PrimeTime Suite Error Messages

This document describes the error messages supported by the PrimeTime Suite tool.

ADES

ADES-002

(info) Checking scenario '%s': %s

Description

This status message is printed during *analyze_design*. It shows the scenario and type of rules currently being checked.

ADES-003

(info) Checking global rules: %s.

Description

This status message is printed during *analyze_design*, while checking scenario-independent rules. It shows the type of rules currently being checked.

ADES-004

(error) Scenario '%s' is empty; no rule checks will be performed.

Description

This status message is printed during *analyze_design*. Rules will not be checked for this scenario because it has no constraints.

ADES-005

(error) The 'create_rule_violation' command can only be called during 'analyze_design'.

Feedback

Description

You cannot generate violations of user-defined rules except in the Tcl procedures called during the *analyze_design* command.

What Next

Use *analyze_design* to invoke the user-defined rule check procedures.

See Also

- create_rule_violation

ADES-006

(error) Rule '%s' is not user-defined.

Description

The *create_rule_violation* command must specify a user-defined rule.

What Next

The Tcl procedure for checking user-defined rules should invoke *create_rule_violation* with a user-defined rule. Use *create_rule* to create a user-defined rule.

See Also

- create_rule
- create_rule_violation

ADES-007

(error) Incorrect number of parameters specified for rule '%s':\nrule has %d parameter, create_rule_violation specified %d.

Description

The *create_rule_violation* command must be specified with the number of parameter values expected by the rule.

What Next

Fix the Tcl procedure to invoke *create_rule_violation* with the correct number of parameters.

Feedback

See Also

- create_rule
- create_rule_violation

ADES-017

(error) Violations of a scenario-dependent rule '%s' issued in user-defined global check procedure.

Description

User-defined global check procedure should not perform scenario-dependent checks.

What Next

Consider moving scenario-dependent checks into a user-defined scenario-dependent check procedure.

See Also

- create_rule

ADES-018

(error) Violations of a global rule '%s' issued in user-defined scenario check procedure.

Description

User-defined scenario check procedure should not perform global scenario independent checks.

What Next

Consider moving global checks into a user-defined scenario independent global check procedure.

See Also

- create_rule

ADES-021

(info) Running user-defined checker : %s.

Feedback

Description

This status message is printed during *analyze_design*, while running user-defined checkers. It shows the currently running user-defined checker.

ADES-022

(warning) User-defined rule '%s' is not associated with user-defined checker proc '%s'.

Description

This message is printed when a 'create_rule_violation' command issues a violation of a user-defined rule that is not associated with the current user-defined checker procedure.

What Next

Check the user-defined rule in the user-defined checker procedure associated with the rule when the rule is created.

See Also

- create_rule

AOCVM

AOCVM-001

(error) The field '%s' has already been specified for the current '%s'

Description

This error occurs when a field is specified more than once for a given table. The error can also occur if the user does not include all fields during a table specification.

What Next

Correct the AOCV syntax by ensuring that each field is only specified once for a given table.

AOCVM-002

(error) The current table is missing one or more fields

Feedback

Description

This error occurs when a table is found at the end of the AOCV file without the required number of fields.

What Next

Correct the AOCV syntax by adding the missing fields to the file.

AOCVM-003

(Error) Expected to find a valid field name but found '%s'.

Description

This error occurs when the parser cannot find a valid field name.

What Next

Correct the AOCV syntax by ensuring that each field is specified in the format name: data where name is one of version, table, distance, depth, object_spec, derate_type, delay_type, rf_type, object_type.

AOCVM-004

(error) Cannot specify '%s' for field '%s'.

Description

The data found in the AOCV file is not valid for the given field.

What Next

Check the AOCV spec to see allowed values for the field, and update the AOCV file appropriately.

AOCVM-005

(warning) Cannot associate table with leaf cell '%s'.

Description

AOCV does not support the association of AOCV data with leaf cells.

What Next

Associate AOCV tables with hierarchical cells, library cells and designs only.

Feedback

AOCVM-006

(warning) Cannot find any objects of type '%s' for specification '%s'.

Description

Could not find any objects for the given specification. The table is not annotated on any objects, but parsing and annotation does not stop due to this warning.

What Next

Check that the specification is correct.

AOCVM-007

(error) Expected table of size %d but found table of size %d.

Description

The size of the 2D AOCV table must equal the number of depth indexes by the number of distance indexes.

What Next

Correct the size of the table.

AOCVM-008

(error) Cannot finish AOCV file on a line continuation

Description

The AOCV file ends with a line continuation. The parser expects more data, but there is none.

What Next

Remove the line continuation character.

AOCVM-009

(error) Could not find the specified AOCVM file

Description

The AOCV file could not be found.

Feedback

What Next

Correct the name and path of the AOCV file.

AOCVM-010

(error) The field '%s' must be specified before '%s'

Description

While parsing an AOCV 2D table, a field cannot be set because another field is not specified.

What Next

Change the order of the field specifications.

AOCVM-011

(error) The version '%s' is not valid. Allowable versions are '%s'

Description

An invalid version number has been specified.

What Next

Check the version number.

AOCVM-012

(error) An AOCV file version must be specified.

Description

The version number is used for backward compatibility purposes if the AOCV file format changes in the future. It can affect the analysis results.

What Next

Specify the version of the AOCV file on the first line of the AOCV file. For example:

```
version:1.0
```

AOCVM-013

(error) The %s array does not increase or decrease sequentially

Feedback

Description

Sequential elements in the specified array must sequentially increase or decrease.

What Next

Fix the array so that it sequentially increases or decreases.

AOCVM-014

(error) Negative values are not allowed

Description

Negative values are not allowed for the distance, depth arrays or in the 2D tables.

What Next

Remove negative values from the AOCV file.

AOCVM-015

(error) Cannot specify delay type %s with object type %s

Description

This combination of delay type and object types is not allowed as it makes no sense.

What Next

Correct the AOCV file to remove the invalid combination of delay type and object type.

AOCVM-016

(error) Cannot specify a non-monotonic derate table.

Description

This message is issued because the derate table specified in the message is incorrectly defined. The table has not been annotated.

The timing derates specified in each row and each column of the derate table must increase or decrease monotonically.

What Next

Fix the specified table so that sequential elements in each row and each column of the table sequentially increase or decrease.

Feedback

AOCVM-017

(error) Derate table variability is not decreasing with increasing depth.

Description

This message is issued because the derate table specified in the message is incorrectly defined. The table has not been annotated.

For a late derate table, the timing derates specified in each row of the derate table must decrease monotonically as depth increases. For an early derate table, the timing derates specified in each row of the derate table must increase monotonically as depth increases.

No further restriction is placed on the table contents; however, typically, derate variability should be proportional to 1/sqrt(depth).

What Next

Fix the specified table so that sequential elements in each row of the early (or late) table sequentially increase (or decrease) as depth increases.

AOCVM-018

(error) Derate table variability is not increasing with increasing distance.

Description

This message is issued because the derate table specified in the message is incorrectly defined. The table has not been annotated.

For a late derate table, the timing derates specified in each column of the derate table must increase monotonically as distance increases. For an early derate table, the timing derates specified in each row of the derate table must decrease monotonically as distance increases.

No further restriction is placed on the table contents; however, typically, derate variability should be proportional to distance.

What Next

Fix the specified table so that sequential elements in each column of the early (or late) table sequentially decrease (or increase) as distance increases.

AOCVM-019

(warning) Voltage value is missing in the table at line number %d in the file %s.

Feedback

Description

A voltage field is specified, but an associated voltage value is missing.

What Next

Verify that the missing voltage value is intentional.

AOCVM-020

(warning) Replacing the old table specified for %s %s with voltage %s, with the latest specified table with the same voltage.

Description

Two tables with the same voltage value are specified for the same object. The first table is ignored.

What Next

Investigate to see why two tables with the same voltage are specified for the same object.

AOCVM-021

(Error) Expected to find a valid field name but found '%s'.

Description

This error occurs when the parser cannot find a valid field name.

What Next

Correct the AOCV syntax by ensuring that each field is specified in the format name: data where name is one of version, table, distance, depth, object_spec, derate_type, delay_type, rf_type, object_type, path_type.

AOCVM-022

(error) Cannot set/reset table group on a design that is not the current design.

Description

This message is issued if the user has called the set_aocvm_table_group/ reset_aocvm_table_group with a design, which is not the current design, as an argument.

What Next

If the user has intended to operate on the specified design, then set the current design using the current_design command.

Feedback

See Also

- current_design
- reset_aocvm_table_group
- set_aocvm_table_group

AOCVM-023

(error) Cannot set/reset table group on a hierarchical cell within the current design for the block level flow in HyperScale.

Description

This message is issued in a block level HyperScale flow if the user has called the set_aocvm_table_group/reset_aocvm_table_group command on a hierarchical cell within the current design

What Next

Associate AOCV table groups with the current design only in block level HyperScale flow

See Also

- current_design
- reset_aocvm_table_group
- set_aocvm_table_group

AOCVM-024

(Error) Expected to find a valid field name but found '%s'.

Description

This error occurs when the parser cannot find a valid field name.

What Next

Correct the AOCV syntax by ensuring that each field is specified in the format name: data where name is one of version, table, distance, depth, object_spec, derate_type, delay_type, rf_type, object_type, path_type, group_name.

Feedback

AOCVM-025

(error) Parametric OCV coefficient value is missing in the table at line number %d in the file %s.

Description

A coefficient field is specified but an associated value is missing.

What Next

Enter a valid value for the parametric OCV coefficient.

AOCVM-026

(warning) Variation extracted from AOCV table (%f) overwritten by user-specified variation (%f).

Description

Variation extracted from AOCV table overwritten by user-specified variation.

What Next

Investigate whether inconsistency of user-specified variation with AOCV table is intentional.

AOCVM-027

(Error) Field (%s) cannot be specified with field (%s)

Description

Field (%s) cannot be specified with field (%s).

AOCVM-028

(error) Field (%s) cannot be specified when ocvm_type is specified as (%s).

Description

Invalid field (%s) specified.

What Next

Refer to the (%s) table format in documentation.

Feedback

AOCVM-029

(warning) There is no %s named table set "%s". Ensure that it is loaded before update_timing.

Description

This message is issued when a named table set is assigned to a design or hierarchy but no table set with this name has been read yet. Since there is no required order for the *set_ocvm_table_group* and read_ocvm commands this is only a warning because it is possible that the named table set will still be read after the *set_ocvm_table_group* command.

What Next

Verify the sequence of commands in your script, and crosscheck the names in your name table sets against the names used in the *set_ocvm_table_group* command.

AOCVM-030

(error) Invalid OCV derate group %s "%s".

Description

To manually assign an OCV table from a library to a library cell, you must use the following syntax:

```
library_name/[lib_cell_name/]derate_group_name
```

If this syntax is not adhered to, or you reference a table that has not been read, this error message is issued.

What Next

Correct the name of the derate group and the syntax.

AOCVM-031

(warning) Lib cell based OCVM table can be only assigned to same lib cell.

Description

When manually assigning a library cell based OCV derate group to a library cell, it can only be assigned to the library cell that owns the derating group. If assignment to a different lib cell is attempted, this message is issued and the assignment is ignored.

Feedback

What Next

Remove the unmatched library cells from the library cell collection passed to set_ocvm_table_group.

AOCVM-032

(error) Field (%s) cannot take more than one voltage.

Description

Incorrect number of voltages specified.

What Next

Refer to the (%s) table format in documentation.

AOCVM-033

(error) Incorrect table value.

Description

The bottom right value of the 2D COCV table must be zero.

What Next

Correct the table values.

AOCVM-034

(Information) Removing side file based derates if loaded as OCVM derate side file scaling flow was enabled/dissabled.

Description

Side file based derates are reset when side file derate scaling flow is either enabled or dissabled.

AOCVM-035

(error) Incorrect syntax at line %s of file %s. %s

Description

Unrecognized symbols or extra symbols present at the specified line.

Feedback

What Next

Correct the syntax error.

AOCVM-036

(warning) Unsupported %s derate type "%s" specified and this derate column values will be ignored.

Description

Unsupported derate type specified in the derate file.

What Next

Correct the derate type name.

AOCVM-037

(error) %s derate bin label "%s" already defined.

Description

A given derate bin label can be associated with only one bin.

What Next

Specify unique labels across derate bins.

AOCVM-038

(error) Number of bin values is different from number of derate columns.

Description

Number of derate values in every bin must be same as the number of entries specified as DERATE_COLUMNS field of the derate side file.

What Next

Provide proper number of derate values.

AOCVM-039

(error) "default" bin must be specified and must be the last bin.

Description

Default bin definition missing in the COCVM CPODE dertate side file.

Feedback

What Next

Include default bin definition.

AOCVM-040

(warning) COCVM CPODE timing derate definition missing for lib cell(s) of library %s.

Description

At least one type of COCVM CPODE derate must be defined for all the lib cells of the library.

What Next

Load appropriate COCVM CPODE derates.

AOCVM-041

(warning) No COCVM CPODE timing derate associated with cell %s, using lib cell %s.

Description

At least one type of COCVM CPODE timing derate must be defined for associated lib cell.

What Next

Load appropriate COCVM CPODE derates.

ATTR

ATTR-1

(warning) Attribute '%s' has not been defined for %s

Description

The attribute is not defined for the class of objects that you are using. It is possible that the attribute is not defined at all.

Application attributes are all defined at runtime by the application. You can create user-defined attributes at any time.

Feedback

What Next

Verify that the attribute name is spelled correctly. If this is a documented application attribute, contact support. If this is a user-defined attribute, ensure that you have defined the attribute for all appropriate classes.

ATTR-2

(warning) Attribute '%s' is not user-defined for %ss; can't %s it

Description

The attribute you are referencing is an application attribute. You cannot set or remove this attribute by using the *set_user_attribute* or *remove_user_attribute* command, respectively. There might be other commands that allow you to set or remove the attribute.

What Next

See the documentation to determine if it is possible to set or remove this attribute.

ATTR-3

(Warning) Attribute '%s' does not exist on %s '%s'

Description

The attribute you are trying to get is not found on the object. This is definitely a sparse attribute and most likely user-defined. To suppress this message, use the -quiet option.

ATTR-4

(warning) Value '%s' is not valid for '%s' on %ss

Description

The value you are trying to set on the attribute cannot be converted to the data type defined for the attribute. For example, if the attribute is defined as "float", setting the attribute to *true* is not valid.

What Next

Enter an appropriate value for the attribute.

ATTR-5

(warning) Value '%s' for '%s' is not in range (%s)

Feedback

Description

The numeric value you are trying to set on the attribute is not in the range specified for the attribute. Ranges are either within a minimum and maximum value, greater than or equal to a minimum value, or less or equal to a maximum value. The message text indicates the violated constraint.

What Next

Enter an appropriate value for the attribute.

ATTR-6

(warning) Value '%s' for '%s' is not valid. Specify one of: %s

Description

The string value you are trying to set on the attribute is not one of the valid strings defined for the attribute. The message text indicates the allowable values.

What Next

Enter an appropriate value for the attribute.

ATTR-7

(information) Inferred definition of attribute '%s' for class '%s' because it is imported for class '%s'

Description

You used the *define_user_attribute* command to define a design or port attribute, and asked for it to be imported from DB files. Because design attributes are inherited onto cells (an instance of a design), and port attributes are inherited onto pins (an instance of a port), the attribute you defined for a design/port must also be defined for a cell/pin, respectively. The tool defines the attribute for you if you have not already done so, and issues this message.

What Next

If you want to remove this message, add the appropriate class to the list of classes in your *define_user_attribute* command, or add a dedicated *define_user_attribute* command earlier in the script to define the attribute for the cell or pin class.

See Also

- define_user_attribute

Feedback

ATTR-8

(Error) Remote access is not implemented for attribute %s of %s

Description

You are trying to report the value of an attribute which has no access functionality in the distributed context.

What Next

If you want to remove this message, update your script to remove the call to access the shown attribute.

See Also

- get_attribute

ATTR-9

(Warning) Attribute '%s' is of unsupported type '%s'

Description

The attribute you are trying to create is of unsupported data type.

ATTR-10

(Error) Unsupported attribute %s of %s in all of the modes

Description

Attribute is not supported. It cannot be accessed in both remote and local mode.

What Next

If you want to remove this message, update your script to remove the call to access the shown attribute.

See Also

- get_attribute

ATTR-11

(Warning) More than 1 dvfs scenario not supported for '%s' attribute\n

Feedback

Description

Attributes other than float don't have a well defined way to merge / worst-case them because of that such attributes must be queried with fully specified scenario to that only one value matches the scenario.

ATTR-12

(Error) Incorrect format for attribute value max_transition_sigma_derate_per_voltage: %s

Description

This message tells you that the format for the *max_transition_sigma_derate_per_voltage* attribute is incorrect. Various things can be wrong. The attribute must be a list. Each element of the list is a pair, where the first element is the lower voltage of range and the second is a sigma derate value. The voltage values must be in ascending order. The content of the message isolates where the problem exists.

What Next

Check man page for lib pin attribute *max_transition_sigma_derate_per_voltage* for the example of correct usage.

ATTR-13

(Error) Attribute %s has been defined on library %s, it cannot be overridden.

Description

The given attribute has been already defined on the library. The user cannot override the value specified in the library.

What Next

If you want to remove this message, update your script to remove the call to set the attribute.

ATTRDEF

ATTRDEF-001

(error) This visual (%s) does not exist.

Description

This visual does not exist. Please check the visual name.

Feedback

ATTRDEF-002

(error) Internal error. Not valid type set %s.

Description

Type set is not valid.

ATTRDEF-003

(error) Not valid class name.

Description

Design object class is not valid. Please, specify one of the following: %s

ATTRDEF-004

(error) (error) Incompatible type and subtype values.

Description

Subtype can be specified only if type is string.

ATTRDEF-005

(error) (error) Type must be specified.

Description

Type must be specified if subtype is presented.

ATTRDEF-006

(error) Incompatible type and format values.

Description

Format can be specified only if type is int or double.

ATTRDEF-007

(error) Type must be specified.

Description

Type must be specified if format is presented.

Feedback

ATTRDEF-008

(error) Attribute %s not found.

Description

Specified attribute not found.

ATTRDEF-009

(error) Internal error. Can't create attribute %s.

Description

Specified attribute can not be created.

ATTRDEF-010

(error) Attribute %s already exists.

Description

Specified attribute already exists and can not be created.

ATTRDEF-011

(error) Attribute %s is not user-defined.

Description

Specified attribute is not user-defined and not allowed for this command.

ATTRDEF-012

(error) Internal error. Removing of attribute %s failed.

Description

Removing of attribute failed.

ATTRDEF-013

(error) Internal error. Error getting list of attdefs for %s.

Description

Getting list of attdefs failed.

Feedback

ATTRDEF-014

(error) Internal error. Error getting list of object types.

Description

Getting list of object types failed.

ATTRDEF-015

(error) Error. Option -name valid with -class only

Description

Option -name valid with -class only.

ATTRDEF-016

(error) Attribute group %s already exist.

Description

Specified attribute group already exist and can not be created.

ATTRDEF-017

(error) Attribute group %s not found.

Description

Specified attribute group not found.

ATTRDEF-018

(error) Internal error. Removing of attribute group %s failed.

Description

Removing of attribute group failed.

ATTRDEF-019

(error) Internal error. Removing all attribute groups of class %s failed.

Description

Removing of attribute groups failed.

Feedback

ATTRDEF-020

(error) Error. Options -add, -delete or -move are exclusive with -attr_list.

Description

Options -add, -delete or -move are exclusive with -attr_list.

ATTRDEF-021

(error) Error. Attribute name -attr is required.

Description

Attribute name -attr is required.

ATTRDEF-022

(error) Error. Attribute list or single attribute is required.

Description

Attribute list or single attribute with add/delete/move option is required.

ATTRDEF-023

(error) Error. Option -anchor should be specified with -move.

Description

Option -anchor should be specified with -move after/before options.

ATTRDEF-024

(error) Error. Either -add, -delete or -move should be specified.

Description

Either -add, -delete or -move should be specified.

ATTRDEF-025

(error) Internal error. Error getting list of attribute groups for class %s failed.

Description

Getting list of attribute groups failed.

Feedback

ATTRDEF-026

(error) Attribute %s is application defined.

Description

Specified attribute is aplication defined and can not be deleted.

ATTRDEF-027

(error) Attribute %s is user-defined.

Description

Specified attribute is user-defined. Options -width, -show|-hide, and -show_infotip|-hide_infotip are valid for this type of attribute.

ATTRDEF-028

(error) Content of attribute group %s is system defined.

Description

Specified attribute group is system defined and cannot be deleted or modified.

CATEGORY

CATEGORY-001

(error) cannot create category rule '%s' since the previously created rule is not built-in.

Description

This error message occurs when an attempt is made to create a category rule with the -builtin option even though the previously created rule is not built-in.

What Next

Rerun gui_create_category_rule without the -builtin option.

See Also

- gui_create_category_rule

Feedback

CATEGORY-002

(error) cannot create category rule with name '%s' since a rule with that name already exists.

Description

This error message occurs when an attempt is made to create a category rule with a rule name that is already in use.

What Next

Rerun gui_create_category_rule with a -name option value which is not a rule name that is already in use.

See Also

- gui_create_category_rule

CATEGORY-003

(error) for category rule '%s' cannot add subrule '%s' since no such rule exists.

Description

This error message occurs when gui_create_category_rule -subrules references a rule which does not already exist.

What Next

One possibility is that the subrule name was mis-spelled when passed to -subrules. In that case rerun gui_create_category_rule but passing the correctly spelled rule name to -subrules. Another possibility is that the rule name passed to -subrules was correctly spelled but does not yet exist. In that case, create a new rule with that name (using gui_create_category_rule -name) and then rerun the gui_create_category_rule -subrules command that failed.

See Also

- gui_create_category_rule

CATEGORY-004

(error) cannot add subrule '%s' since that subrule has already been added to the category rule '%s'.

Feedback

Description

This error message occurs when gui_create_category_rule -subrules references the same subrule (using the same rule name) more than once in the subrules list.

What Next

Rerun gui_create_category_rule -subrule but removing duplicate references to the rule name that was listed in the subrules more than once.

See Also

- gui_create_category_rule

CATEGORY-005

(error) -rule_names or -names contains invalid category rule name '%s'.

Description

This error message occurs when a command is run which accepts a list of category rule names via -rule_names or -names and that list includes a category rule name which does not exist.

What Next

Rerun the command with corrected spelling for the rule name (passed to -rule_names or -names) which was mis-spelled.

See Also

- gui_list_category_rules

CATEGORY-011

(error) cannot create category rule '%s' since it has an error in the category specification string at position %d.

Description

This error message occurs when gui_create_category_rule is run with a -category option value which has a syntax error.

What Next

Fix the syntax error in the -category option string value and rerun gui_create_category_rule.

Feedback

See Also

- gui_create_category_rule

CATEGORY-012

(error) cannot create category rule '%s' since it has an error in the filter specification string.

Description

This error message occurs when gui_create_category_rule is run with a -filter option value which has a syntax error.

What Next

Fix the syntax error in the -filter option string value and rerun gui_create_category_rule.

See Also

- gui_create_category_rule

CATEGORY-021

(error) cannot remove category rule '%s' since it is in use by one or more existing categories.

Description

This error message occurs when gui_remove_category_rule is run to remove a rule that one or more existing categories depends on.

What Next

Fix the issue by removing the affected categories and rerun gui_remove_category_rule.

CATEGORY-031

(error) cannot evaluate expression since no attribute '%s' exists for '%s'.

Description

This error message occurs when -category or -filter specifications reference an attribute which does not exist for an object that the category rule is executed for.

What Next

Revise the -category or -filter specification to use an attribute which exists for the object in question.

Feedback

See Also

- gui_create_category_rule

CATEGORY-032

(error) cannot evaluate expression since attribute '%s' is a collection.

Description

This error message occurs when -category or -filter specifications reference an attribute whose value is a collection containing multiple objects.

What Next

Referencing a collection containing multiple objects is currently not supported in -category or -filter specifications. Use a different attribute instead.

See Also

- gui_create_category_rule

CATEGORY-033

(error) cannot evaluate expression since attribute '%s' of type '%s' has sub-attributes.

Description

This error message occurs when -category or -filter specifications reference an attribute whose value is a collection containing a single object.

What Next

Consider using "dot notation" in -category or -filter specification to access an attribute of the object in the collection. For example, instead of -category <startpoint> try -category <startpoint.full_name>. Use list_attributes to discover the attributes supported for the type mentioned in the error message.

See Also

- gui_create_category_rule

CATEGORY-034

(error) cannot evaluate filter expression since attribute '%s' of type '%s' of data type '%s' is not of data type '%s'.

Feedback

Description

This error message occurs when evaluating a filter expression where an attribute for an object that the category rule is executed for doesn't match a required type in the expression.

What Next

Revise the -filter specification so that the type for the attribute matches what is required.

See Also

- gui_create_category_rule

CATEGORY-035

(error) cannot evaluate filter expression because of an operand type mismatch.

Description

This error message occurs when evaluating a filter expression where a operand type mismatch has occured.

What Next

Revise the -filter specification so that the operands match in type.

See Also

- gui_create_category_rule

CATEGORY-036

(error) cannot evaluate filter expression because operator '%s' has a type mismatch.

Description

This error message occurs when evaluating a filter expression where a operator type mismatch has occured.

What Next

Revise the -filter specification so that the operators match in type.

See Also

- gui_create_category_rule

Feedback

CATEGORY-040

(error) cannot create category tree with name '%s' since a category tree with that name already exists.

Description

This error message occurs when an attempt is made to create a category tree with a category tree name that is already in use.

What Next

Rerun gui_create_category_tree with a -name option value which is not a category tree name that is already in use.

CATEGORY-052

(error) No current category tree found.

Description

This error message occurs when the -tree option is omitted when calling one of the category commands, and there is no current category tree. With these category commands, you can pass an explicit -tree option value to specify the category tree to be operated on. If that optional option is omitted, an attempt will be made to use the current category tree. This error happens if there is no current category tree (which can only happen if no category trees exist).

What Next

Create at least one category tree (so that there will be a current category tree) and rerun the command which generated the error.

See Also

- gui_get_category

CATEGORY-053

(error) the categorization script file '%s' already exists.

Description

This error message occurs when the gui_write_category command is run with a -file option value which identifies a file which already exists, and the -overwrite option was not specified.

Feedback

What Next

Rerun the gui_write_category command specifying the -overwrite option to overwrite the existing file. Or else specify a file which does not yet exist via the -file option.

CATEGORY-054

(error) the categorization script file '%s' could not be opened for write.

Description

This error message occurs when the gui_write_category command is run with a -file option value which identifies the file to be written, and the file cannot be opened for write.

What Next

Investigate parent directory permissions to figure out why the file could not be opened for write. Fix any such permissions problems and rerun the gui_write_category command.

CATEGORY-055

(error) cannot create new subcategories of a hierarchical category which already has subcategories that were created via a separator character

Description

The categorization engine can create category hierarchy as a result of interpreting hierarchical separator characters embedded in the string value produced by a category rule's category specification. This error message occurs when the gui_create_category command is used to try to add additional subcategories to a category which already has one or more subcategories that were created by interpreting a separator character.

What Next

Choose a different category to pass to the -parent_category option of gui_create_category.

See Also

- gui_create_category_rule

CATEGORY-056

(error) cannot remove subcategories of a hierarchical category which has subcategories that were created via a separator character

Feedback

Description

The categorization engine can create category hierarchy as a result of interpreting hierarchical separator characters embedded in the string value produced by a category rule's category specification. This error message occurs when the gui_remove_category command is used to try to remove subcategories of a category which has one or more subcategories that were created by interpreting a separator character.

What Next

Choose a different category to pass to the -parent_category option of gui_remove_category.

See Also

- gui_create_category_rule

CATEGORY-091

(warning) cell '%s' has no block mark.

Description

This warning message occurs when a command is run to get or remove the block mark of a cell instance which has no block mark.

What Next

Rerun the command but specify a cell instance for which a block mark has been previously set.

See Also

- gui_get_cell_block_marks
- gui_remove_cell_block_marks

CI

CI-001

(error) Can not open cell edge info side file '%s'

Description

The cell edge info side file name given is incorrect or the search path for this side file is not given or the path is incorrect.

Feedback

What Next

Check whether the side file exists and has read permissions.

CI-002

(error) Physical data base is not read in successfully. Skip external CPODE spacing calculation.

Description

External CPODE spacing calculation is only available after check_eco.

What Next

Please check check_eco if physical data is loded successfully.

See Also

- check_eco

CI-003

(error) read_cell_info is not performed after external CPODE spacing is updated.

Description

read_cell_info is not performed after external CPODE spacing is updated by update_cell_info

What Next

Please remove_cell_info then read_cell_info again.

CI-004

(warning) read_cell_info found duplicate definition in cell edge side file. '%s' is skipped.

Description

read_cell_info found duplicate definition in cell edge side file. The line is skipped.

What Next

Please check whether the side files have duplicate definition.

Feedback

CI-005

(error) Cell edge info side file is not read in successfully.

Description

Cell edge side file is not read in successfully. Skip CPODE spacing calculation.

What Next

Please check whether the cell edge side files are successfully read in.

CI-006

(error) Found syntax error in cell edge info sidefile on line '%d'. Skip '%s'.

Description

Found syntax error in cell edge info sidefile. The line is skipped

What Next

Please check the syntax error in side file.

CI-007

(error) SITE ROW information is missing. Skip external CPODE spacing calculation.

Description

SITE ROW information is missing. Skip external CPODE spacing calculation.

What Next

Please check check_eco if physical data is loaded successfully.

CI-008

(error) CPP width is missing. Skip external CPODE spacing calculation.

Description

CPP width is missing. Skip external CPODE spacing calculation.

What Next

Please check check_eco if physical data is loaded successfully.

Feedback

CI-009

(error) Cell '%s' (lib cell '%s') is not defined in the side file.

Description

Internal CPODE info of the cell is missing.

What Next

Please check the missing interal CPODE info in side file.

CI-010

(error) Cell '%s' (lib cell '%s') is defined with %d row high in side file but with %d row high in physical database.

Description

Row high of cell in physical database does not match with the side file definition.

What Next

Please check if the LEF/DEF files and side files are matched.

CLE

CLE-01

(information) Command line editor mode is set to %s successfully.

Description

This information message confirms that the command line editor mode is set to the mode that you specified.

To set the line editing mode to vi or emacs, use the *sh_line_editing_mode* variable.

What Next

This is an informational message. No action is required.

See Also

- sh_line_editing_mode

Feedback

CLE-02

(warning) Command line editor mode cannot be set to %s. Proceeding with %s mode.

Description

This warning message occurs when you attempt to set the line editing mode to an invalid value. If you attempt to set the variable to an invalid value, the tool uses the previously specified editing mode or the default emacs mode.

What Next

Set the *sh_line_editing_mode* variable to *vi* or *emacs*.

See Also

- sh_line_editing_mode

CLE-03

(warning) Command line editor is already in %s mode.

Description

This warning message occurs when you specify the same value for the command line editing mode that is currently in use.

What Next

This is a warning message. No action is required.

See Also

- sh_line_editing_mode

CLE-04

(warning) Variable sh_enable_line_editing can be set only in the .synopsys_pt.setup file.

Description

This warning message occurs when you attempt to enable command line editing by setting the *sh_enable_line_editing* variable in the shell rather than in the .synopsys_pt.setup file.

What Next

To enable command line editing, set the *sh_enable_line_editing* variable to *true* in the .synopsys_pt.setup file.

Feedback

See Also

- sh_enable_line_editing

CLE-05

(Warning) Command line editing is not active.

Description

Since command line editing is not currently active, setting the *sh_line_editing_mode* variable has no effect.

What Next

To enable the line editing mode, set the *sh_enable_line_editing* variable to *true* in the .synopsys_pt.setup file.

See Also

- sh_enable_line_editing
- sh_line_editing_mode

CLE-06

(information) %s is currently in %s editing mode.

Description

This information message displays the current editing mode.

What Next

This is only an informational message. No action is required.

To change the line editing mode, set the *sh_line_editing_mode* variable to *vi* or *emacs*.

See Also

- sh_line_editing_mode

CLE-07

(information) Terminal beep is %s.

Description

This information message displays the current terminal beep mode.

Feedback

What Next

This is an informational message. No action is required.

To turn the terminal beep on or off, use the *set_cle_options* command.

CLE-08

(error) Terminal beep mode value can be either on or off.

Description

This message occurs when you attempt to set the line editor beep mode to an invalid value. The value can be either *on* or *off*. If you attempt to set the beep mode to an invalid value, then the tool uses the existing beep mode.

What Next

To specify a valid beep mode, use the *set_cle_options* command.

CLE-09

(warning) -defaults option will override other options.

Description

The *-defaults* option overrides the other options of the *set_cle_options* command.

What Next

This is a warning message. No action is required.

CLE-10

(information) Term was not able to be set up using %s . Using "xterm" by default instead.

Description

This warning message occurs in certain OS when the term cannot be set up under its default term name.

CLE-100

(Warning) Cannot use command line editor for terminal type '%s'.

Feedback

Description

The command line editor has failed to initialize for terminal type '%s'. This can occur when the terminfo database could not be found or the database does not have an entry for the terminal type '%s'. If this message is printed, advanced shell editing capabilities cannot be used.

What Next

Use a terminal window that has the required capabilities, such as a linux dtterm.

CMCR

CMCR-001

(error) Cannot specify option '%s' when setting the local process options.

Description

The command *set_host_options* was used with an option that cannot be specified when *set_host_options* is used to set usage limits of the local process. Note that even if *-local_process* is not specified, the option is implied unless the *-num_processes* option is used.

What Next

If the command was intended to specify remote process options, then specify the *-num_processes* option. Otherwise, remove the option indicated above and reissue the command.

See Also

- set_host_options

CMCR-002

(error) Cannot specify machine name '%s' with local host.

Description

The *set_host_options* command was used with a specified machine name while using the local host setting. The machine name cannot be specified when using the *-local* option.

What Next

See the man page for the *set_host_options* command.

Feedback

See Also

- set_host_options

CMCR-003

(Warning) Replacing host options '%s'.

Description

The command is defining host options with the name specified. However, host options of the same name already exist. The original host options will be removed, and all associated host instances will be shutdown. The new host options will replace the original host options.

What Next

To launch the processes specified by the new host options, use the *start_hosts* command.

See Also

- start_hosts

CMCR-004

(Warning) No submit command or protocol specified to access hosts, the 'rsh' protocol will be used.

Description

The *set_host_options* command has been called specifying no *-protocol* option or *-protocol auto*, no *-submit_command* option and specifying a list of hostnames upon which to launch worker processes. The list of hostnames contains at least one hostname which is remote from the manager so the *rsh* protocol and command will be used to launch worker processes specifed by the host options.

What Next

If a specific protocol and/or submit command is required, remove the host options using the *remove_host_options* command and call the *set_host_options* command with the required options.

See Also

- remove_host_options
- set_host_options

Feedback

CMCR-005

(warning) Not all processes could be added for starting.

Description

While adding the processes to be launched, some of the processes could not be added due to internal limits.

What Next

To determine which host options did not have some processes started, use the *report_hosts* command.

CMCR-006

(error) Timeout has been set to '%d' seconds. Timeout must be set to a nonnegative value.

