report_pg_mask_constraints**
[*name*]
[-tcl]

Data Types

name string

ARGUMENTS

name

Reports the specified PG mask constraint. If this option is not specified, the command reports all PG mask constraints defined by **set_pg_mask_constraint**.

-tcl

Reports single specified PG mask constraint with Tcl format.

DESCRIPTION

This command reports the PG mask constraints. With no options, the command reports all mask constraints specified with the **set_pg_mask_constraint** command. If you specify a constraint name, the command reports only that constraint.

EXAMPLES

The following example reports the PG mask constraint named *r1*.

prompt> **report_pg_mask_constraints r1**

The following example reports the PG mask constraint named *r1* with Tcl format.

prompt> **report_pg_mask_constraints r1 -tcl**

SEE ALSO

set_pg_mask_constraint(2)
remove_pg_mask_constraints(2)

report_pg_patterns

Reports the specified power ground pattern.

SYNTAX

status **report_pg_patterns**
[*pattern_name*]
[-tcl]

Data Types

pattern_name string

ARGUMENTS

pattern_name

Reports the specified power ground pattern. If this option is not specified, the command reports all pre-defined power ground patterns.

-tcl

Reports single specified power ground pattern with Tcl format.

DESCRIPTION

This command reports the specified power ground pattern or all pre-defined patterns if the name is not specified.

EXAMPLES

The following example reports power ground wire pattern p1.

```
prompt> report_pg_patterns r1
Pattern Name    : p1
Pattern Type    : Wire
Direction       : Horizontal
Layer           : M3
Center          : 0
```

```
Low end        : 100
High end       : 300
Extend low     :
Extend high    :
Width          : 10
Spacing        : minimum
Trim           : true
Parameters     :
```

The following example reports power ground macro connection pattern r2.

```
prompt> report_pg_patterns p2
Pattern Name    : p2
Pattern Type    : Macro connection
Macro Pin Type  : Long pin
Nets            : pwr gnd
Direction       : Horizontal
Width           : @w
Layers          : M4
Spacing         : 3
Pitch           : 20
Number          :
Offset          : 3
Via rule        : {intersection: all}{via_master: VIA34}
Parameters      : w
```

The following example reports power ground macro connection pattern r2 with Tcl format.

```
prompt> report_pg_patterns p2 -tcl
```

report_pg_regions

Reports the specified power ground region names and areas.

SYNTAX

status **report_pg_regions**
[*region_name*]

Data Types

region_name string

ARGUMENTS

region_name

Reports the specified power ground region. If you do not specify a region name, the command reports all power ground regions.

DESCRIPTION

This command reports all power ground regions, or only the power ground region you specify.

EXAMPLES

The following example reports power ground region *r1*.

```
prompt> report_pg_regions r1
Region: r1
Points: {{100 150} {150 150} {150 100} {100 100}}
```

The following example reports all power ground regions.

```
prompt> report_pg_regions
Region: core_region
Points: {{225 374} {425 374} {425 225} {225 225}}
Region: r1
Points: {{100 150} {150 150} {150 100} {100 100}}
Region: r2
```

Points: {{200 250} {250 250} {250 200} {200 200}}

SEE ALSO

report_pg_strategies

Reports the specified power ground strategy.

SYNTAX

status **report_pg_strategies**
[*strategy_name*]
[-tcl]

Data Types

strategy_name string

ARGUMENTS

strategy_name

Reports the specified power ground strategy. If you do not specify a strategy name, the command reports all power ground strategies.

-tcl

Reports single specified power ground strategy with Tcl format.

DESCRIPTION

This command reports all power ground strategies, or only the specified power plan strategy.

EXAMPLES

The following example reports power ground strategy *s_mesh1*.

```
prompt> report_pg_strategies s_mesh1
name: s_mesh1
region:
   Region: core area
   Coordinate: {{400.0000 400.0000} {400.0000 3307.6080}
         {3308.2160 3307.6080} {3308.2160 400.0000} }
```

```
Pattern Expression :

report_pg_strategy_via_rules

Reports the specified power ground strategy via rule.

SYNTAX

status **report_pg_strategy_via_rules**
[*rule_name*]
[-tcl]

Data Types

rule_name string

ARGUMENTS

rule_name

Reports the specified power ground strategy via rule. If this option is not specified, the command reports all power ground strategy via rules defined by **set_pg_strategy_via_rule**.

-tcl

Reports single specified power ground strategy via rule with Tcl format.

DESCRIPTION

This command reports the specified power ground strategy via rule, or all pre-defined via rules by **set_pg_strategy_via_rule** if the name is not specified.

EXAMPLES

The following example reports power ground strategy via rule *r1*.

```
prompt> report_pg_strategy_via_rules r1
****************************************
Report : Power Ground Strategy Via Rule
Design : chip
Date   : Mon Feb 14 15:40:09 2010
```

```

Via Rule Name   : r1
Via Rule        : {intersection: adjacent}{via_master: default}
```

The following example reports power ground strategy via rule *r1* with Tcl format.

```
prompt> report_pg_strategy_via_rules r1 -tcl
```

SEE ALSO

set_pg_strategy_via_rule(2)
remove_pg_strategy_via_rules(2)

report_pg_via_master_rules

Reports the specified power ground via rule.

SYNTAX

status **report_pg_via_master_rules**
[*rule_name*]
[-tcl]

Data Types

rule_name string

ARGUMENTS

rule_name

Reports the specified power ground via rule. If this option is not specified, the command reports all power ground via rules defined by **set_pg_via_master_rule**.

-tcl

Reports single specified power ground via rule with Tcl format.

DESCRIPTION

This command reports the specified power ground via rule, or all predefined via rules by **set_pg_via_master_rule** if the name is not specified.

EXAMPLES

The following example reports power ground via rule *r1*.

```
prompt> report_pg_via_master_rules r1
#----------------------------------------#
Via definition rule        : r1
Contact code               : VIA34
Offset                  : 3.0000 4.0000
```

```
    Array dimension (Column row)  : 5 5
    Pitches between arrays        : not set
    Spacing between cuts          : default default
    Offset start                  : center
    Orient                        : R0
    Via site ratio                : 1 1
    Track alignment               : no_align
    Cut mask                      : no_mask
    #-----------------------------------------#
```

The following example reports power ground via rule *r1* with Tcl format.

```
prompt> report_pg_via_master_rules r1 -tcl
```

remove_pg_via_master_rules(2)

report_pin_blockages

report_pin_blockages

Reports the pin blockages in the design.

SYNTAX

status **report_pin_blockages**
[-verbose]
[-nosplit]
[-significant_digits *digits*]
[*pin_blockage_list*]

Data Types

digits int
pin_blockage_list list

ARGUMENTS

-verbose

Displays verbose pin blockage information, including the associated pins, nets, or ports.

-nosplit

Does not split lines if column overflows.

-significant_digits *digits*

Specifies the number of digits to the right of the decimal point to report. Allowed values are 0-13; the default is determined by the **shell.common.report_default_significant_digits** application option, whose default is 2. Use this option if you want to override the default.

pin_blockage_list

Specifies a list of pin blockages to report. The list can contain pin blockage names, patterns, or collections. A collection can be specified by using the **get_pin_blockages** command. This argument is mutually exclusive with the **-all** option. You must specify one, but not both.

DESCRIPTION

This command reports the user-specified pin blockage constraints in the design, as specified by the **create_pin_blockage** command. If you use the **-all** option, all pin blockages in the design, created by the **create_pin_blockage** command are reported.

The report includes pin blockage name, boundary, layers, and associated pins, nets, or ports.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example reports the pin blockage *PIN_BLOCKAGE_1*:

```
prompt> report_pin_blockages -verbose PIN_BLOCKAGE_1

Pin Blockage       Description
-----------------------------------------------------------------
PIN_BLOCKAGE_1     Boundary:    (0.00 0.00}
                             (0.00, 2000.00)
                             (2000.00, 2000.00)
                             (2000.00, 0.00)
                   Layers:      metal1
                             metal2
                   Pins:        cellA/pin1
                             cellA/pin2
                             cellA/pin3
1
```

report_pin_buses

Displays pin bus information within the design.

SYNTAX

string **report_pin_buses**
[-verbose]
[-nosplit]
[*pin_bus_list*]

Data Types

pin_bus_list string or collection

ARGUMENTS

-verbose

Includes in the output the name of each member pin. By default, a summary section is displayed that lists all pin buses, their start bit, end bit, and bit order.

-nosplit

Prevents line splitting if the column overflows. Most design information is listed in fixed-width columns. If the information for a given field exceeds the column width, the next field begins on a new line, starting in the correct column. This option prevents line-splitting and facilitates writing software to extract information from the report output.

pin_bus_list

Displays information only on the specified pins buses in the current design. *pin_bus_list* contains either a collection of pin buses or a pattern that matches the pin buses names.

DESCRIPTION

This command displays information about pin buses in the current design. By default, the command produces a brief report including all pin buses in the current design, their start bit, end bit, and bit order.

EXAMPLES

This example outputs the default pin bus report.

```
prompt> report_pin_buses

****************************************
Report : report_pin_buses
Design : ORCA
Version:
Date   :
********************************************
Name                Start  End  Bit order
------------------------------------------------
cellBus/bus_A         9     0   down
cellBus/bus_B         0     7   up
1
```

SEE ALSO

create_pin_bus(2)
get_pin_buses(2)
remove_pin_buses(2)
report_design(2)
report_hierarchy(2)
report_references(2)

report_pin_constraints

Generates a report of pin constraints.

SYNTAX

string **report_pin_constraints**
[-nosplit]
[*pin_constraints_list*]
[-pins *pins*]
[-ports *ports*]
[-nets *nets*]

Data Types

pin_constraints_list collection
pins collection
ports collection
nets collection

ARGUMENTS

-nosplit

If the information for a given pin constraint exceeds the column width, the next field begins on a new line, starting in the correct column. The **-nosplit** option prevents line-splitting and facilitates writing software to extract information from the report output. The **-nosplit** option is mutually exclusive with the **-pins**, **-ports**, and **-nets** options.

pin_constraints_list

Specifies a list of pin constraint objects to report. This collection may include only individual and/or bundle pin constraints. The **pin_constraints_list** option is mutually exclusive with the **-pins**, **-ports**, and **-nets** options.

-pins *pin_collection*

Specifies the pins to report. The **-pins** option is mutually exclusive with the **pin_constraints_list**, **-nosplit**, **-ports**, and **-nets** options.

-ports *port_collection*

Specifies the ports to report. The **-ports** option is mutually exclusive with the **pin_constraints_list**, **-nosplit**, **-pins**, and **-nets** options.

-nets *net_collection*

Specifies the nets to report. The **-nets** option is mutually exclusive with the **pin_constraints_list**, **-nosplit**, **-ports**, and **-pins** options.

DESCRIPTION

This command generates a report describing the pin constraints in the current design. The report includes basic attribute information for each constraint. By default, the command reports all individual and bundle pin constraint in the current design, unless the user specifies specific objects using the **pin_constraints_list** argument or one of the **-pins**, **-ports**, or **-nets** options.

The **-pins**, **-ports**, or **-nets** options report all related constraints, including individual pin constraints, block pin constraints, bundle pin constraints, and topological pin constraints on every level set by using a related set or create constraint command.

The **-pins**, **-ports**, or **-nets** options are mutually exclusive with the **pin_constraints_list** and **-no_split** options.

EXAMPLES

The following example displays all related constraints for the I_ALU/Optr pin.

```
prompt> report_pin_constraints -pins [get_pins I_ALU/Optr]
```

SEE ALSO

report_individual_pin_constraints(2)
report_block_pin_constraints(2)
report_bundle_pin_constraints(2)
report_topological_constraints(2)

report_pin_guides

report_pin_guides

Reports the pin guides in the design.

SYNTAX

status **report_pin_guides**
[-verbose]
[-nosplit]
[-significant_digits *digits*]
[*pin_guide_list*]

Data Types

digits int
pin_guide_list list

ARGUMENTS

-verbose

Displays verbose pin guide information, including the associated pins, nets, or ports.

-nosplit

Retains wide lines and does not split lines if column overflows.

-significant_digits *digits*

Specifies the number of digits to the right of the decimal point to report. Allowed values are 0-13; the default is determined by the **shell.common.report_default_significant_digits** application option, whose default is 2. Use this option if you want to override the default.

pin_guide_list

Specifies a list of pin guides to report. The list can contain pin guide names, patterns, or collections. A collection can be specified by using the **get_pin_guides** command. This argument is mutually exclusive with the **-all** option. You must specify one, but not both.

DESCRIPTION

This command reports the user-specified pin guide constraints in the design, as specified by the **create_pin_guide** command. If you use the **-all** option, all pin guides in the design, created by the **create_pin_guide** command are reported.

The report includes pin guide name, boundary, layers, parent modules, exclusivity, pin spacing, and associated pins, nets, or ports.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example reports the pin guide *PIN_GUIDE_1*:

```
prompt> report_pin_guides -verbose PIN_GUIDE_1

Pin Guide         Description
-----------------------------------------------------------------
PIN_GUIDE_1       Boundary:    (0.00 0.00}
                             (0.00, 2000.00)
                             (2000.00, 2000.00)
                             (2000.00, 0.00)
                  Layers:      metal1
                               metal2
                  Parents:     cellA
                  Exclusive:   false
                  Pin Spacing: not specified
                  Pins:        cellA/pin1
                               cellA/pin2
                               cellA/pin3
1
```

report_pin_name_synonym

Reports pin-name synonym definitions.

SYNTAX

status **report_pin_name_synonym**
[-nosplit]

ARGUMENTS

-nosplit

Prevents line splitting. If the information for a given field exceeds the column width, the next field begins on a new line, starting in the correct column.

DESCRIPTION

The report_pin_name_synonym command displays all of the currently defined pin name synonyms.

EXAMPLES

The following command set shows the pin-name synonym settings and then uses the report_pin_name_synonym command to report pin-name synonyms:

```
prompt> set_pin_name_synonym SYN_CD CD
1

prompt> set_pin_name_synonym SYN_QN QN
1

prompt> set_pin_name_synonym -full_name \
    mid1/bot1/LSR0P_at_bot/SYN_R mid1/bot1/LSR0P_at_bot/R

SEE ALSO

remove_pin_name_synonym(2)
set_pin_name_synonym(2)

report_pin_placement

Reports the pin name, layer, side and offset for block pins or top-level terminals in the design.

SYNTAX

string **report_pin_placement**
[-cells *cells*]
[-nets *nets*]
[-pins *pins*]
[-ports *ports*]
[-self]
[-format {layer side offset}]

Data Types

cells collection
nets collection
pins collection
ports collection

ARGUMENTS

-cells *cells*

Specifies the block cells for which to report pin locations. If this option is not specified, the command reports pin locations for all block cells.

-nets *nets*

Specifies the nets for which to report pin locations. If this option is not specified, the command reports pin locations for all nets.

-pins *pins*

Specifies the pins for which to report pin locations. If this option is not specified, the command reports pin locations for all block pins.

-ports *ports*

Specifies the top-level terminals for which to report pin locations. If this option is not specified, the command reports pin locations for all top-level terminals.

-self

Reports output terminal locations for the top-level design. If this option is not specified and the **-cells**, **-nets**, **-pins** and **-ports** options are not specified, the command reports pin locations for all child block cells.

-format {layer side offset}

Limits the report to the specified information. The **-format {layer}** option reports only layer information. The **-format {layer side}** option reports both layer and side. Side is automatically included when you specify offset. By default, the command reports layer, side, and offset for each pin.

The side specifies the side number for a reference block where the pins are inserted. The side number is a positive integer that starts from 1. Given any block with a rectangular or rectilinear shape, the leftmost edge is side number 1. If there are multiple leftmost edges, then edge 1 is the lowest leftmost edge. The sides are numbered in consecutive order proceeded clockwise around the shape. The shape here referring to block

The offset is calculated based on the center of the corresponding pin. The offset specifies the distance in microns from the starting point of a specific side to the block pin's location on that side in clockwise direction. The starting point also follows the clockwise ordering. For instance, for a bottom horizontal side, the starting point is the right vertex of the side as it is counted in clockwise and bottom side's starting point is right point vertex. The side refers to the side of the reference block.

DESCRIPTION

This command reports the cell, layer, side, offset for each block pin or top-level terminal in the design. Use command options to limit to report to specific blocks, nets, pins, or ports. Use the **-self** option to report the placement settings for top-level terminals. Blocks, nets and pins on every level can be reported.

EXAMPLES

The following example writes a report to the terminal that contains the pin layer, side and offset information for pin A.

```
prompt> report_pin_placement -pins [get_pins A] -format {layer side offset}
```

The following example writes a report for all block pins to the pins.rpt file in the local directory.

```
prompt> report_pin_placement > pins.rpt
```

The following example writes a report for all block pins to the pins.rpt file in the local directory. The report contains only the layer for each block pin.

```
prompt> report_pin_placement -format {layer} > pins.rpt
```

SEE ALSO

check_pin_placement(2)
place_pins(2)

report_pipeline_scan_data_configuration

Displays options specified by the **set_pipeline_scan_data_configuration** command.

SYNTAX

status **report_pipeline_scan_data_configuration**

ARGUMENTS

The **report_pipeline_scan_data_configuration** command has no arguments.

DESCRIPTION

This command displays options specified by the **set_pipeline_scan_data_configuration** command on the current design.

The command reports the following information:

- Head Pipeline Clock
- Tail Pipeline Clock
- Head Pipeline Stages
- Tail Pipeline Stages

EXAMPLES

The following is an example of a pipeline scan data configuration report:

```
prompt> report_pipeline_scan_data_configuration
****************************************
Report : Pipeline Specification
Design : top
Version: P-2019.03
Date   : Thu Feb  7 07:07:54 2019
****************************************
```

```
Head Clock Name          PCLK
Tail ClockName           PCLK
Head Pipeline Stage      2
Tail Pipeline Stage      2
```

SEE ALSO

set_pipeline_scan_data_configuration(2)

report_placement

Generates a quality of results (QoR) report for placement, including hard macro placement and standard cell placement.

SYNTAX

status **report_placement**
[-physical_hierarchy_violations all | internal | external | none]
[-voltage_area_violations all | internal | external | none]
[-wirelength all | interface | hard_macro | IO | none]
[-swimming_pool_area]
[-thin_channel_area]
[-hard_macro_route_over]
[-hard_macro_overlap]
[-hard_macro_hierarchy_perimeter]
[-hierarchical]
[-ignore_fixed]
[-error_view *view_name*]
[-verbose minimum | low | high]
[-hard_macro_pin_track_violations all | constrained_only | none]
[-hard_macro_orientation_violations]
[-hard_macro_density_gradient_violations]
[-user_grid]
[-poly_rule]
[-macro_spacing_rule]
[-maximum_swimming_pool_area *value*]
[-maximum_thin_channel_width *value*]
[-maximum_thin_channel_height *value*]

Data Types

view_name string
value float

ARGUMENTS

-physical_hierarchy_violations all | **internal** | **external** | **none**

Specifies the type of placement violations to report. An **internal** violation is caused by a cell that belongs to a block and is placed outside its core area. An **external** violation is caused by a cell that does not belong to a block, but is placed inside the block boundary. **all** reports both internal and external violations. **none** skips physical hierarchy violations. By default, the reporting type is **all**. It is expected that the placer occasionally leaves small, single row height violations on standard cells, so these are not reported. It is expected the legalizer can handle these.

-voltage_area_violations all | **internal** | **external** | **none**

Specifies the type of voltage area macro placement violations to report. An **internal** violation is caused by a cell that belongs to a voltage area which is associated with, but not placed inside it. An **external** violation is caused by a cell that does not belong to a voltage area, but is placed inside the voltage area. **all** reports both internal and external violations. **none** skips voltage area placement violations. By default, the reporting type is **internal**. This command option does not care the legality of standard cell voltage area placement.

-wirelength all | **interface** | **hard_macro** | **IO** | **none**

Specifies which nets to consider when reporting the half perimeter bounding box wirelength of the design. **all** specifies all nets. **interface** specifies nets that cross a physical boundary. **hard_macro** specifies nets that are connected only to hard macros. **IO** specifies nets connected only to I/Os (ports or pads). **none** skips wirelength violations. By default, the reporting type is **all**.

By default, the command reports two wirelength values for the top-level design. The first value is reported by stopping at the subblock pins. If the pin is not assigned, then the closest location for the pin is used. The second, larger wirelength (aka see-through wirelength) value considers the connectivity through the subblocks for the interface nets. If the "-hierarchical" option is used, then these two wirelengths are also reported for subblocks. However, one difference is that the second wirelength for subblocks does not consider subblock port connectivity. This is because that wirelength is already accounted for at the top level.

-swimming_pool_area

Reports the total area in design which is enclosed (or almost enclosed) by blocks, hard macros, soft placement blockages or hard placement blockages. These areas can lead to placement or routing problems and should be covered with a placement blockage or removed.

-thin_channel_area

Reports the total area in design which are thin channels between hard macros (also blocks). Thin channels can lead to placement or routing problems and should be widened or covered with a placement blockage.

-hard_macro_route_over

Reports an estimate of the number of nets that route over the hard macros in the design. Horizontal and vertical routes are reported separately.

-hard_macro_overlap

Reports on overlaps between hard macros and also between hard macros and hard macro blockages. This report will consider any user-defined hard macro keepout margin.

-hard_macro_hierarchy_perimeter

Reports the sum of perimeters for hard macros at the parent level and the grandparent level. The first value reported is the sum of bounding box perimeters for hard macros that belong to the parent hierarchy. The second value reported is the sum of bounding box perimeters for hard macros that belong to the grandparent hierarchy. This option reports the sum of hard macro hierarchy perimeters for all parent and grandparent hierarchies in the design that have at least two hard macros.