Description

The *start_hosts* command was used with the *-timeout* option set to a negative value. This parameter specifies the maximum duration the command blocks for remote processes to come online before returning and must be set to a value greater than or equal to 0.

What Next

Specify a value greater than or equal to 0 when using the *-timeout* option of the *start_hosts* command.

See Also

- start_hosts

CMCR-007

(error) The '-min_hosts' parameter has been set to '%d'. This parameter must be set to a nonnegative value.

Description

The *start_hosts* command was used with the *-min_hosts* option set to a negative value. This parameter specifies the minimum number of hosts that must come online before returning and must be set to a value greater than or equal to 0.

What Next

Specify a value greater than or equal to 0 when using the *-min_hosts* option of the *start_hosts* command.

Feedback

See Also

- start_hosts

CMCR-008

(error) The host options named '%s' does not exist.

Description

The specified host option name does not exist.

What Next

To create the named host options, use the *set_host_options* command.

See Also

- set_host_options

CMCR-009

(Warning) Process '%d' could not be stopped for host options '%s'

Description

The process indicated could not be stopped. Since the process could not be stopped, the associated host options could not be removed.

What Next

Examine the logged information when the processes were started. If there was an error in the options used to launch the processes then these process will never come online or be able to shutdown and therefore cannot be controlled. If there was no error during the launch of the processes, wait for the processes to come online, and then remove the host options.

See Also

- remove_host_options
- report_host_usage

CMCR-010

(error) Must specify a resource limit option with -local_process.

Feedback

Description

The *-local_process* option requires the *-max_cores* options to be specified.

What Next

When using the *set_host_options* command with the *-local_process* option, also specify the *-max_cores* option.

See Also

- set_host_options

CMCR-011

(information) %s manager licenses %s worker usage.

Description

When the manager is not using all its licensed cores it will float some of its licenses for worker usage. When the load increases at the manager and it needs to use its cores, it will reclaim its licenses from worker usage.

What Next

No action is required.

CMCR-012

(error) '%s' can only be called in a distributed processing context.

Description

The command specified or options passed to the command specified cannot be used unless PrimeTime is being run or configured to run some form of distributed analysis.

What Next

See the man page for the specific command for details when the command or options should be used.

CMCR-013

(Error) Failed to set the remote working directory because %s

Description

Setting the remote working directory failed due to the specified reason.

Feedback

What Next

See the man page for the working directory variable being set for the conditions necessary when setting the remote working directory.

CMCR-014

(Error) Failed to setup subdirectory '%s' because %s

Description

The directory specified could not be created with write permissions for the reason indicated.

What Next

See the man page for the working directory variable being set, and check the directory to ensure that the directory can be created.

CMCR-015

(error) Failed to start worker processes: %s (%s)

Description

Starting the worker processes failed due to the specified reason.

See also *set_host_options* to verify that your protocol and *submit_command* are configured correctly.

What Next

Check all the logs in the system_log directory for information about the failure. Redo the run with the variable *distributed_logging* set to its highest value to capture more detailed information in the system_log directory to help identify the source of the failure.

Check any output or error files generated by the farm submission engine.

See Also

- set_host_options
- start_hosts
- distributed_logging

Feedback

CMCR-016

(error) Additional processes cannot be added to already started hosts.

Description

You must use the *set_host_options* command before using the *start_hosts* command. Before you add more hosts, use the *stop_hosts* command.

What Next

See the man page for the *set_host_options* command.

See Also

- set_host_options
- start_hosts

CMCR-017

(warning) Hosts already started.

Description

Hosts have already been started by a previous call to *start_hosts*. No further hosts will be started.

What Next

See the man page for the *start_hosts* command.

See Also

- start_hosts

CMCR-018

(error) No host options exist.

Description

No host options exist so there is nothing to start.

What Next

Use the *set_host_options* command to define host options and then call the *start_hosts* command.

Feedback

See Also

- report_host_usage
- set_host_options
- start_hosts

CMCR-019

(Error) Invalid submission command '%s'.

Description

You cannot specify a blank or empty string as the submission command.

What Next

Specify a valid submission command.

See Also

- set_host_options

CMCR-020

(Error) Invalid hostname '%s'.

Description

You cannot specify a blank or empty string for the host name.

What Next

Specify a valid host name.

See Also

- set_host_options

CMCR-021

(Warning) Unrecognized command '%s' for protocol '%s'

Feedback

Description

The command does not match the typical command expected for the protocol. The typical commands expected for each protocol are as follows:

```
Protocol       Command
 sh             sh
 rsh            rsh
 ssh            ssh
 lsf            bsub
 sge            qsub
 rtda           nc
 pba            qsub
```

What Next

If the submission command targets the resource in the same manner as the underlying protocol, you can ignore this warning. All options that are supported by the protocol must be passed through to the underlying protocol command.

See Also

- set_host_options

CMCR-022

(Error) Protocol '%s' cannot target host '%s'.

Description

The current protocol targets the local host on which the manager process is running. It cannot target the specified host because it is remote from the manager.

What Next

Select a protocol that can access hosts remote from the manager, or target the manager host.

See Also

- set_host_options

CMCR-023

(Error) Protocol '%s' does not target hosts in this manner.

Feedback

Description

The protocol indicated either submits jobs to a managed compute resource, or it cannot target hostnames in the specifed manner.

What Next

To target a managed compute resource, do not pass the *hostname* option to the *set_host_options* command.

To use the custom protocol, do not pass the *hostname* option to the *set_host_options* command. The hostnames to be targeted must be part of the custom script passed to the *-submit_command* option of the *set_host_options* command.

To target specific hostnames, ensure that the *-protocol* option of the *set_host_options* command specifies a protocol that can target a host.

See Also

- set_host_options

CMCR-024

(Error) The '%s' protocol requires a submit command.

Description

The submit command cannot be blank or unspecified when this protocol is used.

What Next

Specify a suitable submit command for launching worker processes.

See Also

- set_host_options

CMCR-025

(error) Cannot open temporary file '%s' for %s.

Description

The specified temporary file needs to be opened for reading or writing by the *start_hosts* command.

If reading, the file may not exist, or might have incorrect permissions. If writing, you may not have access to the directory or the file may already exist and cannot be overwritten due to insufficient file permissions.

Feedback

What Next

Verify that you have the correct permissions to access the distributed working directory and to write or read the specified file in this directory. Change the distributed working directory if file permissions cannot be changed.

See Also

- start_hosts
- multi_scenario_working_directory

CMCR-026

(error) Failed to complete writing to file '%s'.

Description

The specified temporary file created by the *start_hosts* command was not fully written. This error is issued when writing of the required data into the specified file was not completed.

What Next

Check the available disk space in the distributed working directory. Check your disk quotas. Verify that a file can be created in the distributed working directory.

See Also

- start_hosts
- multi_scenario_working_directory

CMCR-027

(error) An error occured in closing file '%s'.

Description

An error occured when *start_hosts* command tried to close the specified temporary file. This may happen if there is no available disk space left in the distributed working directory or due to a disk IO error.

What Next

Check the available disk space in the distributed working directory. Check your disk quotas. Verify that a file can be created in the distributed working directory.

Feedback

See Also

- start_hosts
- multi_scenario_working_directory

CMCR-028

(error) the submit_command '%s' can't be executed or is not in the PATH.

Description

The submit command must be available from the current working directory or on the path and the user must have executable permissions.

What Next

Check your path and the permissions of submit command.

See Also

- set_host_options

CMCR-029

(error) %s.

Description

The submit command must not contain the options identified.

What Next

Remove the unsupported options and re-call the command.

See Also

- set_host_options

CMCR-030

(error) Cannot access file '%s' for '%s'.

Description

The specified file needs to be accessed for it to be sourced at startup of a worker primetime shell. It needs to be present at the location where it can be accessed from the worker process.

If reading, the file may not exist, or might have incorrect permissions. The directory where it is present may not be accessible by the worker process owing to several possible reasons such as, the directory is not an NFS point or it might not have execute permission.

What Next

Verify that you have the correct permissions to access the working directory of worker process and to read the specified file in this directory. Change the distributed working directory if file permissions cannot be changed.

See Also

- start_hosts
- multi_scenario_working_directory

CMCR-031

(error) Failed to setup communication infrastructure: %s (%s)

Description

The error indicated arose while initializing critical communication infrastructure and the current operation cannot proceed.

What Next

Examine the logs located in the 'system_log' directory for why the failure occured.

See Also

- distributed_logging

CMCR-032

(error) The host_options are already started, there is nothing to start.

Description

There are no unstarted host_options so there is nothing for the *start_hosts* command to do.

What Next

Defined host_options using the *set_host_options* command and call *start_hosts* again.

See Also

- set_host_options

Feedback

CMCR-033

(error) could not access the current working directory for use as the working directory because '%s'

Description

The working directory was not set and trying to get the current working directory for use failed because of the reason shown.

What Next

See the man page for the working directory variable being set, and check the directory to ensure that the directory can be created.

CMCR-034

(information) start_hosts timeout expired, workers will be accepted online in the background.

Description

The timeout for the *start_hosts* command has expired. All remaining workers launched will be accepted online in the background.

See Also

- start_hosts

CMCR-035

(Information) start_hosts interrupted, workers will be accepted online in the background.

Description

The *start_hosts* command has been interupted by the user. All remaining workers launched will be accepted online in the background.

See Also

- start_hosts

CMCR-036

(error) Cannot use '%s' as a name for host options.

Feedback

Description

An invalid value was specified for the -name option to the *set_host_options* command. The value passed to the *-name* option cannot be empty or whitespace.

What Next

Call the set_host_options command passing a valid value to the *-name* option or pass no -name option resulting in the options being auto-named.

See Also

- set_host_options

CMCR-037

(error) '%d' job submissions failed to launch; the remaining pending and running jobs '%d' cannot meet the required minimum worker count '%d'.

Description

Although the *start_hosts* command submitted the number of worker jobs indicated, while waiting for the queued worker jobs to come online, the PrimeTime distributed manager noticed that some jobs failed to launch. This error message occurs when the remaining pending jobs and running jobs are no longer sufficient to meet the required minimum worker count.

A job fails to launch when:

- The compute farm unqueues (rejects) the job for some reason, such that the PrimeTime process never attempts to run.
- The compute farm runs the job and the PrimeTime process attempts to launch, but it terminates before registering itself (network issues, unavailable working directory, etc.)

Potential causes of this message are:

- Slow or unreliable network connection
- Firewall rules that block communication between the worker and manager processes
- Slow or unreliable network file system
- Inaccessible distributed analysis working directory
- Operational issues with the compute farm manager

This message does not apply to worker processes that terminate after successfully launching on the compute farm.

Feedback

For more information on the check associated with this message, see the *distributed_farm_check_pending_workers_interval* man page.

What Next

Examine the PrimeTime distributed manager's log file (in the system_log directory within the distributed working directory) to determine why submitted workers have been aborted.

If the issue is caused by slow network response times, you can try increasing the value of the *distributed_farm_check_pending_workers_interval* variable.

See Also

- set_host_options
- start_hosts
- distributed_logging
- distributed_farm_check_pending_workers_interval

CMCR-038

(error) launched '%d' workers, requiring '%d' workers to come online but only '%d' workers in the online/launched state due to '%d' failed worker startups.

Description

Although the start_hosts command launched the number of workers indicated, while waiting for workers to come online, the number of workers in the online/launched state dropped below the level needed to satisfy the number of required online workers.

This was caused by workers failing to successfully startup and connect back to the manager.

Since the number of required online workers can never be satisfied by the *start_hosts* command, it has errored out.

What Next

Examine the manager system log file in the system_log directory to determine why launched workers have failed.

Look in the distributed working directory and the users home directory for special log files written by the worker during its startup. The special log files will identify the manager to which the worker tried to connect and why the worker failed to startup. The files have the following naming convention.

pt_worker_<worker_hostname>_<worker_process_id>.fail

Feedback

See Also

- set_host_options
- start_hosts
- distributed_logging

CMCR-039

(error) Empty host options name list specified.

Description

The list of host options specified is empty. In order to report specific host options, pass a list of the names of existing host options to the *report_host_usage* command.

What Next

Specify the names of host options to report.

CMCR-040

(Warning) The value for load_factor (%d) must be within the range 1<=value<=%d. Resetting it to %d.

Description

The argument of the *-load_factor* option in the *set_host_options* command must be an integer in the range from 1 to the maximum value shown in the warning message.

What Next

The command automatically set the load factor to an allowed value and proceeded with the next command. No action is needed to correct the invalid setting, but be aware of the actual load factor being used.

CMCR-041

(error) failed to launch '%d' CDSL servers: (%s)

Description

The error indicated arose while launching CDSL servers and the current operation cannot proceed.

What Next

Examine the logs located in the 'system_log' directory for why the failure occured.

Feedback

See Also

- distributed_logging

CMCR-042

(error) failed to connect to CDSL session: (%s)

Description

The error indicated arose while connecting to the CDSL session and the current operation cannot proceed.

What Next

Examine the logs located in the 'system_log' directory for why the failure occured.

See Also

- distributed_logging

CMCR-043

(warning) Environment variable LD_PRELOAD is set and will be synchronised to remote processes

Description

This warning indicates that the UNIX environment variable LD_PRELOAD is set at the manager process to a non-empty value. This may cause the launching of remote workers to fail if the security settings of the computing farm do not allow LD_PRELOAD usage.

If the farm allows LD_PRELOAD to be set, the remote processes launched by the manager process will inherit this variable.

What Next

If the *start_hosts* command fails to launch workers, check the security policy of your computing farm with respect to allowing LD_PRELOAD to be set. Unset LD_PRELOAD in the manager process if needed.

CMCR-044

(warning) The directory %s set by environment variable %s is not writable.

Feedback

Description

This warning indicates that the directory set by the UNIX environment variable is not writable because the directory does not exist or has the incorrect permissions.

What Next

Check the setting of the environment variable.

CMCR-045

(warning) Worker wrapper %s is not an executable script.

Description

This warning indicates that the worker wrapper script used by the Synopsys Testcase Packager is not an executable script or that the script is not found.

What Next

Check your installation of the Synopsys Testcase Packager to ensure that the wrapper script exists and its permissions allow it to be executed.

CMCR-046

(information) distributed worker process on %s (PID = %d) was shut down

Description

This message informs about the distributed worker that was shut down.

CMCR-047

(warning) The '-min_hosts' parameter has been set to '%d' which is greater than the total number of hosts '%d' to be launched. The option is ignored.

Description

This warning message is issued when the *-min_hosts* parameter has been set to a value which is greater than the total number of hosts to be launched. This warning is triggered when this condition is violated either by *start_hosts* or by *set_host_options*. The incorrectly set value will be ignored and the respective command will proceed as if the *-min_hosts* option was not set.

The *-min_hosts* parameter specifies the minimum number of hosts that must come online before returning and must be set to a value less or equal to the total number of hosts to be launched and greater than or equal to 0.

Feedback

What Next

Specify a value less or equal to the total number of hosts to be launched when using the *-min_hosts* option.

See Also

- start_hosts
- set_host_options

CMCR-048

(error) Unexpected worker setup failure. Check error log file %s.

Description

This errors is produced by a distributed worker process that encountered an unexpected error at startup and exited. Please refer to the log file that was created in the distributed working directory. The file can be identified by its name, the format of the name is pt_worker_$hostname_$pid.fail.

What Next

Check the correctness of the distributed analysis setup. If needed send error log file to Synopsys for analysis.

See Also

- start_hosts
- set_host_options

CMCR-101

(warning) Current host has %d cores, reverting the max_cores limit to %d instead of %d.

Description

The *set_host_options* command was specified to set a local process host cores usage limit greater than the total number of physical cores on the machine.

What Next

Rerun PrimeTime on a machine with more cores, if needed.

See Also

- set_host_options

Feedback

CMCR-102

(error) Cannot modify the local process max_cores limit.

Description

The *set_host_options* command was specified to modify the local process host cores usage limit too late in the script execution.

What Next

Use the *set_host_options* command earlier in the script.

See Also

- set_host_options

CMCR-103

(information) The max_cores limit for the local (current) process has been modified by %d to %d.

Description

The *set_host_options* command was specified to increase or decrease the local process host cores usage limit by the value indicated. This message serves as a confirmation of the user setting after validating the available physical cores on the target hardware.

What Next

No further action is needed.

See Also

- set_host_options

CMCR-104

(warning) Using a max_cores setting of %d instead of %d due to licensing restrictions.

Description

The *set_host_options* command was specified to set a local process host cores usage limit that requires additional licenses. However, queries to the license server failed to appropriate the needed license count. However, the cores limit is still be augmented with a value lesser than requested.

Feedback

What Next

Rerun the command when more licenses are available.

See Also

- set_host_options

CMCR-105

(error) The specified cores limit requires additional licenses, but none could be obtained.

Description

The *set_host_options* command was specified to increase the local process host cores usage limit. The change did require additional licenses to be obtained. However, the query to the license server failed to obtain any new licenses. Therefore, the *set_host_options* command failed, and the original cores limit is unmodified.

What Next

Rerun the *set_host_options* command when more licenses are available.

See Also

- set_host_options

CMCR-106

(Warning) The current local process cores limit is already equal to the total number of cores and cannot be further increased.

Description

The *set_host_options* command was specified to increase the local process host cores usage limit. However, the current local process limit is already equal to the available number of cores on the host machine.

What Next

Rerun on a machine with enough cores to match the required limit.

See Also

- set_host_options

Feedback

CMCR-107

(error) Cannot change the value of %s %s.

Description

Cannot change the value of the variable due to the reason given in the error message.

What Next

Check the script where the error occurs, and move the setting of the variable to an appropriate location.

CMCR-108

(error) Cannot launch workers with %s protocol inside a container environment.

Description

The displayed *set_host_options* protocol is not currently supported to launch distributed worker processes inside a container environment.

What Next

Use one of the supported protocols to launch workers inside a container environment. Refer to the man page of *set_host_options*.for details on unsupported protocols.

See Also

- set_host_options

CMCR-109

(error) Cannot find %s under %s

Description

The Synopsys Container script which is used to launch product binary within a container environment was not found under the shown directory path.

What Next

Check your product installation to ensure that the Synopsys Container script is available in the same folder as the application launch script.

CMCR-110

(Information) Docker containerization is disabled for distributed workers

Feedback

Description

The command that produced this message has disabled Docker containerization for distributed workers. Worker processes launched with *start_hosts* will not be launched within Docker containers.

What Next

No action is necessary unless the Docker containerization has been disabled unintentionally.

See Also

- set_distributed_parameters

CMCR-111

(Error) Communication protocol %s is not compatible with Docker containerization

Description

The specified communication protocol passed as an option to the *set_host_options* command is not compatible with running distributed worker processes inside a Docker container.

What Next

Use one of the supported communication protocols in *set_host_options* or disable Docker containerization.

See Also

- set_distributed_parameters
- set_host_options

CMCR-112

(Error) Incompatible host options %s prevents enabling of Docker containerization

Description

The host options defined by the *set_host_options* command use communication protocols that are not compatible with running distributed worker processes inside a Docker container. This prevents enabling of Docker containerization for distributed workers.

Feedback

What Next

Use one of the supported communication protocols in *set_host_options* or disable Docker containerization.

See Also

- set_distributed_parameters
- set_host_options

CMCR-301

(information) child process (%d) failed to reduce its cores usage within %ld seconds of parent request.

Description

This message indicates the child process is running a multi-threaded task which has been instructed by the manager to reduce cores usage but has yet to comply.

What Next

No further action is required at this time.

See Also

- parallel_execute

CMD

CMD-001

(error) Cannot specify '%s' with '%s'.

Description

The listed command options are exclusive. Only one of them can be specified.

What Next

Look at the manpage for this command for more information on command options.

CMD-002

(error) Value for '%s' cannot be negative

Feedback

Description

The value for this option must be greater than or equal to zero.

What Next

Enter the command again with a valid option value.

CMD-003

(error) Cannot specify %s without %s.

Description

One command option requires another.

What Next

Refer to the manual page for this command for detailed information on valid options.

CMD-004

(error) Must specify one of these options: %s.

Description

This command requires that one of the options in the list is specified.

What Next

Refer to the manual page for this command for detailed information on valid options.

CMD-005

(error) unknown command '%s'

Description

The command is not recognized.

What Next

Look for a typographical error in the command. If it is correct, make sure that the program you are running supports the command, or you have the license to use the command.

CMD-006

(error) ambiguous command '%s' matched %d commands:\n \t(%s)

Feedback

Description

The command does not have sufficient characters to distinguish it from other commands. The first three commands which match the abbreviation are listed. To see them all, use the help as follows: if the abbreviation is cmd, type 'help cmd*'. This lists all commands that begin with 'cmd'.

What Next

Type enough characters so the command is unambiguous.

CMD-007

(error) Required argument '%s' was not found

Description

The listed argument to the command might not be omitted.

What Next

Supply the required argument.

CMD-008

(error) value not specified for option '%s'

Description

The listed argument requires a value (that is, it is not a boolean option), and none were supplied.

What Next

Supply a value for the argument.

CMD-009

(error) value '%s' for option '%s' not of type '%s'

Description

The value given for the listed argument is not the correct type. For example, if 'abc' is given for an integer option, this error occurs.

What Next

Supply a compatible value for the argument.

Feedback

CMD-010

(error) unknown option '%s'

Description

The option is not recognized.

What Next

If this is not a simple mistake, retype the command with by the -help option. This lists all of the possible options.

CMD-011

(error) ambiguous option '%s'

Description

The option does not have sufficient characters to distinguish it from other options.

What Next

Type enough characters so that the option is unambiguous.

CMD-012

(error) extra positional option '%s'

Description

The command expects some positional arguments and has already received enough. It might also be the case that this was intended as a dash option and is misspelled.

What Next

Verify that the option given is not a misspelled dash option. If a list is provided directly instead of as a variable, ensure it is enclosed by curly braces or double quotation marks. Use -help with the command to verify which arguments are already given.

CMD-013

(error) %s\n \tUse error_info for more info.

Feedback

Description

A script or complex command failed and there is a stack trace for the failure. The trace points out the source files and loops where the error occurred. The error_info command is used to display this stack.

What Next

Fix the error indicated by error_info.

CMD-014

(error) Invalid %s value '%s' in list.

Description

A list argument is expected to be a common type (like integer or float) and one or more elements cannot be converted to that format.

What Next

Fix the offending list element.

CMD-015

(error) could not open %s file

Description

A script or an output redirect file cannot be opened.

What Next

Verify that the file exists or that you have write access to the directory. Write access depends on the file type.

CMD-016

(error) could not close %s file

Description

A script or an output redirect file cannot be closed.

CMD-017

(warning) duplicate option '%s' ignored.

Feedback

Description

The given option is already issued. This command uses the first value of the option, and subsequent values are ignored.

What Next

Make sure this is the option you want to use. If so, decide which value you want and verify that you get the correct one.

CMD-018

(warning) duplicate option '%s' overrides previous value.

Description

The given option has already been issued. This command uses the last value of the option, and previous values are ignored.

What Next

Make sure that this is the option you want to use. If so, decide which value you want and make sure that you get the correct one.

CMD-019

(error) value '%s' for option '%s' not in range (%s).

Description

The value given for the listed argument is not in the allowable range. For example, if 4 is given for an integer option, which has a range of 1 to 3, this error occurs.

What Next

Supply a compatible value for the argument.

CMD-020

(error) unknown OR extra positional option '%s'

Description

The dash option is not recognized. Further, all positional arguments have already been received. This is most likely a misspelled dash option.

Feedback

What Next

Check to see if the option is misspelled. Look at the entire command, as other options may have misled the interpreter.

CMD-021

(warning) invoked %s outside of a loop

Description

The listed control command (break or continue) was used outside of the context of control structure (such as foreach, while, and so on).

What Next

Look for a loop that ends prematurely or for a misspelled control word.

CMD-022

(warning) Can't create alias named '%s' - %s%s.

Description

An attempt was create an alias with an invalid name. Invalid names include those which match an existing command or procedure, and those which can be converted to a decimal, hexadecimal, or octal number.

What Next

Choose another name. Use 'help' and 'alias' (with no arguments) to see what names are in use.

CMD-023

(error) Alias loop: %s

Description

You have aliases that refer to one another.

What Next

Use the alias command to look at the aliases listed in the diagnostic. Remove the loop and re-execute the command.

Feedback

CMD-024

(error) can't %s "%s": %s

Description

You attempted an operation on a variable which failed. You may have tried to read a non-existent variable (set var). Or, you may have tried to unset a non-existent or application-owned variable. The text of the message will indicate which operation failed.

What Next

Verify that the variable exists with the printvar command. If it's not a user variable, you cannot remove (unset) it.

CMD-025

(error) No manual entry for '%s'

Description

The topic for which you requested man pages does not exist.

What Next

Verify that the topic is spelled correctly.

CMD-026

(error) %s required for the '%s' argument.

Description

The command is incomplete as entered. The specified argument requires a valid object or list of objects.

What Next

Enter the command with valid values for all arguments.

CMD-027

(error) couldn't change working directory to '%s'

Description

The directory which you specified to the cd command is not valid.

Feedback

What Next

Verify that the directory is spelled correctly.

CMD-028

(error) couldn't get working directory name

Description

The pwd command was unable to access the current directory. It is most likely the case that the directory which you are in no longer exists,

What Next

Use the cd command to get into an existing directory.

CMD-029

(warning) no aliases matched '%s'

Description

You specified a pattern to the unalias command, and there are no aliases which match that pattern.

What Next

There is no adverse effect of this action. However, check the spelling of the arguments to unalias to ensure that you removed all of the aliases which you wanted to remove.

CMD-030

(warning) File '%s' was not found in search path.

Description

The 'which' command evaluated an filename argument and the file was not found.

What Next

No adverse effect on the result of the command, but check spelling, etc.

CMD-031

(error) value '%s' for option '%s' is not valid. Specify one of:\n \t%s

Feedback

Description

The value given for the listed argument is not one of the limited allowable strings. This messages lists all of the appropriate values.

What Next

Supply a compatible value for the argument.

CMD-032

(warning) command '%s' requires some options.

Description

No options were given for the command, yet some are required.

What Next

Supply appropriate arguments.

CMD-033

(error) cannot source the current log file.

Description

An attempt to source the log file of the currently running interpreter is not allowed. It would cause the tool to infinitely loop.

What Next

Copy the part of the log to be a source for another file, then source that file instead.

CMD-035

(error) Value for %s cannot be larger than the %s value.

Description

Some commands work in pairs, specifying a maximum and minimum value. The minimum value should be less than the maximum value. For example, never specify a *min_capacitance* which is larger than the *max_capacitance* for the same design or port.

What Next

Remove the old value or use a different value.

Feedback

CMD-036

(error) Value for list '%s' must have %s elements.

Description

The value given for the list argument does not have the correct number of elements. Some commands have list arguments which require either a specific number or an even number of elements. The message will indicate which it is.

What Next

Supply a correct number of elements in the list. If the list is provided directly instead of as a variable, ensure it is enclosed by curly races or double quotation marks.

CMD-037

(error) value '%s' for option '%s' is invalid: must be %s.

Description

The value given for the listed argument is greater than or less than the allowable limit. For example, if 4 is given for an integer option, which is required to be less than or equal to 3, this error occurs.

What Next

Supply a compatible value for the argument.

CMD-038

(information) The '%s' option for %s is unsupported.%s

Description

The option which you specified is not currently supported.

CMD-039

(information) The '%s' variable is unsupported.%s

Description

The variable which you specified is not supported.

What Next

If a replacement variable is specified, use it instead of this one.

Feedback

CMD-040

(information) No %s matched '%s'.

Description

In command or variable search functions (help and printvar), you specified a pattern that did not match any variables or commands.

Note that printvar cannot find a specific array element; it can only find the entire array by name.

What Next

Try using more wildcards (* or ?) in your search pattern.

CMD-041

(information) Defining new variable '%s'.

Description

This message is issued when a variable is set for the first time.

When combined with the *printvar* command, this message can be used to isolate spelling errors in system (application) variables. However, like many debugging features, this has significant CPU cost. Therefore, the feature should only be used interactively or when developing scripts.

This feature is enabled by setting the *sh_new_variable_message* variable to true. When combined with a true value for variables *sh_new_variable_message_in_script* or *sh_new_variable_message_in_proc*, this setting causes a warning message (CMD-042) to be issued, which indicates that the performance of scripts (or Tcl procedures) will be adversely affected. To enable the feature in Tcl procedures, set the *sh_new_variable_message_in_proc* variable to true. To enable the feature in Tcl scripts, set the *sh_new_variable_message_in_script* variable to true.

In the following example, the user has misspelled the variable *sh_continue_on_error* by making it plural. With this feature, debugging is simplified.

```
prompt> set sh_continue_on_errors true
Information: Defining new variable 'sh_continue_on_errors' (CMD-041)
true
prompt> printvar sh*
sh_arch              = "sparcOS5"
sh_continue_on_error = "false"
sh_continue_on_errors = "true"
sh_enable_page_mode  = "false"
sh_new_variable_message = "true"
```

Feedback

```
sh_new_variable_message_in_proc = "false"
sh_product_version    = ""
sh_source_uses_search_path = "false"
prompt> unset sh_continue_on_errors
prompt> set sh_continue_on_error true
true

Application variables are always defined, so if this message appears,
a new user-defined variable has been created.
```

What Next

If attempting to set an application variable, use *printvar* with wildcards to get the correct spelling for the variable.

See Also

- printvar
- sh_new_variable_message
- sh_new_variable_message_in_proc
- sh_new_variable_message_in_script
- CMD-042

CMD-042

(warning) Enabled new variable message tracing -\n \tTcl scripting optimization disabled.

Description

This message is issued when you enable new variable tracing for Tcl scripts or procedures. That occurs when you set the variable *sh_new_variable_message* to TRUE, and when you set the variables *sh_new_variable_message_in_proc* or *sh_new_variable_message_in_script* to TRUE. It warns you that the performance of the application will be negatively mpacted because this feature is costly in CPU time when enabled.

This feature is intended for debugging, and should only be used interactively or when developing scripts. It should not be used in a main flow.

What Next

Set one or more of the variables to FALSE unless you are debugging a script.

Feedback

See Also

- sh_new_variable_message
- sh_new_variable_message_in_proc
- sh_new_variable_message_in_script

CMD-050

(error) Unknown procedure '%s'.

Description

The procedure name argument to *define_proc_attributes* is not a procedure.

What Next

Verify that the argument is correct.

CMD-051

(error) Procedure '%s' cannot be modified.

Description

The procedure that you passed to *define_proc_attributes* is a permanent procedure that cannot be modified.

What Next

The procedure might be part of the application, in which case it was correctly defined with *-permanent*. If it is not part of the application, it is possible that it was erroneously defined with *-permanent*.

CMD-052

(error) Unknown command group '%s'

Description

The command group referenced does not exist. For example, using the *-command_group* option with the *define_proc_attributes* command, and passing in a non-existent command group will raise this error.

What Next

Verify that the correct command group name is being used.

Feedback

CMD-053

(warning) The body of procedure '%s' is protected

Description

You attempted to examine the body of a procedure using *info body*. That procedure was protected by the writer so that it's body cannot be displayed.

What Next

No action required.

CMD-060

(error) Syntax error in argument definition %d for proc '%s'.

Description

Using the *-define_args* option for *define_proc_attributes*, there is some kind of syntax error, for example, an improperly formatted list.

What Next

Use *error_info* to narrow the problem, then reenter the command.

CMD-061

(error) Need at least 2 fields in argument definition %d for proc '%s'.

Description

Using the *-define_args* option for *define_proc_attributes*, an argument definition had insufficient arguments. At least 2 are required: the argument name and the option help text.

What Next

Reenter the argument definition with the correct number of fields.

CMD-062

(error) Unknown %s '%s' in argument definition %d (%s) for proc '%s'.

Description

Using the *-define_args* option for *define_proc_attributes*, either a data type or attribute is invalid.

The allowable data types are string, boolean, int, float, and list. The allowable attributes are required and optional.

What Next

Correct the invalid data and reenter the command.

CMD-063

(error) Illegal name '%s' for Boolean argument definition %d for\n \t proc '%s': must begin with '-'.

Description

Using the *-define_args* option for *define_proc_attributes*, you attempted to create a Boolean argument with a name not preceded by a '-'. Boolean arguments require a leading '-'.

What Next

Correct the argument name and reenter the command.

CMD-064

(warning) Value help ignored for Boolean option %s\n \tin argument definition %d for proc '%s'.

Description

Using the *-define_args* option for *define_proc_attributes*, you tried to add value help for a Boolean argument. Boolean arguments cannot have the value help.

What Next

Remove the value help field for boolean arguments and reenter the command.

CMD-065

(error) Can't specify both 'optional' and 'required' in argument\n \tdefinition %d (%s) for procedure '%s'

Description

This message indicates an attempt to specify conflicting flag values as part of the definition of a procedure argument within the *define_proc_attributes* command.

What Next

Decide whether the argument is optional or required, and remove the opposite flag.

Feedback

CMD-066

(error) Must specify a value for attribute 'values' when using '%s'\noption type as in option %d (%s) for procedure '%s'

Description

This message is issued by the *define_proc_attributes* command when you attempt to define an argument whose value must be one of a set of pre-defined strings (the one_of_string data type), without specifying the set of valid strings.

What Next

If the value type really needs to be one_of_string, pass the values in as a list within the attributes list (i.e. {values {a b c}}).

CMD-067

(error) Invalid attribute specification for attribute '%s'\n \t(%s)\n \tin option %d (%s) for procedure '%s'

Description

This message is issued by the *define_proc_attributes* command. It indicates an incorrect attempt at specifying an attribute for a procedure argument. The reason for the error is included in the message.

What Next

Fix the syntax of the command and try again.

CMD-068

(error) Could not find procedure '%s'. Arguments can't be parsed.

Description

This message indicates an attempt to use the parse_proc_arguments command from within a procedure which has not been defined using define_proc_attributes.

What Next

Define the procedure's arguments using define_proc_attributes and try again.

CMD-069

(error) Could not set '%s(%s)' while parsing arguments in '%s'.

Feedback

Description

This message indicates that the *parse_proc_arguments* command was not able to set the specified Tcl array variable to hold the value of a command option.

What Next

This typically indicates that the variable was read-only. Use a different variable and try again.

CMD-070

(error) %s can only be called from within a procedure

Description

This message indicates an attempt to use the given command from the interpreter command line. Calls to this command are only supported from within a Tcl procedure.

What Next

Create a procedure and call the command from within the scope of the procedure body.

CMD-080

(warning) Command '%s' is disabled.

Description

Although part of the application, the listed command is not currently enabled. The sh_disabled_is_error variable controls the severity of this message. When true, a Tcl error is issued for this command. When false, the command is a no-op.

What Next

Look at the user documentation to determine how various commands are enabled and disabled.

See Also

- sh_disabled_is_error

CMD-081

(information) script '%s'\n \tstopped at line %d due to %s.

Feedback

Description

The execution of a script was terminated. This message tells you which script stopped, the line number where it stopped, and why it stopped.

If the *sh_continue_on_error* variable is false (the default), any Tcl error, either syntax or semantic, stops the script. If *sh_continue_on_error* is false and the *sh_script_stop_severity* variable is W or E, messages of that severity or higher stop the script.

If the *sh_continue_on_error* variable is true, the *sh_script_stop_severity* variable is ignored and the script continues even if there are errors or warnings.