-hierarchical

Reports wirelength and violations at the top level and for subblocks in the design. Subblock reports are not generated for I/O wirelength and hard macro route-overs. By default, the command reports only on the current level of physical hierarchy.

-ignore_fixed

Controls whether to skip violations between fixed hard macros and all other hard macros. This only affects the **-physical_hierarchy_violations**, **-hard_macro_overlap** and **-hard_macro_density_gradient_violations** options. This option is typically used for certain special hard macros where overlaps are allowed and are manually created.

-error_view *view_name*

Specifies the name of the file in which to save the generated error view. If this option is not used, no separate error view file is created.

-verbose minimum | low | high

Controls the relative number of messages generated by the command. **minimum** results in the minimal amount of information. **low** results in a one or two page report. **high** indicates no limit to report size. By default, the relative number of messages is **low**.

-hard_macro_pin_track_violations all | constrained_only | none

Reports the sum of illegal pin shapes which are misaligned or color mismatched with wire tracks in hard macros. The values for the parameter are: "all", "constrained_only" and "none". The value "all" means all hard macros in design are checked. The default parameter value is "none" to be backward compatible. Only macros having constraints set with command **set_macro_constraints -align_pins_to_tracks list_of_macros** are considered in "constrained_only" mode for consistency with command **create_placement -floorplan**.

For a legal pin shape aligned with wire track, it meets following two requirements:

(1) The color attribute matched between pin shape and wire track. The following table shows how to judge the color attribute of pin shape and wire track is matched or not:

|--|
| pin_shape| | | | |
track	mask_one	mask_two	no_mask	same_mask
no_mask	no	no	yes	warning
mask_one	yes	no	yes	warning
mask_two	no	yes	yes	warning

If the color attribute of pin shape is not set, tool will recognize its color attribute as no_mask. If the color attribute of wire track is not set, tool will recognize its color attribute as no_mask.

(2) The track center is aligned with pin shape. Without option **-verbose**, this command only reports the sum of illegal pin shapes in hard macros. With the option **-verbose high**, more detailed information for each illegal pin shape is reported.

Pin shape size (width for vertical layer and height for horizontal layer) is larger than the threshold value specified using application option **plan.macro.pin_shape_track_match_threshold** will be ignored in the checking.

The application option **plan.macro.align_pins_on_parallel_edges** controls aligning pin shape along macro edge in the direction parallel to that macro edge. By default, pins are expected to be close to an edge, and to align in the direction perpendicular to that edge.

-hard_macro_orientation_violations

Report the orientation violations of hard macros in the design. The current orientation of a hard macro is considered as its orientation relative to the orientation of its parent block. When the current orientation of the hard macro is not one of its allowed orientations, neither its legal orientations, the report will list the name of the hard macro, its current orientation, allowed orientations and legal orientations. The allowed orientations could be set using command **set_macro_constraints -allowed_orientations**, and the legal orientations could be set using command **set_attribute -name allowable_orientation**. The report will also show the number of cells with orientation violations in each design and the total number of violations.

-hard_macro_density_gradient_violations

Reports the density gradient violations for all hard macros in all layers. This option calculates the density of inner window (Din) and outer window (Dout). If |Din - Dout| >= gradient tolerance, it will report this violation. The parameters used in checking hard macro density gradient violations are specified by the **set_density_gradient_options** command.

-user_grid

Reports violations of the user_grid constraint set on hard macros. The grid can be created by using the **create_grid** command.

And the constraint can be set using command **set_macro_constraints** with the **-alignment_grid** option.

-poly_rule

Reports poly rule violations. The poly rule requires that in a group of continuous poly stripes with the same length, the number of poly stripes must be greater than or equal to N. If the number of poly stripes is less than N, then it must have poly stripes greater than or equal to N on both right and left sides. Here N is the narrow placeable site threshold and can be specified by the **plan.place.poly_rule** application option.

-macro_spacing_rule

Reports on macro spacing rule violations between hard macros. This macro spacing rule is set with the **plan.macro.spacing_rule_widths** and **plan.macro.spacing_rule_heights** application options.

-maximum_swimming_pool_area *value*

Report swimming pools whose area is smaller than the threshold value.

-maximum_thin_channel_width *value*

Report thin channels whose width is smaller than the threshold value. For thin channels whose height is smaller than default threshold that tool computes are also reported.

-maximum_thin_channel_height *value*

Report thin channels whose height is smaller than the threshold value. For thin channels whose width is smaller than default threshold that tool computes are also reported.

DESCRIPTION

This command generates a placement report to indicate the quality of placement. By default, the command reports on the total half perimeter bounding box wirelength in the design and the placement violations in the design. Other reports are available, based on the command options you provide.

EXAMPLES

Here is an example output.

```
prompt> report_placement -hard_macro_overlap

****************************************

report_placement_attractions

Reports placement_attractions in the current design.

SYNTAX

int **report_placement_attractions**
[-verbose]
[-nosplit]
[*placement_attraction_list*]

Data Types

digits int
placement_attraction_list list

ARGUMENTS

-verbose

Displays verbose placement_attraction information.

-nosplit

Does not split lines if column overflows.

placement_attraction_list

Specifies a list of placement_attractions to report. The list may contain bound names, patterns, or collections. A collection may be specified by using the **get_placement_attractions** command.

DESCRIPTION

The **report_placement_attractions** command generates a report about the bound constraints in the design. The report includes the placement_attraction name and a description of the placement_attraction. If **-verbose** is specified, the report also includes placement_attraction region coordinates, dimensions, and cells and ports assigned to the placement_attraction.

If *placement_attraction_list* is specified, those bounds will be reported. If it is not specified, then all placement_attractions in the design will be reported.

EXAMPLES

The following example reports all placement_attractions in the design.

```
prompt> report_placement_attractions *
Placement Attraction          Description
-------------------------------------------------------------------------
attraction1                   Add internal logic: false
                              Effort:          medium
                              Exclude buffers:   edge
                              Region:          floating
1
```

report_placement_ir_drop_target

Report IR drop voltage area targets.

SYNTAX

string **report_placement_ir_drop_target**

ARGUMENTS

DESCRIPTION

This command will show all IR aware placement target settings for all voltage areas in the design. The report has three columns: the voltage area, the low target and the high target. The two target columns are subdivided into a percentage and its type columnn. For each voltage area a row is printed. The number in the percentage column is target number in percentages. The type denotes the type of target: **vdrop** stands for a voltage drop target; **cells** stands for a population target and **default** shows that the target is not set and the default is used. The default for the low target is defined by app option **place.coarse.ir_drop_target_voltage_drop_low_percentage**. For the high target it is defined by app option **place.coarse.ir_drop_target_voltage_drop_high_percentage**.

EXAMPLES

The following example reports the voltage drop settings:

```
prompt> set_placement_ir_drop_target DEFAULT_VA high 2.0
prompt> get_placement_ir_drop_target DEFAULT_VA
{ { DEFAULT_VA high 2.000000 } }
prompt> report_placement_ir_drop_target

Placer: IR aware voltage drop target settings:
Voltage area --target low- -target high-
          vdrop    type vdrop    type
------------- ----- ------- ----- -------
 DEFAULT_VA   1.0 default   2.0   cells

report_placement_spacing_rules

Generates a report of placement spacing rules in the current design as set by commands **set_placement_spacing_label** and **set_placement_spacing_rule**.

SYNTAX

status **report_placement_spacing_rules**

DESCRIPTION

This command generates a placement spacing rule report. It lists

- All placement spacing labels
- The library cells to which they apply, on which side of the library cell in the R0 orientation
- All rules that apply to the given labels

EXAMPLES

The following example reports the placement spacing rules.

```
prompt> report_placement_spacing_rules
------------------------------------------------------
    Placement Spacing Labels:

    Label   side    lib_cell
    SNPS_BOUNDARY
    A       left    tcbn90glvt/AN2LVTD8
                    tcbn90ghvt/AO222HVTD1
                    tcbn90glvt/AO222LVTD0
                    tcbn90ghvt/AOI22HVTD0
                    tcbn90ghvt/BUFFHVTD0
                    tcbn90ghvt/BUFFHVTD3
                    tcbn90glvt/BUFFLVTD16

report_pop_up_object_options

Reports options for command pop_up_objects to pop up objects.

SYNTAX

string **report_pop_up_object_options**
[-object_type *{pg_routing routing_guide blockage pin_guide pin_blockage cells}*]

ARGUMENTS

-object_type *{pg_routing routing_guide blockage pin_guide pin_blockage cells}*

Specifies the types of the objects whose options will be displayed. You can specify one or more of the supported object types by using the keywords: pg_routing, routing_guide, blockage, pin_guide, pin_blockage and cells. If *-object_type* is not specified, the settings for all object types are reported.

DESCRIPTION

This command reports options for command pop_up_objects.

EXAMPLES

The following example reports the options for *pg_routing* .

prompt> **report_pop_up_object_options -object_type pg_routing**

SEE ALSO

report_port

Displays port information within the design.

SYNTAX

string **report_ports** [-verbose]
[-design_rule]
[-drive]
[-input_delay]
[-output_delay]
[-nosplit]
[*port_list*]

list *port_list*

ARGUMENTS

-verbose

Indicates that the port report includes all port information. By default, only a summary section is displayed that lists all ports and their direction.

-design_rule

Reports only port design rule information, including maxCap, manLoad, and maxFanout.

-drive

Reports only drive resistance, input transition time, and driving cell information for only input and inout ports.

-input_delay

Reports only the port input delay information you set.

-output_delay

Reports only the port output delay information you set.

-nosplit

Prevents line splitting if column overflows. Most design information is listed in fixed-width columns. If the information for a given field exceeds the column width, the next field begins on a new line, starting in the correct column. This option prevents line-splitting and facilitates writing software to extract information from the report output.

port_list

Displays information on these ports in the current design. Each element in this list is either a collection of ports or a pattern

matching the port names.

DESCRIPTION

Displays information about ports in the current design. By default, the command produces a brief report including all ports in the design.

The input and output delay information lists the minimum rise, minimum fall, maximum rise, maximum fall delays, and the clock to which the delay is relative. If "(f)" follows the clock name, the delay is relative to the falling edge of the clock; otherwise the delay is relative to the rising edge. If "(l)" follows the clock name, input delay is considered to be coming from a level-sensitive latch, or output delay is considered to be going to a level-sensitive latch. By default, the delay is relative to a rising edge-triggered device.

Some information, such as whether the port is in an ideal network or not, is displayed after a timing update (as a result of manually executing an update_timing function or experiencing an implicit timing update as a result of executing other commands). This behavior is intended to help you to obtain information and statistics about ports without incurring the cost of a complete timing update.

EXAMPLES

This example shows the default port report.

```
prompt> report_ports

****************************************
Report : port
 ...

****************************************

report_port_buses

Displays port bus information within the design.

SYNTAX

string **report_port_buses**
[-verbose]
[-nosplit]
[*port_bus_list*]

Data Types

port_bus_list string or collection

ARGUMENTS

-verbose

Includes in the output the name of each member port. By default, a summary section is displayed that lists all port buses, their start bit, end bit, and bit order.

-nosplit

Prevents line splitting if the column overflows. Most design information is listed in fixed-width columns. If the information for a given field exceeds the column width, the next field begins on a new line, starting in the correct column. This option prevents line-splitting and facilitates writing software to extract information from the report output.

port_bus_list

Displays information only on the specified ports buses in the current design. *port_bus_list* contains either a collection of port buses or a pattern that matches the port buses names.

DESCRIPTION

This command displays information about port buses in the current design. By default, the command produces a brief report including all port buses in the current design, their start bit, end bit, and bit order.

EXAMPLES

This example outputs the default port bus report.

```
prompt> report_port_buses

****************************************
Report : report_port_buses

report_port_protection_diodes

Reports the port protection diodes in the current design.

SYNTAX

status **report_port_protection_diodes**

ARGUMENTS

This command has no arguments.

DESCRIPTION

The **report_port_protection_diodes** command reports the port protection diodes in the current design.

The reporting format is shown as below:

```
************************************************************
 Diode_Name        Location          Protected_Port
************************************************************

Number of ports with one diode             :
Number of ports with more than one diode   :
Number of ports with no diode              :
```

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example runs the **report_port_protection_diodes** command.

```
prompt> report_port_protection_diodes
```

report_ports

Displays port information within the design.

SYNTAX

string **report_ports** [-verbose]
[-design_rule]
[-drive]
[-input_delay]
[-output_delay]
[-nosplit]
[*port_list*]

list *port_list*

ARGUMENTS

-verbose

Indicates that the port report includes all port information. By default, only a summary section is displayed that lists all ports and their direction.

-design_rule

Reports only port design rule information, including maxCap, manLoad, and maxFanout.

-drive

Reports only drive resistance, input transition time, and driving cell information for only input and inout ports.

-input_delay

Reports only the port input delay information you set.

-output_delay

Reports only the port output delay information you set.

-nosplit

Prevents line splitting if column overflows. Most design information is listed in fixed-width columns. If the information for a given field exceeds the column width, the next field begins on a new line, starting in the correct column. This option prevents line-splitting and facilitates writing software to extract information from the report output.

port_list

Displays information on these ports in the current design. Each element in this list is either a collection of ports or a pattern

matching the port names.

DESCRIPTION

Displays information about ports in the current design. By default, the command produces a brief report including all ports in the design.

The input and output delay information lists the minimum rise, minimum fall, maximum rise, maximum fall delays, and the clock to which the delay is relative. If "(f)" follows the clock name, the delay is relative to the falling edge of the clock; otherwise the delay is relative to the rising edge. If "(l)" follows the clock name, input delay is considered to be coming from a level-sensitive latch, or output delay is considered to be going to a level-sensitive latch. By default, the delay is relative to a rising edge-triggered device.

Some information, such as whether the port is in an ideal network or not, is displayed after a timing update (as a result of manually executing an update_timing function or experiencing an implicit timing update as a result of executing other commands). This behavior is intended to help you to obtain information and statistics about ports without incurring the cost of a complete timing update.

SEE ALSO

report_design(2)
report_hierarchy(2)
report_net(2)
report_cell(2)
report_references(2)

report_power

Calculates and reports dynamic and static power for the design or instance.

SYNTAX

status **report_power**
[-net_power]
[-cell_power]
[objects *cell_or_net_list*]
[-hierarchy]
[-blocks]
[-early]
[-levels *level_value*]
[-leaf]
[-include_boundary_nets]
[-scenarios *scenario_list*]
[-modes *mode_list*]
[-corners *corner_list*]
[-significant_digits *digits*]
[-nosplit]
[-verbose]
[-force]

Data Types

cell_or_net_list list
level_value integer
scenario_list list
mode_list list
corner_list list
digits integer

ARGUMENTS

-net_power

Reports the power consumption of nets. Use the **-net_power** option alone, or use it with the **-cell_power** option. By default, only the summary power information for the design is reported when neither option is specified.

-cell_power

Reports the power consumption of cells. When you use the **-cell_power** option, some entries in the power report might not apply to certain cells. The column entry for such cells is annotated with N/A. Use the **-cell_power** option alone or with the **-net_power** option to report the cells and nets. By default, only the summary power information for the design is reported when neither option

is specified.

objects *cell_or_net_list*

Specifies a list of cells and nets to display with the **-net_power** or **-cell_power** options. With this option, only the cells and nets in the *cell_or_net_list* are listed in the power report. If both **-net_power** and **objects** options are specified, the *cell_or_net_list* must contain at least one net. Similarly, if both **-cell_power** and **objects** options are specified, the *cell_or_net_list* must contain at least one cell. If the **-net_power**, **-cell_power**, and **objects** options are specified together, the *cell_or_net_list* must contain at least one net and one cell.

-hierarchy

Specifies that the report is written in a hierarchical format, with power information reported on a block-by-block basis. Use the **-levels** option to limit the number of levels of hierarchy shown in the report. The switching, internal, and leakage power numbers are reported for each hierarchical block. The hierarchy is shown through indentations.

-blocks

Specifies that a physical-block oriented report should be written. The report will contain the per-physical-block power consumption for all power groups that are present in the block. Use the -levels option to indicate how many levels of physical hierarchy should be reported. The default number of levels is 0, indicating that no block-specific power should be reported. Only a accumulation of all sub-block power will be printed. A typical -levels value of 1 will print a power report for each first-level sub block and a power report for the top-level design. Power reporting with physical hierarchy supports abstract views of blocks, provided that the abstracts were generated with the *abstract.annotate_power* application option set to true.

-early

Reports power numbers for early timing. The default is to report for late timing.

-levels *level_value*

Specifies the number of levels of hierarchy to display in the hierarchical report. You can specify a positive integer greater than 1 with this option. Hierarchy levels deeper than those specified in this option are not shown in the hierarchical report. This option is only used for the hierarchical report and is ignored for all other types of reports.

-leaf

Specifies that the power report traverse the hierarchy and report objects at all lower levels (assumes a flat design hierarchy). The default behavior is to report objects at only the current level of hierarchy. For cell report, if the **-leaf** option is not specified, the power reported for a subdesign is the total power estimated for that subdesign, including all of its contents.

-include_boundary_nets

Specifies that the switching power of primary input nets must be counted when generating the power report; the default is to exclude boundary input nets.

-scenarios *scenario_list*

Specifies the scenarios to be considered. If this option is not specified, then only those scenarios are considered which contain the modes and corners specified through **-modes** and **-corners** options. Output of the command is generated separately for each scenario. If none of the **-modes**, **-corners**, or **-scenarios** options are specified, the command reports for the current scenario in the design.

-modes *mode_list*

Specifies the mode filter on the set of scenarios to be considered. A scenario is considered if its mode is present in *mode_list*. If this option is not specified, no filtering on modes will occur.

-corners *corner_list*

Specifies the corner filter on the set of scenarios to be considered. A scenario is considered if its corner is present in *corner_list*. If

this option is not specified, no filtering on corners will occur.

-significant_digits *digits*

Specifies the number of digits to the right of the decimal point to report. Allowed values are from 0 to 13. The default is 2.

-nosplit

Prevents line-splitting and facilitates writing scripts to extract information from the report output. Most of the design information is listed in fixed-width columns. If the information in a given field exceeds the column width, the next field begins on a new line starting in the correct column.

-verbose

Writes additional information to the report. By default, this option is enabled.

-force

Generates the power report for all the specified active/inactive scenarios irrespective of the leakage_power/dynamic_power flags of a scenario. Since timing data is not available for inactive scenarios, dynamic power numbers will not be accurate for -force option.

DESCRIPTION

The **report_power** command calculates and reports power for a design. The command uses the user-annotated switching activity to calculate the net switching power, cell internal power, and cell leakage power, and displays the calculated values in a power report. The **report_power** command requires switching activity information on all design nets, and uses a switching activity propagation mechanism to estimate switching activity information on non-annotated design objects.

The options enable you to specify cells and nets for reporting. The default operation is to display the summary of power values for only the current design. If user specified power groups are present then they are also reported in the summary along with the default power groups. Column 'Attrs' in summary report indicates whether the power group is user specified or default power group. If 'power.report_user_power_groups' is set as 'exclusive' then default and user power groups are reported in one table itself in the summary report. If the app option value is 'inclusive' then summary report has two tables, default power groups table followed by user power groups table.

Leakage power analysis is disabled if leakage_mode power app option is 'off' or leakage_power flag of a scenario is 'false'. Swcap power analysis is disabled if swcap_mode power app option is 'off' or dynamic_power flag of a scenario is 'false'. Internal power analysis is disabled if internal_mode power app option is 'off' or dynamic_power flag of a scenario is 'false'. The -force option can not override the leakage_mode / swcap_mode / internal_mode app options, but it can be used to override the leakage_power/dynamic_power flags of a scenario.

Multicorner-Multimode Support

report_power_budget

Reports the power budget values for either the current design or a list of cells in the design.

SYNTAX

status **report_power_budget**
[-scenarios *scenario_list*]
[-significant_digits *digits*]
[-nosplit]
[-cell *cell_list*]

Data Types

scenario_list	list
digits	integer
cell_list	list

ARGUMENTS

-scenarios *scenario_list*

Indicates the scenario for which the budget values are reported. If no scenario is specified, the current_scenario is used.

-significant_digits *digits*

Specifies the number of digits to the right of the decimal point to report. Allowed values are from 0 to 13. The default is 2.

-nosplit

Prevents line-splitting and facilitates writing scripts to extract information from the report output. Most of the design information is listed in fixed-width columns. If the information in a given field exceeds the column width, the next field begins on a new line starting in the correct column.

-cell *cell_list*

Specifies a list of cells for which the power budget values are reported.

DESCRIPTION

This command is used to report the budget values either for the design or for specific cells in the design.

If the command is called with the -cell option specified, then budget reports will only be issued for the instances specified in the cell

list.

For significant digits used in power budget report, the -significant_digits option can be used. By default, the number of significant digits used to display values is 2.

Multicorner-Multimode Support

[-early]
[-rise]
[-fall]
[-scenarios *scenario_list*]
[-significant_digits *digits*]
[-verbose]
object_list

Data Types

pin_value_pair_list list
scenario_list list
digits integer
object_list string or collection

ARGUMENTS

-rise

Specifies that the internal power report should be limited to rise transitions only. If not specified, both rise and fall transitions are reported, which is equivalent to specifying both the **-rise** and **-fall** options.

-fall

Specifies that the internal power report should be limited to fall transitions only. If not specified, both rise and fall transitions are reported, which is equivalent to specifying both the **-rise** and **-fall** options.

-early

Reports power numbers for early timing. The default is to report for late timing.

-scenarios *scenario_list*

Specifies the scenarios to be considered for detailed power reporting. If this option is not specified, the scenario set currently in the design is considered.

-transition *pin_value_pair_list*

Specifies the total of rise and fall transitions that can be used to print the calculation of the virtual internal power of a module. Internally, half of this value is used for each of the rise and the fall transitions. It is specified as a list of {pin, value} pairs where the pin can either be a port in a module or a pin in an instance. The effect on internal power can be determined by varying the values specific to each port or pin of the module or the instance. Only one object can be specified in the **object_list** when this option is used and it has to be either a module or an instance. This option can not be specified with any of the **-rise_transition** and **-fall_transition** options.

-rise_transition *pin_value_pair_list*

Specifies the rise transition that can be used to print the calculation of the virtual internal power of a module. It is specified as a list of {pin, value} pairs where the pin can either be a port in a module or a pin in an instance. The effect on internal power can be determined by varying the values specific to each port or pin of the module or the instance. Only one object can be specified in the **object_list** when this option is used and it has to be either a module or an instance. This option can not be specified with the **-transition** option.

-fall_transition *pin_value_pair_list*

Specifies the fall transition that can be used to print the calculation of the virtual internal power of a module. It is specified as a list of {pin, value} pairs where the pin can either be a port in a module or a pin in an instance. The effect on internal power can be determined by varying the values specific to each port or pin of the module or the instance. Only one object can be specified in the **object_list** when this option is used and it has to be either a module or an instance. This option can not be specified with the **-transition** option.

-capacitance *pin_value_pair_list*

Specifies the total of rise and fall capacitance values that can be used to print the calculation of the virtual internal power of a module. Internally, half of this value is used for each of the rise and the fall capacitance values. It is specified as a list of {pin, value} pairs where the pin can either be a port in a module or a pin in an instance. The effect on internal power can be determined by varying the values specific to each port or pin of the module or the instance. Only one object can be specified in the **object_list** when this option is used and it has to be either a module or an instance.

-toggle_rate *pin_value_pair_list*

Specifies the total of rise and fall toggle rates that can be used to print the calculation of the virtual internal power of a module. Internally, half of this value is used for each of the rise and the fall toggle rates. It is specified as a list of {pin, value} pairs where the pin can either be a port in a module or a pin in an instance. The effect on internal power can be determined by varying the values specific to each port or pin of the module or the instance. Only one object can be specified in the **object_list** when this option is used and it has to be either a module or an instance.

-probability *pin_value_pair_list*

Specifies the probability value that can be used to print the calculation of the virtual internal power of a module. It is specified as a list of {pin, value} pairs where the pin can either be a port in a module or a pin in an instance. The effect on internal power can be determined by varying the values specific to each port or pin of the module or the instance. Only one object can be specified in the **object_list** when this option is used and it has to be either a module or an instance.

-significant_digits *digits*

Specifies the precision for floating point numbers to report. Allowed values are from 0 to 13. The default is 2.

-verbose

Writes detailed information to the report. Without this option, only the total power numbers for objects are shown.

object_list

Specifies the pin, net, instance or module for which to report the power calculation. If object is module or instance, with or without cap/tran/toggle/prob specified, internal/swcap/leakage power will be computed. If object is net, switching power will be computed else if object is pin, internal power will be computed.

DESCRIPTION

The **report_power_calculation** command provides detailed power calculation information for a specified pin, cell, module or net. You can use this information for debugging or verifying power data in a technology library. The application options - (power.internal_mode, power.swcap_mode, power.leakage_mode) control the output of this command. If the internal mode is off then the internal power is not reported at all. Similarly is the case with other application options. If all three application options are off then, a warning is issued just like it is done in the case of **report_power** command.

Multicorner-Multimode Support

EXAMPLES

The following example outputs a virtual internal power report for a module.