What Next

Use the information in this message to identify and correct the source of errors and warnings. Then reexecute the script.

See Also

- sh_continue_on_error
- sh_script_stop_severity

CMD-082

(information) %s occurred at or before line %d in\n \tscript '%s'.

Description

You receive this message if an error or warning occurs while a script is executing, and the variable *sh_source_emits_line_numbers* is set to E or W. A setting of E causes this message to be issued only if an error occurs, while for a setting of W, this message is issued for both warnings and errors. This message tells you the error or warning and the line and script in which it occurred.

The setting of the *sh_script_stop_severity* variable affects the output of the CMD-082 message. If *sh_script_stop_severity* is set to E, the script stops executing if an error occurs; for a setting of W, the script stops executing if a warning or error occurs. In both cases, message CMD-081 is issued, and takes precedence over CMD-082.

What Next

Use the information in this message to identify and correct the source of errors and warnings. Then reexecute the script.

Feedback

See Also

- sh_script_stop_severity
- sh_source_emits_line_numbers
- CMD-081

CMD-085

(warning) Renaming %s %s cause %s commands which use it to fail.

Description

You receive this message if you rename a command which is not a user-defined Tcl procedure. Renaming commands can be dangerous. Parts of the application are written in Tcl, and if you rename a command that the application is using, it is possible that those parts of the application will not function.

The only true use for *rename* is to wrap a command. For example:

```
shell> rename command1 command1_orig
shell>  \\
  proc command1 {args} {
    # ...
    eval command1_orig $args
    # ...
  }
```

If you use *rename* in this way, it is more likely that application will continue to function correctly. Still, use *rename* with extreme care and at your own risk.

What Next

Consider using *alias*, Tcl procedures, or a private namespace before using *rename*.

See Also

- rename

CMD-086

(error) Could not find command '%s'.

Description

This message indicates that the command name entered does not exist and therefore operation on associated command mode could not be performed.

Feedback

What Next

Check to make sure command name is typed correctly.

CMD-087

(error) The command requires either a command name or a command mode name.

Description

This command requires either a command name or a command mode name to be specified.

What Next

Enter *set_current_command_mode* with the *-command* option flag followed by a command name or the *-mode* option flag followed by a command mode name. These options are mutually exclusive.

CMD-088

(error) Could not find command mode '%s'.

Description

This message indicates that the command mode name entered does not exist and therefore could not be set as the current mode.

What Next

Check to make sure command mode name is typed correctly. *get_command_modes -all* lists all defined command mode names.

CMD-089

(error) Initialization of command '%s' failed.

Description

This message indicates that a failure occurred during initialization and the specified command could not be evaluated.

CMD-090

(error) Initialization of command mode '%s' failed.

Feedback

Description

This message indicates that a failure occurred during initialization of the command mode and the specified command mode could not be made current.

CMD-100

(warning) Detected use of obsolete/unsupported feature. The following\n \twill not be available in a future release of the application:\n \t%s. Use %s instead

Description

You have used a feature which is no longer supported by the application, and the feature is planned to be removed at some future date. The supported method is given in the message.

What Next

Update your command usage as indicated.

CMD-101

(error) Failed to set value of option %s for command %s.

Description

A run of a command such as set_command_option_value failed to set the default or current value of an option. The command option may not have been enabled for value-tracking or a conversion error may have occurred when attempting to set the option value.

What Next

It may be necessary to enable the option for value-tracking.

CMD-102

(error) No such positional option %d for command %s.

Description

An attempt was made to find the positional option of the command at the given position. No such positional option was found. Either the given command has no positional options, or the given position is "out of range". Note that positional options are numbered 0, 1, 2, ... (N-1) where N is the number of postional options of the command.

What Next

Retry the operation using a positional option position that is "in range" for the command.

Feedback

CMD-103

(error) A Severe error has occurred. \n \tTo ensure that the script does not continue, the value of sh_continue_on_error\n \thas been overridden to be false. Your script is being interrupted.\n \tTo see the Tcl call stack for the part of your script which generated\n \tthe Severe error use the error_info command.

Description

A Severe error has occurred during a command execution. To ensure that the script does not continue, the value of sh_continue_on_error has been overridden to be false. Your script is being interrupted. To see the Tcl call stack for the part of your script which generated the Severe error use the error_info command.

What Next

For details on the Severe error please look in your log file. You can also run man on the Severe error id to learn more about the error. Study the Severe error and try to fix the error in your script.

CMD-104

(error) Variable '%s' is not an application variable. Using Tcl global variable.

Description

The specified variable is not declared as an application variable (not returned by get_app_var -list). This message is only generated when the application variable sh_allow_tcl_with_set_app_var is true.

Please see the manpages for get_app_var and set_app_var for additional details.

What Next

Make sure you are using the correct variable name.

CMD-105

(warning) Option '%s' is deprecated, use '%s' instead.

Description

This option is deprecated, you should use a different option for this command feature. The code has automatically used a compatible option setting, but in the future the old option may be removed, so you should update your scripts.

Feedback

What Next

Update your script to use the new option.

CMD-106

(warning) Option '%s' for command '%s' is obsolete. See the command's man page for alternatives.

Description

This option is no longer supported, specifying it has no effect.

What Next

Update your script

CMD-107

(error) Not enough values specified for option '%s', requires %d values found %d.

Description

The listed option requires that the specified number of values and not enough values were supplied.

What Next

Supply all the required values for the option.

CMD-108

(warning) Command %s is obsolete. See the command's man page for alternatives.

Description

This command is obsolete. Calling it has no effect. Please see product documentation for alternatives.

What Next

Update your script as needed.

CMD-109

(warning) Command %s is deprecated. See the command's man page for alternatives.

Feedback

Description

This command is deprecated. Please see product documentation for alternatives.

What Next

Update your script as needed.

CMD-110

(warning) Option '%s' for command '%s' is deprecated. See the command's man page for alternatives.

Description

This option is deprecated, you should use a different option for this command feature.

What Next

Update your script to use the new option.

CMD-111

(error) The write operation failed: %s.

Description

The write operation failed for the reason shown.

CMD-112

(error) duplicate option '%s'

Description

Duplicate options are disallowed for this command option.

What Next

Provide a single entry for this option.

CMD-113

(error) problem running user derived attribute command for %s attribute %s:\n \t%s

Description

Duplicate options are disallowed for this command option.

Feedback

What Next

Provide a single entry for this option.

CMD-114

(severe) Command raised a C++ exception:\n %s

Description

A command raised a C++ exception. This is a tool bug and should be reported to Synopsys. This script will terminate execution and you may try to conintue by saving or attempting some other operation. Other issues are likely.

What Next

Report the issue to Synopsys.

CMD-999

(severe) A Severe error has occurred during testing.

Description

A Severe error has occurred during testing. This should never happen in production.

CNTXT

CNTXT-001

(error) Cannot characterize context in min and max mode.

Description

The design has a minimum and a maximum operating condition defined on it. Context characterization requires only one operating condition be set on the design.

What Next

Set the operating condition for which you want to characterize the context on the design.

CNTXT-002

(information) Characterizing the context for cell '%s'

Feedback

Description

The *characterize_context* command is characterizing the context for the specified cell.

What Next

This is an informational message only. No action is required on your part.

CNTXT-003

(information) Deleting the context for %s

Description

The internal data structures associated with the context of the cell were deleted. Therefore the context cannot be written out (*write_context*) or reported (*report_context*). This occurs when the context is deleted by *remove_context*.

What Next

This is an information message. No action is required unless you want to use *write_context* or *report_context* on the cell for which *CNTXT-003* was issued. Otherwise context must be created by *characterize_context*.

CNTXT-004

(error) This command applies to hierarchical cells only Cell '%s' is a leaf cell.

Description

The specified cell is a leaf cell, and the command you executed applies only to hierarchical cells.

What Next

Run the command again, and ensure that you do not specify a leaf cell.

CNTXT-005

(information) The design has rise/fall qualified exceptions which will not be written out.

Description

The *write_context* command does not write out the rise/fall qualified exceptions in your design. Rise/Fall qualified exceptions are supported only by PrimeTime; neither *write_context* nor *write_sdc* writes them out for either dcsh or dctcl mode.

Feedback

What Next

This is an informational message only. No action is required on your part.

CNTXT-006

(warning) The remove_context command is not supported any more. No action is taken.

Description

The *remove_context* command is not supported any more. You don't need to delete the context.

What Next

This is a warning message only. No action is required on your part.

CNTXT-007

(warning) The '%s' option in characterize_context and remove_context commands is not supported any more. All types of context are characterized or removed.

Description

Different types of context information can be filtered in *write_context* and *report_context* commands. For *characterize_context* command or *remove_context* command, all types of context will be charactrized or removed.

What Next

This is a warning message only. No action is required on your part.

CNTXT-008

(warning) The no_boundary_annotations option in characterize_context command is not supported any more. No action is taken.

Description

The no_boundary_annotations option in *characterize_context* command is not supported any more. It is set to true by default. The parasitics will not be annotated on boundary net.

What Next

This is a warning message only. No action is required on your part.

Feedback

CNTXT-009

(warning) The instance '%s' has already been characterized.

Description

If the context for an instance has already been characterized, the context characterization for this instance will be skipped. If you want to re-characterize context for an instance, please use remove_context to remove the context for the corresponding instance first.

What Next

This is a warning message only. No action is required on your part.

CNTXT-010

(warning) The context for instance '%s' has not been characterized yet.

Description

If the context for an instance has not been characterized, write_context, report_context or set_context_margin can't be used on that instance. Please use characterize_context to characterize context for the corresponding instance first.

What Next

This is a warning message only. No action is required on your part.

CNTXT-011

(error) Cannot characterize context in single operating condition.

Description

The design has a single operating condition defined on it. Context characterization requires on_chip_variation operating condition be set on the design.

What Next

Set the operating condition to on_chip_variation for which you want to characterize the context on the design.

CNTXT-012

(error) write_context doesn't support '%s' format anymore.

Feedback

Description

write_context doesn't support dcsh format anymore, please choose the format among ptsh, dctcl or sdc

What Next

Choose the format among ptsh, dctcl or sdc.

CNTXT-013

(error) Unsupported object type.

Description

set_context_margin only support to be set on object type of cell. If no cell is given, the context margin is set on the top design.

What Next

Set the context marign on cell or design.

CNTXT-014

(warning) The context for pin '%s' has not been characterized yet.

Description

If the context for the instance containing the pin has not been characterized, report_context can't be used on that pin. Please use characterize_context to characterize context for the corresponding instance first.

What Next

This is a warning message only. No action is required on your part.

CNTXT-015

(error) Object list of report_context must be give unless using -parent option.

Description

A collection of pin/port or instance must be given for report_context command unless using -parent option to report context of hyperscale block loaded from top.

What Next

Give proper objects for report_context to report or use -parent to report context of hyperscale block loaded from top.

Feedback

CNTXT-016

(warning) No context data available to report.

Description

report_context command can only be used to report context of objects that is characterized by characterize_context command or context of current design loaded by read_context command.

What Next

Please check whether the context has been characterized or read properly.

CNTXT-017

(error) design/lib_cell/block %s has no instances.

Description

The collection of design/lib_cell or block name given in the cell_block_list of characterize_context/write_context command do not has any instances in the current design.

What Next

Please check that the collection of design/lib_cell or block name you given in the cell_block_list is correct and has instances in the current design.

CNTXT-018

(error) Failed to merge timing context around instance '%s' with reference instance '%s'.

Description

When *characterize_context* with *all_instance* option is used to characterize context for some reference block, the context data internally computed for all its instances are automatically merged into a single overall context for the block.

In order to automatically merge the context for two block instances of the same block, it is required that the instances must be operated in a similar mode and environment, for example, one of the fundamental reqreuirments is that all the instances of the same block must have exactly matching clock and clock topology on the boundary.

Otherwise, their context data cannot be merged together and analysis must be done seperately to cover each operating context seperately in order for the top level analysis to remain valid.

Feedback

It is worth emphasize that ultimately only the users know the design intention and whether or not the different instances of a same physical block are truly operating similarly or equivalently on the same chip under the targeted timing analysis setup.

When merge fails with this error message, the context for the instance noted is discarded and PrimeTime only saves the context covering the reference instance noted.

What Next

Based on the knowledge and intention of the design and analysis setup, there are several options to deal with failed automatic context merging.

You can choose to modify the top level constraints if you ensured that this is a constraint setup problem at top level and the block should have the same clocks and similar contexts when instantiated multiple times.

You can choose to configure for seperate analysis to cover different context for the instances if you ensured that the top level constraint setup is correct and these instances of the same block are assumed to subject to different contexts for timing analysis.

See Also

- characterize_context
- write_context

CNTXT-019

(error) Found clock '%s' propagating to instance '%s' through pin '%s', but no matching clock reaching the equivalent pin on instance '%s' of the same block.

Description

When *characterize_context* with *all_instance* option is used to characterize context for some reference block, the context data internally computed for all its instances are automatically merged into a single overall context for the block.

In order to automatically merge the context for two instances of the same block, it is required that the instances must have exact matching clocking scheme. Otherwise, their context data cannot be merged together and analysis must be done seperately to cover each clocking scheme. When merge fails with this error message, the context for the second instance noted is discarded and PrimeTime only saves the context covering the first instance noted.

What Next

You can use *report_timing*, or *report_attribute* commands to verify the message.

Feedback

Based on the knowledge and intention of the design and analysis setup, there are several options to deal with failed automatic context merging.

You can choose to modify the top level constraints if you ensured that this is a constraint setup problem at top level and the block should have the same clocks and similar contexts when instantiated multiple times.

You can choose to configure for seperate analysis to cover different context for the instances if you ensured that the top level constraint setup is correct and these instances of the same block are assumed to subject to different contexts for timing analysis.

- write_context

CNTXT-020

(information) Timing context around instance '%s' is successfully merged with instance '%s'.

Description

When *characterize_context* with *all_instance* option is used to characterize context for a given block, the context data internally computed for all its instances are automatically merged into a single overall context for the block. This merged context is intended to cover all the instantiation specified.

When merge succeeds with this message, the context for the instance noted is covered by a merged context noted. And a single context is written for all successfully merged instances for a single block level analysis.

What Next

No action is required.

See Also

- characterize_context
- write_context

CNTXT-021

(error) Found clock '%s' propagating to instance '%s', but no matching clock with equivalent pins of same '%s' on instance '%s' of the same block is found.

Feedback

Description

When *characterize_context* with *all_instance* option is used to characterize context for some reference block, the context data internally computed for all its instances are automatically merged into a single overall context for the block.

In order to automatically merge the context for two block instances of the same block, it is required that the instances must have exact matching clocking scheme. Otherwise, their context data cannot be merged together and analysis must be done seperately to cover each clocking scheme. This error message shows which clocking scheme is causing the merging can not proceed. When merge fails with this error message, the context for the second instance noted is discarded and PrimeTime only saves the context covering the first instance noted.

What Next

You can use *report_timing*, or *report_attribute* commands to verify the message.

Based on the knowledge and intention of the design and analysis setup, there are several options to deal with failed automatic context merging.

CNTXT-023

(Error) Instance name '%s' is not a valid name.

Description

The instance name given in the -objects option is not a valid name.

What Next

Please check the instance name given in the -objects option is correct.

CNTXT-024

(Error) Use '%s' required '%s' license.

Description

The required license of the command is not available.

What Next

Please check whehter the required license is available.

Feedback

CNTXT-025

(Warning) The config cannot be updated for single block instance '%s'.

Description

The instance was already set as a HyperScale hierarchical block by the *set_hier_config* command. In the HyperScale flow, it is not necessary to use the *characterize_context* or *write_context* command to update single block instance, except for top-level constraints-only extraction.

What Next

In the HyperScale flow, use the *set_hier_config* command to specify a hierarchical block instance and the *write_hier_data* command to write out the context data for the instance.

CNTXT-026

(warning) The directory '%s' has already been used as gbc context output.

Description

This warning message warns you that the given output directory has already been used with gbc context. The original contxt in that directory will be overwritten with the new generated context.

What Next

Specify another output directory if you still want to keep the original context.

CNTXT-027

(error) Context for %s %s has not been characterized yet, can't be removed.

Description

If the context for an object has not been characterized, remove_context can't be used on that object. Please use characterize_context to characterize context for the corresponding instance first.

What Next

Please check whether the corresponding block/cell has been characterized. If the block is characterized with -all_instance option, you must also use -all_instance to remove the context.

Feedback

CNTXT-028

(error) Cannot characterize context for '%s' because it is inside a HyperScale block.

Description

If the block/cell to be characterized is within a hierarchical cell which is configured as HyperScale, it can not be characterized.

What Next

Please characterize lower level blocks in flat run or in HyperScale block level run.

CNTXT-029

(Error) Cannot use write_context for cell '%s' because it is a HyperScale block.

Description

If the instance has been configured as a HyperScale block, *write_context* cannot write context on it.

What Next

Use the *write_hier_data* command to write out the context for a HyperScale block.

CNTXT-030

(Error) Reference name of instances does not match name given in -block.

Description

All instances given in *-instance* option of *characterize_context* must be of the same reference object as given in -block.

CNTXT-031

(Error) Multiple instances must have MIM group name with -name.

Description

If the instances given in *-instance* option of *characterize_context* is a subset of all instances of reference object given in -block, -name option is required.

CNTXT-032

(Error) '%s'.

Feedback

Description

The charactrize_context command can only characterize hierarchical cell/instance and ETM leaf cell/instance.

CNTXT-033

(Error) no cell/instance has been characterized with characterize_context command.

Description

No cell/instance has been characterized with *characterize_context*. To write out context for HyperScale objects, the instances or blocks must be explicitly given in the *cell_block_list* of *write_context*.

What Next

characterize_context

CNTXT-034

(information) The MIM group of instance '%s' has already been updated by characterize_context command.

Description

The instance was already set as a HyperScale hierarchical block by the *set_hier_config* command. If *characterize_context* command is used, then the instance will be updated as required.

What Next

In the HyperScale flow, use the *set_hier_config* command to specify a hierarchical block instance before linking and the *characterize_context* command to specify the block instance after linking.

CNTXT-035

(error) Command ignored because the instances '%s' specified is a mixture of flat blocks and model blocks.

Description

When using the *characterize_context* command to specify the instances set by *set_hier_config* command, the newly set instances can only from HyperScale or Non-HyperScale. They cannot be mixed with each other.

Feedback

What Next

Use *characterize_context* command to specify instances only set by *set_hier_config* or instances excluded from *set_hier_config*.

CNTXT-036

(error) Command ignored because the mim group '%s' specified contains more than one instance.

Description

When using the *characterize_context* command to specify the instances set by *set_hier_config* command, only individual instance can be re-configured. The -instances cannot contain more than one instance.

What Next

Use *characterize_context* command to specify only one instance set by *set_hier_config* or instances excluded from *set_hier_config*.

CNTXT-037

'%s'.

Description

When using the *characterize_context* command to characterize context for ETM leaf cells, only single instance is supported. Characterizing of ETM for MIMs is not supported.

What Next

Use *characterize_context* command to specify only one ETM instance instead of MIMs.

CNTXT-038

(error) write_context doesn't support ptsh, dctcl or sdc format for ETM leaf cell '%s'.

Description

When using the *write_context* command to write context for ETM leaf cells, only binary context format is supported. Other formats like ptsh, sdc and dctcl are not supported.

What Next

Use *write_context* command to specify only the gbc format.

Feedback

CNTXT-039

(warning) Clock '%s' is one of the multiple clocks reaching the same block pin '%s' and will be merged into '%s', merged context will be applied.

Description

When there are multiple top clocks entering the same block clock port during block level timing analysis, the context of the clocks with the same attributes will be merged and the merged context will be applied.

CNTXT-040

(information) Wrote context data for instance '%s' in directory '%s'.

Description

When *write_context* is used for single instance, the context data for instance is written into specified directory.

What Next

No action is required.

See Also

- characterize_context

CNTXT-042

(information) Wrote merged context data for reference instance '%s' in directory '%s'.

Description

When *write_context* is used for multiple instances, the merged context data for reference instances are written into specified directory.

What Next

No action is required.

See Also

- characterize_context

Feedback

CNTXT-044

(information) Wrote constraints for instance '%s' in directory '%s'.

Description

When *write_context* is used for single instance, the constraints data for block instance is written into specified directory.

What Next

No action is required.

See Also

- characterize_context

CNTXT-046

(information) Wrote merged constraints for reference instance '%s' in directory '%s'.

Description

When *write_context* is used for multiple instances, the merged constraints data for reference instances are written into specified directory.

What Next

No action is required.

DA

DA-001

(Error) No hierarchical cell is found with name '%s'.

Description

You receive this message if the -exclude_instances option is used with wrong instance name argument. The given name does not refer to a hierarchical cell.

Feedback

What Next

Check the instance name and reissue the command with correct instance names.

See Also

- set_hier_config
- start_hosts

DA-002

(Warning) Some of the user specified block exclusions are ignored for distributed analysis.

Description

You receive this message if the *set_hier_config -exclude_instances* option is used previously but some or all of the hierarchical instances are ignored for hierarchical distributed analysis partitioning. This can occur because either (a) the specified hierarchy does not have parasitics of its own or (b) the specified hierarchy is not the top level parasitic instance.

What Next

Check the instance name and reissue the *set_hier_config* command with correct instance names.

See Also

- set_hier_config
- start_hosts

DA-003

(Error) The command '%s' is not supported in the distributed analysis manager.

Description

You receive this message if hierarchical distributed analysis is enabled and you have used a command which can not be executed by the distributed analysis manager.

What Next

Check if the command can be used in any block context.

Feedback

See Also

- set_hier_config
- start_hosts

DA-004

(Error) Untranslatable block/instance/design specified.

Description

You receive this message if current_partition was supplied wrong instance name(s) argument. The given name(s) does not refer to a hierarchical cell(s).

What Next

Check the instance name and reissue the command with correct instance names.

See Also

- set_hier_config
- start_hosts

DA-005

(Error) No user commands specified to be executed.

Description

You receive this message if no user commands were supplied to current_partition to be executed at the worker partitions.

What Next

Specify set of commands to be run on partitions.

DA-006

(Error) Remote execution output not available at the manager process.

Description

You receive this message if the remote execution command output could not be captured. Unable to generate command execution reports at the manager process.

Feedback

What Next

Check the command log files of the worker partitions in focus.

DA-007

(Error) Attribute '%s' is not supported in distributed analysis manager.

Description

You receive this message if the hierarchical distributed analysis is enabled and you are trying to access an attribute which can not be accessed by distributed analysis manager.

What Next

Check if the attribute can be used in any block context.

See Also

- set_hier_config
- start_hosts

DA-008

(Error) Option '%s' is not supported with command '%s' in distributed analysis manager.

Description

You receive this message if hierarchical distributed analysis is enabled and you have used an option with a command which can not be executed by the distributed analysis manager.

What Next

Check if the option could be used with the command in any block context.

See Also

- set_hier_config
- start_hosts

DA-009

(Error) Partitions have not been started up to run the command.

Feedback

Description

You receive this message if no partitions are started up to take any task. Please run update_timing to start up partitions in remote hosts.

What Next

Run update_timing before running any distributed command in hierarchical distributed analysis.

DA-010

(Warning) Switching pt_shell out DHA mode unsupported.

Description

pt_shell operates in only one mode DHA/DMSA/AMV at one point in time. Switching out of DHA mode and going back to normal mode is not permitted.

See Also

- set_hier_config
- start_hosts

DA-011

(Error) Design already read and linked cannot run in distributed mode.

Description

You receive this message if you try to enable hierarchical distributed analysis after reading in the design.

What Next

Set *set_hier_config* before reading the design.

See Also

- set_hier_config
- start_hosts

DA-012

(Error) Distributed save could not be performed on partial set of partitions.

Feedback

Description

You receive this message if save_session command has been issued when only a subset of partitions have been restored.

See Also

- save_session

DA-013

(Error) Partition "%s" was not restored with the design.

Description

You receive this message if you are trying to set focus and run commands on a partition which was not restored and thus is not linked to the design.

See Also

- restore_session

DA-014

(Error) Unable to access changelist file %s from %s.

Description

You receive this message if in distributed hierarchical flow either manager or worker machines fail to access temporary eco changelist files dumped by one of the machines.

What Next

Check if the *hier_distributed_working_directory* has enough space left. Try doing ECO in a fresh session.

DA-015

(Error) Partition '%s' could not be restored because '%s' is not accessible.

Description

You receive this message if you are trying to restore a partition which does exist in saved image.

Feedback

See Also

- restore_session

DA-016

(Error) Top partition was not restored from saved session.

Description

You receive this message if Top partition was not requested to be restored in DHA mode.

What Next

Include Top partition in list of partitions to be restored.

DA-017

(Error) Design not available to run hierarchical distributed analysis.

Description

You receive this message if design has not be loaded and linked to distributed analysis manager.

What Next

Load and link the design to distributed analysis manager before issuing any distributed command.

DA-018

(Warning) Started (%d) additional processes on the manager to support (%d) partitions.

Description

You received this message if additional processes had to be started on the manager's host to run all the partitions in the design.

What Next

Please rerun with modified *set_host_options*. Otherwise, the performance of the distributed analysis will not be optimal.

DA-019

(fatal) Internal system error in partition(s) ' %s'. Fatal stack trace available in; %s

Feedback

Description

While executing commands in distributed analysis mode, one or more partition experienced a critical internal error causing it to terminate.

What Next

Examine the worker logs to determine the cause of error and refer to Synopsys for further support.

DA-020

(Error) Insufficient %s resources available to analyze %d partitions.

Description

You receive this message if the number of licensed worker processes online is less than the number of partitions to be analysed due to a lack of licenses or an inability to bring processes online.

What Next

Please rerun with sufficient resources to run the number of partitions determined in the design. If the problem is due to licenses please contact Synopsys for additional licenses or if the problem is due to process startup please modify the *set_host_options* specified.

DA-021

(Error) List values are not supported with option '%s' in '%s' command. Use collections.

Description

You receive this message if hierarchical distributed analysis is enabled and you have used an option values in list form instead of collection with a command which can not be correctly executed by distributed analysis manager with values in list form.

What Next

Provide the option values in collection form.

See Also

- set_hier_config
- start_hosts

Feedback

DA-022

(Error) Only Pin, Port, Cell and Net objects are supported in collection.

Description

You receive this message if hierarchical distributed analysis is enabled and you have used a collection objects other than Pin, Port, Cell and Net.

What Next

Check if the option could be used with the command in any block context.

See Also

- set_hier_config
- start_hosts

DA-023

(Error) Partitions information does not exist. Skipping '%s' command.

Description

You receive this message if no partitions are started up to take any task. This happen if you have not run update timing before the command or your design is non-hierarchical.

What Next

Run update_timing before running any distributed command in DHA. Verify the design.

DA-024

(Error) update_noise failed for distributed analysis.

Description

You receive this message because there was an error happenned during "update_noise".

What Next

Check the out.log of both top and block partitions for details.

DA-026

(Error) netlist/constraint inconsistency detected between manager and top/block partitions

Feedback

Description

You receive this message because there was an inconsistency between the manager netlist/constraint and the top/block session that is being loaded.

What Next

Check the out.log of both top and block partitions for details.

DA-027

(Warning) *Hierarchical distributed analysis* is not fully supported by *set_advanced_analysis*.

Description

You receive this message to inform you *hierarchical distributed analysis* is not fully supported by *set_advanced_analysis*.

What Next

Do not use *set_advanced_analysis* after enabling hierarchical distributed analysis. Alternatively, user can set *timing_enable_auto_mux_clock_exclusivity* to false.

DA-028

(Error) Cannot combine 'report_timing' with 'get_timing_paths' in DMSA when variable 'timing_report_include_eco_attributes' is set to true. Eco attributes will not be reported.

Description

You receive this message because you are using command *report_timing* combined with *get_timing_paths* under DMSA mode in the manager and you have set the value of variable *timing_report_include_eco_attributes* to true. These options are incompatible. The report will not include the ECO attributes.

What Next

Use *remote_execute* to run *report_timing* with these settings on workers. You have to also set variable *timing_report_include_eco_attributes* to true on the workers. Othewise use *report_timing* without *get_timing_paths* or set value of *timing_report_include_eco_attributes* to false.

See Also

- timing_report_include_eco_attributes
- remote_execute

Feedback

DA-029

(Error) Context inconsistency detected between top and block partitions

Description

You receive this message because there was an inconsistency between the top and block session context.

What Next

Make sure that block session has the same context generated by the top session being loaded.

DA-030

(Error) The variable hier_characterize_context_mode is set to constraints_only. Thus, design cannot be run in distributed mode.

Description

You receive this message if you try to enable hierarchical distributed analysis after setting hier_characterize_context_mode to constraints_only.

What Next

Dont set *hier_characterize_context_mode* in hierarchical distributed analysis.

See Also

- hier_enable_distributed_analysis

DA-031

(Error) The variable hier_create_template_scripts is set to true. Thus, design cannot be run in distributed mode.

Description

You receive this message if you try to enable hierarchical distributed analysis after setting hier_create_template_scripts to true.

What Next

Dont set *hier_create_template_scripts* in hierarchical distributed analysis.

Feedback

See Also

- hier_enable_distributed_analysis

DA-032

(Error) The number of workers online '%d' is less than the number of workers needed '%d'.

Description

You receive this error if the number of hosts required to run distributed analysis, is less than the number of hosts online.

What Next

If the -timeout option to the start_hosts command was used and the timeout expired before all workers came online, then increase the timeout specified to allow more worker processes come online.

If the -min_hosts options to the start_hosts command was used, then increase the value specified to at least the number of workers indicated as needed. OR Remove -min_hosts options.

DA-033

(Error) invalid %s '%s' in affinity specification.

Description

You receive this message if hierarchy name or host option name in affinity specification in set_hier_config command is incorrect i.e. hierarchical design corresponding to hierarchy name specified does not exist or host option name specified does not exist.

What Next

Re-run the command with correct values.

See Also

- set_hier_config
- start_hosts
- report_host_usage
- set_host_options

Feedback

DA-034

(Warning) empty affinity specification.

Description

The affinity specification is empty so it will be treated as if no affinity has been specified.

What Next

If you intended to specify an affinity, re-create it specifying a valid affinity.

See Also

- set_hier_config
- start_hosts
- report_host_usage
- set_host_options

DA-035

(Error) The -affinity option can only be used with -partitions option.

Description

You receive this message if partition option is missing with affinity option.

What Next

Re-run the command with partitions options.

See Also

- set_hier_config
- start_hosts
- report_host_usage

DA-036

(Warning) host option name %s specified in affinity does not exist.

Description

You receive this message during restore_session if host option name specified in affinity specification does not exist.

Feedback

What Next

If you are intended to use the host option for affinity then set appropriate host options and restore the session.

See Also

- set_hier_config
- start_hosts
- report_host_usage
- set_host_options

DA-037

(Warning) invalid instance name '%s' in partition specification. Not consider the instance for partitioning.

Description

You receive this message if instance name in partition specification in set_hier_config command is incorrect i.e. hierarchical design corresponding to instance name specified does not exist

What Next

Re-run the command with correct values.

See Also

- set_hier_config

DA-038

(Error) Can not set resource affinity before design is linked.

Description

You receive this message if design has not be loaded and linked.

What Next

Load and link the design at the distributed analysis manager process before setting resource affinity.

Feedback

DA-039

(Warning) full path recalculation with full clock expanded pba reporting is not supported in Distributed Analysis. Thus showing clock path upto partition boundary.

Description

You will get this message when the pba_recalculte_full_path variable is set to true and full clock expanded pba reporting is queried.

What Next

Set pba_recalculte_full_path variable to false and re-issue the query.

DA-040

(Error) We have encountered issues with '%s' passed with 'set_hier_resource_limits' command.\n '%s' seem to be insufficient to analyze design. Please refine them.

Description

You receive this message if the parameters to set_hier_resouce_limits are not well configured.

What Next

Try increasing the memory/cores passed along with set_hier_resource_limits

See Also

- set_hier_config

DA-041

(Error) Cannot run update_timing -full because the compute resources for partitions were released.

Description

You enabled top-only mode in the distributed flow and the compute resources for block partitions were released in the previous timing update.

What Next

Set the *hier_enable_release_resources_in_top_only_flow* variable to *false* if you need to update the timing multiple times in the distributed top-only flow.

Feedback

DA-042

(Error) Cannot update timing because the compute resources for block partitions were released.

Description

You enabled top-only mode in the distributed flow and the compute resources for block partitions were released in a previous timing update.

What Next

Set the *hier_enable_release_resources_in_top_only_flow* variable to *false* if you need to update the timing multiple times in the distributed top-only flow.

DA-043

(Error) Cannot perform reporting because timing is not updated. Skipping '%s' command.

Description

For some reason, timing was not updated in the distributed flow.

What Next

Please check previous error messages to understand the reason behind this error.

DA-044

(Error) Cannot update noise because the compute resources for block partitions were released.

Description

You enabled top-only mode in the distributed flow and the compute resources for block partitions were released in a previous timing update.

What Next

Set the *hier_enable_release_resources_in_top_only_flow* variable to *false* if you need to update the timing/noise multiple times in the distributed top-only flow.

DA-045

(Warning) In distributed analysis, the "Net Interconnect Area" and "Design Area" reported by the report_constraint command are pessimistic.

Feedback

Description

In HyperScale distributed analysis, the "Net Interconnect Area" and "Design Area" reported by the *report_constraint* command are pessimistic due to double-counting the overlap between the top and block levels.

What Next

Be aware that the reported areas can be less than the reported area. No further action is required.

DA-046

(Error) In HyperScale distributed analysis, report_timing was used with the -path_type full_clock_expanded option while operating on a path collection that did not have full_clock_expanded data.

Description

In HyperScale distributed analysis, the *report_timing* command, when operating on a path collection, supports the *-path_type full_clock_expanded* option only if the path collection was also generated with the *-path_type full_clock_expanded* option.

Attempting to report *full_clock_expanded* data that is unavailable in a path collection triggers an error, as in the following example:

```
set mypaths [get_timing_paths -max_paths 200000 -nworst 10]
report_timing $mypaths -path_type full_clock_expanded  ->  Error
```

What Next

To include *full_clock_expanded* data in the path collection during HyperScale distributed analysis, use the *-path_type full_clock_expanded* option when you gather the paths:

```
set mypaths [get_timing_paths -max_paths 200000 -nworst 10 \\
  -path_type full_clock_expanded]
report_timing $mypaths -path_type full_clock_expanded
```

Alternatively, you can get the full report directly without using a path collection:

```
report_timing -path_type full_clock_expanded -max_paths 200000 -nworst 10
```

DA-047

(Error) DMSA and %s doesn't work together.

Description

You receive this message if the DMSA is enabled and you are trying to enable distributed_enable_analysis or hier_enable_distributed_analysis.

Feedback

What Next

Check if DMSA is enabled.

DA-048

(Error) The script %s doesn't exist.

Description

The script mentioned in start_dsta command is wrong.

What Next

Input correct path for the script file.

DA-049

(Error) Option '%s' is not supported with command '%s' in distributed analysis mode.

Description

You receive this message if hierarchical distributed analysis is enabled and you have used an option with a command which can not be executed in distributed analysis engine.

What Next

Check if the you can provide spef/gpd version of the command.

DA-050

(Error) Cannot set timing_aocvm_enable_analysis variable in distributed analysis

Description

You receive this message if distributed analysis is enabled and you have tried to enable aocvm analysis by setting timing_aocvm_enable_analysis variable.

What Next

Please check the script

DA-051

(Error) Attribute %s is not supported in filter_collection.

Feedback

Description

You receive this message if you are trying to access remotely_available attribute in filter collection when distributed_enable_analysis is enabled

---

DA-052

(Warning) Following license was not found for distributed analysis '%s'.

Description

You receive this message if license has not been activated for distributed analysis

What Next

Check which licenses are activated using list_licenses command

---

DA-053

(Information) Setting distributed_working_directory variable to '%s'.

Description

In case distributed_working_directory is not explicitly set by user, the tool sets it to a default value during start_hosts call. If user wants to specify their own, please make sure to set it before calling start_hosts command.

DA-054

(Error) Minimum 2 cores are required in Hypergrid Analysis.

Description

You receive this message because you are using command *set_host_options* with specified max cores option which is less than two. The local process host cores usage limit by the value indicated.

What Next

Use the *set_host_options* with max_cores option set to 2 in HyperGrid Master

See Also

- set_host_options

Feedback

DA-057

(Error) Working directory contain inaccessible file or directory '%s'.

Description

You receive this message if present working directory has a file or directory which doesn't have read/access permission.

What Next

Please check the present working directory for such file or directory.

DA-060

(Error) The netlist connectivity check failed.

Description

You receive this error message if the netlist was partitioned incorrectly by HyperGrid. This is not a user error.

What Next

Please provide this and any previous "DA-###" errors to Synopsys.

DA-061

(Error) The following net segment exists in a secondary MIM hierarchy but does not exist in the primary MIM hierarchy: p_hier:%s,s_hier:%s,p_net:MISSING,s_net:%s

Description

You receive this error message if the netlist was partitioned incorrectly by HyperGrid. This is not a user error.

What Next

Please provide this and any previous "DA-###" errors to Synopsys.

DA-062

(Error) The cell of the following pin does not exist in the hierarchy: level:%d,hier:%s,net:%s,pin:%s

Feedback

Description

You receive this error message if the netlist was partitioned incorrectly by HyperGrid. This is not a user error.

What Next

Please provide this and any previous "DA-###" errors to Synopsys.

DA-063

(Error) The following net segment exists both in the primary and the secondary MIM hierarchies, and it's connected to a cell in the primary MIM hierarchy, which is missing from the secondary MIM hierarchy: level:%d,p_hier:%s,s_hier:%s,p_net:%s,s_net:%s,p_cell:%s,s_cell:MISSING

Description

You receive this error message if the netlist was partitioned incorrectly by HyperGrid. This is not a user error.

What Next

Please provide this and any previous "DA-###" errors to Synopsys.

DA-064

(Error) The following net segment exists both in the primary and the secondary MIM hierarchies, and it's connected to a pin in the primary MIM hierarchy, which is missing from the secondary MIM hierarchy: level:%d,p_hier:%s,s_hier:%s,p_net:%s,s_net:%s,p_pin:%s,s_pin:MISSING

Description

You receive this error message if the netlist was partitioned incorrectly by HyperGrid. This is not a user error.

What Next

Please provide this and any previous "DA-###" errors to Synopsys.

DA-065

(Error) The following primary net's global net has %s segments than the secondary net's global net: level:%d,p_hier:%s,s_hier:%s,p_net:%s,s_net:%s,#p_g_net_segments:%d,#s_g_net_segments:%d\n Primary net's global net segments:\n%s\n Secondary net's global net segments:\n%s\n

Feedback

Description

You receive this error message if the netlist was partitioned incorrectly by HyperGrid. This is not a user error.

What Next

Please provide this and any previous "DA-###" errors to Synopsys.

DA-066

(Error) The following net segment exists both in the primary and the secondary MIM hierarchies, but a net segment of the primary net's global net exists in the primary but not in the secondary MIM hierarchy: level:%d,p_hier:%s,s_hier:%s,p_net:%s,s_net:%s,p_g_net_segment:%s,s_g_net_segment:MISSING

Description

You receive this error message if the netlist was partitioned incorrectly by HyperGrid. This is not a user error.

What Next

Please provide this and any previous "DA-###" errors to Synopsys.

DA-067

(Error) min_partition can not be less than 2.

Description

You receive this error message if minimum number of partitions is less than or equal to 1.

What Next

Please provide this and any previous "DA-###" errors to Synopsys.

DA-068

(Error) Minimum number of partitions can not be more than NoOfPartitions.

Description

You receive this error message if minimum number of partitions is greater than Number of Partitions provided by the user.

What Next

Please provide this and any previous "DA-###" errors to Synopsys.

Feedback

DA-069

(Information) Enabling hypergrid pre scan.

Description

You receive this information message if you use the enable_hypergrid_pre_scan command.

DA-070

(Information) Disabling hypergrid pre scan.

Description

You receive this information message if you use the disable_hypergrid_pre_scan command.

DA-071

(Error) No Master arc info found for selective disabling, using any loop arc for loop breaking.

Description

You receive this message if there is no selective loop arc breaking at distributed workers to be in sync with arcs broken at master. This will happen under gvar dsta_ignore_loop_break_sync set to true.

DB

DB-1

(error) File is not a DB file.

Description

The identified file was not in the DB file format.

What Next

Check to see what format the file is in, and read it with the appropriate command. For example, edif files can be read into *dc_shell* with the *read -format edif <filename>* command.

Feedback

DB-3

(warning) Can't locate file '%s'.

Description

This warning message will be printed out the first time if we can not resolve a link to a given file. In the absense of the given file, there will be some unresolved references.

What Next

Check the link_library and the search_path variables and set their value accordingly.

DB-4

(error) Open gen_state (0x%x) -- %s object '%s' (0x%x)\n attach '%s' id = %d

DB-5

(error) Limit exceeded: Cannot create attribute %s for class %s, so program cannot continue.

Description

This message appears when the internal limit of 32k attributes per database object is exceeded. Once this limit is exceeded, work in progress cannot be saved and the program cannot continue.

What Next

Check the scripts to see if an excessive number of *create_attribute* commands are run with unique attribute names. Try to reuse names where possible. If many scripts are run in one large session, attempt to break up the single long run into a number smaller runs, saving your work each time.

DB-6

(error) Limit exceeded: Cannot create attach %s for class %s, so program cannot continue.

Description

This message appears when the internal limit of 32k types of attaches per database object is exceeded. Once this limit is exceeded, work in progress cannot be saved and the program cannot continue.

Feedback

What Next

If many scripts are run in one large session, attempt to break up the single long run into a number smaller runs, saving your work each time.

DBPG

DBPG-101

(warning) Missing %s attribute for internal PG pin '%s' of cell '%s' which is defined as fine-grain switch cell in the library. This internal PG pin is not considered as an internal switchable PG pin during power analysis.

Description

Liberty PG pin syntax provides the syntax for modeling fine-grain switch cell in the library. A PG pin is considered as an internal switchable power or ground if the PG pin has pt_type of internal_power or internal_ground and it has both switch_function and pg_function attributes defined. If either attribute is missing, the internal PG pin is not considered as an internal switchable PG pin in PrimeTime; the value of the other switch related DB attribute is ignored.

The switch_function attribute specifies the Boolean condition under which the cell switches off the controlled design partitions. It must refer to valid input signal pins of the cell. The pg_function attribute is used for the switch cell's internal and virtual power output pins to represent the propagated power level through the switch as a function of the input power or ground pin.

When either switch_function or pg_function attribute is missing for an internal_power or internal_ground PG pin of a fine-grain switch cell, the internal PG pin is not considered as an internal switchable PG pin during power analysis. There is no impact on timing analysis. This can result in overestimation of power consumption for the fine-grain switch cell, as PrimePower cannot not detect when a fine-grain switch cell is switched off.

What Next

Refer to Liberty modeling for fine-grain switch cell. Provide switch_function and pg_function definitions in the .lib file for the internal switchable PG pin of a macro switch cell.

DBPG-102

(error) The pin '%s' specified in '%s' as defined for switch_function of PG pin '%s' is not defined for library cell '%s'. The switch_function cannot be interpreted thus ignored.

Feedback

Description

The switch_function attribute specifies the Boolean condition under which the cell switches off the controlled design partitions. It must refer to valid input signal pins of the cell.

If the switch_function attribute cannot be interpreted, the internal PG pin is not considered as an internal switchable PG pin during power analysis. There is no impact on timing analysis. This can result in overestimation of power consumption for the fine-grain switch cell, as PrimePower cannot detect when a fine-grain switch cell is switched off.

What Next

Refer to Liberty modeling for fine-grain switch cell. Provide a correct specification for the switch_function attribute in the .lib file for the internal switchable PG pin of a macro switch cell.

DBPG-103

(error) Invalid specification '%s' for switch_function of PG pin '%s' for library cell '%s'. The switch_function is ignored.

Description

The specification for the switch_function is not a valid Boolean expression. The internal PG pin is not considered as an internal switchable PG pin during power analysis. There is no impact on timing analysis. This can result in overestimation of power consumption for the fine-grain switch cell, as PrimePower cannot detect when a fine-grain switch cell is switched off.

What Next

Check the Boolean expression for the switch_function.

Refer to Liberty modeling for fine-grain switch cell. Provide a correct specification for the switch_function attribute in the .lib file for the internal switchable PG pin of a macro switch cell.

DBPG-104

(error) Boolean expression exceeds length limit for switch_function of PG pin '%s' for library cell '%s'. The current length limit is 2048 characters. The switch_function is ignored.

Description

The current length limit for switch_function Boolean expression is 2048 characters.

The internal PG pin is not considered as an internal switchable PG pin during power analysis. There is no impact on timing analysis. This can result in overestimation of power

Feedback

consumption for the fine-grain switch cell, as PrimePower cannot detect when a fine-grain switch cell is switched off.

What Next

Check the Boolean expression for the switch_function. If needed, contact Synopsys Customer Support Center.

Refer to Liberty modeling for fine-grain switch cell. Provide a correct specification for the switch_function attribute in the .lib file for the internal switchable PG pin of a macro switch cell.

DBPG-105

(error) Unknown function operator '%c' in boolean expression '%s' for switch_function of PG pin '%s' for library cell '%s'. The switch_function is ignored.

Description

The operator used in the Boolean expression for switch_function is not supported. The following operators are allowed: (,), ~, &, |, ^, !.

The internal PG pin is not considered as an internal switchable PG pin during power analysis. There is no impact on timing analysis. This can result in overestimation of power consumption for the fine-grain switch cell, as PrimePower cannot detect when a fine-grain switch cell is switched off.

What Next

Check the Boolean expression for the switch_function.

Refer to Liberty modeling for fine-grain switch cell. Provide a correct specification for the switch_function attribute in the .lib file for the internal switchable PG pin of a macro switch cell.

DBPG-106

(error) Missing close bracket in Boolean expression '%s' for switch_function of PG pin '%s' for library cell '%s'. The switch_function is ignored.

Description

The close bracket (]) in the Boolean expression is missing for switch_function.

The internal PG pin is not considered as an internal switchable PG pin during power analysis. There is no impact on timing analysis. This can result in overestimation of power consumption for the fine-grain switch cell, as PrimePower cannot detect when a fine-grain switch cell is switched off.

Feedback

What Next

Check the Boolean expression for the switch_function.

Refer to Liberty modeling for fine-grain switch cell. Provide a correct specification for the switch_function attribute in the .lib file for the internal switchable PG pin of a macro switch cell.

DBPG-107

(warning) Unable to interpret '%s' as defined for pg_function of PG pin '%s' for library cell '%s'. The pg_function is ignored.

Description

The tool failed to interpret the specific pg_function as defined in the library. The pg_function attribute is used for the switch cell's internal and virtual power output pins to represent the propagated power level through the switch as a function of the input power or ground pin. To derive the switch input from the pg_function, PrimePower requires that the pg_function attribute resolves to only one valid external power or ground pin with matching pg_type. Multiple PG pins in pg_function is not supported.

If there is an unresolved pg_function, PrimePower assumes that the external supply is always on. The fine-grain switch cell can still be switched off internally by its control signal.

What Next

Check the expression for the pg_function.

Refer to Liberty modeling for fine-grain switch cell. Provide a correct specification for the switch_function attribute in the .lib file for the internal switchable PG pin of a macro switch cell.

DBPG-108

(warning) Attribute pg_function for internal PG pin '%s' has unmatched pg_type (library cell '%s'). The pg_function ('%s') is ignored.

Description

The pg_function attribute is used for the switch cell's internal and virtual power output pins to represent the propagated power level through the switch as a function of the input

Feedback

power or ground pin. PrimePower requires that the pg_type must be matched between internal PG pin and its related external PG pin:

- If internal PG has type of internal_power, the PG pin as specified in pg_function must have type of primary_power
- If internal PG has type of internal_ground, the PG pin as specified in pg_function must have type of primary_ground

If there is an unresolved pg_function, PrimePower assumes that the external supply is always on. The fine-grain switch cell can still be switched off internally by its control signal.

What Next

Check the expression for the pg_function.

Refer to Liberty modeling for fine-grain switch cell. Provide a correct specification for the switch_function attribute in the .lib file for the internal switchable PG pin of a macro switch cell.

DBPG-109

(warning) Control pin '%s' in muxed pg_function is not constant, pg_function is ignored.

Description

Control pin in muxed pg_function is always constant.Pg function is ignored , if control_pin in muxed pg_function is not constant.

What Next

Check the expression for the pg_function.

Refer to Liberty modeling for fine-grain switch cell. Provide a correct specification for the switch_function attribute in the .lib file for the internal switchable PG pin of a macro switch cell.

DBR

DBR-001

(error) Cannot read file '%s'.

Description

The file you specified either does not exist or you do not have read access to the file.

Feedback

What Next

Check the search_path or use the *file* command to verify the existence and other attributes of the file.

DBR-002

(information) Errors reading file '%s'.

Description

Errors occurred while reading the specified file.

What Next

Check previous messages, which indicate what went wrong and what action you can take to correct the problem. If there are no messages preceeding DBR-002, then the file is most likely corrupt.

DBR-003

(warning) Design '%s' (file '%s') is already registered. Remove the design before rereading.

Description

While reading a design from a file, that design/file combination was found in memory. This means that the file was read previously.

What Next

If the file has changed and you want to reread it, remove the design using the *remove_design* command, then reread the file.

DBR-004

(warning) Library '%s' (file '%s') is already registered.

Description

While reading a DB file, a library/file combination that is already in memory was found. This means that the file was read previously.

What Next

If the file has changed and you want to reread it, you can remove the library using the *remove_lib* command, then reread the file. However, in the process, if a linked design

references this library, that design will need to be unlinked and will need to be completely rebuilt.

DBR-005

(information) Design '%s' not loaded.

Description

While reading in a design, some inconsistencies were found, so the design was not loaded. It's likely that the db file has errors, such as multiple nets with the same name on a single design.

What Next

Check previous messages which will indicate what went wrong, and what action you can take to correct the problem. Usually, the application which created the db is the cause.

DBR-006

(error) Unknown pin '%s' makes instance '%s' of '%s' in design '%s' inconsistent with previous instances.

Description

While reading in a design, an instance of a design is inconsistent with previous instances because a pin is not found.

What Next

Make sure that the DB is valid.

DBR-007

(warning) Found unsupported LSI reference '%s' to '%s' in design '%s'. The linker will not be able to resolve this reference.

Description

While reading in a design, an instance of a design was found to be derived from an LSI netlist. This tool only supports fully name-based references from LSI netlists. Order-based or mixed order and name based references are not supported.

What Next

Use another Synopsys tool to read the DB, link it, and write it out to a new DB file. This will resolve the naming issue.

Feedback

DBR-008

(error) Cannot remove library '%s': %s%s%s

Description

The library contains objects which are being referenced. For example, some cells may used in the current design, or a wire load model may be in use. If a QTM model is being created, and it is referencing the library, then it must be saved before the library can be removed.

Each reason why the library cannot be removed is listed.

What Next

Remove the designs with the *remove_design* command before using *remove_lib*, since a design is the source of most library references. Other causes, like QTM model creation, may require other actions.

DBR-009

(warning) Found name-based LSI reference '%s' to '%s' in design '%s'. The linker might not be able to resolve this reference.

Description

While reading in a design, an instance of a design was found to be derived from an LSI netlist. The reference is fully name-based. However, even in the case of name-based references, the linker might not be able to resolve references. The LSI netlist allows unconnected pins to be omitted from the reference, so, for example, an FD1 with D, CP, and Q pins connected, would be represented with the QN pin missing. The linker will indicate that the reference has too few ports.

What Next

Use another Synopsys tool (like Design Compiler) to read the DB, link it, and write it out to a new DB file. This will resolve the missing pins issue.

DBR-010

(error) Cannot access temp directory '%s'%s.

Description

The read process utilizes a temporary directory to create transient files. These files are deleted when the read process completes. The name of the directory is found in the variable 'pt_tmp_dir'. In this case, the program was unable to create files in that directory.

Feedback

What Next

Verify that the specified directory exists, is writeable, and that the disk has some space available. If no space is available, try setting pt_tmp_dir to an alternate directory.

DBR-011

(error) Problem in read_%s: %s.

Description

The read process detected an error, which is detailed in the message. Some are intermediate file problems (see DBR-010); others are process related. For example, if the message indicates "invalid access", it means that the command is not being used correctly.

What Next

Action based on the message text.

DBR-012

(error) Cannot read design db files. A db file must be a library.

Description

Reading designs in the db format is not supported. Reading of db files is supported for libraries only.

What Next

Do not read files containing designs in db format. Use other supported formats for reading design files.

DBR-013

(error) read_min_max_lib can only merge libraries.

Description

The *read_min_max_lib* can only be used to read and merge two library DBs - one min library, and one max library.

What Next

Check the arguments provided to command read_min_max_lib.

Feedback

DBR-014

(error) multiple libraries in a single DB not supported.

Description

Command read_min_max_lib can only be used on a DB file which contains multiples libraries.

What Next

Check the arguments provided to command read_min_max_lib.

DBR-015

(warning) Ignoring degenerated cell '%s' from library '%s'.

Description

This message warns you that PrimeTime has found a degenerated cell in the library and is ignoring it.

What Next

Verify that this is what you intended.

DBR-016

(error) Cannot find port '%s' for cell '%s' in all libraries.

Description

You receive this message because PrimeTime has found the specified port in either the min or max condition library db file but not the other. The ports of the library cells in the min and max condition libraries must be identical.

What Next

Examine the min and max condition libraries and ensure that they contain the same set of library cells with the same ports.

DBR-017

(error) Cannot find %s '%s' in all libraries.

Feedback

Description

You receive this message because PrimeTime has found the specified cell in either the min or max condition library db file but not the other. The library cells in the min and max condition libraries must be identical.

What Next

Examine the min and max condition libraries and ensure that they contain the same set of library cells.

DBR-018

(error) %s value '%g' of operating condition '%s' is different from the nominal %s value '%g'.

Description

You receive this message if PrimeTime finds the specified operating condition value in either the min or max condition library db file and that value is different from the nominal value.

What Next

Ensure that all operating conditions in the min and max library db files are nominal.

DBR-019

(error) Cannot find operating condition '%s' in library '%s'.

Description

You receive this message because the operating condition you specified cannot be found in the specified library.

What Next

Use the *report_lib* command to list the operating conditions in the specified library. Then re-execute the command, using only the available operating conditions.

DBR-020

(information) Renamed scalar %s '%s' to '%s' in design '%s'.

Feedback

Description

While reading a Verilog file with PrimeTime's native Verilog reader, two net or port names were found to be in conflict, requiring one of the objects to be renamed. This can occur for one of two reasons: an ambiguous bus naming style or escaped names.

Given a bus_naming_style of "%s%d" and the following verilog port declarations:

```
output z1;
output [1:0] z;
```

the bus reference z[1] infers a port named z1. This conflicts with the scalar port z1, declared with the first output statement.

The second case can be shown with the following verilog wire declarations:

```
wire \\z[1];
wire [1:0] z;
```

Assuming the default bus_naming_style of "%s[%d]", the problem here is that bus reference z[1] infers a net named z[1], and so does the scalar declaration.

What Next

No action is required. This is an informational message.

DBR-021

(warning) Library file '%s' is already registered.

Description

You tried to read a library DB file which has already been loaded into memory.

What Next

If the file has changed and you want to reread it, you can remove the library using the *remove_lib* command, then reread the file. However, in the process, if a linked design references this library, that design will need to be unlinked and will need to be completely rebuilt. If you were using *read_min_max_lib*, then using the -force option will do all of this for you.

DBR-022

(error) Template %s is not the same in min and max libraries.

Description

The two libraries given to command read_min_max_lib contain a template of the same name but different content. Two templates must be the same to allow use of the cell

lookup tables from two libraries as one min-max table. This is both an implementation limitation and a feature to improve performance of delay calculation. Two templates are considered same if the variables and indices have same name and same order, same size of the array for each index, and each index value is the same.

What Next

Check the libraries provided to command read_min_max_lib. They should contain same templates. The easiest way to achieve this is to do textual difference on the two .lib files and make sure that the sections describing templates are absolutely the same (excluding blanks and formating). In case when the templates differ you will have to choose one of the sets of templates, put it into the other .lib file, and manually or using a script recalculate all cell delay tables in that library to conform to the new templates. Another way is to set options in the characterization tool that generates .lib files to use a fixed template for both libraries if such option is available.

DBR-023

(error) Duplicate reference port '%s/%s' in module %s ending at line %d in %s

Description

While reading a Verilog file with PrimeTime's native Verilog reader, an instance was found where a scalar port and a bus port in the terminal list are in conflict because of the bus_naming_style. For example:

BOX i0 (.DATA1(a), .D({c ,d}), .\\D[1] (b), .Z(z));

Here, the scalar port D[1] and the bus port D[1] are in conflict if the bus_naming_style is %s[%d]. If the bus_naming_style is %d(%d), there is no conflict. This is an error because renaming reference ports is unpredictable, and therefore, not supported.

What Next

Either change the bus_naming_style or investigate how such a conflict was introduced into your netlist.

DBR-024

(warning) Can't connect pin '%s' to net '%s' in design '%s': already connected to net '%s'

Description

An attempt was made to connect a pin to a net and the pin is already connected to a net. This is typically an error in the netlist, such as a duplicated connection. For example, this

Feedback

message would be generated when reading an EDIF file which has a construct similar to this:

```
(net d
      (joined
       (portRef d)
       (portRef D (instanceRef n1))
       (portRef D (instanceRef n1))
      )
     )
```

What Next

This is a warning indicating that the connection was ignored, so no specific action is necessary.

DBR-026

(error) Unable to create %s '%s' in design '%s'

Description

While reading in a design, an object (such as a port, cell, or net) could not be created. It's likely that the db file has errors, such as multiple nets with the same name on a single design. The object name and design name are given in the message. Such an error will cause the loading of the design to fail, although other designs in the file which do not exhibit problems will be loaded.

What Next

Usually, the application which created the db is the cause.

DBR-030

(error) Invalid global reference '%s' - %s in module ending at line %d in %s

Description

You receive this message if PrimeTime finds an invalid global reference while reading a Verilog file with PrimeTime's native Verilog reader. A global reference is a connection to a wire in another module. PrimeTime's native Verilog reader puts several restrictions on the use of global references. For a reference of the form *module.wire*, all of the following must be true:

- The module must exist in the file being read.
- The module must precede the module that is making the reference.
- The wire must exist in the module.
- The wire must be a logic constant.

Feedback

Any deviation from these rules generates this error message.

What Next

There is no other support for global signals. You must remove them from your netlist.

DBR-031

(error) Attribute '%s' cannot be imported: You defined it as %s; db defines it as '%s'.

Description

You receive this error message because while reading an attribute from db, there was a mismatch between the type (integer, string, etc.) that db defines for the attribute and the type that PrimeTime defines for the attribute. Usually, this is a user-defined attribute, defined with the *-import* option on *define_user_attribute*, and the types do not match.

What Next

Rerun PrimeTime and define the attribute correctly. You might need to use other Synopsys applications to determine the actual type of the attribute.

DBR-032

(information) Ignoring library cell '%s' which does not have any pins defined on it.

Description

This message indicates that while reading the library, PrimeTime detects that the named library cell does not have any pins defined on it. Library cells without pins are ignored and not loaded because they do not have any effect in the timing analysis.

What Next

There is no user actions required unless you think the indicated cell should have pins. If so, you need to go back to the original source of the library in order to fix it.

DBR-033

(warning) Found bad bus definition for '%s' - %s.

Description

This message indicates that while reading the DB file, PrimeTime detected that the named bus definition is wrong or not consistent. PrimeTime may not be able to properly link the design due to this problem.

Feedback

What Next

Normally, this indicates errors in the DB file. Please fix the bus definition in the DB file by going back to the source of the DB file and regenerate it from the tools originally created this DB file.

DBR-040

(error) Design '%s' was not found in '%s'

Description

You receive this message because *swap_cell* loaded the file you specified using the *-file* option, but did not find the specified design in the file. This error could be caused by a misspelling or typo in the design name or filename, or both; or by inadvertently specifying a file that does not contain the intended design.

What Next

Examine the file, verify that the intended design name is contained in the file, and note the spelling of the design name. Then re-execute *swap_cell* using the correct design and file names.

DBR-050

(warning) Number of state table inputs for %s/%s/%s (%d) exceeds %d.

Description

During the reading of a sequential cell from a DB library, an output pin was found with a state table for more than 16 inputs. This message warns you that the presence of this cell with its large state table will degrade read performance, because processing is exponential.

What Next

This is a warning message only. No action is required on your part.

DBR-051

(error) Too many table inputs for %s/%s/%s (%d). State table information ignored in this case.

Feedback

Description

During the reading of a sequential cell from a DB library, an output pin was found with a state table for more than 30 inputs. PrimeTime cannot load state table information for more than 30 inputs, and is ignoring this information.

What Next

Consult the Library Compiler documentation for alternatives to storing state tables.

DBR-060

(error) Can't set min library to %s.

Description

You receive this message if the min library you passed to *set_min_library* is invalid. For example, the min library you specified might have been the same as the max library, or it might have already been used as the max library in a *set_min_library* command. The max and min libraries must be different. The message text will indicate the condition.

What Next

Re-execute *set_min_library* and specify a valid min library.

DBR-061

(information) '%s' already has '%s' as its min library.

Description

The min library you passed to *set_min_library* has already been related to the max library using *set_min_library*.

What Next

If you intended to change the relationship of the max library to a different min library, check the spelling of the min library argument and re-execute the command if necessary.

DBR-062

(error) Cannot create max/min library cell relationship for '%s': %s.

Description

The *set_min_library* command found a library cell in the min library that matches the library cell in the max library. However, some aspect of the two library cells is different. For example, one might have more pins than the other; the pins might be in a different order;

Feedback

or the timing arcs might be different. The text of the message states the most serious difference. To create a max/min library cell relationship, both cells must have the same timing arcs and the same pins, with the same order and direction.

For cells where the max/min relationship fails, as in the current situation, the command uses a minimum condition delay calculation based on the max library. If even one of the library cell pairs matches and compares correctly, the *set_min_library* command continues executing and succeeds.

What Next

Decide if it is acceptable to not use this min library cell for your design. If you want to use this min library cell for your design, ensure it is consistent in the max and min libraries.

DBR-063

(Error) No match for %s/%s in library '%s'.

Description

The *set_min_library* command could not find a library cell in the min library that matches the specified library cell in the max library. Therefore, a max/min library cell relationship cannot be created for that cell.

For cells where the max/min relationship fails, as in the current situation, the command uses a minimum condition delay calculation based on the max library. If even one of the library cell pairs matches and compares correctly, the *set_min_library* command continues executing and succeeds.

What Next

Find out why there is no match for the specified cell. If this is not acceptable, fix and ensure that the max and min libraries are consistent.

DBR-064

(error) min library %s is in link path.

Description

The min library in the *set_min_library* command should not be in the link path; the max library should be in the link path.

What Next

Delete the min library from the link_path, and put the max library into the link_path.

Feedback

DBR-100

(information) Ignoring external links found in design '%s' (file '%s') because dbr_ignore_external_links is set to true.

Description

You receive this message if your design contains external links but the *dbr_ignore_external_links* variable is set to *true*. In this case, the application ignores the external links and instead searches for an object by name only in the libraries in the *link_path*.

External links are created by Design Compiler in certain situations when writing a DB file; for example, when there is a link from a design to a wire load model in a library. The external link records information about the library to which the wire load was linked. Operating conditions can also have external links created for them.

You would set the *dbr_ignore_external_links* variable to *true* if you wanted to use a different library in PrimeTime than was used in Design Compiler.

What Next

If you intended for the external links to be ignored, no action is required on your part. Otherwise, set the *dbr_ignore_external_links* variable to *false* and reexecute the application.

DBR-101

(warning) Pin '%s' is not found on library cell '%s'. Generated clock defined on this pin will not be created.

Description

While reading in a design, a generated clock definition has been found for a library cell, but the source pin of the generated clock does not exist on that library cell. Thus, the generated clock will not be created if this was the only source pin of the generated clock.

What Next

The Synopsys database format (.db) appears to be incorrect. Please recreate the database with the correct source pin name for the generated clock.

DBR-200

(warning) Cannot read DDC attribute %s for design %s.

Feedback

Description

The specified attribute could not be read for the given design. The attribute is ignored.

What Next

Modify the design in the tool that generated the DDC file so that it does not generate this attribute.

DBR-201

(warning) Unknown pin direction in DDC for pin %s

Description

The DDC file has a pin direction that PrimeTime does not recognize. It uses the internal direction for such pins.

What Next

Change the design so that the tool that generates the DDC file does not generate the bad pin direction.

DBR-202

(error) Scenario name %s supplied when no scenarios stored

Description

A *read_ddc* command was issued with a scenario name argument, but there were no scenarios stored in the DDC file.

What Next

Either re-generate the DDC rile with the scenario, re-issue the *read_ddc* command as *-netlist_only* to ignore all constraints, or re-issue the *read_ddc* command without the scenario to pick up the non-scenario constraints.

DBR-203

(error) Scenario name %s did not match an available scenario %s.

Description

A *read_ddc* command was issued with a scenario name that did not match any of the scenarios in the DDC file. A list of available scenarios is listed.

Feedback

What Next

Choose one of the available scenarios and re-issue the *read_ddc* command with the chosen scenario.

DBR-204

(error) File %s is not in DDC format.

Description

The *read_ddc* command was issued for the given file, but the file is not in DDC format.

What Next

Either remove the file from the *read_ddc* command, or generate the file as a DDC file.

DBR-205

(error) File %s has too old a version for PrimeTime to read.

Description

PrimeTime cannot read the given file because the DDC version number is too old.

What Next

Convert the DDC file to a new version. Simply read the file into a tool that can write DDC (such as DC), then write the file out again. The tool will write it out as a new version.

DBR-206

(Warning) The library has non-continuous base curves and can have a negative impact on PrimeTime's performance and memory.

Description

The base-curve ids for the CCS library that is used is not numbered continuously. For eg, the curve_y ids for the base curves in the library are (1, 2, 5, 6, 7 ..) instead of the recommended sequential ordering (1, 2, 3, 4, 5, ...). Such libraries can cause a negative impact on performance and memory of PrimeTime.

What Next

Use the latest version of Library Compiler to get a compatible version of the library.

Feedback

DBR-207

(error) Library %s does not have a complete set of trip-point thresholds.

Description

Delay and slew trip-point thresholds are critical library characterization information needed by delay calculation. One or more of the following trip-point thresholds is missing in this library

input_threshold_pct_rise input_threshold_pct_fall output_threshold_pct_rise output_threshold_pct_fall slew_lower_threshold_pct_rise slew_lower_threshold_pct_fall slew_upper_threshold_pct_rise slew_upper_threshold_pct_fall

What Next

Check with the library characterization team, add the trip-point thresholds in .lib, and recompile .db file.

DBR-209

(information) The *read_ddc* command no longer supports reading constraints.

Description

The *read_ddc* command reads only the netlist.

What Next

No action is required. This is an information.

DCM

DCM-100

(warning) Unable to load DCM library for '%s'. \n Using the default delay model as specified in the .db library.

Description

The program is unable to load the DCM library corresponding to the .db library as specified in the error message. This happens because of one of the following reasons:

```
* One or more of the following shell environment variables
          are not set or are incorrectly set:
                DCMRULEPATH (or CDCRULEPATH)
                DCMRULESPATH (or CDCRULESPATH)
```

```
                DCMTABLEPATH (or CDCTABLEPATH)
        * The DCM library does not exist in the location specified or
          it does not have the proper file permissions.
        * Your installation is not authorized for the
DCM-Delay-Calculation
          feature.
```

When this error is encountered, the program treats the library as a non-DCM library and derives the delay model as though it were a .db library.

What Next

The error messages preceding this one should make the exact cause of the problem clear. Make sure that the aforementioned shell environment variables are set correctly and the DCM library exists as specified with the correct file permissions. Make sure your Synopsys key file includes the DCM-Delay-Calculation license.

DCM-101

(error) Errors found during rule_init() - library '%s' will be unloaded.

Description

The PI function rule_init() of the Delay Calculation System (DCS) standard returned an error code. Typically, the DCS itself issues the diagnostic messages that display before this message. When this message is issued, the program cannot load the remaining DCM subrules and link the EXPOSE and EXTERNAL functions correctly.

What Next

Please contact the library provider or Synopsys if you encounter this message.

DCM-102

(warning) No DCM model for cell '%s' of library '%s'.

Description

This error message is issued when the DCM library returns a nonzero error status

What Next

Check the error messages issued by the DCM prior to this error message and correct any problems. Verify that you have matching versions of the DCM timing and auxilary cell libraries. Contact your library provider for more information.

Feedback

DCM-103

(error) Unable to load DCM EXPOSE function '%s' from the DCM library. This\n \tlibrary cannot be used by this program without the specified EXPOSE function.

Description

This message is issued when the program tries to load the specified DCM EXPOSE function from the specified DCM library and cannot locate a matching function. Because this EXPOSE function is considered critical for the proper calculation of delay values, this library cannot be used by this program for timing calculations.

What Next

Please contact your library provider for more information.

DCM-104

(error) The following feature of the DCL language is not (yet) \n \tsupported by this program: %s.

Description

The current implementation of the program does not fully support the specified feature of the Delay Calculation System (DCS) standard specification. This can result in this particular DCM library being unsuitable for use for delay calculations by this program.

What Next

You cannot use this DCM library for timing calculations until this restriction is removed. Please contact your library provider to see if a version of the library without the specific feature is available.

DCM-105

(error) Error while processing DCL external function '%s' - passed pin '%s' is\n \tnot part of the current timing arc.

Description

The DCL-PI standard defines a number of functions that request the netlist information from the timer application using the pin name rather than the pin pointer. The current implementation of the program supports this feature only as long as the referenced pin name is part of the timing arc currently under consideration. That is, you can substitute the external call with the equivalent byPin() call.

by the equivalent byPin() call.

Feedback

What Next

If you have access to the DCM library source, modify it such that the equivalent byPin() function is used instead of the named external function. Otherwise, please contact your library vendor. equivalent byPin() function is used instead of the named external function. Otherwise, please contact your library vendor.