```
prompt> report_power_calculation stdcell_lib/MXI2X1M \
  -capacitance {{A 1.0} {B 2.0} {Y 6.0}} \
  -transition {{A 2.2} {S0 3.4} {Y 2.4}} \
  -toggle_rate {{A 11.0} {B 12.0} {Y 13.0}} \
  -probability {{A 0.8} {B 0.9} {Y 0.4}}

[INTERNAL POWER CALCULATION] (libcell: stdcell_lib/MXI2X1M)

Warning: Power table extrapolation (extrapolation mode) for port Y on
module stdcell_lib/MXI2X1M for parameter Cout. Lowest table
value = 0.000583, highest table value = 0.126985, value = 6.000000 (POW-046)
Warning: Power table extrapolation (extrapolation mode) for port Y on
module stdcell_lib/MXI2X1M for parameter Tinp. Lowest table
value = 0.047080, highest table value = 2.000000, value = 0.000000 (POW-046)

 Total Internal Power: 0.33171

---------------------------------------------------------------------
Total Internal Power for this libcell in scenario 'default' is 0.33171 mW
---------------------------------------------------------------------
```

The following example shows an internal power report for an instance when some of its parameters such as transition and probability have been modified.

```
prompt> report_power_calculation GPRs/U2199 \
  -capacitance {{A 1.0} {B 2.0} {Y 6.0}} \
  -transition {{A 2.2} {S0 3.4} {Y 2.4}} \
  -toggle_rate {{A 11.0} {B 12.0} {Y 13.0}} \
  -probability {{A 0.8} {B 0.9} {Y 0.4}}

[INTERNAL POWER CALCULATION] (cell: GPRs/U2199)
```

```
Warning: Power table extrapolation (extrapolation mode) for port Y
on cell GPRs/U2199 for parameter Cout. Lowest table value = 0.000583,
highest table value = 0.126985, value = 6.000000 (POW-046)

 Total Internal Power: 0.331765

---------------------------------------------------------------------
Total Internal Power for all cells in scenario 'default' is 0.331765 mW
---------------------------------------------------------------------
```

The following example shows the switching power section in the report for an instance that has been modified.

```
prompt> report_power_calculation Product[26] -verbose

[SWITCHING POWER CALCULATION] (net: Product[26])

Operating Environment:
   mode: default
   corner: default
   scenario: default
   voltage: 0.9
   temp: 125

Net Switching Power Calculation
net: Multiplier/Product[26]
driver: Multiplier/S_reg_reg_26_/Q

Switching power = 0.000169667
   net switching power = switching energy * net toggle rate

   Switching Energy Per Transition = 0.00509
     switching energy = 0.5 * capacitance * voltage ^ 2
     total net capacitance = 0.0125679
     voltage = 0.9
   Net Toggle Rate = 0.0333333 (default)

---------------------------------------------------------------------
```

SEE ALSO

report_power(2)

report_power_clock_scaling

Reports the clock frequency scaling values stored.

SYNTAX

status **report_power_clock_scaling**
[-scenarios *scenarios*]
[clock_list]

Data Types

scenarios list
clock_list list

ARGUMENTS

-scenarios *scenarios*

Specify a list of scenarios for which the scaling factor is to be retrieved, if found. If not specified, then scaling data is filtered for only the clock objs specified through clock_list option. If both scenarios and clocks are not specified then complete scaling data is printed.

clock_list

Specify a list of clocks in the design for which the scaling factor is to be retrieved, if found. If not specified, then scaling data is filtered for only the scenarios specified through -scenarios option. If both scenarios and clocks are not specified then complete scaling data is printed.

DESCRIPTION

Clock frequency used in Switching Activity Interchange Format (SAIF) files, from logic simulation for functional verification can differ from the clock frequency used in Synopsys Design Constraints (SDC) file for timing and power analysis. This command reports the scaling factors stored in the set_power_clock_scaling command.

The clock_objects option in this command is a list of clocks in the design that have the specified period or ratio values used in simulation for SAIF generation. The scenarios are the ones for which the scaling factors are to be retrieved and displayed. Note that if both the scenario and the clock options are not specified then the complete scaling data for all the scenarios is displayed.

When period value is specified for a clock, then the scaling ratio is calculated as the ratio of (period of the clock from set_power_clock_scaling cmd) / (period of the fastest clock of an object). This ratio is applied to the retrieved simulated activity of the object. If the ratio value is specified then it is directly applied as the scaling ratio.This ratio is applied to the retrieved simulated

activity of the object.

Multicorner-Multimode Support

EXAMPLES

The following examples describe the behaviour of the cmd.

```
prompt> set_power_clock_scaling {CLK CLK2 C_A} -period 2.6
prompt> set_power_clock_scaling -ratio 1
prompt> report_power_clock_scaling
------------------------------------------------------------
        Clock Scaling Data
------------------------------------------------------------
Scenario:default, Clock name:CLK, Period:2.600000
Scenario:default, Clock name:CLK2, Period:2.600000
Scenario:default, Clock name:C_A, Period:2.600000
------------------------------------------------------------
Scaling Ratios for Scenarios without Clocks

set_power_clock_scaling(2)
reset_power_clock_scaling(2)
get_power_clock_scaling(2)

report_power_derate

Reports the power derating factors for either the current design, a list of cells, or library cells in the current design. If no scenario is specified the current scenario is used.

SYNTAX

status **report_power_derate**
[-scenarios *scenario_list*]
[-include_inherited]
[-significant_digits *digits*]
[-nosplit]
[*object_list*]

Data Types

scenario_list	list
digits	integer
object_list	list

ARGUMENTS

-scenarios *scenario_list*

Indicates the scenario for which the derate_value is applied. If no scenario is specified the current_scenario is used.

-include_inherited

Indicates that the power derating factors reported on each object should also include those set by other objects in the design.

-significant_digits *digits*

Specifies the number of digits to the right of the decimal point to report. Allowed values are from 0 to 13. The default is 2.

-nosplit

Prevents line-splitting and facilitates writing scripts to extract information from the report output. Most of the design information is listed in fixed-width columns. If the information in a given field exceeds the column width, the next field begins on a new line starting in the correct column.

object_list

Specifies current design or a list of cells or library cells to which the specified power derating factor is applied. Note groups and object_list are mutually exclusive option.

DESCRIPTION

This command is used to report the derate factors either on the design, specific cells or library cells of the design. If this command is called without any option, a separate report will be invoked for the power derating factors stored on the current design and also for each cell or library cell that has power derating factors set on it.

If this command is called with option -include_inherited each row containing an inherited derating factor will contain a column entry indicating the object from which it was inherited. If the command is called with the object_list specified then derate reports will only be issued for the instances specified in the object list.

For significant digits used in power derate report, the -significant_digits option can be used. By default, the number of significant digits used to display values is 2.

Multicorner-Multimode Support

report_power_domain

Reports information about the specified power domains.

SYNTAX

status **report_power_domains**
[-nosplit]
[*power_domains*]

Data Types

power_domains list

ARGUMENTS

-nosplit

Does not split lines if column overflows.

power_domains

Specifies the power domains to be reported. The command fails if it does not find any of the specified power domains. If this option is not specified the command reports all power domains in the current scope.

DESCRIPTION

The **report_power_domains** command reports detailed information about existing power domains. If you specify the power domains, only those power domains are reported; otherwise all power domains in the current scope are reported.

Until commit_upf command is executed and power intent is finalized, power domains of subblocks are not propagated and will not be included in the report.

The following information is reported for each power domain:

- The full name of the power domain
- The current scope
- The elements of the power domain
- The voltage area of the power domain
- The supply nets available for use in the power domain

- The supply sets available for use in the power domain
- The default supply nets of the power domain and their voltages if set using the **set_voltage** command
- The power switches of the power domain
- The isolation strategies of the power domain
- The level shifter strategies of the power domain
- The repeater strategies of the power domain
- The retention strategies of the power domain

EXAMPLES

The following example reports all the power domains in the current scope:

report_power_domains

Reports information about the specified power domains.

SYNTAX

status **report_power_domains**
[-nosplit]
[*power_domains*]

Data Types

power_domains list

ARGUMENTS

-nosplit

Does not split lines if column overflows.

power_domains

Specifies the power domains to be reported. The command fails if it does not find any of the specified power domains. If this option is not specified the command reports all power domains in the current scope.

DESCRIPTION

The **report_power_domains** command reports detailed information about existing power domains. If you specify the power domains, only those power domains are reported; otherwise all power domains in the current scope are reported.

Until commit_upf command is executed and power intent is finalized, power domains of subblocks are not propagated and will not be included in the report.

The following information is reported for each power domain:

- The full name of the power domain
- The current scope
- The elements of the power domain
- The voltage area of the power domain
- The supply nets available for use in the power domain

- The supply sets available for use in the power domain
- The default supply nets of the power domain and their voltages if set using the **set_voltage** command
- The power switches of the power domain
- The isolation strategies of the power domain
- The level shifter strategies of the power domain
- The repeater strategies of the power domain
- The retention strategies of the power domain

EXAMPLES

The following example reports all the power domains in the current scope:

```
prompt> report_power_domains

SEE ALSO

create_power_domain(2)
get_power_domains(2)

report_power_groups

Reports existing power groups and number of cells attached to that power group.

SYNTAX

status **report_power_groups**
[*group_names*]

Data Types

group_names list

ARGUMENTS

group_names

Specifies the power group names that needs to be reported. If this option is not present, all the power groups (user specified and default power groups) are reported.

DESCRIPTION

The report_power_groups command reports all the existing power groups(user and default power groups) and number of cells present in each of these power groups. The report depends on the value of app option 'power.report_user_power_groups'

Multicorner-Multimode Support

This command has no dependency on scenario-specific, mode-specific, or corner-specific information.

EXAMPLES

The following example report power groups macro1 and memory.

prompt> **report_power_groups {macro1 memory}**

SEE ALSO

set_power_group(2)
reset_power_group(2)
get_power_group(2)
get_power_group_objects(2)
report_power(2)
power.report_user_power_groups(3)

report_power_io_constraints

Reports power constraints set on specified I/O guides.

SYNTAX

int **report_power_io_constraints**
[-io_guide_list *io_guides*]
[-significant_digits *digits*]

Data Types

io_guides list
digits int

ARGUMENTS

-io_guide_list

Specifies the names or collection of the target I/O guides. If this option is not used, all I/O guides are selected.

-significant_digits *digits*

Specifies the number of digits to the right of the decimal point to report. Allowed values are 0-13; the default is determined by the **shell.report_default_significant_digits** application option, whose default is 2. Use this option if you want to override the default.

DESCRIPTION

This command reports power constraints set on I/O guides. There are four power constraint categories for each type of power pads: ratio, share, spacing, and offset. If there is no constraint on any category, nothing is reported. If some categories, but not all categories, have constraints, the unconstrained categories are reported with the string "no constraint".

EXAMPLES

The following example reports power constraints on an I/O guide named "north".

prompt> **report_power_io_constraints -io_guide_list north**

The following example reports power constraints on all I/O guides.

```
prompt> report_power_io_constraints
```

SEE ALSO

place_io(2)
set_signal_io_constraints(2)
set_power_io_constraints(2)
remove_power_io_constraints(2)

report_power_model

Report information of power models in the design.

SYNTAX

status **report_power_model**
[-csv]
[-example]
[-html]
[-output *output_file*]
[-verbose]

ARGUMENT

-csv

Print report in CSV (Comma-Separated Value) format.

-example

Display a list of typical example usages of this command.

-html

Print report in HTML format.

-output <*output_file*>

Print report into <*output_file*>.

-verbose

Report detailed information about power models in the design.

DESCRIPTION

This command reports power model information. It includes information about power domains created in the **define_power_model** command and applied in the **apply_power_model** command.

In verbose mode, it also displays detailed information about the options used in the **define_power_model** and **apply_power_model** commands.

EXAMPLES

The following example reports all power models found in the design:

```
prompt> report_power_model
****************************************
Report : report_power_model

```

SEE ALSO

apply_power_model(2)
define_power_model(2)

report_power_scopes

Reports information about the power scopes of the design.

SYNTAX

status **report_power_scopes**
[-nosplit]

ARGUMENTS

-nosplit

Does not split lines if column overflows.

DESCRIPTION

The **report_power_scopes** command enables you to get detailed information about existing power scopes in the current design.

Until commit_upf command is executed and power intent is finalized, power intent of subblocks are not propagated and will not be included in the report.

The report includes the name of the scope and all the power domains, supply ports, supply nets, supply sets and power state tables that are defined in each scope.

EXAMPLES

The following example reports all the power scopes in the current design:

```
prompt> report_power_scopes
****************************************
Report : Power Scope
 ...

****************************************
--------------------------------------------------
Scope           : top (top level)
Power Domains   : pd
Supply Ports    : vdd, vdd1
```

```
    Supply Nets       : vdd, vdd1
    Supply Sets       : vddset, vddset1
    Power State Tables : pst, pst1
    ---------------------------------------------------
    Scope             : U11
    Power Domains     : pd3
    Supply Ports      : vdd_port, vdd_port1
    Supply Nets       : vdd, vdd1
    Supply Sets       : vddset, vddset1
    Power State Tables :
    ---------------------------------------------------
```

SEE ALSO

report_power_switch_patterns

Reports power switch patterns.

SYNTAX

status **report_power_switch_patterns**
[-nosplit]
[*pattern_name*]

Data Types

pattern_name string

ARGUMENTS

-nosplit

Does not split lines if column overflows.

pattern_name

Specifies the power switch pattern name. By default, the command reports all the defined power switch patterns. Report includes the HEAD pin and TAIL pins of the patterns specified. Please note, in case of HFN connections only HEAD pins will be reported.

DESCRIPTION

This command reports power switch patterns.

EXAMPLES

The following example reports the power switch patterns in the design.

```
prompt> report_power_switch_patterns
Pattern             :
  Head
    Tail
PSW_PATTERN_INST_pattern2_0 :
  InstDecode/headerfooter_snps_INST__inst_sw_snps_HEAD64DM_R0_C0_0/SLEEP
```

InstDecode/headerfooter_snps_INST__inst_sw_snps_HEAD32DM_R3_C0_3/SLEEPOUT

SEE ALSO

create_power_switch_array(2)
set_power_switch_placement_pattern(2)
get_power_switch_patterns(2)
connect_power_switch(2)

report_power_switch_placement_patterns

Reports power switch placement patterns.

SYNTAX

status **report_power_switch_placement_patterns**
[*pattern_name*]

Data Types

pattern_name string

ARGUMENTS

pattern_name

Specifies the power switch placement pattern name. By default, the command reports the power switch placement patterns for all defined pattern names.

DESCRIPTION

This command reports power switch placement patterns.

EXAMPLES

The following example reports the power switch placement patterns in the design.

prompt> **report_power_switch_placement_patterns**

SEE ALSO

create_power_switch_ring(2)
create_power_switch_array(2)
set_power_switch_placement_pattern(2)

report_pr_rules

Reports information about the cell row spacing rules defined in the specified technology object.

SYNTAX

status **report_pr_rules**
[-tech *tech_object*]
[-library *library*]
[-nosplit]
[-all]
[*patterns*]

Data Types

tech_object collection
library collection
patterns collection

ARGUMENTS

-tech *tech_object*

Specifies the technology object from which to report the cell row spacing rules.

The **-tech** and **-library** options are mutually exclusive; you can specify only one. If you do not specify either option, the rules are reported from the technology object of the current library.

-library *library*

Specifies the library from which to report the cell row spacing rules. The command reports the rules from the technology object associated with the specified library. In an implementation tool, the library is a design library. In the library manager, the library is a cell library. You can specify the library using the library's name or a collection that contains the library.

The **-tech** and **-library** options are mutually exclusive; you can specify only one. If you do not specify either option, the rules are reported from the technology object of the current library.

-nosplit

Prevents line splitting if the column overflows. Most information is listed in fixed-width columns. If the information for a given field exceeds the column width, the next field begins on a new line, starting in the correct column.

This option prevents line-splitting and facilitates writing software to extract information from the report output.

-all

Reports all cell row spacing rules.

The **-all** option and *patterns* argument are mutually exclusive; you must specify one.

patterns

Reports the cell row spacing rules that match the specified patterns. You can specify a list of patterns or a collection of cell row spacing rules.

The **-all** option and *patterns* argument are mutually exclusive; you must specify one.

DESCRIPTION

This command reports information about the cell row spacing rules in the specified technology object.

EXAMPLES

The following example reports information about all the cell row spacing rules in the technology object of the current library.

```
prompt> report_pr_rules -all
****************************************
Report : report_pr_rules
****************************************
Name            Property Name          Value
-------------------------------------------------
PR_RULE_0       row_spacing_top_top    0
                row_spacing_top_bot    1.03
                row_spacing_bot_bot    0
                abut_table_top_top     1
                abut_table_top_bot     0
                abut_table_bot_bot     1
1
```

The following example reports information about the cell row spacing rule named PR_RULE_0.

```
prompt> report_pr_rules PR_RULE_0
****************************************
Report : report_pr_rules
****************************************
Name            Property Name          Value
-------------------------------------------------
PR_RULE_0       row_spacing_top_top    0
                row_spacing_top_bot    1.03
                row_spacing_bot_bot    0
                abut_table_top_top     1
                abut_table_top_bot     0
                abut_table_bot_bot     1
1
```

report_programmable_spare_cell_mapping_rule

This command report rules for programmable spare cells mapping.

SYNTAX

status **report_programmable_spare_cell_mapping_rule**
-psc_type_id *id_list* | -all

Data Types

id_list list

ARGUMENTS

-psc_type_id *id_list*

Specify the list of psc_type_id of which the mapping rules will be reported. This option is mutually exclusive with option *-all*.

-all *id_list*

Report all mapping rules for all psc types. This option is mutually exclusive with option *-psc_type_id*.

DESCRIPTION

This command report rules for programmable spare cells mapping. Users can specify the list of psc_type_id to report mapping rules or report all mapping rules for all types.

The report summary is as the following.