DCM-106

(warning) The DCL-PI function '%s' returned a nonzero error code %d while\n \tprocessing the timing segment '%s'.

Description

This message appears when the program calls one of the CALCULATION functions as defined in the DCS standard specification and that function returns a bad error code. This typically indicates a problem in the DCM library itself.

What Next

If you have access to the DCL source code of the library, modify please contact your library provider.

DCM-107

(warning) Unsupported test type or edge propagation pair '%s' specified for\n \tthe arc '%s'. This arc will be ignored.

Description

This message is displayed when the program loads the timing arc and detects that test type or the edge propagation characteristics specified for this arc types and edge propagation pairs, please consult your documentation.

What Next

If you have access to the DCL source code of the library, change program. Otherwise, please contact your DCM library provider.

DCM-108

(warning) Internal timing pin '%s' of cell '%s' in library '%s' is\n \tnot defined in the corresponding .db library. Any timing arcs connecting to or from\n \tthis pin will be ignored.

Feedback

Description

This message is displayed when the program loads the timing arcs and detects that the DCM has requested the creation of a new timing point, but no of the library cell's pins, including the internal timing points, must be defined in the technology library .db file before they can be referenced in the DCM.

What Next

If you have access to the source code of the Synopsys technology library (.lib) corresponding with the DCM being loaded, you can add a new internal timing pin for the corresponding cell in the library. Note that current limitations of the Library Compiler product dictate that a "timing()" group must be present for each internal timing pin. However, when using the DCM library, all the each internal timing pin. However, when the DCM library is used, all the timing information comes from the DCM library and any timing data specified in the .db library is ignored.

DCM-109

(warning) %s '%s' is invalid. The valid values are '%s' and '%s'

Description

This message is displayed when an invalid version is set.

What Next

Change the version to one of the valid values and re-run the design.

DCM-110

(warning) DPCM expose dpcmAddWireLoadModel not supported in DPCL library. Therefore DB/custom wireload models are not supported.

Description

This message is displayed when the expose dpcmAddWireloadModel is not supported in the DPCM Procedural Interface.

What Next

Use DPCM wireloads. If db wireload has to be used support the expose in DPCM.

DCM-111

(warning) The design %s read in has wireload %s, which is not present in the current DPCM. Changing to default DPCM wireload %s.

Feedback

Description

You receive this warning message when the current wireload attached to the design is not present in one of the DPCM libraries.

What Next

Use a wireload that is in one of the DPCM libraries. To see a list of wireloads in the DPCM libraries, use the *report_lib* command.

DCM-112

(warning) The design %s read in has a DCPM wireload %s. Deleting the dpcm wireload.

Description

This message is displayed when the current wireload attached to the design is from a DPCM library and not db.

What Next

Use DB wireloads. List DB wireloads by doing report lib.

DCM-113

(information) Propagating clocks through cell '%s' instantiated from design '%s'.

Description

Generate ouput clocks for special cells such as DLL/DCM.

DCM-114

(information) The clock '%s' with period '%s' generated on pin '%s'.

Description

Generate a clock for ouptut pin of special cells such as DLL/DCM.

DCM-115

(information) Please check CLKFX_DIVIDE value: '%s'.

Description

CLKFX_DIVIDE value is not valid.

Feedback

DCM-116

(information) Please check CLKFX_MULTIPLY value: '%s'.

Description

CLKFX_MULTIPLY value is not valid.

DCM-117

(information) Please check CLKDV_DIVIDE value: '%s'.

Description

CLKDV_DIVIDE value is not valid.

DCM-118

(warning) During the polynomial reduction procedure, the '%s' variable is saturated from %f to %f.

Description

This warning message occurs when a boundary value instead of the original variable value is used for polynomial reduction.

What Next

A polynomial is reduced before final calculation if its parameters contain one of the following variables defined in the operating conditions: *temperature*, *parameter1*, *parameter2*, *parameter3*, *parameter4*, *parameter5*, *voltage*, *voltage1*, ..., *voltage99*.

If the variable value defined in the operating conditions is out of the boundary defined in the polynomial, then the closest boundary value for the variable will be used for polynomial reduction.

For example, if the *temperature* variable defined in the current operating condition is 20, while the range of the *temperature* in the polynomial is [25, 40], then 25 instead of 20 is used to reduce this polynomial.

DDB

DDB-1

(warning) Cell %s not added to design %s because a cell with that name already exists.

Feedback

DDB-2

(warning) Net %s not added to design %s because a net with that name already exists.

Description

A net with the specified name already exists.

What Next

Reissue the command with a new net name. Use the *report_net* command to find a list of all the nets currently present in the design.

DDB-3

(warning) Consistency problem: port %s is not owned by any design or reference.

Description

The specified port is not owned by any design.

What Next

Check the consistency of your design database.

DDB-4

(warning) Consistency problem: a pin is not owned by any cell.

Description

The specified pin is not owned by any design.

What Next

Check the consistency of your design database.

DDB-5

(warning) Consistency problem: cell %s is not owned by any design.

DDB-7

(warning) Consistency problem: net %s is not owned by any design.

Feedback

DDB-8

(warning) Consistency problem: a pin was found without a corresponding port.

DDB-9

(warning) Consistency problem: cell %s was found without a corresponding reference.

DDB-10

(warning) Consistency problem detected in design %s\n%s

DDB-11

(warning) Internal error\n%s

DDB-12

(warning) Removed duplicate cell '%s'.

DDB-13

(warning) The name of net '%s' in design '%s' can't be changed \n\ \tto the name of both ports '%s' and '%s' to which it's connected.

DDB-14

(warning) The net '%s' in design '%s' is connected to both \n \tports '%s' and '%s'.

Description

Two ports can only be connected to a net if they are inout ports or if they drive wired logic. Connecting two input ports to a net can limit the optimization that can be performed by Design Compiler on the net.

What Next

Disconnect one of the ports from the net using the *disconnect_net* command.

DDB-21

(error) Conflict between logic 0 and 1. Can't %s.

Feedback

Description

The two specified ports were set previously as logic 0 and 1. They might not have been directly set, but could have been implicitly set by a sequence of *set_equal* and *set_opposite* commands.

What Next

If the ports were directly set as logic 0 and 1, the next steps are as follows:

```
Use report_attributes commands on the two ports. They will have the
driven_by_logic_zero and driven_by_logic_one attributes set.

Remove one of these two attributes, one of which is incorrect,
using the remove_attribute command

Reissue the original command.
```

If the ports were implicitly set as logic 0 and 1 through a sequesce of *set_equal* and *set_opposite* commands, the next step is as follows:

```
Use the reset_design command to remove the setting of 0 and 1 on the
ports. this command removes all other constraints on the design and
 should
be used with caution.
```

DDB-22

(error) Can't set equal ports opposite in design '%s': '%s' '%s'.

Description

The two ports were set as equal ports previously. They might not have been directly set, but could have been implicitly set by a sequence of *set_equal* and *set_opposite* commands.

What Next

The two specified ports were set previously as equal ports. The only way to revert back this setting is to reset the design using the *reset_design* command. This command removes all other constraints on the design and should be used with caution.

DDB-23

(error) Can't set opposite ports equal in design '%s': '%s' '%s'.

Feedback

Description

The two ports were set as opposite ports previously. They might not have been directly set, but could have been implicitly set by a sequence of *set_equal* and *set_opposite* commands.

What Next

The two specified ports were previously set as opposite ports. The only way to revert back this setting is to reset the design using the *reset_design* command. This command removes all other constraints on the design and should be used with caution.

DDB-24

(warning) Overwriting design file '%s/%s'.

Description

Overwriting the specified version of the design with more recent version.

What Next

Warning only. No action is required.

DDB-27

(error) '%s' value must be positive.

Description

A negative value was entered. Constraint values must be positive (or 0).

What Next

Please enter a non-negative value.

DDB-28

(error) '%s' cannot be set on %s pin '%s'.

Description

The specified constraint cannot be set on a pin of the specified direction. The constraint command will be ignored.

What Next

Please enter a correct constraint command.

Feedback

DDB-29

(error) '%s' cannot be set on %s port '%s'.

Description

The specified constraint cannot be set on a port of the specified direction. The constraint command will be ignored.

What Next

Please enter a correct constraint command.

DDB-30

(error) Can't specify output port '%s' as a path startpoint.

Description

Output ports are not valid as path startpoints. There are no timing paths from such ports.

What Next

Examine the design to determine the correct startpoint for the path.

DDB-31

(error) Can't specify input port '%s' as a path endpoint.

Description

Input ports are not valid as path endpoints. There are no timing paths to such ports.

What Next

Examine the design to determine the correct endpoint for the path.

DDB-32

(error) Can't specify hierarchical cell '%s' as a path '%s'.

Description

Hierarchical cell names are not valid as path startpoints or endpoints.

What Next

Use a clock, port, pin (leaf or hierarchical), or cell (leaf only) as the path startpoint or endpoint.

Feedback

DDB-33

(error) Pin '%s' does not have a library hold time.

Description

None.

What Next

Check the target library.

DDB-34

(error) %s '%s' is in design '%s', but %s '%s' is in design '%s'.

Description

None.

What Next

None.

DDB-35

(error) '%s' does not exist in library '%s'.

Description

The listed key in the error message does not exist in the library.

What Next

Check the key file.

DDB-38

(error) Can't open security file '%s' for protected library '%s'.

Description

Cannot open security file.

What Next

Check the security file.

Feedback

DDB-39

(error) Bad security key in file '%s' for library '%s'.

Description

You are trying to invoked *read_lib* on a protected library.

What Next

If a nodelocked library, check and correct these attributes: key_file, key_seed, and key_bit. If a network licensing library, check and correct these attributes: key_feature, key_version, and key_seed. Then reinvode the *read_lib* command.

DDB-40

(error) Can't read protected library '%s'.

Description

You are trying to invoked *read_lib* on a protected library.

What Next

If a nodelocked library, check and correct these attributes: key_file, key_seed, and key_bit. If a network licensing library, check and correct these attributes: key_feature, key_version, and key_seed.

DDB-41

(error) Incomplete library protection attributes.

DDB-43

(warning) Could not create attribute '%s' for %s objects.

DDB-44

(error) Can't read unprotected library '%s'.

DDB-45

(error) A design with name '%s' already exists in the same\n \tdesign file as design '%s'.

Feedback

DDB-46

(error) A reference with name '%s' already exists in design '%s'.

DDB-47

(error) A cell with name '%s' already exists in design '%s'.

DDB-48

(warning) Creating port '%s' on design '%s' with direction unknown.

DDB-51

(warning) In the value of %s, \n \tthe characters separating the \tthose separating each

DDB-52

(error) The value of %s \n \tmust include one

DDB-53

(error) The value of %s \n \tmust include one

Description

The message is printed out when the current command found invalid value in the indicated variable.

What Next

Check the value of the given variable and provide the valid value.

DDB-54

(error) The value of %s \n \tmust include only one

Description

The error message is printed out when the current command found invalid value in the indicated variable.

What Next

Provide the valid value for this variable.

Feedback

DDB-55

(error) The value of %s \n \tmust include only one

Description

The error message is printed out when the current command found invalid value for the indicated variable name included in the message.

What Next

Provide the valid value for this variable.

DDB-56

(error) In the value of %s, \n \tthere are no characters separating %s.

Description

This error message is printed out when the current command found that there are no character separators.

What Next

Provide the valid value for the command.

DDB-57

(error) In the value of %s, \n \tthe %s of the characters separating \n \t%s must not be%s a digit.

Description

This error message is printed out when the current command found digit in the character separators.

What Next

Provide the valid value for the command.

DDB-58

(warning) In the value of %s, \n \tthere are no characters separating the \tbe ambiguous).

Description

If no characters separate the array name from the member number, the bus names will be ambiguous for arrays whose names end in a digit. For example, with *bus_naming_style*

set to "%s%d", the name of the third member of array "A1" and the thirteenth element of array "A" would both have the name "A13".

What Next

Most likely you should change the value of the bus naming style to contain some characters between the "%s" and "%d". See the help page for *bus_naming_style* for details.

DDB-60

(error) Could not find library pin for pin '%s'.

Description

The back-annotation failed because the pin does not have a corresponding pin in the link library.

What Next

Verify that the design is fully linked with the 'link' command. Verify that all link and target library search paths are valid.

DDB-66

(warning) Removing group '%s'.

Description

The path group is being removed because the operation being performed has removed the last path from the group.

What Next

Be aware that any subsequent attempts to use this path group will fail because the group has been deleted. If you think the group should not have been deleted, identify at least one path you think should still be in the group and trace back to find which action deleted that path.

DDB-67

(warning) Removing %s from group '%s'.

DDB-68

(warning) Removing external delay related to clock %s.

Feedback

Description

When a clock source is deleted from the design using the 'remove_clock' command, all input and output delay values that were specified relative to that clock are also deleted from the design. For example, consider the following script:

create_clock -name CLK -period 10 set_input_delay 2 -clock CLK all_inputs()
set_output_delay 2 -clock CLK all_outputs()

remove_clock CLK

The 'remove_clock' command will also have the effect of removing the input and output delay values that were specified relative to CLK.

What Next

No action is required, this is merely an informational warning.

DDB-70

(error) None of the selected cells were grouped.

Description

When using the 'group' command on an hdl design that has not been compiled yet, it is possible that the cells you specified to be grouped cannot be grouped because they need to stay with thier neighboors until the design has gone through resource sharing in compile.

What Next

Use the 'group' command after the design has been compiled.

DDB-71

(error) Design '%s' requires one of the following licenses: '%s'.

Description

The specified design is licensed and requires one of the listed licenses to be available. An error has occurred because none of the licenses could be obtained.

What Next

Verify that your site has at least one of the specified licenses. If it does not, then one must be purchased. If your site does have one of the licenses, try again when the license is available.

Feedback

DDB-72

(information) Added key list '%s' to design '%s'.

Description

Indicates that the listed set of licenses have been associated with the specified design. Accessing the design will require that one of the listed licenses can be successfully checked out.

What Next

No action is required since this is just an information message.

DDB-73

(warning) License '%s' contains the illegal character '%c'.\n\tIt was ignored.

Description

One of the licenses associated with a design contains an invalid character. That license will be dropped from the list of licenses which can be used to access the design.

What Next

If a design is associated with multiple licenses, it may be possible to access the design via a different, valid license. In any case the license name should be updated so that it does not contain any invalid characters. Invalid characters include: ',', '}', '{', '*', '\'.

DDB-74

(warning) Design '%s' inherited license information from design '%s'.

Description

All of the licenses associated with one design have now been associated with another design. This typically happens when a design is ungrouped. In that situation, the parent design will inherit all licensing information from the ungrouped design.

What Next

Although this is classified as a warning, it is essentially just an information message. No action is required.

DDB-75

(warning) Design '%s' is being converted to a limited design.

Feedback

Description

This message indicates that the indicated design has been converted into a limited design. A limited design is a design which can be compiled and analyzed, but whose contents may not be examined or written out.

A design gets converted into a limited design in two situations. In the first case you have only an evaluation license for the design (obtained by manually setting synlib_disable_limited_licenses = "FALSE"), and the design will remain limited because the intent of an evaluation license is for the design data to be restricted. In the second case the design was derived from a DesignWare part and has not yet been run through the *compile* command. In this latter case the design remains limited only until after it has been compiled, at which point the limitation is removed. The intent of this latter limitation is to protect the technology- independent structure of the design.

What Next

If you have only an evaluation license for the limited design, then the only way to gain access to the internals of that design is through the use of a full license for that part; if a full license is subsequently obtained then the first *compile* command will remove the 'limited design' restrictions. If the design has already been compiled, it is sufficient to run the *get_license* command to convert the limited design back to a regular, unrestricted format.

If you already have a full license for the limited design, then after the first *compile* command you can expect the design to be converted back to a regular, unrestricted format.

DDB-76

(error) Cannot load design '%s'.

Description

The named design cannot be loaded into Design Compiler's internal data structures. This can happen if certain synthetic parts cannot be found.

What Next

Attempt to link the design with the command *link -all*. If this fails, check that the software is correctly installed.

DDB-77

(error) License '%s' is a Synopsys internal key and should\n \tnot have a seed associated with it.

Feedback

Description

When license names are set on a design, third party keys must have a seed associated with them. It is an error, however, for Synopsys internal keys to have seeds.

What Next

When creating your own license names, make sure that they do not clash with the Synopsys internal license names.

DDB-78

(error) No seed provided for the third-party license '%s'.

Description

When adding a third-party license, you must specify both a license name and a non-zero seed. This prevents third party vendors from creating keys for each other's licenses.

What Next

Specify the license name as *name/seed*. For example: "MY_LIC/1234"

DDB-79

(error) The license '%s' has an invalid seed associated with it.

Description

This error occurs when the *set_design_license command* is used to store a third party license and a seed, and the seed that is specified is not consistent with the seed that was used to create the key.

What Next

Either generate a new key with the correct seed, or change the *set_design_license* command line so that the seeds are consistent.

DDB-80

(error) The seed '%s' specified for license '%s' is\n\tnot a valid 32-bit integer.

Description

Licenses can be specified in the from '<license>/<seed>' where <seed> is supposed to be a valid integer which can be represented in 32 bits. In this case the <seed> specified was either not an integer, or was too large to be represented in 32 bits.

Feedback

What Next

The <seed> associated with the license needs to be corrected such that it is a valid integer which can be stored in at most 32 bits.

DDB-81

(warning) Unable to find specified driving_cell for port '%s'.

Description

The driving_cell attributes indicate that a port should inherit its drive capability from a certain library cell. This error means that the tool was unable to locate a matching library cell or pin on that library cell. This may happen if the link_library does not contain the library for that cell, or if the cell name or pin name was incorrect. The driving cell information can be seen using *report_port -drive*. It may have been set by either *set_driving_cell* or *characterize*.

What Next

If the driving cell requires a library that has not been identified in the *link_library*, the *link_library* should be changed to include that library. Otherwise, check the information for errors in cell_name, library name, or pin names using *report_port -drive -only port_name.*

DDB-84

(error) Only ports of the same direction can be grouped.

DDB-85

(error) Objects must be either all ports or all nets.

Description

This error message is issued if a mixture of objects of different types is given as input to a command that requires a homogenous set of ports or nets as input.

What Next

Re-issue the command specifying only ports or only nets as input.

DDB-86

(error) Bus name '%s' conflicts with existing names.

Feedback

Description

This error message is issued when an attempt is made to create a bus with a name that conflicts with the name of an existing bus.

What Next

Re-issue the command with a non-conflicting name for the bus.

DDB-87

(error) All objects must be from the same design.

Description

This error message is issued if a command that requires a set of objects belonging to the same design is invoked with objects that belong to different designs.

What Next

Re-issue the command with a set of objects that belong to the same design.

DDB-88

(error) At least one of the port objects specified is already a member of a bus.

Description

This error message is displayed if an attempt is made to insert a port that belongs to a bus into a new bus.

What Next

Re-issue the command with ports that do not belong to an existing bus.

DDB-89

(error) Type name '%s' conflicts with existing type.

Description

This error message is issued if an attempt to create a type for a new bus object is made with a type name that is already used for another bus object with a different width.

What Next

Change the name of the new bus type.

Feedback

DDB-90

(error) specified range is different from number of objects to be bussed.

DDB-91

(error) only designs or references can have busses created in them.

DDB-92

(error) Cannot load design '%s' for an HDL embedded command.

Description

The named design cannot be loaded for the current command embedded in an HDL file. The current embedded command is not legal within an embedded script. See the HDL Compiler Manual for details.

What Next

Change the embedded script so that it does not use the offending command.

DDB-95

(warning) Unable to find net instance '%s' in design '%s'.

Description

Back-annotation, such as a set_load or set_resistance value, was stored on a net instance within the design, but that instance can no longer be found. This can occur if a lower-level design containing the net instance was modified but the top-level design was unaware of this change. Commands which could modify lower level designs include *ungroup*, *change_names*, and *compile*.

What Next

Perform *ungroup* and *change_names* at the top level so that the top level design will have a chance to update its back-annotation records. Use *characterize* to move annotation to a subdesign before running *compile* or *reoptimize_design* on that subdesign.

DDB-100

(warning) Unable to find minimum version of library cell '%s/%s' in library '%s'.

Feedback

Description

The *set_min_library* command has been used to indicate that timing data for minimum analysis must use a particular library, but this library cell cannot be found in that minimum library. Design Compiler will use the maximum version of the cell for both maximum and minimum analysis in this case.

What Next

Check that the *set_min_library* command specified the correct library for minimum analysis. See if the indicated library cell was accidentally left out of the minimum analysis library.

DDB-101

(warning) Unable to find minimum version of library pin '%s/%s' in library '%s'.

Description

The *set_min_library* command has been used to indicate that timing data for minimum analysis must use a particular library, but the indicated library cell has conflicting pin descriptions between the maximum and minimum libraries. In this case, a pin exists on the library cell in the maximum library, but that pin does not exist in the minimum library. Design Compiler will use the maximum version of the library pin for both maximum and minimum analysis in this case.

What Next

Check that the *set_min_library* command specified the correct library for minimum analysis. See if the indicated library pin was accidentally left out of the minimum analysis library.

DDB-102

(warning) Conflicting timing arc descriptions between maximum library '%s' and minimum library '%s' to pin '%s/%s'.

Description

The *set_min_library* command has been used to indicate that timing data for minimum analysis must use a particular library, but the indicated library cell has conflicting timing arc descriptions between the maximum and minimum libraries. In this case, a timing arc exists on the library cell in the maximum library, but a corresponding timing arc does not exist in the minimum library. Design Compiler will use the maximum version of the timing arc for both maximum and minimum analysis in this case.

In order to consider timing arcs as compatible between minimum and maximum libraries, they must have the same sense (for example, positive unate, or clear), they must have the same SDF condition, and there must be the same number of arcs of each type between a pair of pins.

What Next

Check that the *set_min_library* command specified the correct library for minimum analysis. See if timing arcs to the indicated library pin were accidentally left out of the minimum analysis library.

DDB-103

(warning) Pin %s of lib cell %s exists in maximum library %s but not in minimum library %s. Assuming min delay for pin to be same as max delay.

Description

The *set_min_library* command has been used to indicate that timing data for minimum analysis must use a particular library, but the indicated library cell has some pins in the max library which don't exist in the minimum libraries. Design Compiler will use the maximum version of the timing arc for both maximum and minimum analysis in this case.

In order to be compatible between minimum and maximum libraries, the library cells must have the same pins and same timing arcs (same sense (for example, positive unate, or clear), they must have the same SDF condition), and there must be the same number of arcs of each type between a pair of pins.

What Next

Check that the *set_min_library* command specified the correct library for minimum analysis. See if the specified pins of the specified library cell were accidentally left out of the minimum analysis library.

DDB-105

(warning) Design '%s' requires one of the following licenses: '%s'. \n\tWaiting for license to become available, press <ctrl>-C to terminate.

Description

The specified design is licensed and requires one of the listed licenses to be available. None of the licenses could be obtained. Design Compiler will wait for one of the licenses to become available and then continue.

Feedback

What Next

Verify that your site has at least one of the specified licenses. If it does not, then one must be purchased. If you wish to terminate the command instead of waiting for the license to become available, set synlib_wait_for_design_license = {}

DDB-107

(warning) Deleted or recreated %d internal pin(s) on cell '%s'. All attributes and attaches on it(them) are lost.

Description

The *access_internal_pins* variable controls creation and deletion of internal pins and user access to them. Because of the source of internal pins, they are created or deleted during link time, depending on the setting of this variable. You can use the *find* and *get_pins* commands to show internal pins, if such pins exist. Certain timing commands can also set constraints on internal pins.

What Next

If this is what you intended to do, no action is necessary.

See Also

- find
- get_pins
- link

DDC

DDC-1

(error) Unable to open DDC file '%s' for writing.

Description

dc_shell encountered an I/O error when it attempted to open the specified DDC file for writing.

What Next

Check that the file name is correct, that the directory exists and is writable, and that the filesystem is not full. If the target file already exists it must be writable in order for dc_shell to overwrite it.

Feedback

DDC-2

(error) Unable to open file '%s' for reading.

Description

The tool encountered an error when it attempted to open the specified DDC file for reading.

What Next

Check that the path to the file is correct and that the file is readable by the current user. Also verify that the file was written in DDC format.

DDC-3

(error) DDC internal write error in design '%s'.

Description

dc_shell encountered an internal error while attempting to write the specified design. No DDC file was produced.

What Next

Please contact the Synopsys Support Center for assistance.

DDC-4

(error) DDC internal read error in file '%s'.

Description

dc_shell encountered an internal error while attempting to read the specified file. No designs were read.

What Next

Please contact the Synopsys Support Center for assistance.

DDC-5

(error) Design data is corrupt in DDC file.

Description

The file being read has been modified or corrupted since it was originally written by *dc_shell*.

Feedback

What Next

The DDC file must be re-created from the original design source. Note that DDC files cannot be edited by the user.

DDC-6

(error) DDC file version is not compatible. The DDC file was written with\n dc_shell version %s dated %s.

Description

The file being read was written with an incompatible version of of the .ddc format that cannot be read with this release of the tool. The .ddc format is updated from time to time to support new features or functionality, and sometimes the new format cannot be read with older tool versions.

What Next

Use the current version of the tool to read the .ddc file.

DDC-7

(error) File is not in DDC format.

Description

dc_shell has determined that the file being read is not a DDC format file.

What Next

Verify that the correct format option has been provided to the read_file command, and that the file path is correct.

DDC-8

(error) Attempt to write duplicate design name '%s' to DDC file.

Description

dc_shell detected an attempt to write multiple designs with the same name to a DDC file, which is not allowed by the DDC format.

What Next

Check the list of designs provided to the write command. It is possible, although unusual, for duplicate design names to have been read from different files, such as multiple .db

files. If the duplicate design names must be preserved, they must be written to separate DDC files.

DDC-9

(warning) The DDC format cannot be used to store physical data. Any physical\n information that is present will not be written to the DDC file.

Description

You receive this warning message when you write out a DDC file that contains physical data. The DDC file format is not capable of representing physical data. Only the logical representation will be written to the DDC file.

What Next

It is considered best practice to use the Milkyway storage format for designs that contain physical information. You can use the *write_milkyway* command to write the design to a Milkyway database.

DDC-10

(error) Scenario '%s' does not exist.

Description

The specified scenario, which was provided with the -scenarios option to the *write* command, does not exist.

What Next

Check that the scenario name is correct, and that any scenarios which are to be written to the DDC file have been created.

See Also

- create_scenario

DDC-11

(error) DDC file contains packed command syntax that cannot be processed by\n this version of dc_shell. Please use a current version of dc_shell\n to read this file.

Feedback

Description

The current DDC file contains embedded commands (constraints) which were written by a newer version of *dc_shell* and utilize a syntax which cannot be parsed by the current executable.

What Next

Use the same (or newer) version of *dc_shell* to read the file as was used to write it.

See Also

- read_file

DDC-12

(warning) DDC file was written with a newer version of dc_shell.\n Some embedded commands may be ignored.

Description

You are trying to read a DDC file which was written by a newer version of *dc_shell*, and the DDC file contains some packed commands (constraints) which are not recognized by the older version of *dc_shell*. Normally this would result in a DDC-6 error; however, if the variable ddc_allow_unknown_packed_commands is set to "true" then *dc_shell* will attempt to read the file, but any unrecognized packed commands will be ignored. (A DDC-13 warning message will be printed when each such command is first encountered.)

What Next

To avoid losing potentially important information, always read the DDC file with the same (or newer) version of *dc_shell* as was used to write it.

See Also

- DDC-13
- read_file

DDC-13

(warning) Ignoring unknown packed command #%d: %s

Description

dc_shell attempted to unpack an embedded command which it does not recognize. This can happen when a DDC (or Milkyway) file which was written with a newer version of *dc_shell* is read with an older version of the product, while the variable

Feedback

ddc_allow_unknown_packed_commands is set to "true". The unrecognized command is simply discarded.

What Next

To avoid losing potentially important information, always read the DDC file with the same (or newer) version of *dc_shell* as was used to write it.

DDC-14

(information) This file contains data for the following %d scenarios:\n %s

Description

The DDC or Milkyway reader prints this message if the file being read contains any scenario-specific constraint data. The message will report the name of each scenario for which the file contains data. If the scenario was inactive when the file was written, an asterisk (*) appears after the scenario name.

What Next

This is an informational message. No action is required.

See Also

- read_file
- read_milkyway
- create_scenario
- current_scenario

DDC-15

(warning) Ignoring %s attribute %s on %s object(s):\n Attribute type conflicts with existing attributes.

Description

An attribute contained in the DDC file conflicts in type with with an attribute that is already registered with the tool. The conflicting attribute is ignored by the DDC reader.

An attribute saved in a DDC file must have the same type as an existing attribute of the same name on the same netlist object class (e.g., string attribute on design objects).

This message is most likely seen when reading in DDC files written by the X-2005.09 release or earlier. Attribute conflicts from more-recent files are silently discarded.

Feedback

What Next

This message could appear if there happens to be a user-defined attribute that has the same name (but different type) as a built-in attribute that was added in a later version of the tool. It is good practice to use a prefix for user-defined attributes, such as your company's name, that is unlikely to be used by Synopsys in the future.

See Also

- report_attribute

DDC-16

(error) ddc file contains no scenario-specific data. Cannot specify\n -scenarios option for this file.

Description

The *-scenarios* option to the *read_file* command can only be used to read files that contain scenario-specific constraint data.

What Next

See *read_file*(2) for more information on controlling which scenarios' constraints are read from the ddc file.

See Also

- read_file
- read_ddc

DDC-17

(error) ddc file contains no data for any of the requested scenarios

Description

The specified ddc file does not contain any constraint data for any of the scenarios specified to the *-scenarios* option to the *read_file* command.

What Next

Check the list of scenario names supplied to the *read_file -scenarios* option. See *read_file*(2) for more information on controlling which scenarios' constraints are read from the ddc file.

Feedback

See Also

- read_file
- read_ddc

DDC-18

(error) DDC file contains no data for any of the requested active scenarios

Description

The specified ddc file does not contain any constraint data for any of the scenarios specified to the *-active_scenarios* option to the *read_file* command.

What Next

Check the list of scenario names supplied to the *read_file -active_scenarios* option. See *read_file*(2) for more information on controlling which scenarios' constraints are read from the ddc file.

See Also

- read_file
- read_ddc

DDC-19

(warning) ddc file contains no data for the following requested scenarios:\n %s

Description

The specified ddc file does not contain any constraint data for one or more of the scenarios specified to the *-scenarios* option to the *read_file* command. The file will be read and the list of scenarios to be read in will be restricted according to the remaining scenarios specified to the *-scenarios* option.

What Next

Check the list of scenario names supplied to the *read_file -scenarios* option. See *read_file*(2) for more information on controlling which scenarios' constraints are read from the ddc file.

See Also

- read_file
- read_ddc

Feedback

DDC-20

(warning) This .ddc file contains special features and may only be read by\n\t tools that support the required features.

Description

This warning message occurs when you write a .ddc file that is "feature locked." It is a reminder that the tool that is writing the file has flagged the file as requiring specific features in order for it to be read, and the file might not be readable by other tools or by the same tool if the required features have not been enabled.

What Next

This is only a warning message. No action is required.

See Also

- DDC-21

DDC-21

(error) The feature used to generate this .ddc file is not supported by\n\t this tool or is not enabled in the current session.

Description

This error message occurs when you attempt to read a .ddc file that was "feature locked" by the tool that wrote it. The current session does not have, or has not enabled the specific features required to read the file. This usually happens when *dc_shell* writes the file when it is in a special mode and the resulting files cannot be read by all tools that consume the .ddc format.

What Next

Review any other messages that were printed to understand which tool and features are required to read the file.

Feedback

DDC-22

(error) Cannot read design '%s' as a block abstraction because the file does not contain block abstraction information.

Description

This error occurs when the *set_top_implementation_options* command has been run to specify that the design be read as a block abstraction, but no block abstraction information was saved in the .ddc file.

What Next

Make sure you run the *create_block_abstraction* command immediately before writing the .ddc file. Also, verify that the correct design name is specified by the *set_top_implementation_options* command.

See Also

- read_ddc
- read_file

DDC-23

(error) Cannot read design '%s' as a block abstraction because the specified interface features are not present in the file.

Description

This error occurs when the *set_top_implementation_options -load_logic compact_interface* command is used to specify that the named design be read as a block abstraction with a compact_interface, but the block abstraction has been generated with an older version of the tool that does not support the annotation of compact_interface logic.

What Next

Regenerate the block abstraction with the latest version of the tool in order to obtain support for compact_interface markings. Alternatively, the block abstraction can be loaded as a block abstraction with a full_interface.

See Also

- read_ddc
- read_file

Feedback

DDC-24

(error) Output file %s is the source file for the block abstraction.

Description

This error occurs when the specified output file is the source .ddc file for the block abstraction that is being written out. Design Compiler does not allow you to overwrite the original .ddc file because each design's core (non-interface) logic is retrieved from that file and merged with the block abstraction's interface logic in order to write out the complete netlist for the design.

What Next

Specify an output file that is not the source of any block abstractions that are currently in memory.

DDC-25

(error) Block abstraction source file %s appears to have been modified since the design was read.

Description

This error occurs when the design that is being written out is a block abstraction and the .ddc file that it was originally read from has since been modified. The .ddc files containing block abstractions must not be modified until after their blocks have been written back out because the core (non-interface) logic is retrieved from the original files.

What Next

Do not modify the source files for block abstractions if the designs are still being used.

DDC-26

(error) Cannot open block abstraction source file %s.

Description

This error occurs when the design that is being written out is a block abstraction and the .ddc file that it was originally read from cannot be opened. The file might have been deleted or renamed, or there might be a permissions problem. The .ddc files containing block abstractions must remain available until their blocks have been written back out because the core (non-interface) logic is retrieved from the original files.

Feedback

What Next

Make sure the original .ddc files remain available as long as the block abstractions are being used.

DDC-27

(information) Reading %s block abstraction for design '%s' and its hierarchy.

Description

This message occurs when the specified design hierarchy is being loaded as a block abstraction. Only the specified type of interface logic (full or compact interface) is being loaded, not the entire design netlist. This behavior is controlled by the *set_top_implementation_options* command.

What Next

This is an informational message. No action is required.

DDC-28

(error) Block abstraction interface logic has been modified in an unsupported manner. Cannot write .ddc file.

Description

This message occurs when the interface logic of a block abstraction has been modified in a way that the *write_file* command does not expect. This prevents the merging of the interface logic in memory with the core logic from the original .ddc file. This could be caused by manual modifications you have made to the netlist.

What Next

Do not make manual modifications to block abstractions. Any such changes should be made prior to running the *create_block_abstraction* command.

DDC-29

(error) You must specify the output file name when writing a block abstraction.

Description

This message occurs if you are writing a block abstraction to a .ddc file and you have not specified the *-output* option with the *write_file* command. In this case, "block abstraction" refers to either the full design that has been processed by the

create_block_abstraction command or the block abstraction (interface logic only) as specified by the *set_top_implementation_options* command.

Specifying the *-output* option causes Design Compiler to write all designs to a single file, which is required for block abstraction hierarchies.

What Next

Specify an output file when writing block abstractions to .ddc files.

DDC-30

(warning) Forcing the -hierarchy option because a block abstraction is being written.