```
****************************************
Report : PSC Mapping Rule Report
Design : r4000
Version: M-2016.12-SP2-BETA
Date   : Tue Jan 19 22:19:13 2017
****************************************
   PSC Type 1:
      Not Overlap Layers:    M1
      Compatible PSC Types:  2

   PSC Type 2:
```

```
    Partial Overlap Layers: M1
    Partial Overlap Side:   Right
    Compatible PSC Types:   1

  PSC Type 3:
    Partial Overlap Layers: M1
    Partial Overlap Side:   Right
    Split PSC Types:        2
    Merge PSC Types:        1, 2
```

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example report the rule for psc_type_id 1 and 2.

```
prompt> report_programmable_spare_cell_mapping_rule -psc_type_id {1 2}\
```

The following example report all rules.

```
prompt> report_programmable_spare_cell_mapping_rule -all\
```

SEE ALSO

map_freeze_silicon(2)

report_pst

Reports the power state table(s) in the current design.

SYNTAX

status **report_pst**
[-derived]
[-reconcile]
[-psts *pst_list*]
[-supplies *supply_list*]
[-voltage_type *voltage_type*]
[-nosplit]

Data Types

pst_list list
supply_list list
voltage_type none|nominal|all

ARGUMENT

-derived

Report the derived PST of the design.

-reconcile

Report the voltage reconciliation settings of the design. Reconciliation setting can be done by set_design_attribute of upf_reconcile_boundary attribute and set_variation command. The report is done after resolving supply variations between top level design and block level designs.

-psts *pst_list*

Specifies a list of user-defined power state tables to be included in the report. By default, all used-defined power state tables in the current scope and child scopes are included. This option is mutually exclusive with the **-derived** option. When referencing any PSTs that are not in the top scope, the scope of the PST must be given. For example, if a PST name 'pst' is defined at scope 'u0', it must be referenced as 'u0/pst'.

-supplies *supply_list*

Specifies a list of supply nets, supply ports, or supply set functions to be included in the report. The order of supplies in this list also determines the order they are shown in the report. For user-defined power state table, the report shows the specified supply name followed by the supply name defined in the table if they are different but equivalent. By default, all supplies in the current design are included.

-voltage_type *voltage_type*

Specifies the voltage type to be included in the report. If the value is 'nominal', only the nominal voltage value of supply state(s) will be included. If the value is 'all', all defined voltage values of supply state(s) will be included. By default, the value is 'none' and voltage values are not included in the report.

-nosplit

Does not split lines if column overflows.

DESCRIPTION

This command reports the power state table(s) of the current design. If **-derived** option is not specified, the report will include user-defined power state tables of the design. If **-derived** option is specified, the derived power state table which combines all user-defined power state tables contained in the current design or in its logical hierarchy will be shown.

Until commit_upf command is executed and power intent is finalized, power state tables of subblocks are not propagated and will not be included in the report.

If the power state tables has not been created, the power state table is full, meaning that any power state is allowed. Once the power state table is created, the table becomes empty and new power states could be created and added to the table using the **add_pst_state** command.

A "*" in place of a state name in the report indicates this is a "don't care" for that supply.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

SEE ALSO

add_power_state(2)
add_port_state(2)
add_pst_state(2)
create_pst(2)

report_pt_options

Report configuration options specified by the **set_pt_options** command

SYNTAX

status **report_pt_options**

ARGUMENTS

None.

DESCRIPTION

The **report_pt_options** command reports all the options specified by the **set_pt_options** command.

EXAMPLES

The example below reports all the options.

prompt> **report_pt_options**

SEE ALSO

set_pt_options(2)
eco_opt(2)
check_pt_qor(2)

report_push_down_object_options

Reports the current option settings for the **push_down_objects** command. The options are set with the **set_push_down_object_options** command.

SYNTAX

string **report_push_down_object_options**
[-object_type {*types*}

Data Types

types list

ARGUMENTS

-object_type {*types*}

Specifies the types of objects for which to display current option settings. Specify one or more of the supported object types by using the following keywords: **pg_routing**, **signal_routing**, **routing_guide**, **routing_corridor**, **blockage**, **pin_guide**, **pin_blockage**, **cells**, and **charging_station**.

If **-object_type** is not specified, the command reports the settings for all object types.

DESCRIPTION

This command reports option settings for the **push_down_objects** command. Options are set with the **set_push_down_object_options** command.

EXAMPLES

The following example reports the options for *pg_routing*.

prompt> **report_push_down_object_options -object_type pg_routing**

The following example reports the options for *routing_corridor*.

prompt> **report_push_down_object_options -object_type routing_corridor**

push_down_objects(2)
remove_push_down_object_options(2)
set_push_down_object_options(2)

report_pvt

Reports per-corner PVT information, including mismatches between specified and effective PVT values.

SYNTAX

string **report_pvt**
  [-object_list *objects*]
  [-mismatched]
  [-nosplit]
  [-significant_digits *digits*]
  [*corner_list*]

list *corner_list*
list *objects*

ARGUMENTS

-object_list *objects*

Specifies a list of cell instances or ports to report PVT information for.

-mismatched

If given with the **-object_list** option, this will cause only the objects with specified vs. effective PVT mismatches to be reported.

-nosplit

Indicates that lines are not to be split when column fields overflow. This is most useful when comparing previous script files with the UNIX diff command, or for post-processing the script.

-significant_digits *digits*

Specifies the number of digits after the decimal point to be displayed for values in the report. Allowed values are 0-13; the default is determined by the **shell.common.report_default_significant_digits** application option. Use this option if you want to override the default.

corner_list

Lists corners to report. If you do not specify this option, all corners in the current design are reported.

DESCRIPTION

Displays information about the PVT conditions used by the cells and ports of each corner of the design. The PVT parameters include the specified and effective values of the process label, the process number, the temperature, and the voltages of each power rail, for both early and late analysis types. The actual early and late pane numbers are also reported.

If no options are given, *report_pvt* will report all mismatched PVT conditions, and the number of cells and ports that use each one.

If the **-object_list** option is given, the command will report the specified and effective PVT parameters used by each cell or port in the list. If the **-mismatched** option is also given, the report will be filtered to include only the objects with mismatched specified vs. effective PVT parameters.

Multicorner-Multimode Support

This command works on all corners.

report_corner(2)
set_process_label(2)
set_process_number(2)
set_voltage(2)
set_temperature(2)

report_qor

Displays QoR information and statistics for the current design.

SYNTAX

status **report_qor**
[-include *content_list*]
[-summary]
[-modes *mode_list*]
[-corners *corner_list*]
[-scenarios *scenario_list*]
[-significant_digits *digits*]
[-pba_mode none | path | exhaustive]
[-nosplit]

Data Types

mode_list collection
corner_list collection
scenario_list collection
digits integer

ARGUMENTS

-include *content_list*

Specifies the types of information to be reported. Valid list entries are: design_stats, electrical_drc, hold, and setup.

-summary

Gives a summary of the design costs.

-modes *mode_list*

Each active scenario of the modes given by the **-modes** option and the corners specified by the **-corners** option will be reported. If the **-corners** option is not given with this option, all corners will be used. If neither a mode, corner, nor scenario list is given, the current scenario (if any) will be reported. If the **-scenarios** option is given, this option is not allowed.

-corners *corner_list*

Each active scenario of the modes given by the **-modes** option and the corners specified by the **-corners** option will be reported. If the **-modes** option is not given with this option, all modes will be used. If neither a mode, corner, nor scenario list is given, the current scenario (if any) will be reported. If the **-scenarios** option is given, this option is not allowed.

-scenarios *scenario_list*

Each active scenario given by the **-scenarios** option will be reported. If this option is given, the **-mode** and **-corner** options are not allowed.

-significant_digits ***digits***

Specifies the number of digits to the right of the decimal point that are reported. Allowed values are from 0 through 13. The default value is 2 for all sections except the Area section, which has a default value of 6. Using this option overrides the value set by the **shell.common.report_default_significant_digits** application option.

-pba_mode none | **path** | **exhaustive**

Controls path-based analysis with the following modes:

- **none** (the default) - Path-based analysis is not applied.
- **path** - Path-based analysis is applied over the paths that gave the worst graph-based analysis violation. There is no guarantee that the reported path-based analysis slack over every endpoint is the worst one.
- **exhaustive** - An exhaustive path-based analysis path search algorithm is applied to determine the worst path-based analysis slack violations.

-nosplit

Prevents line splitting and facilitates writing software to extract information from the report output. Most of the design information is listed in fixed-width columns. If the information for a given field exceeds its column's width, the next field begins on a new line, starting in the correct column.

DESCRIPTION

This command reports Quality of Results information about the design. This includes timing information, cell count details, and statistics such as combinational, noncombinational, and total area.

Timing-related information is reported separately for each scenario specified by the **-mode**, **-corner**, and **-scenario** options.

Under the Cell Count section, the Leaf Cell Count report includes all leaf cells that are not constant cells. Constant cells are omitted in this count. The Combinational Cell Count and Sequential Cell Count only include leaf cells.

Under Area section, Cell Area (netlist) ignores physical-only cells but Cell Area (netlist and physical only) includes them for area calculation. Later one is identical to Total physical cell area reported by "report_design -physical" command.

If you specify the **-pba_mode exhaustive** option, path-based analysis is used to calculate the slack values. This option requires that a path search be performed to ensure that the returned slack values are truly the worst. The additional runtime required for this option depends on the amount of timing improvement resulting from path-based analysis. As the timing improvement from path-based analysis increases, the runtime for the path search increases.

Multicorner-Multimode Support

By default, this command works on all active scenarios. To specify different scenarios, use the **-scenarios** option or the **-corners** and **-modes** options.

EXAMPLES

The following is an example of a QoR report:

```
prompt> report_qor

SEE ALSO

shell.common.report_default_significant_digits(3)

report_qor_snapshot

Reports an existing QoR snapshot.

SYNTAX

void **report_qor_snapshot**
[-name *name*]
[-directory *snapshot_directories*]
[-display]
[-save_as *report_name*]

Data Types

name string
snapshot_directories list
report_name string

ARGUMENTS

-name *name*

Specifies the name of the QoR snapshot to be reported. If you do not specify this option, the tool reports all the QoR snapshots in the snapshot directory.

-directory *snapshot_directories*

Specifies the location of the snapshots. If you do not specify this option, the tool looks for the QoR snapshot in the directory specified by the application option **time.snapshot_storage_location**.

-display

Displays the QoR report in the interactive browser.

-save_as *report_name*

Specifies the name of the report. The report is saved under this name; you can then can access the report at a later time using this name.

DESCRIPTION

This command reports the specified QoR snapshots that are located in the specified directory. The tool issues an error if no snapshot exists.

The output of the report is stored at the location specified by the application option **time.snapshot_storage_location**.

Multicorner-Multimode Support

This command has no dependency on scenario-specific, mode-specific, or corner-specific information.

EXAMPLES

In the following example, the **report_qor_snapshot** command reports the QoR snapshot named *preroute* which is saved in the snapshot directory.

```
prompt> report_qor_snapshot -name preroute
```

report_rail_minimum_path

Reports resistance and voltage drop values per layer in minimum resistance path based on the current rail result.

SYNTAX

status **report_rail_minimum_path**
-net *supply_net*
-cell *cell*
-error_cell
[-all]
[-verbose]

Data Types

cell_collection *cell*
supply_net_collection *supply_net*

ARGUMENTS

-cell *cell_object*

Specifies the cell object to be reported.

-net *supply_net_object*

Specifies the supply net object to be reported.

error_cell

Writes the minimum resistance path to the error view named rail_min_path_resistance.<cell_name>.<net_name>.err

all

Reports all pin shapes.

verbose

Shows the detailed report.

DESCRIPTION

The command reports the minimum resistance path based on the current rail result. The minimum resistance path is the shortest

distance from each PG pin which is connected to the given supply net to tap.

Following is the format of the output:

- Metal layer

Node# Layer Net X,Y IRD IRD_diff Resist Resist_diff Width,Length

- Via layer

Node# Layer Net X,Y IRD IRD_diff Resist Resist_diff -,-

- Tap

Node# Tap Net X,Y

- Switch cell

Node# Switch cell='<cell name>' xy=(X,Y) resist=<resistance>

The length and location unit in the report file is um, the resistance unit is Ohm, and the voltage unit is mV.

EXAMPLES

The following example reports the minimum resistance path of U19/VDD PG pin which is connected to the supply net VDD.

```
prompt> open_rail_result RAIL_RESULT_1
prompt> report_rail_minimum_path -cell U19 -net VDD

Cell  : U19
PG Pin: VDD
Node#  Layer   Net   X,Y(um)          IRD(mV)  Diff(mV)    Res(Ohm)   Diff(Ohm)  Width,Length(um)
=============================================================================================================
  46    Tap  VDD   470.700,   0.660     0.000       -         -         -  --

SEE ALSO

open_rail_result(2)

report_rail_result

Writes rail result data to a text file.

SYNTAX

status **report_rail_result**
-type *type_name*
-supply_nets *supply_net_objects*
[-threshold *threshold*]
[-limit *count*]
file_name

Data Types

string *file_name*
string *type_name*
float *threshold*
integer *count*
supply_net_collection *supply_net_objects*

ARGUMENTS

file_name

Specifies the name of the file to which the rail data is to be saved.

-type *type_name*

Specifies what type of rail data to be reported. The supported data types are pg_pin_power, voltage_drop_or_rise, effective_voltage_drop, minimum_path_resistance, effective_resistance, instance_minimum_path_resistance, instance_power, missing_vias, and unconnected_instances.

-threshold *threshold*

Specifies a threshold to filter the rail data to be reported. When specified, rail data that is smaller than the specified threshold is filtered out.

This option is supported for the following report types: **pg_pin_power**, **voltage_drop_or_rise**, and **effective_voltage_drop**.

-limit *count*

Specifies the number of elements to be reported.

When you use this option, the specified number of elements are included in the file. The elements are sorted in descending order of the value.

-supply_nets *supply_net_objects*

Specifies the supply net objects to be reported.

This option is supported for the following report types: **pg_pin_power**, **voltage_drop_or_rise**, **effective_voltage_drop**, **instance_minimum_path_resistance**, and **and minimum_path_resistance**.

DESCRIPTION

The command writes a file containing rail data from the current result. In the output file, the rail data is listed in a descending order.

The rail data reported to the file can be limited to a specific type by using the **-type** option. The supported types are

- **pg_pin_power**: The power value on each power or ground pin

  The format of the output file is

  PG_PIN full_path_cell_instance_name pg_pin_name power

- **voltage_drop_or_rise**: Dynamic voltage violations

  The format of the output file is

  full_path_cell_instance_name/pg_pin_name voltage

- **effective_voltage_drop**: The effective voltage violations

  For static analysis, the format of the output file is

  cell_instance_pg_pin_name mapped_pg_pin_name supply_net_name effective_voltage_drop
  The output is sorted by **effective_voltage_drop**.

  For dynamic analysis, the format of the output file is
  cell_instance_pg_pin_name mapped_pg_pin_name supply_net_name
  average_effective_voltage_drop_in_tw max_effective_voltage_drop_in_tw
  min_effective_voltage_drop_in_tw max_effective_voltage_drop

  The output is sorted by **max_effective_voltage_drop**.

- **minimum_path_resistance**: Power and ground pin minimum path resistance values

  The format of the output file is

  full_path_cell_instance_name/pg_pin_name resistance

- **instance_minimum_path_resistance**: Minimum path resistance value on each instance

  The format of the output file is

  Rmax(ohm): maximum value of report
  Rmin(ohm): minimum value of report
  Supply_net Total_R(ohm) R_to_power(ohm) R_to_ground(ohm)
  Location Pin_name Instance_name

  The output is sorted by **Total_R**.

- **instance_power**: Power values on each instance

- **missing_vias**: Overlaps of supply net routing on different layers that do not have vias connected
- **unconnected_instances**: Instances that are not connected to any ideal voltage drop sources

The power unit in the report file is Watt, the current unit is Amp, and the voltage unit is Volt.

EXAMPLES

The following example writes a file containing top five PG pin power values to an output file called power.rpt.

```
prompt> open_rail_result RAIL_RESULT_1
prompt> report_rail_result -type pg_pin_power -limit 5 \
  power.rpt -supply_nets { VSS }
1
prompt> sh cat power.rpt

report_rail_scenario

Reports all associations between rail results and design scenarios.

SYNTAX

status **report_rail_scenario**

DESCRIPTION

The command reports all associations between rail results and design scenarios set through the **set_rail_scenario** command.

EXAMPLES

The following example loads three different rail results, and sets associations to design scenarios.

```
prompt> open_rail_result { static_result vcd_result vector_free_result }
prompt> set_rail_scenario -design_scenario fast -result_name
    static_result -percentage_threshold 0.02 -priority_weight 5.0
prompt> set_rail_scenario -design_scenario typical -result_name
    vcd_result -percentage_threshold 0.1 -priority_weight 1.0
prompt> set_rail_scenario -design_scenario slow -result_name
    vector_free_result -percentage 0.1 -priority_weight 1.0
prompt> report_rail_scenario
-------------------------------------------------------------------------------
Design_scenario          Rail_result              Priority  Percentage_threshold
fast                     static                   5         2.00%
typical                  vcd_result               1         10.0%

open_rail_result(2)
set_rail_scenario(2)

report_rdl_routes

Generates a report of RDL nets.

SYNTAX

int **report_rdl_routes**
[-file *output_file*]
[-open_nets true | false]
[-nets *collection_of_nets* | -nets_in_file *nets_file*]
[-create_error_data false | flyline_only | verification]

Data Types

output_file string
collection_of_nets collection
nets_file string

ARGUMENTS

-file *output_file*

Specifies the name of the output file to which to write the list of RDL nets.

-open_nets true | **false**

If this option is true, the command reports all open specified RDL nets. If this option is false, the command reports all specified RDL nets. By default, **-open_nets** is false.

Nets that are routed with GLinks are not considered to be open nets. GLinks are the result of RDL global routing and are used during RDL detail routing. See **route_rdl_flip_chip** for more information.

-nets *collection_of_nets*

Specifies the flip-chip nets to report.

-nets_in_file *nets_file*

Specifies the name of the file that contains the list of flip-chip nets to report.

-nets has higher priority than **-nets_in_file**.

-create_error_data false | **flyline_only** | **verification**

Specifies the mode of create_error_data. In flyline_only mode, the command will create an error data to save the flylines. In verification mode, the command will check open and short violations and create an error data. For flyline_only/verification mode, user can use error browser to open the error data. In false mode, the command will not create any error data.

The default value is false.

DESCRIPTION

The command displays information about the RDL nets.

EXAMPLES

The following example reports all open RDL nets in the design and writes open net names to the file named RDLopen.

```
prompt> report_rdl_routes  -open_nets true -file RDLopen
```

report_ref_libs

Gets the reference library list from a library.

SYNTAX

report_ref_libs
[-library *name*]

ARGUMENTS

-library *name*

Which library to generate the reference library report from. If no library is specified, the *current_lib* is used.

DESCRIPTION

The **report_ref_libs** command generates a report listing each library in the reference library path list. Each line reports the library in-memory name (if known), the library path, and the location of the library on disk (if known.)

If the library is open, that is indicated with a "*". If the library has technology information, that is indicated with a "+". If the library has hierarchical reference libraries, that is indicated with a ">", and those reference libraries are indented under this library. A library's in-memory name and location on disk is only given if it is currently open.

EXAMPLES

The following example sets a reference library list on this library, then generates a reference library report.

```
prompt> set_ref_libs -ref_libs {r4000 RAMS macros/TSMC24}
r4000 RAMS macros/TSMC24
prompt> report_ref_libs
****************************************
Report : Reference Library Report

report_reference

Reports the references in the current instance or design.

SYNTAX

status **report_references**
[-nosplit]
[-hierarchical]
[-by_module]

ARGUMENTS

-nosplit

Does not split lines if the column overflows.

-hierarchical

Reports all the references inside the logic hierarchy.

-by_module

This option can be used with **hierarchical** option only, it reports the references based on module and from the full design hierarchy.

DESCRIPTION

Displays information about all references in the current instance or current design. If the current instance is set, the report is generated relative to that instance; otherwise, the report is generated for the current design.

EXAMPLES

The following is an example of the report generated by the **report_references** command.

prompt> **report_references**

****
Report : reference

```
Design : middle
****************************************

report_regular_multisource_clock_tree_options

It reports options from command set_regular_multisource_clock_tree_options for performing auto tap synthesis and global clock tree synthesis for regular multisource clock trees.

SYNTAX

status **report_regular_multisource_clock_tree_options**

DESCRIPTION

The *report_regular_multisource_clock_tree_options* command reports options set through the corresponding set option command.

Multicorner-Multimode Support

This command has no dependency on scenario-specific, mode-specific, or corner-specific information.

EXAMPLES

The following example sets the auto tap synthesis options and reports the options.

```
prompt> set_regular_multisource_clock_tree_options -clock clk -topology htree_only -prefix MSCTS \
 -tap_boxes {4 2} -tap_lib_cells [get_lib_cells */CKBUF*] \
 -htree_lib_cells [get_lib_cells */CKINV*] -htree_layers "m9 m10" -htree_routing_rule "htree_ndr"

prompt> report_regular_multisource_clock_tree_options
```

SEE ALSO

set_regular_multisouce_clock_tree_options(2)
remove_regular_multisouce_clock_tree_options(2)

report_repeater_group_constraints

Reports constraints that are set for a group of repeaters.

SYNTAX

status **report_repeater_group_constraints**

DESCRIPTION

This command reports the constraints for a group of repeaters that were set using place_group_repeaters, add_group_repeaters, or set_repeater_group_constraints commands. The constraints include horizontal_repeaters_spacing, vertical_repeater_spacing and layer_cutting_distance.

EXAMPLES

The following examples show the usages of this command.