Description

This message occurs if you are writing a block abstraction to a .ddc file and you have not specified the *-hierarchy* option with the *write_file* command. In this case, "block abstraction" refers to either the full design that has been processed by the *create_block_abstraction* command or the block abstraction (interface logic only) as specified by the *set_top_implementation_options* command.

Design Compiler requires that block abstractions be written hierarchically, starting from the top design of the block abstraction. Therefore, the *-hierarchy* option is inferred if it has not been explicitly specified.

What Next

Specify the *-hierarchy* option when writing block abstractions to .ddc files.

DDC-31

(error) You must specify only the top design of the block abstraction hierarchy.

Description

This message occurs if you are writing a block abstraction to a .ddc file and you have specified more than one design name with the *write_file* command or the specified design is not the top design of the block abstraction hierarchy. In this case, "block abstraction" refers to either the full design that has been processed by the *create_block_abstraction* command or the block abstraction (interface logic only) as specified by the *set_top_implementation_options* command.

A block abstraction's entire hierarchy must be written to a single .ddc file. The only design name that can be specified with the *write_file* command is the top design of the block abstraction. However, the design name can be omitted if that design is the current design. The *-hierarchy* and *-output* options are mandatory when writing block abstractions.

Feedback

What Next

Specify only the top design of the block abstraction when writing .ddc files.

DDC-32

(information) Merging block abstraction with non-interface netlist data from %s.

Description

This message occurs when writing out a design that was loaded as a block abstraction as specified by the *set_top_implementation_options* command. Since the block abstraction's interface logic might have been modified after it was loaded into memory, the interface logic in memory is merged with the core (non-interface) logic from the original .ddc file, and a new .ddc file is written out.

What Next

This is an informational message. No action is required.

DDC-33

(information) Block abstraction information will not be preserved. If this\n information is required, you must run the create_block_abstraction\n command prior to writing the design.

Description

This message occurs when you read a .ddc file that contains block abstraction information that was created by the *create_block_abstraction* command. If the *set_top_implementation_options* command was not used to tell Design Compiler to read the file as a block abstraction (to read the interface logic only), then the design is read in its entirety. This message is a reminder that the block abstraction information is not automatically preserved if the design is written to a new .ddc file. If you want to preserve the block abstraction's information in a new file, you must run the *create_block_abstraction command immediately before writing it out.*

What Next

This is an informational message. No action is required.

DDC-34

(error) Cannot write IC Compiler block abstraction %s in ddc format.

Feedback

Description

This message occurs when you attempt to write a block abstraction that was created by IC Compiler to a .ddc file. Only block abstractions created by Design Compiler can be written in the ddc format.

DDC-35

(error) Reading of ILM designs is no longer supported. Cannot read %s.

Description

This message occurs when you try to read ILM designs in ddc format. ILM designs are no longer supported for use in Design Compiler.

What Next

Migrate to the use of block abstractions instead of ILMs for loading the blocks at the top level.

DEFR

DEFR-001

(error) Cannot find def file %s.

Description

The def file specified to the set_eco_options command cannot be read.

What Next

Check the existence of the def file provided to the set_eco_options in the search_path using the *which* command.

DEFR-002

(error) read def '%s' failed.

Description

read def file failed.

What Next

Check the logfile file provided to the set_eco_options for def file syntax and content related errors.

Feedback

DEFR-004

(error) Cannot find %s '%s' at lineNumber %d.

Description

The specified object cannot be found in the verilog netlist.

What Next

Check that the specified object exists in the design, if it is a design object. Or check that the specified object exists in the library, if it is a library or technology object.

DEFR-017

(warning) Skipping unplaced component '%s' at lineNumber %d.

Description

The specified component is skipped because it has no placement information.

What Next

Check the component in the def file for FIXED, COVER or PLACED placement keywords.

DEFR-050

(error) Reference cell %s of instance %s has invalid size. It's width is %d and height is %d at lineNumber %d.

Description

This error comes when the reference cell to which the def instance is bound to has invalid coordinates.

What Next

Check the reference cell definition in the LEF files provided to set_eco_options command. Usually this definition can be found in the standard cell LEF or the block LEF file. Ensure the existance and correctness of the reference cell width and height coordinates.

DEFR-051

(warning) Instance '%s' extends outside the core area of physical block %s at lineNumber %d.

Feedback

Description

The specified component is not fully contained inside the core area of the physical block it lies in. Any physical constraint that is applicable to the region that lies outside the core area of the physical block will be ignored.

What Next

Check the component bounding box and the physical block bounding box coordinates in the def file provided to the set_eco_options for correctness.

DEFR-052

(warning) Instance '%s' not found in the logical netlist at lineNumber %d.

Description

The specified component cannot be found in the verilog netlist files provided. This component will be skipped.

What Next

Check the verilog netlist files and the def file provided to the set_eco_option. Ensure logical netlist is consistent with the physical information.

DEFR-053

(warning) Physical binding of instance '%s' with reference cell is not consistent with logical binding. Physical reference cell is '%s' while the logical reference cell is '%s' at lineNumber %d.

Description

The specified component is bound to a different reference cell in the physical and logical netlist. The physical binding for this component will be honored while processing the physical information.

What Next

Check the logical and the physical bindings for this component.

DEFR-054

(error) No LEF Macro cell named %s found for instance '%s' in design %s at lineNumber %d.

Feedback

Description

The specified component is not bound to any LEF Macro. The tool will error out.

What Next

Check the list of LEF files provided to set_eco_options command. The LEF file containing this component's macro cell definition maybe missing.

DEFR-055

(error) Instance '%s' is a HALO. However it has invalid coordinates (%d %d %d %d) at lineNumber %d.

Description

The specified component is HALO with invalid coordinates provided to create the HALO blockage.

What Next

Check the HALO definition in the def file provided to the set_eco_options command for correctness.

DEFR-056

(error) Invalid ROW '%s' detected at lineNumber %d.

Description

The specified ROW is invalid.

What Next

Check SITE sitename definitions in the LEF files provided to the set_eco_options. A matching sitename to this ROW name must exist. If it exists, ensure the matching SITE sitename in the LEF has valid width and height specified.

DEFR-057

(warning) Cannot create rectangles from polygon shapes for MACRO instance '%s' defined at lineNumber %d.

Description

The specified component is MACRO cell with polygon shapes. However the polygon shapes inhibit creation of smaller rectangular shapes. This maybe because some or all coordinates of the polygon shape are invalid, non orthogonal or have odd numbere of

intersecting edges. Incase the polygon has intersecting edges, an even number of edges is required to faciliate creation of smaller rectangles from it. The polygon shapes for this MACRO will be ignored and the rectangular shape from the LEF file for this MACRO will be used instead.

What Next

Check the component's polygon shape in the def file provided to the set_eco_options for correctness.

DEFR-058

(Information) Instance '%s' is a MACRO cell with placement obstructions at lineNumber %d.

Description

The specified component is MACRO cell with placement obstructions specified in the LEF file.

DEFR-059

(warning) NAMECASESENSITIVE statement detected with value %d.

Description

The NAMECASESENSITIVE statement's valid value is 0. This NAMECASESENSITIVE will be skipped.

What Next

Check the def file provided to the set_eco_options for correctness of the NAMECASESENSITIVE statement.

DEFR-060

(error) No Metal Layer of TYPE ROUTING defined by LAYER layerName statement in any LEF file.

Description

There are no Metal Layers of TYPE ROUTING defined in any LEF file provided. Metal routing layer information is mandatorily needed to create valid physical information for vias.

Feedback

What Next

Check the LEF files provided to the set_eco_options command for for Metal Layer definitions of TYPE ROUTING. These definitions are usually present in the technology LEF file. Ensure the technology LEF file is provided in your search_path using the *which* command. Additionally ensure it contains some Metal ROUTING layer definitions.

DEFR-061

(warning) Via definition '%s' has invalid number of layers '%d' specified at lineNumber %d.

Description

The via definition specified has invalid number of layers specified. The number of layers specified for each via definition must be greater than or equal to 3. Skipping this via definition.

What Next

Check the DEF file provided to the set_eco_options command for for via definition for correctness.

DEFR-062

(warning) Via definition '%s' has invalid top '%s' or bottom metal '%s' layer specified at lineNumber %d.

Description

The via definition specified has invalid metal layers specified. Each via definition must have a valid top and bottom metal layer. This via definition will be skipped.

What Next

Check the DEF file provided to the set_eco_options command for for layers specified in the via definition for correctness.

DEFR-063

(warning) Placement blockage associated with component '%s' is not supported at lineNumber %d.

Description

The placement blockage is associated with the specified component cell. Component specific placement blockages are not supported. This placement blockage will be ignored.

Feedback

What Next

Component specific placement blockages are specified using the +COMPONENT component_name syntax in the DEF file provided to the set_eco_options.

DEFR-064

(warning) Port '%s' is specified with invalid geometry (%s %s %s %s) at lineNumber %d.

Description

The pin geometry is specified in microns in the (xl yb xr yt) format. The specified pin definition has invalid geometry. Skipping this pin.

What Next

Check the pin placement geometry specified in the DEF file provided to the set_eco_optins for correctness.

DEFR-065

(error) Invalid ROW '%s' detected at lineNumber %d.

Description

The specified ROW is invalid.

What Next

Check SITE sitename definitions in the LEF files provided to the set_eco_options. A matching sitename to this ROW name must exist. If it exists, ensure the matching SITE sitename in the LEF has valid width and height specified.

DEFR-066

(warning) Duplicate ROW '%s' definition detected at lineNumber %d.

Description

The specified ROW is duplicate. This ROW definition will be skipped.

What Next

Check the ROW definitions in the DEF files provided to the set_eco_options for duplicate entries.

Feedback

DEFR-067

(warning) Ignoring net %s as it is (USE : %s) at lineNumber %d.

Description

The specified net is not a signal net. No Physical ECO is permitted on this net. This net will be skipped.

What Next

Check the +USE <type> for this net in the DEF files provided to the set_eco_options. Physically aware ECO commands only work on + USE SIGNAL nets.

DEFR-068

(warning) Identified FIXED cell %s at lineNumber %d. Sizing is disabled for this cell.

Description

The specified component has its DEF placement marked FIXED. Sizing is disabled for this cell.

What Next

Check the + FIXED placement attribute for this component in the DEF files provided to the set_eco_options. Physically aware ECO commands only work on + PLACED components.

DEFR-069

(warning) Identified +COVER cell %s at lineNumber %d. Sizing is disabled for this cell.

Description

The specified component has its DEF placement marked COVER. Sizing is disabled for this cell.

What Next

Check the + COVER placement attribute for this component in the DEF files provided to the set_eco_options. Physically aware ECO commands only work on + PLACED components.

DEFR-070

(warning) Treating filler cell %s as occupied_site as it is marked FIXED at lineNumber %d.

Feedback

Description

The specified component is marked FIXED in the DEF file provided to set_eco_options. This instance of LEF filler cell macro will not be treated as open_site by physically aware ECO commands.

What Next

Check the + FIXED placement attribute for this component in the DEF files provided to the set_eco_options. Only + PLACED components that are instances of LEF filler cell macros will be treated as open_site by physically aware ECO commands when eco_allow_filler_cells_as_open_sites is set to true. This variable's default value is true.

DEFR-071

(warning) Treating filler cell %s as occupied_site as it is marked COVER at lineNumber %d.

Description

The specified component is marked COVER in the DEF file provided to set_eco_options. This instance of LEF filler cell macro will not be treated as open_site by physically aware ECO commands.

What Next

Check the + COVER placement attribute for this component in the DEF files provided to the set_eco_options. Only + PLACED components that are instances of LEF filler cell macros will be treated as open_site by physically aware ECO commands when eco_allow_filler_cells_as_open_sites is set to true. This variable's default value is true.

DEFR-072

(warning) DEF Port %s has POLYGON shape at lineNumber %d.

Description

The specified PORT has POLYGON shape in DEF file provided to set_eco_options. Polygon shapes are not supported for DEF port pins. This port will be ignored and no physical ECO is supported for paths to and from this port.

What Next

Check the PINS section in the DEF file provided to set_eco_options for this port's definition for POLYGON shape. Only ports with RECT shapes are currently supported by physically aware ECO commands.

Feedback

DEFR-073

(warning) DEF Port %s is marked SPECIAL at lineNumber %d.

Description

The specified PORT is marked as a special pin in the DEF file provided to set_eco_options. Regular routers do not route to special pins. The special router routes special wiring to special pins. This port will be ignored and no physical ECO is supported for paths to and from this port.

What Next

Check the PINS section in the DEF file provided to set_eco_options for this port's definition for SPECIAL routing. Only ports routed by regular routers are supported by physically aware ECO commands.

DEFR-074

(warning) Cell %s is inside a placement blockage or is marked FIXED or COVER.

Description

The specified cell lies either inside a placement blockage or is marked FIXED or COVER in the DEF file provided to set_eco_options. As a consequence physically aware ECO commands will not size this cell. Sizing is only permitted on cells that lie outside of placement blockages and are marked PLACED. If buffer insertion is an available ECO fixing method provided, the portion of the net connected to this cell that does not lie in a physical blockage can be leveraged for buffer insertion to fix violations.

What Next

Check the COMPONENT section in the DEF file provided to set_eco_options for this cell's placement specification for FIXED or COVER. Incase the placement specification is PLACED, then check if this cell lies in a placement blockage.

DEFR-075

(warning) Could not find the via cell %s used by net %s.

Description

The specified via cell's definition not exist in any LEF file provided to the set_eco_options. This net cannot be traced to all sink pins routed through this via cell. As a consequence if there a timing/ DRC violation on one or more of those sink pins, physically aware ECO commands cannot deploy buffer insertion as a fixing methodology to fix those violations. Sizing can still be used to fix violations on such pins. This via cell will be ignored.

Feedback

What Next

Check the via cell definition in the LEF files provided to set_eco_options for correctness.

DEFR-076

(warning) Ignoring + HALO 0 0 0 0 for component %s as it does not enclose a region inside this component at lineNumber %d.

Description

The specified component has a hard HALO 0 0 0 0 defined on it in the DEF file provided to the set_eco_options. This HALO specification is invalid as it does not enclose any region inside the component. This HALO will be ignored.

What Next

Check the HALO specification for this component in the DEF file provided to set_eco_options for correctness. Only hard HALOs that specify a valid region inside the component are considered HALOs by physically aware ECO commands. No placement blockage will be created for this HALO specification.

DEFR-077

(warning) Identified physical only PORT '%s' at lineNumber %d.

Description

The specified PORT pin cannot be found in the verilog netlist. This PORT will be ignored.

What Next

Check that the specified PORT exists in the design, if it is a design object. Or check that the specified object exists in the library, if it is a library or technology object. Incase this a valid physical only PORT pin, this PORT pin will be ignored. No paths to or from this PORT can be traced in the design. Physically aware ECO commands only work on PORTS and paths to and from PORTS that are preesent both in the verilog netlist and in the physical LEF/DEF files provided to the set_eco_options.

DEFR-078

(warning) Net '%s' has no parasitic nodes with location. add_buffer_on_route to fix setup violations is disabled for this net.

Feedback

Description

Technique add_buffer_on_route can only take place to fix setup violations on nets which have SPEF files generated with parasitic node locations. This net does not have any parasitic node location. add_buffer_on_route will be disabled for this net.

What Next

Check that the SPEF file provided to PrimeTime that contains this net for locations. It is likely the SPEF file is generated without location generation enabled. Parasitic Node locations are manditorily needed for physically aware setup buffer add_buffer_on_route ECO guidance.

DEFR-079

(warning) DEF for physical block %s is missing. Will apply a set_dont_touch on it and all its sub blocks.

Description

The specified component is missing DEF information. No physical ECO guidance will be provided for this physical block and all its sub blocks. The tool will proceed by applying a set_dont_touch attribute on this block and all its sub blocks. Physical ECO guidance will be provided for all other blocks for which DEF is available and which do not lie in the missing block's design sub-hierarchy.

What Next

Check the list of DEF files provided to set_eco_options command for completeness. The DEF file for the specified component maybe missing.

DEFR-080

(information) No LEF Macro cell named %s found for instance '%s' in design %s at lineNumber %d.

Description

The specified component is not bound to any LEF macro. This is allowed for any component with a model name that has been provided in the -allow_missing_lef option.

What Next

The specified component will be omitted from the physical database. If there are cell rows underneath the component's intended footprint, then it may be necessary to add placement blockage to a DEF file to protect that area from cell insertion.

Feedback

DEFR-081

(information) LEF macro named '%s' found for instance '%s' in design '%s' at line number %d, despite being allowed to be missing.

Description

A LEF macro was found for the listed DEF component, despite that macro being allowed to be missing, as specified with the -allow_missing_lef option. Its special dispensation will be ignored, and the instance will be treated normally.

What Next

Check the provided LEF/DEF files and -allow_missing_lef list to ensure that they reflect the desired state of affairs.

DEFW

DEFW-001

(warning) The specified units-per-micron value of %d is less than the database length precision of %d.

Description

The database units is less than precision.

What Next

Check the existence of the ndm file provided to the set_eco_options in the search_path using the *which* command.

DEFW-002

(warning) The DEF syntax does not support multiple spacings for non-default rule %s layer %s.

Description

Unsupported syntax detected for non-default rules.

What Next

Check the existence of the ndm file provided to the set_eco_options in the search_path using the *which* command.

Feedback

DEFW-003

(warning) Skipping invalid scan chain %s; %s.

Description

Scan chain is invalid.

What Next

Check the existence of the ndm file provided to the set_eco_options in the search_path using the *which* command.

DEFW-004

(error) Failed to write from unsupported current design view '%s'.

Description

current design view is invalid.

What Next

Check the existence of the ndm file provided to the set_eco_options in the search_path using the *which* command.

DEFW-005

(error) Cell '%s' has multiple keepouts; only the %s keepout is written.

Description

The cell has multiple keepout margins.

What Next

Check the existence of the ndm file provided to the set_eco_options in the search_path using the *which* command.

DEFW-006

(Information) Creating dummy net '%s' for unconnected port '%s'.

Description

The port is unconnected.

Feedback

What Next

Check the existence of the ndm file provided to the set_eco_options in the search_path using the *which* command.

DEFW-007

(warning) Library '%s' is missing technology information.

Description

Missing technology information.

What Next

Check the existence of the ndm file provided to the set_eco_options in the search_path using the *which* command.

DEFW-008

(Information) The specified %s '%s' cannot be written; %s.

Description

unsupported DEF syntax detected.

What Next

Check the existence of the ndm file provided to the set_eco_options in the search_path using the *which* command.

DEFW-009

(Information) DEF %s section is filtered by the -objects option list; %d %s written to this section.

Description

DEF section is filtered out.

What Next

Check the existence of the ndm file provided to the set_eco_options in the search_path using the *which* command.

DEFW-010

(warning) %d %s ignored in the -objects option list; %s.

Feedback

Description

DEF syntax is ignored.

What Next

Check the existence of the ndm file provided to the set_eco_options in the search_path using the *which* command.

DEFW-011

(warning) Unsupported mask '%s' found for %s '%s'.

Description

Mask is unsupported for this DEF category..

What Next

Check the existence of the ndm file provided to the set_eco_options in the search_path using the *which* command.

DEFW-012

(Information) Converted site definition '%s' to '%s'.

Description

Site row converted.

What Next

Check the existence of the ndm file provided to the set_eco_options in the search_path using the *which* command.

DEFW-013

(Information) Design '%s' contains net fills which cannot be expressed using DEF 5.7 syntax.

Description

Net fills are not supported in DEF 5.7.

What Next

Check the existence of the ndm file provided to the set_eco_options in the search_path using the *which* command.

Feedback

DEFW-014

(warning) 'routing_rules' is not in the include_list for option -include.

Description

Routing rules are not included.

What Next

Check the existence of the ndm file provided to the set_eco_options in the search_path using the *which* command.

DEFW-015

(error) Technology information is missing for layer number '%d'.

Description

Missing technology information for layer.

What Next

Check the existence of the ndm file provided to the set_eco_options in the search_path using the *which* command.

DEFW-016

(error) Via definition '%s' referenced by routing rule '%s' is undefined.

Description

Missing via definition.

What Next

Check the existence of the ndm file provided to the set_eco_options in the search_path using the *which* command.

DEFW-017

(warning) Skipping invalid trim metal shape on layer "%s".

Description

Trimp metal shapes on said layer are ignored.

Feedback

What Next

Check the existence of the ndm file provided to the set_eco_options in the search_path using the *which* command.

DEFW-018

(warning) Layer "%s" has wrong-way default width.

Description

Layer definition is invalid.

What Next

Check the existence of the ndm file provided to the set_eco_options in the search_path using the *which* command.

DEFW-019

(warning) Technology information is missing for purpose number '%d' of layer number '%d'.

Description

Missing technology information.

What Next

Check the existence of the ndm file provided to the set_eco_options in the search_path using the *which* command.

DEFW-020

(error) DEF version 5.7 does not support '%d' units per micron.

Description

The DEF version 5.7 file cannot be written out with the specified units per micron value.

What Next

Check the existence of the ndm file provided to the set_eco_options in the search_path using the *which* command.

DEFW-021

(error) Tech precision value is used as units per micron and DEF version 5.7 does not support '%d' unitsPerMicron.

Feedback

Description

The DEF version 5.7 file cannot be written out with current units per micron value.

What Next

Check the existence of the ndm file provided to the set_eco_options in the search_path using the *which* command.

DEFW-022

(error) Routing rules must be included when the application option 'file.def.non_default_width_wiring_to_net' is true.

Description

Routing rules are necessary because write_def needs to generate nondefault rules in DEF, when the the application option 'file.def.non_default_width_wiring_to_net' is set to true. This application option causes write_def to output nondefault width wiring to the DEF NETS section. In order to do so correctly, write_def needs to generate dummy nondefault rules with the wiring width in the DEF NONDEFAULTRULES section. These rules are referenced by the DEF NETS section to define the nondefault width wiring. If the rules are missing, the DEF is incomplete and read_def cannot process the DEF NETS section.

What Next

Check the existence of the ndm file provided to the set_eco_options in the search_path using the *which* command.

DEFW-023

(warning) Cannot output shield net for net '%s', because it is shielded by unnetted shapes.

Description

The specified net is shielded by shapes that are not owned by any net. In order to express the net's shield net relationship with the DEF "+ SHIELDNET shieldNetName" statement in the output, the shield shapes must be owned by a net (e.g., a ground net).

What Next

Check the existence of the ndm file provided to the set_eco_options in the search_path using the *which* command.

DEFW-030

(warning) Net shape '%s' shields multiple nets. Writing the first shielded net only.

Feedback

Description

The given shape shields more than one nets. The DEF SPECIALNETS wiring syntax "+ SHIELD shieldNetName" supports shielding one net only. The DEF Writer writes out this syntax, only for the first net shielded by the net shape.

What Next

Check the existence of the ndm file provided to the set_eco_options in the search_path using the *which* command.

Use 'add_shield_association' and 'remove_shield_association' commands to correct the shield association between the specified net shape and shielded net in Fusion Compiler.

DEL

DEL-001

(error) You cannot mix an LCD operating conditon with a non LCD operating condition.

Description

A operating condition is detected to be an LCD operating condition, while another specified operating condition is not an LCD operating condition. The ability to specify two different types of operating conditions is not supported.

What Next

Supply a consistent min and max operating conditions. Either two non-LCD operating conditions or two LCD operating conditions.

DEL-002

(error) You cannot specify a single LCD operating conditon.

Description

LCD operating conditions can be specified in min-max mode only.

What Next

You need to use the min-max mode with LCD operating conditions.

DEL-003

(warning) Library '%s' has time unit of %gnsbut the main library unit is %gns

Feedback

Description

If multiple libraries are used in analysis, they must have the same units. This restriction will be removed in a future version of PrimeTime.

What Next

Convert the units in the .lib and regenerate a library .db file using Library Compiler if possible.

DEL-004

(warning) Library '%s' has capacitive_load unit of %gpFbut the main library unit is %gpF

Description

If multiple libraries are used in analysis, they must have the same units. This restriction will be removed in a future version of PrimeTime.

What Next

Convert the units in the .lib and regenerate a library .db file using Library Compiler if possible.

DEL-005

(error) Cannot remove operating_condition from cell '%s': Power rails inherited from '%s' would not match rails of cell '%s'.

Description

Removing rail voltages or an operating condition from a hierarchical cell, may cause a lower level leaf cell to inherit a new set of power rails from a higher level hierarchical cell. Such a removal is disallowed unless the power rails in the library of the leaf cell are a subset of the newly inherited rails.

What Next

Ensure that appropriate rail voltages/ operating conditions have been previously set on such leaf cells.

DEL-006

(warning) The operating condition does not define all rails of cell '%s'.

Feedback

Description

The operating condition or rail voltage does not contain all power rails therefore default voltages will be used on the remaining power rails. The default voltages are defined in power_supply section of the .lib.

What Next

Ensure that the power rails specified in the library of the cell are same as (or a subset of) the rails in the operating condition.

DEL-007

(warning) Setting of multi-rail operating condition or rail voltage on hierarchical cell '%s' may result in incomplete assignment of power rails.

Description

Assignment of voltages to power rails on multi-rail cells is based on matching rail names in the operating conditions and power_supply definition in library description of the cell.

When setting operating condition or rail voltages on hierarchical cell this information is inherited by all cells in the hierarchy unless they have their explicit operating condition or rail voltage. Since rails in two different libraries can have same name then the effect of setting operating condition or rail voltage with multiple rails on hierarchical cell may result in unintended or incomplete voltage assignment.

What Next

Set an operating condition or rail voltages on any lower level cells that require different power rail voltages.

DEL-008

(warning) Default %s operating conditions per library resulted in cells having different temperature, e.g., %s has %g but %s has %g.

Description

This warning message tells you that default operating conditions assigned to cells may not represent actual operating environment because temperature is not same for all cells in the design.

This message is displayed during update_timing.

What Next

If the temperature difference is intentional and you are trying to model temperature variation on the chip then no action is required. If not intentional then use

set_operating_conditions to explicitly set operating conditions on the design or individual blocks.

See Also

- set_operating_conditions
- report_cell
- default_oc_per_lib

DEL-009

(error) Cannot set single rail voltage on multirail cell '%s'.

Description

You may not set a single rail voltage on a cell using set_rail_voltage -rail_rvalue if that cell has multiple power rails defined in the library.

What Next

Use set_rail_voltage -rail_list.

DEL-010

(Error) Unable to parse input/output_voltage in lib '%s': ('%s' = '%s').

Description

When parsing the input_voltage or output_voltage attribute of a library, PrimeTime has encountered a string that it cannot parse. Note that PrimeTime can only parst binary expressions for input/output_voltage.

What Next

Ensure that the input/output_voltage attributes of you library contain only binary expressions.

DEL-011

(information) The most constraining rise and fall values of the '%s' constraint arc occur for different input conditions.

Description

Due to non-monotonicity in arc data, the most constraining rise and fall delay values arise from different computation input parameters. In most libraries, constraint arcs are

characterized with respect to the transition time at the clock or reference pin as well as the transition time at the data or related pin. In min-max analysis modes, the arc delay can be computed in two libraries, with min and max values on the input transitions. Specifically, in on-chip-variation (OCV) mode, up to eight calculations may be necessary to identify the most constraining value of the arc delay.

Given that the delay is a potential permutation of various input parameters, it is possible that the most constraining, or maximum, rise and fall delays arise from different permutations of the input parameters. This scenario has occurred for the specific constraint arc delay being reported.

What Next

This is an advisory message as no further action is necessary.

DEL-012

(error) The desired operating-condition setting for cell '%s' is improper for '%s' analysis due to %s.

Description

Operating-condition or rail-voltage or temperature setting should only be set so that it is covered by the scaling library group or the linked library when there is no scaling group. If the *define_scaling_lib_group* command was used to setup a group of libraries that includes the specified lib cell, any operating-condition or rail-voltage set on the cell must be within the process, voltage, and temperature domain covered by the group. When -exact_match_only is specified on that scaling group, the operating condition of the cell must match with the operating condition of one library in the scaling group. In the above two cases, set_voltage, set_rail_voltage, set_operating_conditions, or set_temperature command are not allowed to set a wrong operating condition. When there is no associated scaling group, and the desired setting does not match that of the linked libraray, this message is issued to let you know wrong setting is used and there is no CCS scaling support. However the setting is allowed to be performed so that you can still use k-factor scaling on NLDM data.

Note that the complete operating_conditions check is so far only available in *check_timing*. There is no operating_condition check in *update_timing* to avoid runtime penalty on every *update_timing*. *check_timing* does not issue *DEL-012*, but it performs the same check and report all violations.

What Next

Correct either the operating condition or the scaling library group.

Feedback

- define_scaling_lib_group
- create_operating_conditions
- set_operating_conditions
- set_voltage
- set_rail_voltage
- set_temperature
- check_timing

DEL-013

(information) Assuming the default level shifter strategy '%s'

Description

The commands without any arguments resets the level shifter strategy to the default 'all'. Default strategy is to reports all driver and load signal signal level mismatches.

What Next

To set a specific startegy use *set_level_shifter_strategy -rule <strategy>*.

See Also

- set_level_shifter_strategy
- check_timing
- set_level_shifter_threshold

DEL-014

(information) The operating conditions set are outside the conditions defined by the libraries in the scaling group for atleast one instance in the design, so extrapolation is being done.

Description

If you set an operating-condition that goes outside the domain covered by an applicable scaling library group, extrapolation will be done for the given operating condition it the scaling libraries are defined for atleast two different operating conditions. If the define_scaling_lib_group command was used to setup a group of libraries that includes

the specified cell, any operating-condition or rail-voltage set on the cell must be within the process, voltage, and temperature domain covered by the group to avoid any extrapolation.

What Next

Correct either the operating condition or the scaling library group if extrapolation is not desirable.

See Also

- define_scaling_lib_group
- create_operating_conditions
- set_operating_conditions

DEL-015

(warning) The operating conditions set are far outside the conditions defined by the libraries in the scaling group for atleast one instance in the design, so extrapolation far beyond the safe range is being done.

Description

If you set an operating-condition that is outside the domain covered by an applicable scaling library group, extrapolation will be done for the given operating condition if the scaling libraries are defined for atleast two different operating conditions. If the define_scaling_lib_group command was used to setup a group of libraries that includes the specified cell, any operating-condition set on the cell must be within the process, voltage, and temperature domain covered by the group to avoid any extrapolation. The accuracy of results may not be good if the operating conditions are set far outside the domain of the scaling group.

What Next

Correct either the operating condition or the scaling library group if extrapolation is not desirable.

See Also

- define_scaling_lib_group
- create_operating_conditions
- set_operating_conditions

Feedback

DEL-016

(information) PrimeTime did not compute a valid '%s' transition at input; report_delay_calculation will use zero instead.

Description

Transition times at the output of disabled arcs or non-driven transitions of half unate arcs are considered invalid and are propagated as such in PrimeTime so as not to merge with valid signal transitions downstream. For the purposes of delay calculation, a zero slew is used to perform the cell arc calculation. Even though using a zero input slew could result in a corresponding non-zero output slew, this output slew is in turn marked invalid.

What Next

This is an advisory message as no further action is necessary.

DEL-017

(information) The minimum values of the '%s' constraint arc are not used by timing analysis.

Description

For the evaluating the worst possible conditions for a timing violation and given that timing constraint senses implicitly encode minimum versus maximum conditions such as hold and setup, PrimeTime strictly uses the maximum computed constraint arc delay values for computing endpoint slack.

PrimeTime computes and preserves the minimum delay values for constraint arcs for two reasons. First, these minimum values are exported through attributes off the timing_arc object for general use. Second, other applications dependent on PrimeTime delay calculation through SDF generation do require minimum values to be present.

What Next

This is an advisory message as no further action is necessary.

DES

DES-001

(error) Current design is not defined.

Feedback

Description

The current design is not defined. Many commands require that the current design is set.

What Next

You must read a design database file and link a design.

DES-002

(error) Cannot find %s '%s' in design '%s'

Description

The specified object cannot be found in the given design. This is sometimes seen while reading SDF and parasitics files. In those cases, it could indicate a file which is out of sync with the design.

What Next

If reading SDF or parasitics, verify that the file matches the design.

DES-003

(error) '%s' cannot be used on %s %s '%s'.

Description

Certain commands are valid only for input or output objects.

What Next

Enter the command with a valid list of objects.

DES-004

(error) Cannot find design '%s'.

Description

There is no design with that name is in memory.

What Next

Read in the design or reenter the command with a different name.

DES-005

(Error) Cannot set current instance to leaf cell '%s'.

Feedback

Description

The current instance must be a hierarchical cell.

DES-006

(error) Cannot find pin '%s' on cell '%s'.

Description

The pin does not exist on the specified cell.

What Next

Use *query_objects [select_pin -of_object [select_cell cell_name]] to list pin names on the cell.*

DES-007

(warning) '%s' is not a valid object type.

Description

When -from or -to option is used with set_disable_timing or remove_disable_timing , the object list can only be a cell or a lib cell. This warning is generated for objects of type port and pin.

What Next

Don't use -from or -to option to disable pins or ports.

DES-008

(error) Cannot find %s '%s' in library '%s'.

Description

The specified object cannot be found in the given library.

What Next

Enter the command again with a valid object name.

DES-009

(error) Cannot find pin '%s' on library cell '%s'.

Feedback

Description

The pin does not exist on the specified library cell.

What Next

Enter the command again with a valid object name.

DES-010

(error) Cannot find %s '%s'.

Description

The specified object cannot be found.

What Next

Enter the command again with a valid object name.

DES-011

(error) Cell '%s' is not hierarchical.

Description

The command only works on hierarchical cells.

What Next

Enter the command again with a hierarchical cell.

DES-012

(Error) Cannot use '%s' command on %s '%s'.

Description

The command works only on ports of a specific direction.

DES-013

(Error) Current design is not in min-max mode.

Description

Most of the -min and -max options of commands work only when the design is in min-max mode. The design is considered in min-max mode when 2 operating conditions are specified, such as "set_operating_condition -min OCbest -max OCworst". The design can

also be in min-max mode after reading an SDF file with the -min_max option (for example, read_sdf -min_max mydesign.sdf).

DES-014

(Error) Object '%s' is not in the current design.

Description

You attempted an operation on an object that is outside of the scope of current design. For example, if you select a cell from one design, and attempt to set the current instance to that cell in a different (current) design, this error is generated.

DES-015

(error) Cannot use '%s' command on %s '%s' because it is a limited design.

Description

Access to a design is limited because it requires a license and the only license available was a limited license. As a result, the internals of the design are hidden. Some reports are able to work around limited designs (and instances of them), but some cannot.

What Next

If the design is licensed for full access, ensure that you can check out that license before reading the design. Some designs will always be limited.

DES-016

(error) Cannot use '%s' command on %s '%s' because it contains instances of limited designs%s.

Description

Access to a design is limited because it requires a license and the only license available was a limited license. As a result, the internals of the design are hidden. Some reports are able to work around limited designs (and instances of them), but others cannot.

What Next

If the design is licensed for full access, ensure that you can check out that license before reading the design. Some designs will always be limited.

DES-017

(information) Could not auto-link design '%s'.

Feedback

Description

You executed a command that tried to link the current design. The design could not be linked or it already failed to link. The design now has unresolved references.

What Next

Determine the reason for the unresolved references. This might require changing the value of the search_path or link_path variables. If these references are not yet defined, you can make the linker create black-boxes for them by setting the variable link_create_black_boxes to true. Finally, relink the design using the *link_design* command.

DES-018

(error) There is already an operating condition named '%s' in library '%s'.

Description

The *create_operating_condition* command cannot overwrite an existing operating condition.

What Next

Choose a new name for the operating condition. To list the existing operating conditions in the specified library, use *report_lib*.

DES-019

(warning) Library '%s' has been generated with an old version of the Library Compiler. It needs to be rebuilt to support case analysis on sequential cells.

Description

You receive this message if the current library DB is out of date. The library DBs have detailed functional information generated by Library Compiler from the library .lib file. Information generated by Library Compiler prior to version 2000.11 is not supported.

What Next

Use Library Compiler to regenerate your library DB. Follow these steps:

1. Read in the .lib file.

   ```
   dc_shell> read_lib mylibrary.lib
   ```

2. Write out the .db file.

   ```
   dc_shell> write mylibrary.db
   ```

Feedback

DES-020

(warning) No operating condition is specified, assuming a voltage value of %s volts for RC delay calculation.

Description

No operating condition is specified for the current library, so PrimeTime does not know what is the voltage value when performing RC delay calculation

What Next

Specify the operating condition of the current library with *set_operating_condition*. To get a list of the operating conditions of your library, use *report_library*.

```
pt_shell> report_library my_lib.db

   Name                 Process     Temp        Voltage     Tree Type

 --------------------------------------------------------------------------
---
   WCCOM                3.00      115.00        3.00     balanced_case

pt_shell> set_operating_condition WCCOM
```

DES-023

(warning) Net '%s' is multi-driven.

Description

The specified net is multi-driven by non-three-state cells. PrimeTime will try to peform multi-driven delay calculation for all switching scenarios defined by the networks attached to the drivers' from-pins. In order for such scenarios to be valid, a given from-net must uniquely cover all of the strong drivers attached to the multi-driven to-net.

If a from-net does not cover all of the strong drivers, or if a from-net is attached to more than one pin on a specific driver, detailed RC delay calculation cannot be performed. Instead, fractional lumped analysis will be used; the load will be assumed to be the total capacitance of the multi-driven net divided by the number of drivers.

What Next

Verify that you indeed want the indicated net to be multi-driven. This capability is commonly used to wire cells in parallel to achieve greater drive strength.

Feedback

See Also

- RC-002
- RC-003

DES-024

(warning) Net '%s' has an incomplete RC network.

Description

The specified net has an imcomplete RC network. This means that some RC elements are dangling, or that all drivers and loads of the nets are not connected by all the RC elements.

What Next

The RC network annotation is ignored for the specified net.

DES-025

(error) Pin '%s' is not connected to net '%s'. Ignoring annotation on net '%s'.

Description

You receive this message if the *read_parasitics* command has found the specified pin in the parasitics file but not in the design file; therefore, *read_parasitics* cannot annotate the associated net. Possible causes for this error could include spelling errors or typos, or writing the parasitics file and the design file from different versions of the design.

What Next

Verify that the specified pin is connected to the specified net in both the parasitics file and the design file, and that both are spelled correctly. Regenerate the files if necessary, then reexecute *read_parasitics*.

See Also

- read_parasitics

DES-026

(error) %s pin '%s' is not connected to the RC network of net '%s'. Ignoring the incomplete RC network of the net.

Feedback

Description

You receive this message if *report_annotated_parasitics* detects an incompletely back-annotated RC network in the current design. The message informs you that the RC network on the specified net is being ignored, because it is incomplete; the specified pin is not physically connected to the RC network.

An incomplete RC network might be caused by errors in the parasitics file, or by missing information from the tool that generated the parasitics file. For example, a parasitics file generated by a place and route tool that has parasitics only for the top level (between the blocks) would generate this error, because PrimeTime requires the RC network to connect all leaf drivers to all leaf nodes.

What Next

Examine the SPF or SPEF file to determine why the specified RC network is incomplete. If the error is caused by a valid incomplete network, you can complete it using the parasitics completion feature *read_parasitics -complete_with* or *complete_net_parasitics*. For other errors, you must correct the parasitics file manually. You might need to estimate the missing segments and manually add them. After you have corrected the SPF or SPEF file, reexecute *read_parasitics*.

To determine whether the parasitics file contains a valid incomplete RC network, start from a driver and try to reach all loads through resistances. If all missing segments of a net are between two pins, you can complete them using the parasitics completion feature; otherwise, you must correct the SPF or SPEF file manually.

See Also

- complete_net_parasitics
- read_parasitics
- report_annotated_parasitics

DES-027

(warning) net '%s' has too many (%d) RC elements. Lumped capacitance is used.

Description

The specified net has too many RC elements (more than 10,000). RC delay calculation using AWE technique cannot handle such large RC networks.

What Next

The very large RC network of the net needs to be reduced to a smaller number of RC elements to be handled by PrimeTime.

Feedback

DES-028

(Information) Derived library resistance unit is %f Kohm (Time unit is %.f ns, and Capacitance unit is %f pF).

Description

The library resistance unit is implicit in the synopsys library, it is derived from the library time and capacitance units which are explicit.

DES-029

(Error) Library '%s' has no voltage rails defined.

Description

An attempt was made to define rail voltages to a library which does not have defined rail voltages. It is usually because the library is not a DPCM library, or that the DPCM library does not have pre-defined rail voltages.

DES-030

(error) cannot find rail voltage '%s' in library '%s'.

Description

The specified rail voltage is not declared in the DPCM library. It may be because of a typo.

What Next

Report the specified rail voltage names specified in the DPCM library by executing command report_lib for the specified library. report_lib reports all specified rail voltage names declared in DPCM.

DES-032

(warning) Failed to compute %s RC net delay from '%s' to '%s'.

Description

The delay calculation failed to compute the delay for the given detailed RC network, hence the lump model will be used for delay calculation.

What Next

Simplify the RC network and check if the RC enviorment vairables are set correctly.

Feedback

DES-033

(Error) Failed to compute C-effective for the following timing arc: (%s) %s/%s-->%s (%s %s)

Description

The cell delay calculation failed to compute the effective capacitance of the detailed RC network driven by a specific timing arc, so the total capacitance will be used.

The following are the two most common reasons for this failure:

1.An unrealistically large input transition time or output capacitance has occurred. 2.The RC threshold environment variables are set incorrectly.

Another frequent reason is that library data for the specific sense of timing arc in question is missing or invalid.

The timing arc is displayed by the warning message in the following manner: (<reference-name>) <instance-name>/<from-pin>--><to-pin> (<sense-name>) The sense name has two parts: a rising/falling direction on the to-pin and a sense description.

What Next

You may have to annotate transition times with set_annotated_transition to circumvent unrealistic loading conditions (e.g. like those which you might later solve with buffer trees). Also, be sure the library delay and slew thresholds are set correctly, and that valid library data exists for the desired sense of timing arc through the cell of interest.

See Also

- set_annotated_transition

DES-034

(Warning) subckt '%s' is defined multiple times.

Description

The SPICE deck and all its include files that define the pin order for the SPICE output of the critical has define a subcircuit multiple times.

DES-035

(Error) Out of memory at file %s line %d.

Feedback

Description

Run out of memory during SPICE pin order deck parsing.

DES-036

(Warning) Pin '%s' defined multiple times in subckt '%s'.

Description

A pin is defined multiple time on the SPICE subcircuit header. Only the first one is used.

DES-037

(warning) No SPICE pin order info for cell '%s' (%s).

Description

You receive this message if *write_spice_deck* cannot find the specified cell type in the file you specified using the *-sub_circuit_file* option.

What Next

Examine the subcircuit file and verify that it contains the subcircuit description of the specified library cell. Make any corrections necessary, then re-execute *write_spice_deck*.

DES-038

(error) Library pin '%s' for cell '%s' is not in the SPICE sub-circuit definition.

Description

You receive this message if *write_spice_deck* finds the specified cell in the file you specified using the *-sub_circuit_file* option, but does not find the specified pin.

What Next

Examine the subcircuit file and verify that it contains the specified pin and is consistent with the PrimeTime library. Make any corrections necessary, then re-execute *write_spice_deck*.

DES-039

(warning) SPICE pin '%s' for cell '%s' is not in the library.

Feedback

Description

You receive this message if *write_spice_deck* finds the specified pin in the subcircuit file but cannot find it in the library. If the pin is a power or ground pin, PrimeTime might still be able to do the analysis.

What Next

If the pin is not a power or ground pin, examine the subcircuit file and verify that it is consistent with the PrimeTime library. Make any corrections necessary, then re-execute *write_spice_deck*.

DES-040

(warning) The driver waveform %s is bad and will be ignored.

Description

While reading the driver waveform, the application found that waveform is bad. For example, the number of voltage points in the waveform are less than two.

What Next

Examine your waveform is according to the liberty syntax for driver waveforms. Correct the waveform and re-execute it.

DES-050

(error) Too many %ss matched '%s' in design '%s'

Description

While searching for an object by name, the application found multiple objects that match the name. This usually occurs after some flattening of the design, when the hierarchy character becomes embedded in the names. For backannotation, this is an ambiguous situation, because the application cannot determine which object to annotate.

This situation occurs rarely, during the reading of parasitics files, and could be caused by a design error. Multiple objects in the flat space should not have the same name.

What Next

Examine your design to determine why multiple objects in the flattened file have the same name. Correct the design, then re-execute the application.

Feedback

DES-051

(Error) Command requires a linked design but linking is blocked because auto_link_disable is TRUE.

Description

You receive this message if you execute a command that requires a linked design, your design is not linked, and the *auto_link_disable* variable is set to true. By default, many PrimeTime commands automatically attempt to link the current design for you (for example, *set_load* invokes the linker if the current design is not linked). Setting *auto_link_disable* to true disables the default auto-link process.

What Next

If you intend for auto linking to be disabled, you must link the design manually before executing any commands that require a linked design. Setting *auto_link_disable* to true is intended to be used in conjunction with a manual link step. For more information, see the manual page for the *auto_link_disable* variable.

Alternatively, if you want to enable auto linking, set the *auto_link_disable* variable to false.

DES-060

(warning) Ignoring retain library timing arc from '%s' to '%s'.

Description

You receive this message if the current library DB is out of date. Retain arcs generated by Library Compiler prior to version 2000.11 are not supported.

What Next

Use Library Compiler to regenerate your library DB. Follow these steps:

1. Read in the .lib file.

   ```
   dc_shell> read_lib mylibrary.lib
   ```

2. Write out the .db file.

   ```
   dc_shell> write mylibrary.db
   ```

DES-061

(warning) Found duplicate instantiation of cell '%s' when flattening the hierarchical netlist.

Feedback

Description

You receive this message while outputting a hierarchical netlist in a flattened manner. When flattening the netlist, two instances are being mapped to same name. For example, you may have a cell by name "a/b" at top level and a cell named "b" inside a hierachy named "a". The name of the cell under conflict is given in this message.

What Next

You should uniquify the names of the cells under conflict before doing the current operation.

DES-062

(warning) '%s' unit specified as '%s' does not match with the main library unit '%s%s'.

Description

set_units command can only check the consistency of the specified units with the main library units. Actual setting of units are not allowed.

What Next

If the units of sdc scripts are different, change the sdc scripts so that the units are same as the main library units. It is also possible to select a different library as the main library, which has consistent units as that of sdc scripts.

DES-063

(warning) '%s' unit should be specified in '%s'.

DES-064

(warning) Power unit cannot be checked.

Description

Power unit cannot be checked since no power unit available.

What Next

Enable power analysis mode by setting power_enable_analysis to true, and running power related commands, such as update_power, read_vcd, read_saif, set_switching_activity, etc.

Feedback

DES-065

(warning) '%c' is an unsupported scale.

Description

Valid scales are f|p|n|u|m|k|M.

What Next

Scale the value to the supported scale.

DES-066

(error) Command requires a linked design but linking is blocked because of existing collections.

Description

You receive this message if you execute a command that requires a linked design, your design is not linked, and there are some collections with this design.

What Next

Perform a link first and re-issue the command.

DES-067

(error) Design is already linked.

Description

You are attempting to link a design that is already fully linked. If you want PT to relink, please use -force option.

What Next

No need of any action.

DES-068

(error) Could not find library cell '%s'.

Description

You are attempting to use a library cell in a command and the library cell could not be located in any of the loaded libraries.

Feedback

What Next

Re-issue the command with the correct library cell.

DES-069

(Error) Variable '%s' cannot be set after linking or be reset.

Description

This variable needs to be set before linking or it is not allowed to be reset once is set.

DES-070

(information) Current instance is the top-level of design '%s'.

Description

You executed a command that changes the current instance back to the top-level.

What Next

Check if this design name matches with current design.

DES-071

(info) current_design won't return any data before link

Description

current_design won't return any data before link. Don't use current_design before link to query for any design objects.

What Next

use current_design after link to get the collection.

DES-072

(error) Incompatible options to report_signature. Failed due to: %s

Description

The behaviour of report_signature is dependent on the mode of operation of the current pt_shell (DMSA or regular PT flow etc). Some options to report_signature are hence incompatible.

Feedback

What Next

Refer to the reason for failure in the error message to proceed.

DES-073

(Error) The current_design command must specify the top module name as the argument in the Parasitic Explorer flow.

Description

In the Parasitics Explorer flow, the *current_design* command must specify the top module name as the argument. For example,

```
set_app_var parasitic_explorer_enable_analysis true
read_parasitics -format gpd my_gpd_dir
current_design TOP
```

In this example, the *read_parasitics* command prepares for reading the parasitics but does not actually do the reading until the *current_design TOP* command is run. Using the *current_design* command without an argument triggers the DES-073 error.

When the *current_design TOP* command is run, the tool links the design specified by the *current_design* command and reads in the GPD parasitic data from the specified directory.

What Next

Run the *current_design* command again and specify the top module name as the argument.

See Also

- read_parasitics
- parasitic_explorer_enable_analysis

DES-074

(Information) Resistance unit is %f Kohm (Capacitance unit is %f pF).

Description

The resistance unit is implicit in the synopsys library, it is derived from the library time and capacitance units which are explicit.

DES-075

(error) Cannot set target library subset on cell '%s'; it is not hierarchical.

Feedback

Description

The command only works on hierarchical cells.

What Next

Reissue the command with a hierarchical cell.

DES-076

(Error) Verilog writing disabled due to the presence of encrypted verilog.

Description

When encrypted verilog file is read with read_verilog command, all the commands which writes out the verilog files (like hyperscale netlist) will fail.

What Next

Writing verilog is not possible if the input verilog was encrypted. Please read un-encrypted verilog.

DES-078

(Error) Variable '%s' cannot be set after define_scaling_lib_group.

Description

This variable needs to be set before define_scaling_lib_group.

DES-080

(Information) Detect physical variant lib cell '%s/%s'.

Description

This message is to tell user that physical variant lib cell is detected, this one time information only display one example physical lib cell name, the design could contain other physical variant lib cells.

DFTSCHD

DFTSCHD-001

(warning) No schematic support for DFT violation (%s).

Feedback

Description

Check the man page for %s DRC violation.

DIST

DIST-001

(Error) No user commands specified to be executed.

Description

You receive this message if no user commands were supplied to remote_execute to be executed at the worker machines.

What Next

Specify set of commands to be run on worker machines.

DIST-002

(Error) "%s" option cannot be used in present distributed mode.

Description

You receive this message if an option was specified with remote_execute command whihc is not compatible with the present mode of execution.

What Next

Refer to remote_execute man page.

DIST-003

(Error) No %s specified for the command.

Description

You receive this message if you have not specified a list of objects to be the subject of the remote execution focus.

What Next

Provide a list of objects to be the subject of the remote execution focus.

Feedback

See Also

- remote_execute

DIST-004

(Error) remote_execute cannot be called inside parallel_execute.

Description

You receive this message if you are calling remote_execute inside parallel_execute. remote_execute is not supported to be called inside parallel_execute.

What Next

Refer to man page of remote_execute and parallel_execute

DIST-005

(information) Variable '%s' is assigned the value '%s' following merging of the worker-side value '%s' and the manager-side value '%s'

Description

In the distributed analysis, the indicated variable can be set both at the manager and worker. In this case, the value of the variable at the manager is added to the value of the variable at the worker.

DIST-006

(Warning) The variable '%s' contains a directory '%s' that could not be resolved to an absolute path.

Description

The manager was unable to find the absolute directory location of an entry in a resolved variable. This erroneous entry will not be sent to the worker.

What Next

Remove or correct the erroneous resolved variable entry.

DIST-007

(Error) The distributed farm has encountered a critical failure and all hosts are being stopped, see logs for more information.

Feedback

Description

There was an error in the distributed farm processing that has placed it into an irrecoverable state. Consult the logs to see more about what happened.

What Next

Consult the logs to see more about what happened.

DIST-008

(warning) The type of the specified object is not supported.

Description

The object is not of type list, variable, array, or collection.

What Next

Specify an object that is a list, variable, array, or collection.

DIST-009

(warning) The object %s does not exist.

Description

The specified object does not exist. No object is returned.

What Next

Specify an object that does exist.

DIST-010

(warning) The collection type for object %s is not supported.

Description

The collection type for the specified object is not supported by the distributed objects feature.

What Next

Only query supported collections.

DIST-011

(error) The specified object is not an array.

Feedback

Description

The specified object must be an array indexed by a scenario name.

What Next

Specify an array of the correct type. An array can be created using the array set command.

DIST-012

(error) The specified object %s already exists.

Description

The specified object cannot be returned to the manager because a variable of that name already exists at the manager.

What Next

Use unset to remove the variable at the manager.

DIST-013

(error) Cannot send collection %s to the worker.

Description

The specified collection cannot be sent from the manager to the worker because the collection type is unsupported for the *set_distributed_variable* command.

What Next

Transfer information from the collection into a list or array. Send information to the worker in a list or an array format.

DIST-014

(error) Could not set variable %s because the variable already exists and cannot be overwritten due to incompatible type.

Description

This error has occurred because the *get_distributed_variables* or *set_distributed_variables* command has been issued, and a variable cannot be overwritten at the manager/worker as a variable of that name already exists at the manager/worker of incompatible type.

Feedback

The following variable type transitions are allowed:

```
variable -> collection
variable -> list
collection -> variable
collection -> list
list -> variable
list -> collection
```

The following variable type transitions are disallowed:

```
+0.25in
array -> collection
array -> list
array -> variable
collection -> array
list -> array
variable -> array
```

What Next

Remove the existing variable using the unset command.

DIST-015

(error) Found null value in merged_object when -null_merging_method was set to error.

Description

When merging variables at the manager, this error is issued because the -null_merging_method is set to error and a null value has been found.

What Next

Find the source of the null value.

DIST-016

(error) Could not set %s to be the error log .

Description

The error log was set to an invalid file name. The file name given was either a directory or the file name resolved to a file that could not be opened, or the file name contained a path that could not be resolved.

What Next

Choose a valid file name for the error log.

Feedback

DIST-017

(error) Variable %s size exceeds Tcl limit of 2147483647 characters.

Description

PrimeTime tried to create a Tcl variable of size exceeding Tcl variable size limit of 2147483647 characters (2 GB - 1 byte). For example, this error may be issued if *get_distributed_variables* is called with the option *-merge_type* to merge variables from multiple scenarios into a list and the size of the merged list exceeds the Tcl variable size limit.

What Next

Ensure that *get_distributed_variables* does not create merged variables of sizes larger than 2147483647 characters by limiting the cumulative size of variables received by the command from scenarios.

DIST-018

(Error) Manager job stopped because '%s' [Scope:%s Reason:%s]

Description

A critical error has arisen in the manager process stopping the job managing the tasks being executed by worker processes. This is an unrecoverable error and all tasks and worker processes will be terminated.

What Next

Please run the analysis again with the *distributed_logging* variable at the manager set to highest and send the content of the *system_log* directory to Synopsys for analysis of the problem.

DIST-019

(warning) You are supplying an empty collection or an invalid object pattern / class to %s.

Description

The supplied object specification does not yield any objects (e.g nets, pins, cells) to process.

What Next

Please supply a valid object specification to the command.

DIST-020

(warning) The %s command was issued at %s %s.

Description

The *exit* or *quit* command was issued at a distributed worker process. The behaviour of the command at a distributed worker is controlled by the setting of the *distributed_worker_exit_action* variable.

In the Distributed Multi-Scenario Analysis, the execution of commands for the scenario which issued the 'exit' or 'quit' command is stopped and the scenario will be removed from the current session. The remote worker process running the scenario may be terminated depending on the setting of the *distributed_worker_exit_action* variable.

What Next

Check if the 'exit' or 'quit' command was issued intentionally at a distributed worker.

- distributed_worker_exit_action
- report_host_usage

DMM

DMM-010

(Warning) Switching between mismatch configs is not recommended.

Description

It is not recommended to switch between configs because there might be some design mismatches already repaired in previous config. And those mismatches will not be in sync with current config anymore. There is currently no provision to re-mitigate or invalidate those already mitigated objects.

What Next

Make sure not to change current config if some mismatches have already been repaired.

DMM-011

(Warning) Changing current repair(handler) for a mismatch type in between a flow is not recommended.

Feedback

Description

It is not recommended to change current repair(handler) for a mismatch type in between a flow because there might be some design mismatches already repaired with previous handler. And those mismatches will not be in sync with current repair anymore. There is currently no provision to re-mitigate or invalidate those already mitigated objects.

What Next

Make sure not to change current repair if some mismatches have already been repaired.

DMM-012

(Warning) Changing action for a mismatch type in between a flow is not recommended.

Description

It is not recommended to change action for a mismatch type in between a flow because there might be some design mismatches already repaired with previous action. And those mismatches will not be in sync with current action anymore. There is currently no provision to re-mitigate or invalidate those already mitigated objects.

What Next

Make sure not to change action if some mismatches have already been repaired.

DMM-013

(Information) No mismatch exists on ref library '%s'.

Description

The specified reference library is found with no mismatch information.

DMM-014

(error) Action '%s' is not allowed for '%s' mismatch type.

Description

This action type is not in the allowed list of actions for this mismatch type.

What Next

Use report_mismatch_config output to check which action types are allowed for this mismatch type.

Feedback

DMM-015

(error) Mismatch config '%s' do not exists.

Description

The provided mismatch config do not exists. Check and use existing configs.

What Next

Use report_mismatch_configs output to check which mismatch configs are available to use.

DMM-016

(error) Mismatch config '%s' already exists.

Description

The provided mismatch config already exists.

What Next

Use report_mismatch_configs to see available configs to use.

DMM-017

(error) Config '%s' does not exists.

Description

The named config does not exists. Please use '-all' option to see the existing configs and use one of them.

What Next

Use report_mismatch_configs to see available configs to use.

DMM-021

(Warning) Over-riding current design mismatch config '%s' by block-specific config '%s'.

Description

The design mismatch config settings are stored on a block when it is created. When it is opened or made the current block, these are restored. If they are different from the session's current config settings, the block's settings over-ride the session's settings and come into effect.

Feedback

What Next

Use 'get_current_mismatch_config' and 'report_mismatch_config -verbose' to check what config settings came into effect. for this mismatch type.d

---

DMM-022

(Information) Restoring current design mismatch config value to '%s'.

Description

The block-specific design mismatch config settings are active when the block is open and is the current block. When the block is closed, these block-specific settings are removed and are replaced by the session's config settings that were in effect before this block was opened. This message indicates that the mismatch config setting has been restored to the previous value.

What Next

Use 'get_current_mismatch_config' and 'report_mismatch_config -verbose' to check what config settings came into effect.

DMM-030

(error) '%s' is an empty rtl module.

Description

This denotes that an empty rtl module is read-in. Configure DMM mismatch empty_logic_module to convert it into macro.

What Next

Use report_mismatch_config output to check which action types are allowed for this mismatch type.

DMM-040

(information) Resizing cell ‘%s’.

Description

When creating a macro type blackbox on an empty module mismatch mitigated using the create_macro strategy, tool will resize the macro without creating a new blackbox.

What Next

This is an information message no action is needed.

Feedback

DMM-041

(warning) Mitigated empty module cannot be moved to specified library or renamed.

Description

When creating a macro type block-box on an empty module mismatch mitigated using the create_macro strategy -library & -name options will be ignored.

What Next

Review your design mismatch configuration and set the correct strategy action for the empty_logic_module, to disable the mitigation.

See Also

- report_design_mismatch

DMM-042

(warning) Mitigated empty module cannot be move to library ‘%s’

Description

When creating a macro type blackbox on an empty module mismatch mitigated using the create_macro strategy the -name option will be ignored.

What Next

Review your design mismatch configuration and set the correct strategy action for the empty_logic_module, to disable the mitigation

DMM-115

(Warning) Auto deriving '%s' routing direction for layer '%s'.

Description

There is no layer routing direction provided by user and also not available in technology file. So auto deriving the routing direction for the specified layers.

DMM-116

(information) Total %d mismatches are found on block '%s'.

Description

If there exists any inconsistency between design and reference data, they are regarded as a mismatch in the flow. These mismatches can be related to a missing reference, port name case, missing routing direction on a metal layer etc.

When such a mismatch is detected, it is collected and recorded on design. These mismatches are captured during specific flows like linking and routability checks.

What Next

Check output of report_design_mismatch to find more details about mismatches.

Feedback

See Also

- report_design_mismatch

DMM-117

(warning) Reporting design mismatch(es) or creating or setting design mismatch configuration after early data check has been enabled.

Description

User is reporting on design mismatch(es) or is creating or setting design mismatch configuration after the early data check (EDC) system has been enabled. The design mismatch commands and reports are still accepted by the tool after enabling the EDC system. However, the design mismatch manager turned inactive and will no longer check, record, or repair design mismatches since these are now checked and handled by the EDC system. It is still possible to report the mismatches that have been recorded by the design mismatch manager before the EDC system got enabled.

What Next

The warning can be ignored when reporting design mismatches that got recorded before enabling EDC. When creating or configuring design mismatch configuration, consider using the EDC system instead by using related EDC checks with matching policies and strategies. The EDC system is enabled by 'set_early_data_check_policy' or by 'set_qor_strategy -mode early_design' command. Please refer to below commands related to the EDC system.

set_early_data_check_policy

```
report_early_data_checks
get_early_data_check_records
```

DMM-121

(warning) Repair skipped for '%s' for object '%s' as it would cause loss of UPF data.

Description

Repaired skipped for design mismatch as it would cause UPF data loss as part of converting empty logic module to macro.

What Next

If you do not want to repair then change action to 'ignore'. If still repair is needed then enable design mismatch to repair before loading upf.

Feedback

DVD

DVD-001

(error) Can not open DvD file '%s'.

Description

The DvD file name given is incorrect or the search path for this DvD file is not given or the path is incorrect.

What Next

Check whether the DvD file exists and has read permissions.

DVD-002

(warning) Can not close DvD file '%s'.

Description

The DvD file cannot be closed.

DVD-003

(error) Please remove the DvD before reading DvD file '%s'.

Description

Read_dvd is not performed because design has already been annotated with a previously read DvD file.

What Next

Assigning the DvD is allowed only after the existing DvD is removed.

See Also

- remove_dvd

DVD-004

(error) Read_dvd is not performed because there is no format header from file '%s'.

Description

Read_dvd requires a format header in the DvD file.

Feedback

What Next

Make sure the format header is in the beginning of your DvD file, containing "inst_name", and "STA_VDD" or "eff_VDD". For example, "# loc_x loc_y eff_vdd max_pg_w domain inst_name STA_VDD".

DVD-005

(error) Read_dvd is not performed because there is no valid data from file '%s'.

Description

Failed to read any cell name and DvD voltage from the DvD file. Read_dvd is skipped.

What Next

Check your DvD file for the correct syntax.

DVD-006

(warning) Cannot read in cell name and DvD voltage from file "%s" lines [%s]. These lines are skipped.

Description

Failed to read cell name and DvD voltage from the reported lines of the DvD file.

What Next

Check your DvD file for the correct syntax.

DVD-007

(error) Please read the DvD before removing it.

Description

Remove_dvd is not performed because design has not been annotated with a DvD file.

What Next

Use command 'read_dvd' to read in a DvD information first.

DVD-008

(warning) DvD-aware timing analysis is not performed because -pba_mode is not specified.

Description

DvD-aware timing analysis is only available for *PBA mode*.

What Next

To enable DvD-aware timing analysis, specify the *-pba_mode path|exhuastive* option on *get_timing_paths* or *report_timing*.

See Also

- get_timing_paths
- report_timing

DVD-009

(error) DvD-aware timing analysis cannot specify both -path and -strip_path for read_dvd.

Description

DvD-aware timing analysis can only specify one of -path and -strip_path for read_dvd.

What Next

Use command 'read_dvd' with one of -path and -strip_path only.

DVD-010

(error) read_dvd -rail_map is not performed while parsing file "%s" lines [%s].

Description

read_dvd -rail_map requires correct "object_spec" and "version" in the DvD file.

What Next

Check your DvD file for the correct syntax.

DVD-011

(warning) Cannot read the syntax of rail_map file from file "%s" lines [%s]. These lines are skipped.

Feedback

Description

Failed to read rail_map file from the reported lines of the DvD file.

What Next

Check your DvD file for the correct syntax.

DVD-012

(info) Removing existing dvd rail map.

Description

Removed existing dvd rail map

DVD-013

(info) No existing dvd rail map to remove.

Description

remove_dvd -rail_map_only is not performed because there is no existing dvd rail map to remove.

DVD-014

(info) %lu out of %lu cell(s) annotated with DvD voltage in the design. Annotation rate is %.3f%%.

Description

The message shows the numbers of all cells, cells annotated with DvD voltage in the design and annotation rate.

DVD-015

(error) DvD-aware timing analysis cannot specify both -mode and -rail_map for read_dvd.

Description

DvD-aware timing analysis can only specify one of -mode and -rail_map for read_dvd.

DVD-016

(error) read_dvd -rail_map is not performed while parsing file "%s" lines [%s].

Feedback

Description

read_dvd -rail_map requires only one or two value in scaling, offset and clamp

What Next

Check your DvD file for the correct syntax.

ENV

ENV-001

(error) Value for %s cannot be larger than the %s value.

Description

Some commands work in pairs, specifying a maximum and minimum value. The minimum value must be less than the maximum value. For example, never specify a min_capacitance that is larger than the max_capacitance for the same design or port.

What Next

Remove the old value, or use a different value.

ENV-002

(warning) Invalid value '%s' for variable '%s'. %s

Description

You specified an invalid value for the specified variable. The message should provide valid values for the variable.

What Next

If the message did not provide valid values for the variable, refer to the man page for the variable. Reset the variable with a valid value, then run the command again.

ENV-003

(Information) Using automatic %s wire load selection group '%s'%s.

Description

Automatic wire load selection by area is being performed on the design or on a hierarchical cell. The specified selection group is used to determine which wire load model

to apply to hierarchical cells at and below this cell or design, based on their cell area. There might be a different selection group for max and min conditions.

What Next

To see which wire load models are set, use the *report_wire_load* command.

ERRDM

ERRDM-001

(error) Failed to open error data which is not for the current design.

Description

An attempt was made to open an error data which is not associated with the current design.

What Next

Select an error data file which is associated with the current design.

ERRDM-002

(error) Failed to open error data which does not exist.

Description

An attempt was made to open an error data file which does not exist.

What Next

Select an existing error data file which is associated with the current design.

ERRDM-003

(error) Could not create the error data file.

Description

The error data file could not be created.

What Next

Check for inadequate write permissions on the disk or a possible collision with existing filenames.

Feedback

ERRDM-004

(error) Invalid file format.

Description

An invalid file format was specified for the error data file.

What Next

Provide a valid file format.

ERRDM-005

(error) Corrupt error data.

Description

A syntax error was encountered while reading a corrupt error data file.

ERRDM-006

(error) The error data has unsaved changes.

Description

An attempt was made to close an error data file which has unsaved changes.

What Next

Use the -force option to force closure without saving changes, discarding any pending changes. For exported error data files, you may also use the -save option to first save the unsaved changes. For standard error data attached to a design block, first save the block with save_block, then close the error data.

ERRDM-007

(error) The error data %s is open.

Description

An attempt was made to remove an error data file which has not been closed.

What Next

Close the error data before removing it.

Feedback

ERRDM-008

(error) An error type with the given name already exists.

Description

An attempt was made to create an error type with an existing name. Error type names must be unique.

What Next

Specify a unique name for the new error type.

ERRDM-009

(error) The error class was missing or was invalid.

Description

An attempt was made to create an error type without specifying a valid error class.

What Next

Specify a valid error class.

ERRDM-010

(error) Invalid error type.

Description

An attempt was made to create an error for an invalid error type.

What Next

Specify a valid error type.

ERRDM-011

(error) Invalid error specification.

Description

An attempt was made to create an error with invalid parameters.

What Next

Specify a valid parameters.

Feedback

ERRDM-012

(error) An error data file with the given name already exists.

Description

An attempt was made to create an error data file with an existing name. Error file names must be unique.

What Next

Specify a unique name for the new error data file.

ERRDM-013

(error) The given error data file is read-only.

Description

An attempt was made to edit an error data file which was open in read-only mode.

What Next

Open the error data file in read-write mode.

ERRDM-014

(error) For a top level 3DIC design, you cannot create drc errors with layers.

Description

create_drc_error command cannot be used to specify layers for a top level 3DIC design.

ERRDM-032

(error) For a top level 3DIC design, you cannot create drc errors with layers.

Description

create_drc_error_shapes command cannot be used to specify layers for a top level 3DIC design.

ERRDM-033

(error) At least one of options '-polygons', '-polylines', '-points' or '-endpoints' for create_drc_error_shapes should be specified.

Feedback

Description

create_drc_error_shapes command requires at least one of options: '-polygons', '-polylines', '-points' or '-endpoints' to be specified.

ERRDM-034

(warning) There must be two coordinates given for each endpoint shape.

Description

There must be two coordinates given for each endpoint shape.

ERRDM-035

(error) ERRDM_LOCK_FAIL_ACTION `%s' not one of: `off', `complain', or `die'. Turning off.

Description

This is an internal error. Please report to Synopsys.

What Next

Internal error, please report to Synopsys.

ERRDM-036

(info) lock check failed!.

Description

This is an internal message. Please report to Synopsys.

What Next

Internal message, please report to Synopsys.

ERRDM-037

(error) %s cannot be saved independent of the associated block.

Description

Error data that are attached to a block cannot be saved independent of saving the block.

Feedback

What Next

To save changes to the given error data, call save_block to save the block. Alternatively, you may export the error data to a file using the command write_drc_error_data.

ERRDM-038

(warning) option '-readonly' and '-readwrite' will be ignored when opening error data which is attached with current block.

Description

option '-readonly' and '-readwrite' will be ignored when opening error data which is attached with current block.

ERRDM-039

(error) Use '-endpoints' option with two point coordinates to specify two endpoints for an open error.

Description

Open error accepts only '-endpoints' option with two point coordinates to describe open error shape.

ERRDM-040

(error) Saving to the given version %s is not supported. %s

Description

Provide a version string in the supported range.

ERRDM-041

(error) The drc error data schema version string %s is invalid.

Description

Provide a properly formed version string, <major version number>.<minor version number>, "1.6", for example.

ERRDM-042

(error) The design schema version string %s is invalid.