```
prompt> set_repeater_group_constraints -type insertion -horizontal_repeater_spacing 7
-layer_cutting_distance {{M1 2.12 13.2} {M2 0.5 0.78} {M3 3.01 3.78}}
prompt> set_repeater_group_constraints -type placement -horizontal_repeater_spacing 10
prompt> report_repeater_group_constraints

Report Format:

Type:  Insertion
-------------------------------------------------
 Horizontal repeater spacing: 7
 Vertical repeater spacing: -
 Layer cutting distance: { { M1 2.120000 13.200000 }  { M2 0.500000 0.780000 }
 { M3 3.010000 3.780000 }  }

 -------------------------------------------------

 Type:  Placement
-------------------------------------------------
 Horizontal repeater spacing: 10
 Vertical repeater spacing: -
 Layer cutting distance: { }

 -------------------------------------------------
```

SEE ALSO

set_repeater_group_constraints(2)
remove_repeater_group_constraints(2)

report_repeater_groups

Report infomation of repeater groups.

SYNTAX

status **report_repeater_groups**
[-group_ids *group_id_list*]

Data Types

group_id_list list

ARGUMENTS

-group_ids *group_id_list*

Specifies list of group ids to report. Report all groups if the option is not specified.

DESCRIPTION

This command reports cells and cutline of each register group, and path drivers and path loads if there is any.

EXAMPLES

The following examples show the usages of command.

prompt> **report_repeater_groups**

prompt> **report_repeater_groups -group_ids {1 2}**

SEE ALSO

set_repeater_group(2)
place_group_repeaters(2)

report_resources

Lists the resources and datapath blocks used in the design.

SYNTAX

string **report_resources**
[-summary]
[-power]
[-toggling_activity]
[-html_file *file*]
[-hierarchy]
[-nosplit]
[*module_list*]

ARGUMENTS

-summary

Reports the summary of singleton and extracted datapath of the design or specified modules. The implementation overview is also reported. Without specifying this option, all resources are reported in detail view that each cell is in separate section.

-power

Reports the information related to power, including internal, switching, leakage and total power for each DesignWare cell that is not ungrouped. When this options is set, the command may take longer because of the propagation of switching activity.

-toggling_activity

Reports the toggling activity of each inputs of the datapath, in detail view. This option can't be used together with **-summary**.

-html_file *file*

Redirect the output of the report to specified files in HTML format.

-hierarchy

Reports information about all resources used in the hierarchy of specified modules. This option can only be used when *module_list* is specified. By default, the tool reports all resources hierarchically if *module_list* is not specified; or only the resources in current hierarchy if *moulde_list* is specified.

-nosplit

Does not split lines if column overflows.

module_list

The list of modules for which the resources are reported. When not specified, all hierarchies of current design is reported.

DESCRIPTION

This command lists the resources and datapath blocks used in the NDM design after compile.

A resource is an arithmetic or comparison operator read in as part of an HDL design. Resources can be shared when compiling the design and are reported after the compile operation completes.

A datapath block contains one or more resources that are grouped together and optimized by a datapath generator.

This report also has information on the parameters used to build the module, user-declared resources in each module, shared operations, and resources that are transformed into datapath blocks.

If the resources are not ungrouped after compile, this report will additionally report the area, power, slack information. Specially, the power is reported only when the leakage and dynamic scenarios can be automatically recognized.

EXAMPLES

The following example displays resource information for the current design. The content summary section has three tables: singleton resources width, extracted resources width, and a statisitics table. The implementation overview section lists all resources with their module name, current implementation and multiplier arch info.

```
prompt> report_resources -summary

set_datapath_architecture_options(2)

report_routing_corridors

Reports the corridor names and associated shapes, min and max layers, nets and supernets for the specified routing corridors.

SYNTAX

status **report_routing_corridors**
[-verbose]
[-nosplit]
[-significant_digits *digits*]
[-output *file_name*]
[*routing_corridor_list*]

Data Types

digits int
file_name string
routing_corridor_list list

ARGUMENTS

-verbose

Displays additional debugging information.

-nosplit

Writes out long report lines, even if the line length is greater than 80 columns. Use this option to simplify post-processing of the output or when comparing the report files by using the UNIX **diff** command. If this option is not specified, the command breaks long constraint command lines near column 80 and inserts a line continuation character (\).

-significant_digits *digits*

Specifies the number of digits to the right of the decimal point to report. Allowed values are 0-13; the default is determined by the **shell.report_default_significant_digits** application option, whose default is 2. Use this option to override the default.

routing_corridor_list

Specifies the routing corridors on which to report. The list can contain routing corridor names, patterns, or collections. A collection can be specified by using the **get_routing_corridors** command. If you do not specify this option, all routing corridors in the design are reported.

-output *file_name*

Generates a Tcl script that contains **create_routing_corridor** commands. You can use the Tcl script to re-create the existing routing corridors.

DESCRIPTION

This command reports information about the specified routing corridors, including

- The name of the routing corridor
- The names, minimum and maximum layers, of the corridor shapes contained in the routing corridor
- The names of the associated nets and supernets

This command also reports the results of connectivity checking and pin checking.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example reports information about the routing corridor named RC_1.

```
prompt> report_routing_corridors RC_1

CORRIDOR NAME: RC_1
Shape Name              min/max     Shape
--------------------------------------------------------------------------------
CORRIDOR_SHAPE_1        M2/M5       {20.00 20.00} {30.00 21.00}
CORRIDOR_SHAPE_2        M4/M6       {25.00 25.00} {27.00 30.00}
--------------------------------------------------------------------------------
Shapes Connected:         no
Shapes Cover Pins and Ports: no
Objects:                n4 supernet_1
--------------------------------------------------------------------------------
```

report_routing_guides

Reports details of access preference type of routing guides.

SYNTAX

status **report_routing_guides**
-rectangle *rect*
[-level *all* | *top_level*]

Data Types

rect bounding box points

ARGUMENTS

-rectangle *rect*

Specifies the coordinates of the bounding box of the routing guide for which we want the details (including the access preference data).

This option is required.

-level *all* | *top_level*

Specifies the level on which the routing guides are to be searched.

If you do not specify this option, the tool searches at all levels hierarchically. You can specify "top_level" value for this option if you want the top level route guides to be searched only.

DESCRIPTION

This command fetches the routing guides based on the bbox specified by the user as part of the -rectangle option. The routing guides whose base rectangle overlaps with the bbox specified are considered for printing out details.

The details include the access preference related data.

The returned values are plain text information.

EXAMPLES

The following examples depict the behavior.

```
prompt> report_routing_guides -rectangle {{0.0 0.0} {100.0 100.0}} \
      -level top_level

Info for Unnamed Route Guide
Access Preference Data for Layer - METAL4
  wire_access_preference  Rect - (100000, 100000 -> 200000, 200000)      Strength - 1.000000
  wire_access_preference  Rect - (1400000, 1400000 -> 1500000, 1500000)   Strength - 1.000000
  via_access_preference   Rect - (100000, 100000 -> 200000, 200000)      Strength - 1.000000
  via_access_preference   Rect - (1200000, 1200000 -> 1500000, 1400000)   Strength - 1.000000
  .in -0.25in
```

SEE ALSO

get_routing_guides(2)
create_routing_guide(2)

report_routing_rules

Reports non-default routing rules in the design.

SYNTAX

status **report_routing_rules**
[-verbose]
[-nosplit]
[-significant_digits *digits*]
[-output *file_name*]
[-of_objects *net_list*]
[*routing_rule_list*]

Data Types

digits int
file_name string
net_list list
routing_rule_list string

ARGUMENTS

-verbose

Displays verbose non-default rule information.

-nosplit

Does not split lines if column overflows.

-significant_digits *digits*

Specifies the number of digits to the right of the decimal point that are to be reported. Allowed values are 0-13; the default is determined by the **shell.common.report_default_significant_digits** application option, whose default is 2. Use this option if you want to override the default. Fixed-precision floating-point arithmetics is used for delay calculation; therefore, the actual precision might depend on the platform. For example, on SVR4 UNIX see FLT_DIG in limits.h. The upper bound on a meaningful value of the argument to -significant_digits is then FLT_DIG -ceil(log10(fabs(any_reported_value))).

-output *file_name*

Generates a Tcl script that defines the specified routing rules. If the *routing_rule_list* option is used, the Tcl script will contain the non-default rule definitions. If **-of_objects** *net_list* option is used, the Tcl script will contain the net non-default rule assignments.

-of_objects *net_list*

Specifies the nets of which to report non-default rules.

routing_rule_list

Specifies the non-default routing rules to report. By default, the tool reports all non-default routing rules in the design.

DESCRIPTION

This command reports the details of the specified non-default routing rules, or the non-default routing rules assigned to the specified nets.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example reports on the non-default rule named WideMetal.

```
prompt> report_routing_rules WideMetal
```

SEE ALSO

create_routing_rule(2)
remove_routing_rules(2)
set_routing_rule(2)

report_rp_groups

Reports the placement status of relative placement groups and violations of relative placement constraints.

SYNTAX

collection **report_rp_groups**
{*rp_group_list* | -all}
[-critical]
[-unplaced]
[-non_critical]
[-verbose]

Data Types

rp_group_list list or collection

ARGUMENTS

rp_group_list

Specifies the relative placement groups that will be checked and reported. This option is mutually exclusive with **-all**.

-all

Specifies that all relative placement groups should be checked and reported. This option is mutually exclusive with *rp_group_list*.

-critical

Specifies to report the relative placement groups that could not be placed.

-unplaced

Specifies to report the relative placement groups that are unplaced. The placement of such relative placement groups has not been done.

-non_critical

Specifies to report the relative placement groups that are placed but not meeting relative placement constraints.

-verbose

Specifies to report exact location of the failures in relative placement group.

DESCRIPTION

The **report_rp_groups** command checks and reports any violation of constraints for the specified relative placement groups along with its placement status. The relative placement group placement status and violations are reported in following four categories for top level relative placement groups.

The placed relative placement groups without any constraint violations are reported under category *placed top level relative placement groups*.

The placed relative placement groups with constraint violations are reported under category *top level groups not meeting constraints, but placed*.

The relative placement groups which are not placed yet are reported under category *unplaced top level relative placement groups*.

The relative placement groups which could not be placed successfully are reported under category *failed top level relative placement groups*.

The command returns a collection containing the relative placement groups that are checked. If no groups are checked, an empty string is returned.

EXAMPLES

The following examples use **report_rp_groups** to report constraint violations:

```
prompt> report_rp_groups rp_fixed_cell

****************************************************************************
Report  : Relative Placement Summary
Total number of specified top level relative placement groups: 1
Total number of placed top level relative placement groups: 1

report_sadp_track_rule

Reports a track rule.

SYNTAX

status **report_sadp_track_rule**
rules_names | -all
[-nosplit]
[-significant_digits *digits*]

Data Types

rules_names string
digits integer

ARGUMENTS

rule_names

Specifies the list of SADP track rules to report. You must specify one or more SADP track rule names or the **-all** option.

-all

Reports all SADP track rules. You must specify one or more SADP track rule names or the **-all** option.

-nosplit

Specify nosplit style reporting behavior. By default, line wrapping of long rows of data is done automatically. In nosplit mode, line wrapping is not done. Readable column alignment is still maintained in nosplit mode.

-significant_digits *digits*

Specifies the number of digits to the right of the decimal point to report. Allowed values are from 0 through 13. The default is 2.

DESCRIPTION

This command reports self-aligned double patterning (SADP) track rules set with the **create_sadp_track_rule** command.

EXAMPLES

The following example defines three SADP track rules in the current library and reports them.

```
prompt> create_sadp_track_rule -name tr1 \
  -pattern {{1 1 "vdd"} {2 1 "vss"} } -sadp_spacing 0.50
prompt> create_sadp_track_rule -name tr2 \
  -pattern {{2 1 "vdd"} {1 1 "vss"} } -sadp_spacing 0.50
prompt> create_sadp_track_rule -name tr3 \
  -pattern {{2 1 "vdd"} {2 1 "vss"} } -sadp_spacing 0.50

prompt> report_sadp_track_rule -all
****************************************
Report : report_sadp_track_rule
Lib    : r4000
Version:
Date   :
****************************************
Rule_name  Spacing  Pattern
-----------------------------------------------------
tr1        0.50     { {1.00 1 "vdd"} {2.00 1 "vss"} }
tr2        0.50     { {2.00 1 "vdd"} {1.00 1 "vss"} }
tr3        0.50     { {2.00 1 "vdd"} {2.00 1 "vss"} }
1
```

The following example reports the SADP track rules only for rules tr2 and tr3.

```
prompt> report_sadp_track_rule {tr2 tr3}
****************************************
Report : report_sadp_track_rule
Lib    : r4000
Version:
Date   :
****************************************
Rule_name  Spacing  Pattern
-----------------------------------------------------
tr2        0.50     { {2.00 1 "vdd"} {1.00 1 "vss"} }
tr3        0.50     { {2.00 1 "vdd"} {2.00 1 "vss"} }
```

SEE ALSO

generate_sadp_tracks(2)
remove_sadp_track_rule(2)

report_safety_logic_port_map

Reports the port mapping information for the module or lib-cell used for voting logic in functional safety flow.

SYNTAX

status **report_safety_logic_port_map**
[-module *module_list*]
[-mapping *lib_cell_list*]

Data Types

module_list collection
lib_cell_list collection

ARGUMENTS

-module *module_list*

Specifies one or more the modules for which the port mapping is to be reported. Either objects or names can be specified.

-mapping *lib_cell_list*

Specifies one or more libcells for which the port mapping is to be reported. Either objects or names can be specified.

DESCRIPTION

This command reports the port mapping information of the given module or libcells. If the port map has been set earlier using set_safety_logic_port_map command, then the list of input ports and error and/or voting outputs are printed. If the port map has not been set, then the reporting is skipped. Either -module or -mapping must be specified. Both options can be specified together as well.

EXAMPLES

The following example reports safety logic port map for a lib-cell.

prompt> **report_safety_logic_port_map -mapping MAJ3**

The following example reports safety logic port map for a module.

```
prompt> report_safety_logic_port_map -module DMR_LOGIC
```

SEE ALSO

report_safety_logic_port_map(2)
create_safety_register_rule(2)
write_safety_register_script(2)

report_safety_register_groups

Reports safety register groups of the current design.

SYNTAX

status **report_safety_register_groups**
[*objects*]

Data Types

objects collection

ARGUMENTS

objects

Specifies the group objects or names which need to be reported

DESCRIPTION

Prints a report of the specified safety register group objects. If nothing is specified, it reports all the groups in the current design.

EXAMPLES

The following example creates a collection of safety_register_group objects and then reports them.

prompt> **report_safety_register_groups [get_safety_register_groups group1*]**

SEE ALSO

create_safety_register_group(2)
get_safety_register_groups(2)
write_safety_register_script(2)

report_safety_register_rules

Reports safety register rules from the current design.

SYNTAX

status **report_safety_register_rules**
[*objects*]

Data Types

objects	collection

ARGUMENTS

objects

Specifies the rule objects or names which need to be reported

DESCRIPTION

Prints a report of the specified safety register rule objects. If nothing is specified, it reports all the rules in the current design.

EXAMPLES

The following example creates a collection of safety_register_rule objects and then reports them.

prompt> **report_safety_register_rules [get_safety_register_rules rule1*]**

SEE ALSO

create_safety_register_rule(2)
get_safety_register_rules(2)
write_safety_register_script(2)

report_safety_status

Perform and report checks related to safety_register_rules and safety_register_groups.

SYNTAX

string **report_safety_status**
[-header *string*]
[-safety_register_rules *safety_register_rules*]
[-safety_register_groups *safety_register_groups*]
[-repelling_group_bounds *repelling_group_bounds*]
[-summary]
[-verbose]

string *string*
list *safety_register_rules*
list *safety_register_groups*
list *repelling_group_bounds*

ARGUMENTS

-header *string*

Provide a custom header for the printed report.

-safety_register_rules *safety_register_rules*

Report given safety_register_rule objects. This option restricts the checks and reporting to the provided rules.

-safety_register_groups *safety_register_groups*

Report given safety_register_group objects. This option restricts the checks and reporting to the provided groups.

-repelling_group_bounds *repelling_group_bounds*

Report given repelling_group_bound objects. This option runs the checks and reporting for the provided bounds.

-summary

With this option specified, the report only displays its summary section with statistics of the current design state. The actual messages informing about individual issues will not be printed. The option -summary is mutually exclusive to the -verbose option.

-verbose

Print additional messages such as SR-036 showing the distance between safety registers that satisfy their spacing requirements. By default this information is omitted, and only violations are displayed via SR-007. The option -verbose is mutually exclusive to the -summary option.

DESCRIPTION

The command **report_safety_status** can be run throughout the Synopsys Automotive Flow and performs checks related to safety rules and groups defined in the current block.

The results of the checks are reported in textual format and stored into a message database, called safety_status.ems. This message database provides interactive detail for examining and addressing safety related issues found by **report_safety_status**.

gui_start
open_ems_database safety_status.ems

Then, use **Window->Message Browser Window to examine the interactive report. Messages generated by this report are tagged by SR-???.**

Checks are enabled by default, but it is possible to disable a specific check, for example **SR-005**, as follows:

set_attribute [get_ems_rules {SR-005}] -name is_enabled -value false

Checks performed by this command are:

SR-000 (info) Safety register related object counts for block %block.
SR-001 (warning) Found safety_register_rule %rule without associated safety_register_group.
SR-002 (error) The design still contains a safety critical register (%safety_critical_register) that must be replaced by fault tolerant or re
SR-003 (error) The safety register groups {%list_of_groups} are not mutually exclusive. The shared cells are {%list_of_cells}.
SR-004 (error) The safety_register_group %group has %actual_count redundancy register(s), while %required_count are required b

report_scan_chains

Displays information about the specified scan chains in the current design.

SYNTAX

status **report_scan_chains**
[-verbose]
[-nosplit]
[-significant_digits *digits*]
[*scan_chains*]

Data Types

digits integer
scan_chains string or collection

ARGUMENTS

-verbose

Specifies whether the report contains additional data, reporting detailed information about stub_chains associated with the reported scan_chains.

-nosplit

Most of the scan chains information is listed in fixed-width columns. If the information in a given field exceeds the column width, the next field begins on a new line, starting in the correct column. The **-nosplit** option prevents line-splitting and facilitates writing software to extract information from the report output.

-significant_digits *digits*

Specifies the number of significant digits (digits to the right of the decimal point) to report. Allowed values are from 0 through 13. The default is 2. Using this option overrides the value set by the **shell.common.report_default_significant_digits** application option.

scan_chains

Specifies the scan_chains to report. This can be either the name/regexp pattern or a collection of multiple scan_chains.

DESCRIPTION

The **report_scan_chains** command displays information about the specified scan chains in the current design.

EXAMPLE

The following command generates a default report for the scan_chains present in current design.

```
prompt> report_scan_chains
****************************************
Report : report_scan_chains
Block  : B1
Version: Q-2019.12-SP2-DEV
Date   : Thu Jan  2 03:07:56 2020
****************************************
Name         Available Bits     Stub Chains

report_scan_compression_configuration

Displays options specified by the **set_scan_compression_configuration** command.

SYNTAX

status **report_scan_compression_configuration**

ARGUMENTS

The **report_scan_compression_configuration** command has no arguments.

DESCRIPTION

This command displays options specified by the **set_scan_compression_configuration** command on the current design.

EXAMPLES

The following is an example of a scan compression configuration report:

```
prompt> report_scan_compression_configuration
****************************************
Report : Scan Compression Configuration
Design : top
Version: P-2019.03
Date   : Thu Feb  7 07:08:49 2019

report_scan_configuration

Displays options specified by the **set_scan_configuration** command.

SYNTAX

status **report_scan_configuration**

ARGUMENTS

Thie **report_scan_configuration** command has no arguments.

DESCRIPTION

This command displays the options specified by the **set_scan_configuration** command on the current design. For more information on what is reported, see the EXAMPLES section.

EXAMPLES

The following is an example of a scan configuration report for the global settings (default test mode):

```
prompt> report_scan_configuration
****************************************
Report : Scan configuration
Design : top
Version: P-2019.03
Date   : Thu Feb  7 07:09:33 2019

```

SEE ALSO

set_scan_configuration(2)

report_scan_group

Reports all scan groups that were specified using the **set_scan_group** command.

SYNTAX

status **report_scan_group**

ARGUMENTS

The **report_scan_group** command has no arguments.

DESCRIPTION

This command reports all scan groups that were specified using the **set_scan_group** command.

EXAMPLES

The following example show how to use the **report_scan_group** command:

```
prompt> set_scan_group {BLKA/A_reg BLKA/B_reg} MY_GROUP
1
prompt> report_scan_group
****************************************
Report : Scan groups specification

--------------------------------------------------------------------------
Scan_group  Cell_#  Instance_name  Serial Routed  Type       Pin
--------------------------------------------------------------------------
MY_GROUP    No scan cells to report
```

SEE ALSO

set_scan_group(2)

report_scan_path

Displays scan paths and scan cells specified by the **set_scan_path** command and displays scan paths inserted by the **insert_dft** command.

SYNTAX

status **report_scan_path**

ARGUMENTS

The **report_scan_path** command has no arguments.

DESCRIPTION

This command displays user-specified scan paths specified by the **set_scan_path** command, as well as the actual scan paths inserted by the **insert_dft** command.

The report contains three different section types.

- VIEW: Specification

  This section contains user-specified scan path information specified with the **set_scan_path** command. This report can contain information on scan path segments, or scan-in, scan-out, and scan-enable signals along with any hookup pin information.

- VIEW: Existing DFT (-chain)

  This section contains summary information about scan paths that currently exist in the design. The summary contains scan-in, scan-out, scan-enable, scan-clock, scan chain name, and scan chain length information in table form, but does not print the ordered scan cell names for each scan chain.

- VIEW: Existing DFT (-cell)

  This section contains detailed information about the scan cell ordering of the scan paths that currently exist in the design.

EXAMPLES

The following is an example of **report_scan_path** in the first format reporting on scan paths in the **spec** view. In this report, the *mychain1* scan path has SI (scan-in), Q (scan-out), and two scan enables SE1 and SE2, which are both hooked up to pin u5/A.

```
prompt> report_scan_path -view spec -chain mychain1 -test_mode mymodeA

****************************************
Report : Scan path
Design : A
Version: 2003.12
Date   : Thu Aug 14 10:46:10 2003
****************************************

========================================
TEST MODE: mymodeA
VIEW    : Specification
========================================
Scan_path        ScanDataIn (h)     ScanDataOut (h)    ScanEnable (h)
---------------  ---------------    ---------------    ---------------
mychain1         SI (-)             Q (-)              SE1 (u5/A)
                                                       SE2 (u5/A)
```

The following is an example of **report_scan_path** in the second format reporting scan paths in the **existing_dft** view. In this report, the *mychain1* scan path is defined in the *mymodeA* test mode, and *mychain2* is defined in the *mymodeB* test mode. The *mychain2* scan chain has SI2 (scan-in), SO (scan-out), and SE2 & SE3 (scan-enable). Clocks MCLK1, MCLK2, and MCLK3 are master clocks for this scan chain, and SCLK is a slave clock.

```
prompt> report_scan_path -view existing_dft -chain all -test_mode all

```

SEE ALSO

set_scan_path(2)

report_scan_rp_group

Reports Scan relative placement groups defined by **set_scan_rp_group**.

SYNTAX

status **report_scan_rp_group**

ARGUMENTS

This command has no arguments.

DESCRIPTION

The **report_scan_rp_group** command reports the Scan relative placement (RP) groups previously defined with the command **set_scan_rp_group**.

The Scan RP groups will be displayed in the tabular format indicating the RP group name, the Scan routing direction (horizontal, vertical), the starting corner (lower left, lower right, upper left and upper right, labeled ll, lr, ul and ur, respectively) and the user max length.

EXAMPLES

The following example reports the Scan relative placement groups set up in the current design.

```
prompt> report_scan_rp_group
****************************************
Report : Scan RP Group Stitching
Design : SUB1
Version: Q-2019.12-SP4
Date   : Fri Apr 20 10:22:32 2020
****************************************

RP Group          Scan Routing     Start Corner     User Length Limit
--------          ------------     ------------     -----------------
RP_1              HORIZONTAL       UR               0
RP_2              VERTICAL         LR               0
```

1

SEE ALSO

set_scan_rp_group(2)
remove_scan_rp_group(2)

report_scan_skew_group

Reports scan skew groups defined by the **set_scan_skew_group** command.

SYNTAX

status **report_scan_skew_group**
scan_skew_group_list

Data Types

scan_skew_group_list list

ARGUMENTS

scan_skew_group_list

When you specify a list of one or more scan skew group names, the command prints a detailed list of the elements in the specified scan skew groups. Wildcards are not supported.

By default, the command reports a summary of all scan skew groups defined, but does not include the individual elements in each scan skew group.

DESCRIPTION

This command displays the user-specified scan skew groups defined by the **set_scan_skew_group** command.

EXAMPLES

To report a summary of the scan skew groups defined, issue the command with no arguments:

```
prompt> report_scan_skew_group

****************************************
Report : Scan Skew Group
Design : top
Version: O-2018.06-SP5-VAL
Date   : Thu Aug 15 00:00:00 2019

```

SEE ALSO

set_scan_skew_group(2)
remove_scan_skew_group(2)

report_scenarios

Prints a brief report of the design's scenarios.

SYNTAX

report_scenarios
[-modes *mode_list*]
[-corners *corner_list*]
[-scenarios *scenario_list*]
[-nosplit]

Data Types

mode_list list
corner_list list
scenario_list list

ARGUMENTS

-modes *mode_list*

Specifies the modes for which to generate the scenario report. Each active scenario of the modes given by the **-modes** option and the corners specified by the **-corners** option will be reported. If this option is not specified, the command reports scenarios of the current mode. If none of the **-modes**, **-corners**, or **-scenarios** options are specified, the command reports every scenario. It is an error to give this option with the **-scenarios** option.

-corners *corner_list*

Specifies the corners for which to generate the scenario report. Each scenario of the modes given by the **-modes** option and the corners specified by the **-corners** option is reported. If this option is not specified, the command reports scenarios of all corners. It is an error to give this option with the **-scenarios** option.

-scenarios *scenario_list*

Specifies the scenarios to report. Each of the given scenarios is reported. It is an error to give this option with the **-modes** or the **-corners** options.

-nosplit

Writes out wide report lines, even if the line length is greater than 80 columns. Use this option to simplify post-processing of the output files or when comparing the output files with the UNIX **diff** command. Most of the design information is listed in fixed-width columns. If the information in a given field exceeds the column width, the next field begins on a new line, starting in the correct column.

DESCRIPTION

This command prints a brief report for the specified scenarios, or all scenarios if no options are given. The report has one line for each scenario, listing the scenario's name, mode, corner, and analysis flags. If the scenario name was explicitly given by the user (as opposed to being auto-generated), it will be labeled with a "*".

Multicorner-Multimode Support

By default, this command works on all scenarios. To specify different scenarios, use the **-scenarios** option or the **-corners** and **-modes** options.

EXAMPLES

The following example prints a brief report for all scenarios.

```
prompt> report_scenarios
```

report_secondary_pg_placement_constraints

report all secondary pg constraints

SYNTAX

status **report_secondary_pg_placement_constraints**

ARGUMENTS

There is no argument for this command

DESCRIPTION

The command reports all secondary pg constraints that have been entered and not removed.

This command can be used before or after commit_secondary_pg_placement_constraints. The secondary pg constraints that are reported by this command are not related to whether the constraints have been committed.

EXAMPLES

The following example report all secondary pg constraint

```
prompt> create_secondary_pg_placement_constraints -name pg_cstr0 -supply vdd0 -region {{20 0 } {30 50}}
prompt> report_secondary_pg_placement_constraints
name: pg_cstr0
  supply: vdd0
  margin: 0
  voltage_areas:
  layers:
  regions:
    rectangle: {20 0} {30 50}
```

SEE ALSO

create_secondary_pg_placement_constraints(2)
remove_secondary_pg_placement_constraints(2)
commit_secondary_pg_placement_constraints(2)

report_self_gating_objects

Report the object inclusion options that have been explicitly set for Self-Gating with **set_self_gating_objects**.

SYNTAX

status **report_self_gating_objects**

DESCRIPTION

This command will report the settings that were explicitly set with the **set_self_gating_objects** command. The report will generate a table with the following columns:

- The action, set with **set_self_gating_objects**, the default values or its inherited values when applicable. The possible values are Include, Exclude or Force.
- The tree type option, set with **set_self_gating_objects**, the default values or its inherited values when applicable. The possible values are XOR, NAND, OR and AUTO. If the corresponding action is Exclude, the value will be "-".
- The minimum bitwidth option associated to the tree type value, set with **set_self_gating_options**, the default values or its inherited values when applicable.
- The maximum bitwidth option associated to the tree type value, set with **set_self_gating_options**, the default values or its inherited values when applicable.
- The interaction with clock gating option associated to the tree type value, set with **set_self_gating_options**, the default values or its inherited values when applicable.
- The instance for which the option values are associated.

Notice that the minimum bitwidth, the maximum bitwidth and the interaction with clock gating options are the derived option values for the given intance and tree type. Those option values may be changed using the **set_self_gating_options** command.

EXAMPLES

The following examples will use a design with three hierarchies (hier1, hier2, hier3), below the top level design, named top. The four, hier1, hier2, hier4 and top, have three registers each one.

The following example will use the following setting:

```
prompt> set_self_gating_options -tree_type xor -min 2 -max 4 \
  -interaction collapse
```

```
prompt> set_self_gating_options -tree_type nand -min 4 -max 4 \
  -interaction collapse
prompt> set_self_gating_options -objects {hier1 hier2} -tree_type nand \
  -min 4 -max 8 -interaction none
prompt> set_self_gating_options -objects {hier2} -tree_type xor \
  -min 4 -max 4 -interaction insert
prompt> set_self_gating_objects -include hier1 -tree_type nand
prompt> set_self_gating_objects -force hier2/out_register* -tree_type xor
prompt> set_self_gating_objects -exclude out_register*
```

The example shows the generated report with **report_self_gating_objects**. Since the hier3 hierarchy doesn't have any explicit option set, it is not shown in the report.

```
prompt> report_self_gating_objects

SYNTAX

status **report_self_gating_options**
[-verbose]

ARGUMENTS

-verbose

By default, the limit of objects to be displayed is 10 for every different setting. With this option all objects of every setting will be displayed.

DESCRIPTION

This command will report the settings that were explicitly set with the **set_self_gating_options** command. For each group of objects with the same explicitly set and derived options, the report will generate a table with the following columns:

- The option name.
- The option value when using XOR combinational logic, set with set_self_gating_objects, the default values or its inherited values when applicable.
- The option value when using NAND combinational logic, set with set_self_gating_objects, the default values or its inherited values when applicable.
- The option value when using OR combinational logic, set with set_self_gating_objects, the default values or its inherited values when applicable.
- The option value when using the automatic combinational logic selection, set with set_self_gating_objects, the default values or its inherited values when applicable.

If an option value has been derived from a parent hierarchy, the option value will have the "(i)" string next to it. If an option value has been obtained from the default values, the option value will have the "(d)" string next to it.

EXAMPLES

The following examples will use a design with three hierarchies (hier1, hier2, hier3), below the top level design, named top. The four, hier1, hier2, hier4 and top, have three registers each one.

The following example will use the following setting:

```
prompt> set_self_gating_options -for_tree_type xor -min 2 -max 4 -interaction collapse
prompt> set_self_gating_options -for_tree_type nand -min 4 -max 4 -interaction collapse
prompt> set_self_gating_options -objects {hier1 hier2} -for_tree_type nand -min 4 -max 8 -interaction none
prompt> set_self_gating_options -objects {hier2} -for_tree_type xor -min 4 -max 4 -interaction insert
```

The example shows the generated report with the **report_self_gating_options**. Since the hier3 hierarchy doesn't have any explicit option set, it is not shown in the report. As the remaining three hierarchies (hier1, hier2 and top) don't have any option set for the **or** and **auto** tree types, their option values are marked as default (d). The hier1 hierarchy doesn't have any option set for the **xor** tree type, but the top hierarchy does. In this case, the options values of this hierarchy and the **xor** tree type is marked as inherited (i).

```
prompt> report_self_gating_options

****************************************
Report: Self-Gating Options
...

****************************************

Objects:
  top
     Options    |   XOR    |   NAND   |    OR    |   AUTO
--------------------+------------+------------+------------+------------
  Minimum Bitwidth |     2    |     4    |   4 (d)  |   4 (d)
  Maximum Bitwidth |     4    |     4    |   8 (d)  |   8 (d)
Interaction with CG|  Collapse  |  Collapse  |  None (d)  |  None (d)

Objects:
  hier1
     Options    |   XOR    |   NAND   |    OR    |   AUTO
--------------------+------------+------------+------------+------------
  Minimum Bitwidth |   2 (i)  |     4    |   4 (d)  |   4 (d)
  Maximum Bitwidth |   4 (i)  |     8    |   8 (d)  |   8 (d)
Interaction with CG|Collapse (i)|    None    |  None (d)  |  None (d)

Objects:
  hier2
     Options    |   XOR    |   NAND   |    OR    |   AUTO
--------------------+------------+------------+------------+------------
  Minimum Bitwidth |     4    |     4    |   4 (d)  |   4 (d)

report_serialize_configuration

Displays options specified by the **set_serialize_configuration** command or the **reset_serialize_configuration** command.

SYNTAX

status **report_serialize_configuration**

ARGUMENTS

The **report_serialize_configuration** command has no arguments.

DESCRIPTION

This command displays options specified by the **set_serialize_configuration** command on the current design.

EXAMPLES

The following example shows a serialize configuration report:

```
prompt> report_serialize_configuration
****************************************
Report : Serialize Specification
Design : top
Version: P-2019.03
Date   : Thu Feb  7 07:50:36 2019
****************************************

Inputs                  1
Outputs                 1
Clock                   Unspecified
Update Stage            false
Wide Duty Cycle         false
Exclude Clocks          Unspecified
```

SEE ALSO

set_serialize_configuration(2)

report_shape_patterns

Generates a report of shape_patterns in the current design.

SYNTAX

string **report_shape_patterns**
[-verbose]
[-nosplit]
[-significant_digits *digits*]
[*shape_pattern_list*]

Data Types

digits integer
shape_pattern_list collection

ARGUMENTS

-verbose

Specifies whether the report contains additional columns of data, reporting more complete information about the given shape_patterns. By default: name, shape_pattern_type, dimension and displacements are reported. With this option additional attributes are shown.

-significant_digits *digits*

Specifies the number of digits to the right of the decimal point that are to be reported. Allowed values are 0-13; the default is determined by the **shell.common.report_default_significant_digits** application option, whose default is 2. Use this application option if you want to override the default. Fixed-precision floating-point arithmetics is used for delay calculation; therefore, the actual precision might depend on the platform. For example, on SVR4 UNIX see FLT_DIG in limits.h. The upper bound on a meaningful value of the argument to **-significant_digits** is then FLT_DIG - ceil(log10(fabs(*any_reported_value*))).

-nosplit

Most of the shape_pattern information is listed in fixed-width columns. If the information in a given field exceeds the column width, the next field begins on a new line, starting in the correct column. The **-nosplit** option prevents line-splitting and facilitates writing software to extract information from the report output.

shape_pattern_list

Specifies a list of shape_patterns in the given block to be reported. The default is to report all shape_patterns in the given container.

DESCRIPTION

The command displays information about the specified shape_patterns in the block. Attributes such as the dimensions and name of the shape_pattern are displayed.

EXAMPLES

The following example reports shape_patterns of a net:

```
prompt> report_shape_patterns [get_shape_patterns -of_objects \
                               [get_nets VDD]]
Shape_pattern       Type         Dimensions GridSize Displacements
--------------------------------------------------------------------------------
RECT_PATTERN_16_0    rect_pattern  {5x4}    1      {1.5000:eastx2.5000:north}
1
```

The following example displays verbose information for the shape_pattern named RECT_PATTERN_16_0.

```
prompt> report_shape_patterns -verbose RECT_PATTERN_16_0
Shape_pattern       Type         Dimensions GridSize Displacements OccupancyPattern
--------------------------------------------------------------------------------
RECT_PATTERN_16_0    rect_pattern  {5x4}    1      {1.5000:eastx2.5000:north}
                                             1101
1
```

report_shaping_channels

Reports the shaping channels created by the **create_shaping_channel** and **create_shaping_constraint** commands.

SYNTAX

string **report_shaping_channels**
[-header *header_string*]
[-channels *shaping_channels*]
[-designs *designs*]
[-of_objects *shapeable_regions*]
[-types *type_list*]

Data Types

header_string string
shaping_channels list
designs list
shapeable_regions list
type_list list

ARGUMENTS

-header *header_string*

Specifies the string used to replace the text following "Report:" in the report header.

-channels *shaping_channels*

Specifies the list of channels to report. A list of channel names can be obtained with the **get_shaping_channels** command. This option is mutually exclusive with the **-designs**, **-types** and **-of_objects** options.

-designs *designs*

Specifies the list of designs to report. If this option is omitted, the current hierarchical design is reported. This option is mutually exclusive with the **-channels** and **-of_objects** options.

-of_objects *shapeable_regions*

Specify the objects for which to report channels. Valid objects are blocks, block instances, voltage areas, move bounds, and shaping groups. Neighbor-specific channels are included if the neighbor matches one of the specified objects. This option is mutually exclusive with the **-designs** and **-channels** options.

-types *type_list*

Limits the report to only the specified channel types. Valid values are **neighbor** and **object**. By default, all channel types are reported. This option is mutually exclusive with the **-channels** option.

DESCRIPTION

This command prints a report of the shaping channels found in the hierarchy of the current top design or the designs specified with the **-designs** option. Optionally, you can restrict the report to specific types, related objects or channels.

EXAMPLES

The following example reports all shaping channels within the current design and its hierarchically nested blocks visible to **shape_blocks**:

```
prompt> report_shaping_channels
```

The following example reports only neighbor-specific channels.

```
prompt> report_shaping_channels -types neighbor
```

The following example reports only the shaping channels found within the ORCA design.

```
prompt> report_shaping_channels -designs [get_designs ORCA]
```

The following example reports the shaping channels related to movebound MB2:

```
prompt> report_shaping_channels -of_objects [get_bounds MB2]
```

The following example reports the details of the specified shaping channel:

```
prompt> get_shaping_channels
{ORCA/SHAPING_CONSTRAINT_0_child_default_channels/NEIGHBOR_CHANNEL_0}
prompt> report_shaping_channels -channels {ORCA/SHAPING_CONSTRAINT_0_child_default_channels/NEIGHBOR_CHAN
```

SEE ALSO

get_shaping_channels(2)
get_shaping_constraints(2)
report_shaping_constraints(2)
shape_blocks(2)

report_shaping_constraints

Reports the shaping constraints created by the **create_shaping_constraint** command.

SYNTAX

string **report_shaping_constraints**
[-header *header_string*]
[-constraints *shaping_constraints*]
[-designs *designs*]
[-types *type_list*]

Data Types

header_string string
shaping_constraints list
designs list
type_list list

ARGUMENTS

-header *header_string*

Specifies the string used to replace the text following "Report:" in the report header.

-constraints *shaping_constraints*

Specifies the list of constraints to report. This option is mutually exclusive with the **-designs** and **-types** options.

-designs *designs*

Specifies the list of designs to report. If this option is omitted, the current hierarchical design is reported. This option is mutually exclusive with the **-constraints** option.

-types *type_list*

Limits the report to only the specified shaping constraint types. Valid values are: **external_channels**, **child_default_channels**, **boundary_channels**, **target_location**, **reference_region**, **alignment_point**, **parent_object**, **aspect_ratio**, **boundary_area**, **child_default_utilization**, **utilization**, **array_layout**, **allowable_orientation**, and **is_rigid_boundary**. By default, all shaping constraint types are reported. This option is mutually exclusive with the **-constraints** option.

DESCRIPTION

This command prints a report of the shaping constraints found hierarchically within the current top design or the designs specified with the **-designs** option. Optionally, you can restrict the report to specific designs, types, or constraints.

EXAMPLES

The following example reports all shaping constraints within the current design and its hierarchically nested blocks visible to the **shape_blocks** command.

```
prompt> report_shaping_constraints
```

The following example reports only the utilization shaping constraints.

```
prompt> report_shaping_constraints -types utilization
```

The following example reports only the shaping constraints within the ORCA design.

```
prompt> report_shaping_constraints -designs [get_designs ORCA]
```

The following example reports only the shaping constraints related to the movebound MB2.

```
prompt> report_shaping_constraints -constraints [get_shaping_constraints -of_objects MB2]
```

report_shaping_options

Reports the default shaping options and the current shaping options set by the **set_shaping_options** command.

SYNTAX

int **report_shaping_options**

ARGUMENTS

This command has no arguments.

DESCRIPTION

Reports the default shaping options and the current shaping options set by the **set_shaping_options** command.

EXAMPLES

The following example reports shaping options for the current design.

```
prompt> report_shaping_options
```

SEE ALSO

set_shaping_options(2)

report_shields

Reports statistics for router automatic shield routing.

SYNTAX

status **report_shields**
[-nets *collection_of_nets*]
[-per_layer true | false]
[-output *file_name*]

Data Types

collection_of_nets collection
net_name string
number_of_tracks int
file_name string

ARGUMENTS

-nets *collection_of_nets*

Specifies the nets to report shielding statistics on.

By default, this command works on all shielded nets.

-per_layer true | false

Controls whether to report the shielding ratio statistics for each layer, as well as the overall ratio. If a net is completely shielded, the breakdown for each layer is omitted. The ratio is reported only on layers that have routing for each reported net.

By default (false), this command reports only the overall ratio for each net.

-output *file_name*

Specifies the output file name.

By default, the results are written to a file named report_shields.txt.

DESCRIPTION

The **report_shields** command reports the statistics of a design that was shielded by router automatic shield routing. The statistics are written to the standard output and to a text file. By default, the report file is named report_shields.txt; to specify a different name

for the report file, use the **-output** option.

By default, the command reports on the same-layer shielding on all nets shielded by the **create_shield** command. The report looks the same as the report generated at the end of the **create_shields** command, which reports the overall shielding coverage ratio per net and for the whole design; however, there might be a slight difference in the shield ratios reported by the **create_shields** and **report_shields** commands. This is due to graph connectivity differences between the two commands. When the reported values differ, use the values reported by the **report_shields** command. The difference in reported values is typically less than three percent, but can be up to five percent.

To explicitly specify the nets on which to report shielding, use the **-nets** option.

By default, the command does not report the ratios on a per-layer basis, but rather reports the overall coverage of the entire net.

For coaxial shielding options, the tool automatically detects which options the nets were shielded with and uses those options for reporting on a per-net basis.

Prerequisites

Before you run this command, the you must have created shielding on the design by using the **create_shields** command.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following reports the overall shielding coverage ratio for the CLK_B1 and CLK_B2 clock nets using the default for all other options. The VSS shielding net is automatically found by the tool from the shielding data. The output shown in the example is the report stored in the text file; the log contains the statistics, but not the report header.

```
prompt> report_shields -nets {CLK_B1 CLK_B2} \
  -output rpt1.txt

************************************
Report : Router Shielding Ratio
      : -nets specified
      : -per_layer false
 ...

************************************

Shielded 99% side-wall of (CLK_B1)
Shielded 97% side-wall of (CLK_B2)
Shielded 2 nets with average ratio as follows.
      1) 98%          (total shield ratio/number of shielded nets)
      2) 97%          (total shield length/total shielded net length)

************************************
```

The following example reports the shielding ratio per layer for the CLK_B5 net, which has coaxial shielding above and below the shielded net segment layers and has no signal routing resources between the coaxial shielding segments. The coaxial options and VSS shielding net are automatically found by the tool from the shielding data.

```
prompt> report_shields -nets {CLK_B5} -per_layer true \
```

```
  -output rpt2.txt

***********************************
Report : Router Shielding Ratio
      : -nets specified
      : -per_layer true
 ...

***********************************

Shielded 90% side-wall of (CLK_B5); 297 coaxial shielding wires added
      Layer          M3 :     95%
      Layer          M4 :     90%
      Layer          M5 :     85%
Shielded 1 nets with average ratio as follows.
      1) 90.00%          (total shield ratio/number of shielded nets)
      2) 91.00%          (total shield length/total shielded net length)

***********************************
```

The following example uses all defaults. It reports all shielded nets using the saved shielding options.

```
prompt> report_shields -output rpt3.txt

***********************************
Report : Router Shielding Ratio
      : -nets all shielded
      : -per_layer false
 ...

***********************************

Shielded 99% side-wall of (CLK_B1)
Shielded 97% side-wall of (CLK_B2)
Shielded 90% side-wall of (CLK_B5); 297 coaxial shielding wires added
Shielded 2 nets with average ratio as follows.
      1) 95.33%        (total shield ratio/number of shielded nets)
      2) 96.25%        (total shield length/total shielded net length)

***********************************
```

SEE ALSO

create_shields(2)

report_si_calculation

Displays the SI delta delay calculations for an entire stage

SYNTAX

status **report_si_calculation**
[-mode *mode*]
[-corner *corner*]
[-scenario *scenario*]
[-min]
[-max]
[-rise]
[-fall]
[-clock *clock*]
[-source_rise]
[-source_fall]
[-significant_digits *digits*]
[*victim_driver_list*]

Data Types

mode	collection
corner	collection
scenario	collection
clock	collection
digits	int
victim_driver_list	list

ARGUMENTS

-mode *mode*

Specifies the mode to use for reporting. The scenario (if any) of the mode specified by the **-mode** option and the corner specified by the **-corner** option will be used. If none of the **-mode**, **-corner**, or **-scenario** options are specified, the command generates a report based on the current scenario. It is an error to give this option with the **-scenario** option.

-corner *corner*

Specifies the corner to use for reporting. The scenario (if any) of the corner specified by the **-corner** option and the mode specified by the **-mode** option will be used. If none of the **-corner**, **-mode**, or **-scenario** options are specified, the command generates a report based on the current scenario. It is an error to give this option with the **-scenario** option.

-scenario *scenario*

Specifies the scenario to use for reporting. It is an error to give this option with the **-mode** or the **-corner** options. If none of the **-**

corner, **-mode**, or **-scenario** options are specified, the command generates a report based on the current scenario.

-max

Reports the calculations for max (late) delta delays. If neither of the **-max** or **-min** options are specified, max delta delays will be reported. If both of these options are specified, each type of calculation will be reported separately.

-min

Reports the calculations for min (early) delta delays. If neither of the **-max** or **-min** options are specified, max delta delays will be reported. If both of these options are specified, each type of calculation will be reported separately.

-rise

Reports the calculations for rising victim driver transitions. If neither of the **-rise** or **-fall** options are specified, rise delta delays will be reported. If both of these options are specified, each type of calculation will be reported separately.

-fall

Reports the calculations for falling victim driver transitions. If neither of the **-rise** or **-fall** options are specified, rise delta delays will be reported. If both of these options are specified, each type of calculation will be reported separately.

-clock *clock*

Uses existing transition data for the specified clock, and clock timing derate values (if any), to calculate delta delays. If this option is not specified, the data transitions and derate values will be used. If the cell or net arcs being reported are not part of the clock's network, a warning will be issued. If the clock does not belong to the mode being reported, the command will attempt to use a clock of the same name from the correct mode.

-source_rise

Specifies that the rising clock edge should be used to determine the transition time at the source node of the timing arc. It is an error to specify **-source_rise** or **-source_fall** without the *-clock* option. If neither **-source_rise** or **-source_fall** is specified with the *-clock* option, the clock source rise/fall will be the same as the rise/fall at the driver. That is, the clock network will be assumed to be non-inverting. If both **-source_rise** or **-source_fall** are specified, each type of calculation will be reported separately.

-source_fall

Specifies that the falling clock edge should be used to determine the transition time at the source node of the timing arc. It is an error to specify **-source_rise** or **-source_fall** without the *-clock* option. If neither **-source_rise** or **-source_fall** is specified with the *-clock* option, the clock source rise/fall will be the same as the rise/fall at the driver. That is, the clock network will be assumed to be non-inverting. If both **-source_rise** or **-source_fall** are specified, each type of calculation will be reported separately.

-significant_digits *digits*

Specifies the number of digits to the right of the decimal point to report. Allowed values are from 0 through 13. The default is 2. Using this option overrides the value set by the **shell.common.report_default_significant_digits** application option.

victim_driver_list

Reports the victim stages driven by the specified pins or ports.

DESCRIPTION

The **report_si_calculation** command creates a detailed report of the delta delay and slew calculations for a stage, which is the combination of a driving cell or port and the driven net, with its interconnect parasitics and loads.

The report includes a summary of the relevant PVT and delay calculation parameters, descriptions of the delay calculations of the victim stage's driver, a description of the net's parasitic RC network, the transition time of each aggressor net and its contribution to the delta delay, and the delay, delta delay, slew, and slew degradation of each load pin.

The **-min**, **-max**, **-rise**, **-fall**, **-clock**, *-source_rise*, and *-source_fall* options control which types of delta delays are reported. Note that each specified min/max/rise/fall/source_rise/source_fall combination will be reported separately. If multiple drivers are specified, each one will be reported separately. It is an error if the specified pin or port is not a driver. The reporting will be based on the current mode and corner. Note that the data calculations will be done by default, even if the stage is part of a clock network.

Multicorner-Multimode Support

By default, this command works on the current scenario. To specify a different scenario, use the **-scenario** option or the **-corner** and **-mode** options.

EXAMPLES

The following command generates a signal integrity report for the current design.

```
prompt> report_si_calculation
```

SEE ALSO

report_delay_calculation(2)
report_stage(2)

report_signal_em

Reports signal electromigration results for the design or specified nets.

SYNTAX

report_signal_em
[-verbose]
[-violated]
[-significant_digits *digits*]
[-nets *net_list*]

Data Types

digits integer
net_list list

ARGUMENTS

-verbose

Reports detailed electromigration analysis information for the nets in the design or violating nets. If **-violated** is specified, it only reports violating nets. Otherwise, it reports all the nets.

-violated

Reports the detailed electromigration analysis information for the violating nets of the design. Works with **-verbose**.

-significant_digits *digits*

Specifies the number of digits after the decimal point to be displayed for values in the generated report. The default value is **2**.

-nets *net_list*

Specifies the list of net names for analysis.

DESCRIPTION

The **report_signal_em** command performs signal (clock and data) electromigration analysis on the current design and generates a report. It displays signal EM QoR for the design or specified nets.

The command performs electromigration analysis of each net by calculating the current on every segment of the net and comparing it with the current limits defined by constraints.

By default, **report_signal_em** analyzes the whole design, including clock nets and signal nets. The net list could be specified for certain group of nets. For example, command **get_nets** could be used to filter out clock nets, **[get_nets -hier * -filter "net_type!=Clock"]**.

Before running **report_signal_em**, make sure the design has signal electromigration constraints. You can load an ITF-EM file into an existing design library.

Also, be sure that the switching activity has been defined for all boundary nets.

This command uses information from current mode and corner.

EXAMPLES

The following example runs signal electromigration analysis and includes detailed violating nets information in the reporting.

```
prompt> report_signal_em -verbose -violated
```

SEE ALSO

set_switching_activity(2)
read_signal_em_constraints(2)

report_signal_io_constraints

Reports signal I/O constraints of the specified I/O guides.

SYNTAX

int **report_signal_io_constraints**
[-io_guide_list *io_guide*]
[-significant_digits *digits*]

Data Types

io_guide list
digits int

ARGUMENTS

-io_guide_list

Specifies the name or collection of I/O guides to report. If no I/O guides are specified, signal constraints of all I/O guides are reported.

-significant_digits *digits*

Specifies the number of digits to the right of the decimal point to report. Allowed values are 0-13; the default is determined by the **shell.report_default_significant_digits** application option, whose default is 2. Use this option if you want to override the default.

DESCRIPTION

This command reports signal constraints existed on I/O guides. The command lists all pad instances described as part of the signal constraints. For each such pad, the command writes a location value as the distance measured from the starting point of the I/O guide.

EXAMPLES

The following example reports signal constraints of an I/O guide named "north".

prompt> **report_signal_io_constraints -io_guide_list north**

The following example reports signal constraints of all I/O guides.

```
prompt> report_signal_io_constraints
```

SEE ALSO

place_io(2)
remove_signal_io_constraints(2)

report_site_defs

Displays information about the specified site definitions in the technology data of the of current or specified library.

SYNTAX

status **report_site_defs**
[-library *library*]
[-tech *tech_object*]
[-nosplit]
[-significant_digits *digits*]
site_defs

Data Types

library string or collection
tech_object collection
digits integer
site_defs string or collection

ARGUMENTS

-library *library*

Site definition will be searched in the technology of this library. Default is current library's tech. This is mutually exclusive with -tech option.

-tech *tech_object*

Site definition will be searched in this technology. Default is current library's tech. This is mutually exclusive with -library option.

-nosplit

Most of the site_def information is listed in fixed-width columns. If the information for a given field exceeds the column width, the next field begins on a new line, starting in the correct column. This option prevents line-splitting and facilitates writing software to extract information from the report output.

-significant_digits *digits*

Specifies the number of significant digits (digits to the right of the decimal point) to report. Allowed values are from 0 through 13. The default is 2. Using this option overrides the value set by the **shell.common.report_default_significant_digits** application option.

site_defs

Specifies the site_defs to report. This can be either the name/regexp pattern or a collection of multiple site_defs.

DESCRIPTION

The **report_site_defs** command displays information about the specified site_defs in the tech of current or specified library. The command reports the name, width, height, type, is_default, tech, symmetry and legal_orientations attributes of the site_defs.

EXAMPLE

The following command generates a default report for the site_defs in the tech of library r4000_lib.

```
prompt> report_site_defs -library r4000_lib

****************************************
Report : report_site_defs
 ...

****************************************
Site_def         Width   Height  Type  Is_default  Tech
  Symmetry  Legal_orientations
--------------------------------------------------------------------------------
lib_site_def_5    5.00    10.00   core  --        r4000_tech
  --       R0
lib_site_def_6    10.00   15.00   pad   --        r4000_tech
  Y        R0 MY
lib_site_def_7    15.00   20.00   core  --        r4000_tech
  X Y      R0 R180 MX MY
lib_site_def_8    20.00   25.00   pad   --        r4000_tech
  X Y R90   R0 R90 R180 R270 MX MXR90 MY MYR90
sd1              5.00    10.00   core  default    r4000_tech
  --       R0
1
```

SEE ALSO

create_site_defs(2)
get_site_defs(2)

report_size_only

Reports size_only information for design objects.

SYNTAX

string **report_size_only**
  [-all]
  [*cell_list*]

list *cell_list*

ARGUMENTS

-all

Reports for all size_only cells, hierarchical pins, and flat nets.

cell_list

Lists cells to report. If you do not specify this or the **-all** option, a summary report will be printed, listing the total number of size_only cells, hierarchical pins, and flat nets.

DESCRIPTION

Displays size_only information for cells, hierarhical pins, and nets in the current design. For each size_only object, the reasons for the size_only status will be listed, along with the relevant mode(s) or corner(s).

EXAMPLES

The following example shows a summary report:

```
prompt> report_size_only

Report : size_only
0 of 251 instances are size_only
4 of 163 hierarchical pins are size_only
4 of 275 flat nets are size_only
1
```

The following example shows a report for one cell that has had **set_size_only** applied to it:

```
prompt> report_size_only cell_3/ABO_CELL_19

Report : size_only

Instance cell_3/ABO_CELL_19 (ND2D1BWP)
  Mode/corner independent:  user
1 of 1 instances are size_only
```

The following example lists all size_only objects and the reasons for the size_only status:

```
prompt> report_size_only -all

Report : size_only

Instance cell_3/ABO_CELL_19 (ND2D1BWP)
  Mode/corner independent:  user

Flat net data_out[4]
  Mode default:  exception

Flat net data_out[2]
  Mode default:  exception

Flat net data_out[1]
  Mode default:  exception

Flat net cell_1/cell_8/ABO_NET_21
  Mode default:  exception

Hierarchical pin cell_2/res[1]
  Mode default:  exception

Hierarchical pin cell_2/res[0]
  Mode default:  exception

Hierarchical pin cell_1/cell_8/cell_4/res_0
  Mode default:  exception

Hierarchical pin cell_1/cell_8/cell_4/res_1
  Mode default:  exception
1 of 251 instances are size_only
4 of 163 hierarchical pins are size_only
4 of 275 flat nets are size_only
1
```

SEE ALSO

set_size_only(2)
report_cell(2)

report_skew_macros

Shows the settings that were specified in **set_skew_macros** command.

SYNTAX

int **report_skew_macros**
[-bank_name *name*]

ARGUMENTS

-bank_name *name*

Specifies the bank whose **set_skew_macros** settings should be shown. If no bank is specified, the settings for all banks are shown.

DESCRIPTION

The **report_skew_macros** command reports the specification of **set_skew_macros** commands. If bank_name is not specified, it shows all the specifications of all banks.

EXAMPLES

This example reports the bank 'tlb_tag' set_skew_macros specification.

prompt> **report_skew_macros -bank_name tlb_tag**
```
****************************************
Report : skew_macros
Design : test_core
Version: 3.5.0
Date   : Fri May 11 00:48:06 2018
****************************************

BankName     Improve_Side     Macros

-----------------------------------------------------------------------------------------
tlb_tag      output       u_tlb_tag_bank0
```

```
                    u_tlb_tag_bank1
                    u_tlb_tag_bank2
                    u_tlb_tag_bank3
---------------------------------------------------------------------------------------------
```

SEE ALSO

set_skew_macros(2)
remove_skew_macros(2)

report_stage

Displays the Arnoldi and/or Elmore delay calculations for an entire stage.

SYNTAX

status **report_stage**
[-mode *mode*]
[-corner *corner*]
[-scenario *scenario*]
[-min]
[-max]
[-rise]
[-fall]
[-clock *clock*]
[-source_rise]
[-source_fall]
[-significant_digits *digits*]
[-startpoint_models]
[*driver_list*]

Data Types

mode collection
corner collection
scenario collection
clock collection
digits int
driver_list list

ARGUMENTS

-mode *mode*

Specifies the mode to be used for reporting. The scenario (if any) of the mode specified by the **-mode** option and the corner specified by the **-corner** option will be used. If none of the **-mode**, **-corner**, or **-scenario** options are specified, the command reports using data from the current scenario. It is an error to specify this option with the **-scenario** option.

-corner *corner*

Specifies the corner to be used for reporting. The scenario (if any) of the corner specified by the **-corner** option and the mode specified by the **-mode** option will be used. If none of the **-corner**, **-mode**, or **-scenario** options are specified, the command reports using data from the current scenario. It is an error to specify this option with the **-scenario** option.

-scenario *scenario*

Specifies the scenario to be used for reporting. It is an error to specify this option with the **-mode** or the **-corner** options. If none of the **-corner**, **-mode**, or **-scenario** options are specified, the command reports using data from the current scenario.

-min

Reports the calculations for min (early) delays. If neither of the **-max** or **-min** options are specified, max delays will be reported. If both of these options are specified, each type of calculation will be reported separately.

-max

Reports the calculations for max (late) delays. If neither of the **-max** or **-min** options are specified, max delays will be reported. If both of these options are specified, each type of calculation will be reported separately.

-rise

Reports the calculations for rising driver transitions. If neither of the **-rise** or **-fall** options are specified, rise delays will be reported. If both of these options are specified, each type of calculation will be reported separately.

-fall

Reports the calculations for falling driver transitions. If neither of the **-rise** or **-fall** options are specified, rise delays will be reported. If both of these options are specified, each type of calculation will be reported separately.

-clock *clock*

If this option is specified, existing transition data for the specified clock, and clock timing derate values (if any), will be used to calculate delays. If this option is not specified, the data transitions and derate values will be used. If the cell or net arcs being reported are not part of the clock's network, a warning will be issued. If the clock does not belong to the mode being reported, the command will attempt to use a clock of the same name from the correct mode.

-source_rise

Specifies that the rising edge should be used to determine the transition time at the source node of the timing arc. This option must be specified together with the **-clock** option, otherwise the tool issues an error. If neither the **-source_rise** or **-source_fall** option is specified with the **-clock** option, the clock source rise/fall will be the same as the rise/fall at the driver. That is, the clock network will be assumed to be non-inverting. If both the **-source_rise** or **-source_fall** options are specified, each type of calculation is reported separately.

-source_fall

Specifies that the falling edge should be used to determine the transition time at the source node of the timing arc. This option must be specified together with the **-clock** option, otherwise the tool issues an error. If neither the **-source_rise** or **-source_fall** option is specified with the **-clock** option, the clock source rise/fall will be the same as the rise/fall at the driver. That is, the clock network will be assumed to be non-inverting. If both the **-source_rise** or **-source_fall** options are specified, each type of calculation is reported separately.

-significant_digits *digits*

Specifies the number of digits to the right of the decimal point to report. Allowed values are from 0 through 13. The default is 2. Using this option overrides the value set by the **shell.common.report_default_significant_digits** application option.

-startpoint_models

Uses the existing driver models for timing startpoints.

driver_list

Reports the stages driven by the specified pins or ports.

DESCRIPTION

The **report_stage** command provides a detailed report of the delay and slew calculations for a stage, which is the combination of a driving cell or port and the driven net, with its interconnect parasitics and loads.

The report will include a summary of the relevant PVT and delay calculation parameters, descriptions of the delay calculations of each driver fanin cell arc, which of those arcs is actually used to drive the net, a description of the net's parasitic RC network, and the delay, slew, and slew degradation of each load pin.

If the tool has Arnoldi delay analysis activated, and the stage can support Arnoldi analysis, a description of the Arnoldi calculations will be reported, along with the equivalent Elmore calculation for comparison. Otherwise, only Elmore calculations will be reported.

The **-min**, **-max**, **-rise**, **-fall**, **-clock**, **-source_rise**, and **-source_fall** options control which types of delays are reported. Note that each specified min/max/rise/fall/source_rise/source_fall combination will be reported separately. If multiple drivers are specified, each one will be reported separately. It is an error of a specified pin or port is not a driver. The reporting will be based on the specified scenario. Note that the data calculations will be done by default, even if the stage is part of a clock network.

Multicorner-Multimode Support

By default, this command works on the current scenario. To specify a different scenario, use the **-scenario** option or the **-corner** and **-mode** options.

SEE ALSO

report_delay_calculation(2)

report_starrc_in_design

Report the setting of StarRC in design

SYNTAX

string **report_starrc_in_desgin**

DESCRIPTION

Report the settings used in StarRC in Design.

Multicorner-Multimode Support

This command has no dependency on scenario-specific, mode-specific, or corner-specific information.

EXAMPLE

The following command reports the setting for StarRC in design:

```
prompt> report_starrc_in_design
 config = ./starRC/star.config
1
```

SEE ALSO

set_starrc_in_design(2)

report_starrc_options

Report the setting of StarRC

SYNTAX

string **report_starrc_options**

DESCRIPTION

Report the settings used in StarRC which is used in PT ECO fusion.

Multicorner-Multimode Support

This command has no dependency on scenario-specific, mode-specific, or corner-specific information.

EXAMPLE

The following command reports the setting for StarRC:

```
prompt> report_starrc_options
 config = ./starRC/star.config
1
```

SEE ALSO

set_starrc_options(2)

report_stub_chains

Displays information about the specified stub chains in the current design.

SYNTAX

status **report_stub_chains**
[-length]
[-verbose]
[-nosplit]
[-significant_digits *digits*]
[*stub_chains*]

Data Types

digits integer
stub_chains string or collection

ARGUMENTS

-length

Specifies whether the report contains manhattan wire length of the stub chains to be reported.

-nosplit

Most of the stub chains information is listed in fixed-width columns. If the information in a given field exceeds the column width, the next field begins on a new line, starting in the correct column. The **-nosplit** option prevents line-splitting and facilitates writing software to extract information from the report output.

-significant_digits *digits*

Specifies the number of significant digits (digits to the right of the decimal point) to report. Allowed values are from 0 through 13. The default is 2. Using this option overrides the value set by the **shell.common.report_default_significant_digits** application option.

stub_chains

Specifies the stub_chains to report. This can be either the name/regexp pattern or a collection of multiple stub_chains.

-verbose

Specifies whether the report contains additional physical data, reporting more complete information about the given stub chain.

DESCRIPTION

The **report_stub_chains** command displays information about the specified stub chains in the current design.

EXAMPLE

The following command generates a default report for the stub_chains present in current design.

```
prompt> report_stub_chains

report_supernet_exceptions

Reports the supernet transparent pins and disabled cells in the current design.

SYNTAX

status **report_supernet_exceptions**
[-nosplit]

ARGUMENTS

-nosplit

Does not split lines if column overflows.

DESCRIPTION

This command reports all the pins which are marked as transparent for supernets and also reports the disabled cells in the current design, as specified by the **set_supernet_exceptions -pins** and **set_supernet_exceptions -disable_cells** command.

EXAMPLES

The following example reports the supernet transparent pins and disabled cells of the design *r4000*:

```
prompt> report_supernet_exceptions

Instance          Supernet Transparent Pins
--------------------------------------------------------------------------------
cntrl/U166              { A1 Z }
alu/r281/U449           { A1 ZN }

report_supply_net

Reports information about the specified supply nets.

SYNTAX

status **report_supply_nets**
[-nosplit]
[*supply_nets*]

Data Types

supply_nets list

ARGUMENTS

-nosplit

Does not split lines if column overflows.

supply_nets

Specifies the supply nets be reported. The command fails if it does not find any of the specified supply nets. If this option is not specified, all the supply nets in the current scope are reported.

DESCRIPTION

The **report_supply_nets** command reports detailed information about existing supply nets. If you specify the supply nets, only those supply nets are reported; otherwise all supply nets in the current scope are reported.

Until commit_upf command is executed and power intent is finalized, supply nets of subblocks are not propagated and will not be included in the report.

The report for a supply net includes the following information: its full name, its maximum and minimum voltages if set using the **set_voltage** command, its resolve type, and the various supply states. The names of the power domains in which the supply net is available are also printed. The name of the power domain is suffixed with an asterisk (*) if the net is set as the domain supply net for that domain.

If the voltage of the supply net is not set, a '--' is printed, indicating that the voltage is undefined.

This command returns 1 on success, 0 otherwise.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example reports information about all the supply nets in the current scope.

```
prompt> report_supply_nets
****************************************
Report : Supply Net
Design : top
Corner : default
 ...

****************************************
------------------------------------------------------

report_supply_ports

Reports information about the specified supply ports.

SYNTAX

status **report_supply_ports**
[-nosplit]
[*supply_ports*]

Data Types

supply_ports list

ARGUMENTS

-nosplit

Does not split lines if column overflows.

supply_ports

Specifies the supply ports to be reported. The command fails if it does not find any of the specified supply ports. If this option is not specified, the tool reports on all supply ports in the current scope.

DESCRIPTION

The **report_supply_ports** command reports detailed information about existing supply ports. If *supply_ports* is not specified, the tool reports on all supply ports within the current scope.

Until commit_upf command is executed and power intent is finalized, supply ports of subblocks are not propagated and will not be included in the report.

The report includes the full name of the supply port, its direction, and the supply nets to which it is connected. Supply ports of power switch strategy can be reported by specifying the full name of the power switch and the supply port name as follows:

report_supply_ports *switch_full_path_name*/*supply_port_name*

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example reports on all supply ports in the current scope:

```
prompt> report_supply_ports
****************************************
Report : Supply Port
Design : top
 ...

****************************************
----------------------------------------
Supply Port       : vdd
Current Scope     : box1 (top level)
Direction         : in

report_supply_sets

Report the specified supply sets in the current scope.

SYNTAX

status **report_supply_sets**
  [-nosplit]
  [*supply_set_name*]

Data Types

supply_set_name string list

ARGUMENTS

-nosplit

Does not split lines if column overflows.

supply_set_name

Specifies the supply sets that are to be reported. If the supply set does not exist in the current scope, the command fails.

DESCRIPTION

The **report_supply_sets** command reports detailed information about the supply sets in the current scope.

Until commit_upf command is executed and power intent is finalized, supply sets of subblocks are not propagated and will not be included in the report.

The report for a supply set includes the following information: its full name, the scope in which it was created. If the actual supply nets have been associated with the power and ground functionalities of the specified supply sets, the pairs of function, supply_net are also printed.

This command returns 1 on success, 0 otherwise.

Multicorner-Multimode Support

This command has no dependency on scenario-specific information.

EXAMPLES

The following example reports information about the supply set primary_sset in the current scope.

```
prompt> create_supply_set primary_sset \
        -function {power VDD} \
        -function {ground VSS} \
primary_sset

prompt> report_supply_sets primary_sset

cell_list list
switching_type_list list
scenario_list list
mode_list list
corner_list list
limit float

ARGUMENTS

-verbose

It matches the current default output of the command.

-nosplit

Prevents line-splitting and facilitates writing software to extract information from the report output. Most of the design information is listed in fixed-width columns. If the information in a given field exceeds the column width, the next field begins on a new line starting in the correct column.

-cells *cells_list*

Indicates that switching activity information is to be reported only for the specified list of cells.

-hierarchy

When the command is used with this option, the report generated includes information about subblocks in the design.

-switching_activity_types *switching_type_list*

When used the report includes only those nets whose activity source matches the ones specified by the user. The allowed switching types are 'annotated', 'propagated', 'simulated', 'sta' and 'default'.

-scenarios *scenario_list*

Specifies the scenarios to be considered. If this option is not specified, then only those scenarios are considered which contain the modes and corners specified through **-modes** and **-corners** options. Output of the command is generated separately for each scenario. If none of the **-modes**, **-corners**, or **-scenarios** options are specified, the command reports for the current scenario in the design.

-modes *mode_list*

Specifies the mode filter on the set of scenarios to be considered. A scenario is considered if its mode is present in *mode_list*. If this option is not specified, no filtering on modes occurs.

-corners *corner_list*

Specifies the corner filter on the set of scenarios to be considered. A scenario is considered if its corner is present in *corner_list*. If this option is not specified, no filtering occurs on corners.

-coverage

Reports the nets having toggle rate greater than or equal to the value specified by the **-toggle_rate_limit** option. Coverage is defined as the percentage of nets with toggle rate more than or equal to the toggle rate limit. This report can be used to verify that switching activities from simulation or propagation are properly exercising the design. Combined with the **-hierarchy** option, it can be used to make sure that each block in the design is properly exercised. This option can not be used with any of the **-list_low_activity**, **-switching_activity_types** or **-essential** options.

-list_low_activity

Reports the list of nets in the design having toggle rate less than or equal to the toggle rate limit, which is specified using the **-toggle_rate_limit** option. This report can be used to help debug which nets are not being exercised by the simulation testbench. This option cannot be used with the **-hierarchy** or **-coverage** options.

-toggle_rate_limit *limit*

Sets the toggle rate limit, which is used by the **-coverage** report and the **-list_low_activity** report. Toggle rate limit represents the maximum toggle rate considered to be low activity. The default limit is 0. This option can only be exercised when either of **-coverage** or **-list_low_activity** options has been specified.

-essential

Reports the activity on the essential activity points. Following are the essential activity points : primary input pins, blackbox output pins, edge-sensitive sequential output pins, level-sensitive sequential output pins, logical cycle and user-defined output pins. This option can not be used with the **-coverage** option.

DESCRIPTION

The command has been deprecated in 18.06-SP4 release and will be removed in future releases. Please use **report_activity** instead.

Reports the switching activities on the nets in the current design or instance.

The default report generated by the **report switching_activity** command gives an overview of switching activity information in the current instance. The report lists the number of nets with switching activity that is either user annotated, simulated (read from a file), propagated, sta (derived from clock waveforms) or default.

Switching activity can be annotated by using the **set_switching_activity** and **read_saif** commands.

EXAMPLES

The following examples report switching activity for the current design.

```
prompt> report_switching_activity

report_synlib

Displays information about synthetic libraries.

SYNTAX

status **report_synlib**
[**-modules** *module_list*]
[**-nosplit**]
library

Data Types

library string
module_list list

ARGUMENTS

library

Specifies the name of the library to be reported. This library must already be read into the tool except the *standard* and *dw_foundation*.

-modules ***module_list***

Specifies a list of modules that are reported. The default is to report information about all modules in the synthetic library. Wildcard pattern can be used in each element of the list.

-nosplit

Does not split lines if column overflows.

DESCRIPTION

The **report_synlib** command displays information about synthetic libraries.

The synthetic library report displays the following information in the following order:

- A list of the operators and their pins
- A list of the modules with their pins, parameters, attributes, implementations and bindings

By default, all the modules are reported. If you specify the **-modules** option, the **report_synlib** command reports only the listed

modules and the associated implementations and bindings.

EXAMPLES

The following report displays the *DW01_add* and *DW01_addsub* modules and their implementations in the *standard* library.

```
prompt> report_synlib -modules {DW01_fp_add*} standard

report_lib(2)

report_taps

Reports information on tap points.

SYNTAX

string **report_taps**
[-static_current]
[*taps*]

Data Types

list *taps*

ARGUMENTS

-static_current

Report static current for each tap point. The info. is only available from static rail analysis.

taps

Specifies a list of taps to be reported. Items within the list can be name patterns or collections of taps.

DESCRIPTION

The **report_taps** command displays information about the tap points in the current session context. By default, the command generates a report that includes all current tap points in the session context. Options can be used to limit the report to a subset of the taps. The report contains the following information about each tap:

- Name
- Type (auto_pg, top_pg, cell_pg, absolute_coord, cell_coord, libcell_pg and libcell_coord)
- Associated net
- Absolute {X Y} coordinate
- Layer number from the technology file (.tf)
- Associated parasitics
- Validity of the tap point location

- Static current

Multicorner-Multimode Support

This command has no dependency on scenario-specific, mode-specific, or corner-specific information.

EXAMPLES

The following example shows how to report all taps:

```
prompt> report_taps

Name   Type    Net    Point        Layer  Is_valid
------------------------------------------------------------------------
Tap_0  cell_coord    VDD    17.600 9.000  31    true
Tap_1  cell_coord    VDD    9.225  21.603 32    true
```

The following example shows how to report partial taps:

```
prompt> report_taps [get_taps Tap_0]

Name   Type    Net    Point        Layer  Is_valid
------------------------------------------------------------------------
Tap_0  cell_coord    VDD    17.600 9.000  31    true

prompt> report_taps Tap_1

Name   Type    Net    Point        Layer  Is_valid
------------------------------------------------------------------------
Tap_1  cell_coord    VDD    9.225  21.603 32    true
```

The following example shows associated parasitics will be shown if any tap has valid RLC:

```
prompt> report_taps

Name  Type  Net Point   Layer R   L   C   Is_valid
-------------------------------------------------------------------------------------------
Tap_5  absolute_coord  VDD 18.225  5.270 32  R(1.000)  L(2.000)  C(3.000)  true
Tap_7  absolute_coord  VSS 22.265  4.475 31  R(3.000)  L(2.000)  C(1.000)  true
```

The following example shows how to report tap static current:

```
prompt> report_taps -static_current

Name  Type  Net Point   Layer Static_Current
-----------------------------------------------------------------------
Tap_28    VSS 521.100 409.740 31  -0.0013228
Tap_29    VSS 521.100 0.200 31  -0.00153719
Tap_30    VSS 420.300 409.740 31  -0.000945483
Tap_31    VSS 420.300 0.200 31  -0.00100271
Tap_32    VSS 319.500 409.740 31  -0.000893119
Tap_33    VSS 319.500 0.200 31  -0.00102184
Tap_34    VSS 218.700 409.740 31  -0.00105649
Tap_35    VSS 218.700 0.200 31  -0.00112674
```

```
Tap_36   VSS 117.900 409.740 31  -0.0012568
Tap_37   VSS 117.900 0.200 31  -0.00133558
Tap_38   VDD 672.300 409.740 31  0
Tap_39   VDD 672.300 0.200 31  0
Tap_40   VDD 571.500 409.740 31  0.00109758

report_target_library_subset

Reports target library subsets on the top block and hierarchical cells.

SYNTAX

status **report_target_library_subset**
[-objects *objects*]
[-top]
[-all]
[-nosplit]

Data Types

objects list or collection

ARGUMENTS

-objects *objects*

Specifies the hierarchical cells for which to report the target library subsets. The cells must be in the current block.

If you do not specify this option, the **-top** option, or the **-all** option, the tool uses the **-top** option by default. Specifying the **-top** and **-objects** options is also supported.

-top

Reports the target library subset on the top block.

If you do not specify this option, the **-objects** option, or the **-all** option, the tool uses the **-top** option by default. Specifying the **-top** and **-objects** options is also supported.

-all

Reports the target library subset on each hierarchy which has an explicitly assigned target library subset. The **-all** option cannot be used with the **-top** or **-objects** options.

-nosplit

Does not split lines if column overflows.

DESCRIPTION

This command reports the target library subsets for the top block and hierarchical cells. This command only reports the subsets which were explicitly set on the objects with the set_target_library_subset command. This command does not report subsets which are inherited from an ancestor hierarchical cell.

EXAMPLES

The following example reports the target library subset for the top hierarchy.

```
prompt> report_target_library_subset -top
```

The following example reports the target library subset for a hierarchical cell.

```
prompt> report_target_library_subset -objects [get_cells top/mid]
```

SEE ALSO

set_target_library_subset(2)
remove_target_library_subset(2)

report_tech_diff

Prints a report of difference between two Techs.

SYNTAX

status **report_tech_diff**
-tech *cmp_tech*
-tech_file *cmp_tech_file*
-ref_tech *ref_tech*
-ref_tech_file *ref_tech_file*

Data Types

tech	collection
tech_file	string
ref_tech	collection
ref_tech_file	string

ARGUMENTS

-tech *tech*

The tech object which needs to be compared against reference.This option and the *-tech_file* option are mutually exclusive.

-tech_file *tech_file*

The tech file which needs to be compared against reference.This option and the *-tech* option are mutually exclusive.

[-tech | -tech_file] is a compulsory option.

-ref_tech *ref_tech*

For reading in tech object who is reference for the comparison of new tech.This option and the *-ref_tech_file* option are mutually exclusive.

-ref_tech_file {*ref_tech_file*}

For reading in tech file who is reference for the comparison of new tech.This option and the *-ref_tech* option are mutually exclusive.

[[-ref_tech] | [-ref_file_tech]] is an optional option. If -ref_tech or -ref_file_tech is not provided, command will take tech of current lib, if current lib is not present it will give Error that no reference tech is present for comparison.

DESCRIPTION

The **report_tech_diff** command will print a detailed report of the differences between the new tech and the reference tech.

The **report_tech_diff** command will compare two techs, regardless of whether they are ASCII (tech file) or Tech database(object):

1. Two ASCII tech files.

2. Two tech databases.

3. An ASCII tech file and a tech database.

The **report_tech_diff** command will produce a detailed report of the differences between the new tech and the reference tech containing the list of all added tech objects, all removed tech objects, and all changed objects of the given type, with the changes detailed for changed tech objects.

EXAMPLES

The following example uses the **-tech_file** and **-ref_tech_file** options for equivalent comparison of techs.

```
prompt> report_tech_diff -tech_file tech_file.tf -ref_tech_file ref_tech_file.tf

report_test_assume

Displays the value set on the pins by the **set_test_assume** command.

SYNTAX

status **report_test_assume**

ARGUMENTS

The **report_test_assume** command has no arguments.

DESCRIPTION

This command displays the pins and the value they are set to by the **set_test_assume** command on the current design. It reports the test assume value of either 1 or 0.

EXAMPLES

The following is an example of the **report_test_assume** command:

```
prompt> report_test_assume
****************************************
Report : Test_Assume Specification
Design : top
Version: P-2019.03
Date   : Thu Feb  7 07:59:36 2019

set_testability_configuration(2)

report_threshold_voltage_group

Reports statistics on cell count and area by threshold voltage group names.

SYNTAX

int **report_threshold_voltage_groups**
[-verbose]
[-significant_digits *digits*]
[-nosplit]
[-summary]
[-detailed *cell_type*]
[-datapath_cells_only]
[-standard_cells_only]
[-hierarchy]
[-hier_vt_groups *group_list*]
[-hier_threshold *digits*]
[*cell_list*]

Data Types

digits int
cell_type list
cell_list list
group_list list

ARGUMENTS

-verbose

Lists all of the cells belonging to each threshold voltage group. If this option is omitted, the default summary report shows only the number and percentage of cells.

-significant_digits *digits*

Specifies the number of digits to the right of the decimal point to report. Allowed values are from 0 through 13. The default is 2. Using this option overrides the value set by the **report_default_significant_digits** variable.

-nosplit

Prevents line splitting and facilitates writing scripts to extract information from the report output. Most of the design information is listed in fixed-width columns. If the information in a given field exceeds the column width, the next field begins on a new line, starting in the correct column.

-summary

Prints the old report format. This format reports the number, area, and percentage of cells in each threshold voltage group for black-box and non-black-box cells in each group.

-detailed *cell_type*

Specifies the cell types for which detailed report is to be generated. Acceptable types are repeater, register and clock_network.

-datapath_cells_only

Reports only for cells in the data path excluding clock_network, macros and blackboxes

-standard_cells_only

Reports only for cells in data path and clock network

-hierarchy

Prints the hierarchical report for all vtGroups present in the design

-hier_vt_groups *group_list*

Prints the hierarchical report for user specified vtGroups in the design.

-hier_threshold *digits*

Limits the report to hierarchical cells that has leaf cells more than the specified threshold. The default value is 10000.

cell_list

Specifies a list of cells on which to report the threshold voltage groups. If not specified, all cells in the **current_design** are considered.

DESCRIPTION

This command reports the number, area, and percentage of cells in each threshold voltage group for the specified list of cells or designs. The report also shows separately, the number, area, and percentage of repeater, combinational, register, sequential, clock_network, macro and physical_only cells in each group.

The threshold voltage group is defined in the technology libraries with the **threshold_voltage_group** attribute on the cell, or with the **default_threshold_voltage_group** attribute on the library. You can also set the attributes on the objects using the **set_attribute** command. The attributes can be any string values, but the values must be related to the threshold voltage of the cell to be meaningful. Any cells in the design that have no threshold voltage group attribute are included in the "undefined" group. Cells in the abstract block will not be reported.

The threshold voltage or vth groups that are to be considered as low Vth are specified using the **set_threshold_voltage_group_type** command.

If specified, these low Vth groups are marked by a letter "L" in the last column of their corresponding rows in the report. The total number, area, and percentage of cells in all of these low vth groups is also reported.

If the command set_max_lvth_percentage is used to set the max lvt percentage, the value will be displayed.

Multicorner-Multimode Support

This command has no dependency on scenario-specific, mode-specific, or corner-specific information.

EXAMPLES

This command generates a summary of cells in each threshold voltage group:

```
prompt> set_max_lvth_percentage 10
prompt> report_threshold_voltage_groups -summary
********************************************************************************
                   Threshold Voltage Group Report

report_threshold_voltage_groups

Reports statistics on cell count and area by threshold voltage group names.

SYNTAX

int **report_threshold_voltage_groups**
[-verbose]
[-significant_digits *digits*]
[-nosplit]
[-summary]
[-detailed *cell_type*]
[-datapath_cells_only]
[-standard_cells_only]
[-hierarchy]
[-hier_vt_groups *group_list*]
[-hier_threshold *digits*]
[*cell_list*]

Data Types

digits int
cell_type list
cell_list list
group_list list

ARGUMENTS

-verbose

Lists all of the cells belonging to each threshold voltage group. If this option is omitted, the default summary report shows only the number and percentage of cells.

-significant_digits *digits*

Specifies the number of digits to the right of the decimal point to report. Allowed values are from 0 through 13. The default is 2. Using this option overrides the value set by the **report_default_significant_digits** variable.

-nosplit

Prevents line splitting and facilitates writing scripts to extract information from the report output. Most of the design information is listed in fixed-width columns. If the information in a given field exceeds the column width, the next field begins on a new line, starting in the correct column.

-summary

Prints the old report format. This format reports the number, area, and percentage of cells in each threshold voltage group for black-box and non-black-box cells in each group.

-detailed *cell_type*

Specifies the cell types for which detailed report is to be generated. Acceptable types are repeater, register and clock_network.

-datapath_cells_only

Reports only for cells in the data path excluding clock_network, macros and blackboxes

-standard_cells_only

Reports only for cells in data path and clock network

-hierarchy

Prints the hierarchical report for all vtGroups present in the design

-hier_vt_groups *group_list*

Prints the hierarchical report for user specified vtGroups in the design.

-hier_threshold *digits*

Limits the report to hierarchical cells that has leaf cells more than the specified threshold. The default value is 10000.

cell_list

Specifies a list of cells on which to report the threshold voltage groups. If not specified, all cells in the **current_design** are considered.

DESCRIPTION

This command reports the number, area, and percentage of cells in each threshold voltage group for the specified list of cells or designs. The report also shows separately, the number, area, and percentage of repeater, combinational, register, sequential, clock_network, macro and physical_only cells in each group.

The threshold voltage group is defined in the technology libraries with the **threshold_voltage_group** attribute on the cell, or with the **default_threshold_voltage_group** attribute on the library. You can also set the attributes on the objects using the **set_attribute** command. The attributes can be any string values, but the values must be related to the threshold voltage of the cell to be meaningful. Any cells in the design that have no threshold voltage group attribute are included in the "undefined" group. Cells in the abstract block will not be reported.

The threshold voltage or vth groups that are to be considered as low Vth are specified using the **set_threshold_voltage_group_type** command.

If specified, these low Vth groups are marked by a letter "L" in the last column of their corresponding rows in the report. The total number, area, and percentage of cells in all of these low vth groups is also reported.

If the command set_max_lvth_percentage is used to set the max lvt percentage, the value will be displayed.

Multicorner-Multimode Support

This command has no dependency on scenario-specific, mode-specific, or corner-specific information.

EXAMPLES

This command generates a summary of cells in each threshold voltage group:

```
prompt> set_max_lvth_percentage 10
prompt> report_threshold_voltage_groups -summary