Feedback

Description

Provide a properly formed version string, <major version number>.<minor version number>, "1.090", for example.

ERRDM-043

(error) The error data %s is closed.

Description

An attempt was made to edit or access data of an error data file which has not been opened.

What Next

Open the error data before editing or accessing its types and violations.

See Also

- open_drc_error_data

ERRDM-044

(error) Unopened error data %s cannot be saved.

Description

An attempt was made to save an error data file which has not been opened.

What Next

Check the error data file input to make sure you specified the correct one.

See Also

- open_drc_error_data

ERRDM-045

(information) Incrementing open_count of error data '%s'.

Description

open_drc_error_data was called for an already opened error data. A reference count was added to the error data. Use close_drc_error_data to decrement the reference count. When the reference count drops to zero, the error data will be closed.

Feedback

See Also

- close_drc_error_data

FILE

FILE-001

(error) Unable to open file '%s' for reading; %s

Description

The file cannot be read for the reason specified.

What Next

Examine the reason given. The file may not exist or may not be readable due to file permissions.

FILE-002

(error) File '%s' cannot be found using search_path of: '%s'.

Description

The file cannot be found on the specified search_path.

What Next

Determine whether the file name or the search_path is incorrect, or whether the file does not exist at all.

FILE-003

(error) Unable to open file '%s' for writing; %s.

Description

The file cannot be opened for writing for the reason specified.

What Next

Examine the reason given. The parent directory may not exist or write permission may be denied.

Feedback

FILE-004

(error) Unable to create directory '%s'; %s.

Description

The directory cannot be created for the reason specified.

What Next

Examine the reason given. The parent directory may not exist or write permission may be denied.

FILE-005

(error) Unable to access directory '%s'; %s

What Next

Check the directory path name.

FILE-006

(error) Unable to remove directory '%s'; %s

Description

The tool was unable to remove the specified directory.

What Next

The directory could not be removed.

FILE-007

(information) Loading %s file '%s'

Description

This informational message shows the full path name and type of a file being read into the application.

What Next

Use the full path name to help understand any problems encountered while reading the file.

Feedback

FILE-008

(error) Directory '%s' already exists

Description

The directory with the specified name already exists.

What Next

Try another name for the new directory.

FILE-009

(error) File '%s' already exists

Description

A file with the specified name already exists.

What Next

Try another name for the new file.

FILE-010

(error) Unable to lock file '%s' for write @%s; %s.

Description

The file cannot be write-locked for the reason specified.

What Next

Examine the reason given. The file may be locked by another process or lock services may not be available on this server.

The reason “No locks available.” indicates a machine error. The ‘lockd’ process (a part of the NFS lock manager, which supports record locking operations on NFS files) is either not running on the server or has malfunctioned. ‘lockd’ may need to be started, or killed and then restarted. In some cases, a server reboot may be needed. These actions typically require the end-user to make a request to their local IT department.

FILE-011

(error) Problem writing to file '%s'; %s.

Feedback

Description

There was an error writing data to the specified file.

What Next

Examine the reason given. The disk may have ran out of space, or there was a system or network event that interrupted the write operation.

FILE-012

(error) Directory '%s' already exists, '%s'.

Description

The directory with the specified name already exists.

What Next

Try another name for the new directory.

FILE-013

(error) Cannot open file '%s' for read.

Description

Unable to open file for read.

What Next

Check that the file exists. Check file/directory for read permissions.

FILE-014

(error) Cannot open file '%s' for write.

Description

Unable to open output file for write.

What Next

Check file/directory for write permissions.

FILE-015

(error) Basenames of original file and new file do not match. Original file: %s New file: %s

Feedback

Description

The given filenames do not have matching basenames.

What Next

This check is done to avoid user error. If this is intended, please run update_cross_probing_files command with -force option to bypass this check.

FILE-016

(error) File %s not found in the set of cross-probing files.

Description

The file being requested for update does not appear to be in the set of Cross-Probing files.

What Next

Run report_cross_probing_files to retrieve the list of files known by Cross-Probing manager.

FILE-017

(error) Unable to retreive the disk space for %s; %s.

Description

The directory cannot be created for the reason specified.

What Next

Examine the reason given. The directory may not exist or permission may be denied.

FILE-018

(error) Unable to get working directory name; %s

Description

The current working directroy name could not be returned. The most common reason is the directory you are in no longer exists.

What Next

Examine the reason given. If your working directory no longer exists, change into a valid directory using absolute path and try again.

Feedback

FILE-019

(error) Decompressing failed; %s.

Description

Unable to decompress the file for the specified reason.

What Next

Check the compressed file.

FILE-020

(error) Command '%s' not executed due to '%s' error.

Description

The command run by you is not successfully executed due to the error message printed.

What Next

Please give a valid command. for example: if there is a directory "dir1" present and if someone creates directory using command "mkdir dir1" then error reported will be "mkdir: cannot create directory ‘dir1’: File exists"

FILE-021

(info) File %s already exists. It will be overwritten.

Description

The command run by you is writing a file that already exists, so it will be overwritten.

FLIB

FLIB-1

(information) %s

Description

This is a general informational message.

What Next

No action required.

Feedback

FLIB-2

(warning) The fusion_lib library '%s' registry file error at line %d. %s

Description

The registry.dat file inside a fusion_lib library (directory) is created and updated by Library Compiler. Note that in the early phase of testing, there may be frequent incompatibility between versions. The following descriptions should help in diagnosing issues.

Bad symbolink link. Most likely the symbolic link points to a file no longer exists.

First line not recognizable. The first line is of a fixed "key" format that users must not modify.

File type not supported. The fusion_lib only supports a limited number of file.

Bad data format. Each line consists of 2 or 3 tokens (fie_type file_name checksum). This line is invalid.

File name already registered. This is most likely a bug as two files cannot have the same name in a given fusion_lib directory.

File missing or not readable. The file has been removed or is not readable.

Bad checksum in registry. The registry checksum in the first line no longer agrees with the checksum generated from the rest of the file. This means a user may have modified the registry.

What Next

If the problem is a bad symbolic link because of a moved file, update the symbolic link. In general, the fusion_lib library needs to be re-checked and saved in order to update the registry. R&D.

FLIB-3

(error) The fusion_lib library '%s' not qualified.

Description

This error message occurs after the fusion_lib checks failed either by check_fusion_lib command or internally called in create_fusion_lib or save_fusion_lib command (equivalent to check_library -logic_vs_physical). The default check is -logic_vs_physical. When it is not qualified by the default check, save_fusion_lib cannot save it as qualified fusion_lib on disk. When there is no frame file, it will print out: No physical library found.

The fusion_lib passing criteria depend on the policy specified by set_early_data_check_policy command:

1) error policy, default mode No missing physical cells reported in LIBCHK-211 and no missing logic or physical signal pins reported in LIBCHK-212.

2) tolerate policy Library data as is, and no severe errors below reported No missing logic or physical signal pins reported in LIBCHK-212.

3) repair policy: Use the same criteria as tolerate policy, and apply check_library -auto_fix

What Next

Check the reported issues in LIBCHK-xxx tables for detail and correct the library accordingly or apply auto fix.

FLIB-4

(error) Failed to save fusion library '%s': %s.

Description

This message indicates that an operation of saving the specified fusion library failed. The reason is given with the message.

What Next

This is just a summary message. Usually there will be other error message(s) before this one to indicate the actual problem. Please refer to those error messages for how to correct the issue.

FLIB-5

(error) Failed to create fusion library '%s': %s.

Description

This message indicates that an operation of creating a fusion library failed. The reason is given with the message.

What Next

Correct the problem and try again.

FLIB-6

(error) Failed to %s ECO file '%s': %s.

Feedback

Description

This message indicates that an operation of specified ECO file failed. The reason is given with the message.

What Next

Correct the problem and try again.

FLIB-7

(error) Failed to save frame '%s' for fusion library '%s'.

Description

This message indicates that saving specified frame of fusion library failed. The reason is given with the message.

What Next

Correct the problem and try again.

FLIB-8

(error) Failed to open fusion library '%s': %s.

Description

This message indicates that an operation of open the specified fusion library failed. The reason is given with the message.

What Next

Correct the problem and try again.

FLIB-9

(information) ECO file '%s' was changed: %s.

Description

This message indicates that the specified ECO file had been changed outside Library Compiler. The actual change and tool's re-action are given with the message.

What Next

Verify whether the change is expected.

Feedback

FLIB-9w

(warning) ECO file '%s' was changed: %s.

Description

This message indicates that the specified ECO file had been changed outside Library Compiler. The actual change and tool's re-action are given with the message.

What Next

Verify whether the change is expected.

FLIB-10

(error) Unable to create a temporary work directory

Description

Library Compiler is unable to create a temporary work directory to store data. If the environment variable TMPDIR is present, please make sure it points to a writable disk location which is not full. If TMPDIR is missing, Library Compiler uses /usr/tmp, please make sure /usr/tmp is writable and not full.

What Next

Fix the problem and run again.

FLIB-11

(information) The fusion_lib %s requires %d number of refresh check(s)

Description

Refresh checks are triggered because the fusion_lib has been copied or moved inappropriately. Although totally harmless, they introduce unnecessary performance overheads. The underlying cause is that some modification time stamps are changed.

When copying using "cp", be sure to specify "-a" (for archive), rather than "-R":

cp -a fusion_lib_dir /destination

When copying using "tar", preserve high-resolution time stamps using posix format.

tar --posix -cf output.tar fusion_lib_dir

Alternatively, you may wish to refresh it using open_fusion_lib & save_fusion_lib commands in Library Compiler

Feedback

FLIB-12

(error) Cannot open fusion library '%s' as it had been changed since last save. Please save it again using Library Compiler first.

Description

This message indicates that the specified fusion library had been changed since last save and cannot be opened. Here, the change means any content or time stamp change of any relavent files in the fusion library.

What Next

Save the fusion library using Library Compiler and try again.

FLIB-13

(error) Frame file using "reflib.ndm" as frame file name is NOT supported.

Description

The "reflib.ndm" is a reserved file name of directory-based ndm library. It usually resides under the ndm library directory. The frame file should be defined using the ndm library directory name.

If it's a file-based ndm file which has schema version prior to 1.200, please avoid using "reflib.ndm" as the file name.

What Next

For directory-based frame libray, please use the parent directory of reflib.ndm as the frame file name. For file-based frame library, please use a different file name as the frame file name.

FLIB-14

(warning) Fusion library '%s' created or saved with inconsistency issues waived.

Description

This message indicates that a fusion library is created or saved with missing or mismatched issues waived between logic and physical libraries. These issues are reported in the library checker in LIBCHK tables above this message line. Please refer to FLIB-3 man page for qualification criteria under each check policy.

Feedback

What Next

Investigate the reported missing or mismatched issues. If those cannot be waived for your design, please fix the library first. You may fix the issues by set_early_data_check_policy -config {repair} or explicitly use set_attribute or other utilities to fix.

FLIB-101

(information) Processing of %s NOT supported. Skipped.

Description

This information indicates a specific command or app option does NOT affect the Fusion Library creation, thus is NOT supported in LM script migration for LC.

What Next

No action required.

FLR

FLR-1

(warning) Variable '%s' cannot be changed once assigned.

Description

This variable cannot be changed once set. Please do not try to set this variable for the second time.

What Next

This particular variable cannot be changed twice. You have to exit from the shell and again run the shell and then use the new value of the variable.

FLT

FLT-002

(information) Errors preprocessing compiled filter.

Feedback

Description

This is a summary message generated after a filter expression has successfully parsed, but unsuccessfully processed because of an unknown identifier, type mismatch in a relation, or invalid operator in a relation.

What Next

Look at previous error messages to determine the problem with the filter expression. Correct the problems, and retry the operation.

FLT-003

(error) while parsing filter expression: %s\n \tat '%s'

Description

A filter expression could not be successfully parsed, typically because of a syntax error. The point in the expression that caused the failure is shown along with the remainder of the expression.

What Next

Look at the man pages for filter expression syntax, and verify that your expression conforms to the syntax. Ensure that supported relation and logical operators are in use, that the expression is constructed of a series of relations separated by logical operations, etc.

FLT-005

(error) Unknown attribute '%s'.

Description

Filters are evaluated within a context. Given the current context, an attribute which you entered is unknown.

A relation in a filter expression is very simple. For example, "area <= 2.4". In this case, the attribute is "area". If you were applying the filter to a pin collection, since "area" is not a valid pin attribute, this error would occur.

What Next

Look at the man pages for the given command, and ascertain the valid values for attributes.

Feedback

FLT-006

(error) Type mismatch between '%s' and '%s'.

Description

A relation in a your filter expression has an identifier and value with inconsistent types. The following simple rules apply:

```
Identifier              Type mismatch
        generates:              when value is:
        ------------------------------------------------
        string                  n/a - never an error
        numeric literal         string, true, false
        boolean                 numeric literal, string
```

Note some important distinctions: the boolean words TRUE and FALSE are interpreted as strings in a string relation, or as boolean in a boolean relation. Similarly, the numeric literal 2.4E-9 is interpreted as a string in a string relation, or as a number in a numeric relation.

What Next

Re-enter the filter with valid identifier/value relations.

FLT-007

(error) Invalid operator '%s' for '%s' and '%s'.

Description

A relation in a your filter expression has an identifier and value with consistent types but an invalid operator. The following simple rules apply:

Type: Invalid operators: ---------- string None. All operators ok. numeric literal =~, !~ boolean =~, !~, <, >, >=, <=

What Next

Re-enter the filter with a valid operator for the failed relation.

FRAM

FRAM-054

(warning) Technology used to create frame-view and current technology have inconsistency: %s.

Feedback

Description

The reported part of the technology are inconsistent between the reference library and the design library.

What Next

Update the library with consistent technology and try again.

GEN

GEN-1

(error) Cell '%s' instance '%s' pin '%s' has same Y coordinate as cell '%s' instance '%s' pin '%s'.

Description

Two pins of the same cell, or different cells in the same column, are found to overlap. This was probably caused by a problem in either the symbol library being used or in schematic generation. Check the identified pins in your symbol library source to see if they are pins of the same cell and if the same Y coordinate has been defined for them. If so, correct the Y coordinates, recompile the symbol library, and rerun the test. If this is not the case, report this as a bug in schematic generation.

GEN-2

(error) Pin '%s' on Cell '%s' does not lie on a grid.

GEN-3

(warning) Creating a symbol for cell '%s' of type '%s'.

Description

This warning is issued when the *gen_show_created_symbols* dc_shell variable is set to "true" and *create_schematic* can not locate the symbol template for a cell in the database or in any of the symbol libraries. In such a case, *create_schematic* automatically generates a rectangular symbol template to use in the schematic. In general, this is done by putting all the input pins on the left side of the symbol and all other pins on the right side. The size of the generated symbol can be controlled by setting the *gen_max_ports_on_symbol_side* variable to an appropriate value.

Feedback

What Next

If this warning is issued for primitive gates, that may indicate that the *symbol_library* or *search_path* variables have not been set properly. This can be resolved by (1) finding the symbol library (a file with a .sdb suffix) to be used and appending it to the *symbol_library* variable, and (2) appending its directory path to the *search_path* variable.

Libraries usually don't have symbol templates for hierarchical cells, so this warning should be ignored for such cells.

GEN-4

(error) Could not find pin: '%s', in cell: '%s' in schematic library '%s'.

GEN-5

(error) Symbol library doesn't have off-sheet connectors.

GEN-6

(warning) Symbol exceeds sheet size.

Description

This warning is issued when one of the symbol templates *create_schematic* creates exceeds the size of the sheet being used. This may be caused by either the sheet being too small or there being too many pins on the symbol.

This message is only issued for symbols that have so many pins that *create_schematic* creates a smaller square symbol with all the pins equally distributed along the four sides, and even then this symbol exceeds the sheet size.

What Next

If this is of concern, use a larger sheet size. Since *create_schematic* will automatically create the smallest symbol possible for the given number of ports when this message is issued, the only way to make the symbol fit the sheet is to use a larger sheet.

GEN-7

(warning) Maximum ports on symbol side limit of '%d' exceeded.

Feedback

GEN-8

(warning) Can't rename off-sheet connector of net '%s'\n to the name of its port '%s'\n because net '%s' already exists.

GEN-10

(warning) Couldn't find all the port symbols in the generic symbol library.

GEN-11

(error) Couldn't find pin name '%s' in ripper symbol '%s'.

GEN-12

(error) Couldn't find a ripper symbol for creating a bussed schematic.

GEN-13

(error) Annotator '%s' has an invalid format specification '%s'.

GEN-14

(error) An unnamed annotator has an invalid format specification '%s'.

GEN-15

(error) Annotator '%s' has more than %d '%%s' specifications \n \tin the format string.

GEN-16

(error) An unnamed annotator has more than %d '%%s' \n \tspecifications in the format string.

GEN-17

(error) Annotator '%s' has an invalid expression '%s'.

Feedback

GEN-18

(error) An unnamed annotator has an invalid expression '%s'.

GEN-19

(warning) The symbol for cell '%s' has a pin off the route grid.\n \tYou may be mixing symbol libraries with different route grids.

Description

This warning is issued when one of the schematic symbols is found to have a pin that is located outside the route grid being used by *create_schematic*, i.e., the pin is somewhere in the middle of the square region defined by the four points around it that represent the intersection of vertical and horizontal grids instead of being on one of the edges or corners. This indicates that the schematic may contain symbols from more than one symbol library and that these libraries specify different route grids. In such a case, *create_schematic* picks up the route grid specified in the first symbol library it runs into, and uses that route grid in the schematic. Any symbols coming from libraries whose route grids do not match the one being used by *create_schematic* are not guaranteed to have their pins aligned with the route grid.

What Next

If this is a problem in transferring the schematic to some external environment, try using symbol libraries with the same route grid. If this is not possible, try modifying the route grids in your symbol libraries to match each other. This is done by editing the .slib file and changing the argument to the *set_route_grid()* specification and then recompiling that library with the *read_lib* command.

GEN-20

(error) One of the pins or port busses is corrupted.

Description

This error is issued when one of the design ports or pins is found to have a corrupt bus structure. This can happen sometimes because of inconsistent bus creation by different tools in the design. In such a case, the port or pin that is found to have a corrupt bus structure will be drawn unbussed in the schematic, i.e. its bus will be ignored by *create_schematic*.

What Next

If there are no other problems with the tool run, this message should be ignored as *create_schematic* automatically ignores the bus objects responsible for corruption.

Feedback

GEN-21

(error) Cell %s's pin %s is on wrong side.

GEN-22

(error) Net %s connects pins of different widths.

GEN-23

(warning) The netlist contains bus-to-bus connections. Any \n\t nets involved in inter-bus connections will be \n\t displayed as disconnected in the no-ripper schematic.

GEN-24

(error) Could not find the type mapper symbol in the \n generic symbol library. The generic symbol library \n is probably old - Please use a new library and \n recreate the schematic.

GEN-25

(warning) All cells are power/ground or have no connection.

Description

Cells in the current design are all power cells or all ground cells. Or the cells have no pins.

GEN-26

(error) member '%d not found in bus '%s' . Only following members present : '%s'. The design is corrupted.

GEN-27

(warning) Creating a very large schematic. \n \tIt is approximately %d wide and %d tall. \n \tMust skip the 'improve' algorithm due to insufficient memory.

Description

You receive this warning when you are trying to create a schematic for a very large design, but there is not sufficient memory available to perform the "improve" algorithm.

Feedback

What Next

You have available three courses of action:

- You can let the schematic creation continue, with the possibility that it will succeed, if there is enough memory.
- You can monitor the performance, using a UNIX utility such as *top*, to see if you are close to running out of address space.
- You can send an interrupt to the application, which terminates the schematic creation at the next check point in the algorithm.

Because large schematics are difficult to work with graphically, consider whether you really want your schematic to be so large. If you have flattened your design, going back to an unflattened design might be more workable and require less address space.

If it is imperative that you produce the schematic, rerun your application using the 64-bit version (if it is available to you), which has a memory address space limit exceeding 4 gigabytes. The process should eventually succeed, providing you have enough swap space on your machine.

GEN-28

(warning) Creating a schematic with an extreme number of sheets. \n \tThe schematic being created has %d sheets. \n \tAborting attempt to create schematic.

Description

You receive this warning because you are trying to create a schematic that has too many sheets, making it impractical to use. The process is terminated.

What Next

You can avoid the issue by choosing a larger sheet size, which will result in fewer sheets: -size A is the smallest sheet size, -size B is larger, and so on, up to -size infinite, which is always just one sheet. For more information about sheet sizes, see the man page for the *create_schematic* command.

GUI

GUI-001

(Error) %s%s '%s' not found.

Feedback

Description

The specified object does not exist.

GUI-002

(Error) %s%s name is empty.

Description

The name for the relevant object type [toolbar|menu|window type|hotkey,..] is empty.

GUI-003

(Error) %sValid %s name cannot consist only of ampersands.

Description

Valid name for specified object type cannot consist only of ampersands. The object type can be a menu, toolbar, window type, hotkey, etc.

GUI-004

(Error) %sTrailing '->' not allowed in menu name '%s'.

Description

Trailing '->' not allow in specified menu name.

GUI-005

(Warning) %sHotkey '%s' is reserved. Please use another hotkey.

Description

Specified hotkey is reserved by application. Please use another hotkey.

GUI-006

(Warning) %sHotkey '%s' is not supported.

Description

Specified hotkey is not supported. Please check spelling or use another hotkey. Shift modifier only work with letter or function hotkey. Thus, "Ctrl+Shift+4" is not supported.

Feedback

GUI-007

(Error) %sHotkey '%s' is invalid. Please check spelling.

Description

Specified hotkey is invalid. Please check spelling.

GUI-008

(Warning) %sMenu item '%s' already exist for %s '%s'.

Description

Specified menu item already exist for specified window type.

GUI-009

(Warning) %sHotkey '%s' will not be set for menu '%s'. Hotkey is in use.

Description

Specified hotkey will not be set for specified menu. It is already in use by another menu item or tcl command.

GUI-010

(Error) %sAnchor offset must be nonzero.

Description

Anchor offset value for specified command must be either a positive or negative integer.

GUI-012

(Warning) %s: Specified dock side '%s' is invalid. Top docking side will be used.

Description

Specified dock side is invalid. Valid values include left|top|right|bottom.

GUI-014

(Error) %s: menu item '%s' not found for window type '%s'.

Feedback

Description

Specified menu item not found for specified window type or default window type if not specified.

GUI-015

(Warning) %s: hotkey '%s' is already set for tcl command '%s'.

Description

Specified hotkey is already set for an existing tcl command.

GUI-016

(Warning) %s: hotkey not set, hotkey '%s' is already set for menu item '%s'.

Description

Specified hotkey has already been used by a menu item. Use -replace option to force hotkey to be set.

GUI-017

(Warning) %s: hotkey '%s' is reserved by system function '%s'.

Description

Specified hotkey has already been used by an internal system function.

GUI-018

(Error) None of the supported browsers %s are in the path

Description

This error message occurs when the application can not find a browser from the list of supported browsers in your environment.

What Next

Please correct the PATH to get one of the supported browsers. Please contact your system administrator to get the location of the browsers.

GUI-020

(Info) No %s installation specified with variable %s

Description

The application extension to ICC specified depends on the variable to point to the installation of that tool. The environment variable specified was not set so this extension to ICC will not be loaded.

What Next

If you would like to load the ICC extension for that tool, then please setup the variable to point to the appropriate tool installation before running the ICC GUI.

GUI-021

(Warning) Extension %s not loaded because extension loading is disabled

Description

The loading of application extensions has been disabled. Therefore the specified extension will not be loaded.

What Next

Re-enable extension loading if you want to have extensions loaded.

Feedback

GUI-022

(Error) %s installation directory specified in variable %s is not a directory. Extension can not be loaded from %s

Description

The installation directory for the extension was not a directory, so the extension could not be loaded.

What Next

Correct the setting of the variable to specify the path to the installation of the tool and re-start the ICC GUI to get the extension loaded.

GUI-023

(Warning) The %s installation specified does not contain an ICC extension setup file %s

Description

The installation directory for the extension did not contain the expected ICC extension, so the extension could not be loaded.

What Next

Correct the setting of the variable to specify the path to the installation of the tool and re-run ICC to get the extension loaded. If this version of the application does not support the ICC extension you may need to update to a newer version of this application.

GUI-024

(Info) Loaded %s extension from %s

Description

This message indicates that the ICC extension for the specified application was automatically loaded. The loading of the extension is controlled by the specification of the application installation for this application via a variable.

What Next

There are no additional steps required to use this extension.

GUI-025

(Error) Error sourcing %s extension setup file %s. %s : error_info is: %s

Feedback

Description

There was an error detected when loading the ICC extension for the specified application. Please contact the support staff for the application to get assistance in correcting the problem.

What Next

Please ensure that the application installation specified is correct. If there is an error in the extension then please contact the support staff for that application to get a fix for their ICC extension.

GUI-026

(Info) Visibility is turned %s for cells and cell contents because the task is set to %s

Description

The visibility options for cells and cell contents are turned OFF automatically when the task is set to Design Planning or turned ON automatically when the task is set to Block Implementation or All.

What Next

You can set the preference setVisibilityByTask to turn on or turn off this behavior. For example, to turn off this behavior, use the following command:

gui_set_pref_value -category layout -key setVisibilityByTask -value false

By default, this preference is set to true.

GUI-027

(Error) All menu items may not be deleted from a window type menu

Description

All menu items may be deleted from a menu using the menu root name but not from a window type menu.

What Next

You can use the -root option to specify a menu root.

GUI-028

(Error) A menu root named %s was not found.

Feedback

Description

A menu root with the given name could not be found.

GUI-029

(Error) A menu root named %s was not found.

Description

A menu root with the given name could not be found.

GUI-030

(Error) Specified view, %s, does not exist

Description

A view with the given name does not exist.

GUI-031

(Error) Specified command, %s, does not exist

Description

The given name for the command option is invalid.

GUI-032

(Error) Specified task, %s, does not exist

Description

The given name for the task option is invalid.

GUI-033

(Error) Task item root: %s not found.

What Next

Check and correct the option value of the -item_root option.

Feedback

GUI-034

(Warning) Layers %s have no preferred routing direction.

Description

Congestion data from those layers which have no preferred routing direction will not be displayed in the map.

What Next

If you would like to see the congestion data from those layers, then please setup the preferred routing direction on those layers.

GUI-035

(Warning) Collection size limit reached

Description

The number of objects in the collection created by the gui command has exceeded the size limit.

What Next

Check the command is correct and if necessary increase the size limit.

GUI-036

(Warning) not all objects could be represented as a collection

Description

Some of the selected or highlighted objects could not be returned as they are not representable in a collection.

What Next

Check the objects are correct and if necessary request gui collection support for the missing objects.

GUI-037

(Error) Given color index is greater than max index: %d

Description

The given color index argument is too large.

Feedback

What Next

Please ensure the the given index is no greater than the maximum color index allowed for the current or given Palette.

GUI-038

(Error) Given color name (%s) is not legal.

Description

The given color name is not a legal color name.

What Next

Please ensure the the given color name is a legal name for the current or given Palette.

GUI-039

(Error) %s%s value '%s' is invalid.

Description

Specified filter value is invalid.

GUI-040

(Warning) Anchor toolbar '%s' not found.

Description

Specified name for an anchor toolbar is invalid.

GUI-041

(Warning) Anchor toolbar '%s' not found.

Description

Specified name for an anchor toolbar is invalid.

GUI-042

(Error) Duplicate toolbar item: %s.

Feedback

What Next

Check and correct the menu item name.

GUI-043

(Error) The file %s could not be opened for write.

Description

There was an error while opening the given file for writing.

What Next

Please check permissions for the file path.

GUI-044

(Error) Specified task, %s, does not exist

Description

The given name for the task option is invalid.

GUI-045

(Error) Specified file does not exist: %s.

Description

The given file could not be found or read.

GUI-046

(Error) No tip files found in the given directory %s.

Description

The given directory could not be found or read, or there were no files found with ".html" file extension in the given directory.

GUI-047

(Error) The given file %s already exists.

Feedback

Description

The given output file already exists. Please move or delete the existing file.

GUI-048

(Error) There was an error wrhile writing to %s.

Description

There was an error while writing to the given output file and not all of the document could be written.

GUI-049

(Error) Preset '%s' not found for category '%s'.

Description

Specified preset not found for specified category.

GUI-050

(Error) Performance monitor could not be found.

Description

Performance monitor program executable files could not be found in the Synopsys tool installation.

GUI-051

(Warning) 3D View requires X Server to have %s extension.

Description

3D View uses an OpenGL renderer which requires your X Server to have the GLX and RENDER extensions. Typically this is caused by using a vncserver which is old or not configured to have the GLX or RENDER extensions.

What Next

You can open a shell window in your X Server and run the command xdpyinfo. The list of extensions is listed near the top. You will need to see the following: GLX RENDER

Feedback

GUI-052

(Warning) 3D View requires a valid DISPLAY environment variable.

Description

3D View uses an OpenGL renderer which requires a connection to a valid X Server via the DISPLAY environment variable.

What Next

You can open a shell window in your X Server and run a simple X application like xclock. You can open a shell window in your X Server and run the command xdpyinfo. The list of extensions is listed near the top. You will need to see the following: GLX RENDER

GUI-053

(Warning) 3D View requires a network connection to a X Server.

Description

3D View uses an OpenGL renderer which requires a connection to a valid X Server via the DISPLAY environment variable.

What Next

You can open a shell window in your X Server and run a simple X application like xclock. You can open a shell window in your X Server and run the command xdpyinfo. The list of extensions is listed near the top. You will need to see the following: GLX RENDER

GUI-054

(Warning) 3D View Could not find a compatible X Visual in the X Server. The X Server needs to support 32 bit planes.

Description

3D View requires the X Server to support 32 bit planes. OpenGL requests 24 bit planes PLUS 8 bits of Alpha. If the output of xdpyinfo for the X Server in question does not have at least one entry contianing "32 planes", then the X Server is not supported. That entry must also state "TrueColor

What Next

If the output of xdpyinfo doesn't contain all these lines, then it is incompatible with the OpenGL based 3D view. GLX RENDER 32 planes

Here is an example of an X Visual output by xdpyinfo that is compatible with the OpenGL based 3D view:

default visual id: 0x21 visual: visual id: 0x21 class: TrueColor depth: 24 planes available colormap entries: 256 per subfield red, green, blue masks: 0xff0000, 0xff00, 0xff significant bits in color specification: 8 bits

The output must contain at least one other entry that can support 32 planes:

visual: visual id: 0x47 class: TrueColor depth: 32 planes available colormap entries: 256 per subfield red, green, blue masks: 0xff0000, 0xff00, 0xff significant bits in color specification: 8 bits

---

GUI-055

(Info) 3D View will not run with the -batch option (offscreen mode).

Description

3D View uses an OpenGL renderer which currently does not work in offscreen mode (-batch option).

What Next

Remove the -batch option when running fc_shell or icc2_shell

GUI-056

(Warning) 3D View is missing OpenGL support library: libxcb-glx.so. Check your platform for QSC compliance.

Description

3D View uses an OpenGL renderer which is only supported on platforms compatible with CentOS 7 or greater and Suse 12 or greater.

What Next

Verify that you are running fc_shell or icc2_shell on a QSC-Q platform.

GUI-057

(Warning) 3D View requires the Synopsys version of libGL.so.

Feedback

Description

3D View uses an OpenGL renderer which is built by Synopsys specifically for this product. This error indicates the application is loading a version of libGL.so that wasn't supplied by Synopsys.

What Next

Make sure you are using the version of libGL.so supplied by Synopsys in the product installation. Make sure you don't have a LD_LIBRARY_PATH setting that finds your OS-installed libGL.so

---

GUI-058

(Warning) Given color has been matched to index: %d.

Description

The given color has been matched to index in a current palette.

What Next

Please ensure the the given color name is a legal name for the current or given Palette.

GUI-059

(Warning) View "%s" is being disabled. See previous "3D View" warnings.

Description

3D Views are disabled when the runtime environemnt won't support a particular X Server, or an installation environemnt for OpenGL libraries isn't set up properly according to QSC-S

What Next

Read the "3D View" warnings prior to the message and take the suggested actions.

GUI-060

(Warning) 3D View requires server glx version 1.4.

Description

3D View uses VKT9 which requires a glx version of 1.4.

Feedback

What Next

You can open a shell window in your X Server and run glxinfo (mesa utilities) to determine current version.

GUI-061

(Warning) The total number of visible errors exceed the set maximum for displayed errors.

Description

The maximum errors that are displayed in the layout are set using a preference key and can be changed using the same.

What Next

You can use the command "gui_set_pref_value -category {Globals} -key {gui_error_browser_show_all_max} -value {val}" where val is the number of errors to be displayed in the layout and reload the database. However, increasing this value above the recommended limit (200000) might result in the application displaying slow downs depending on the available computational resources.

GUI-062

(Warning) The application can display slow downs since the gui_error_browser_show_all_max value is greater than the recommended value (%d).

Description

Since a large number of errors are now being loaded into the error browser, the application can display a slow down depending upon the computational resources available.

What Next

Reset the value to the default value.

GUI-063

(Warning) Since the desired value of the preference is out of bounds (minimum %s, maximum %s), it is being reset to the nearest bound.

Description

If the desired value is less than the minimum value of the preference, then the value is set equal to the minimum value. On the contrary, if it is greater than the maximum value of the preference, then the value is set equal to the maximum value.

Feedback

GUI-064

(Warning) Initialization of Tk can prevent use of other application features (See man page for details)

Description

If Tk is initialized then the GUI can no longer support close and reopen of display as Tk does not allow this feature.

That means user cannot call 'gui_stop -close' (to close gui) and then 'gui_start' (to restart gui) for example when switching from offscreen display to normal X11 display.

It also means that save_checkpoint command cannot be used, as that command can only be run when GUI is closed and restore of the closed checkpoint, with the saved Tk state would fail.

GUI-065

(Warning) Failed to find application's associated terminal

Description

The gui will try to find the terminal associated with the application on gui start but may fail depending on the invocation method or terminal X11 support.

If this functionality is needed, and message is output, then please report so specific environment can be investigated.

GUI-998

(Warning) %s

Description

A warning was issued for a non-fatal error when running the command.

What Next

If the error indicates a problem then fix it and re-run the command. If the error is benign then ignore the error.

GUI-999

(Error) %s

Feedback

Description

An error was found when running the command as desribed in the error message.

What Next

Fix the error and re-run the command.

HCEXT

HCEXT-001

(Error) For generated clock: %s, either master clock does not reach the boundary of HyperScale block %s or there are parallel clock source paths (with at least one of them going through sequential logic) from master clock to the boundary pin %s.

Description

If the master clock of a generated clock doesnt reach the boundary of a HyperScale block, there is no way to define the generated clock at block level. In order to fix this, user needs to create a new auxiliary generated clock for each cross-boundary generated clock such that the boundary pin falls in the direct clock network of this new gclock. Now the original generated clock can be defined w.r.t this new generated clock and the boundary pin should be used as the master pin of the original gclock.

Also if there are multiple parallel paths (with at least one of them sequential) from the master source to a block boundary pin, the source latency of generated clock cannot be captured at block level. It is recommended that a unique generated clock is defined for the driver pin of the last sequential element before the block boundary for each of these paths . Then cross-boundary generated clocks can be safely defined w.r.t one or more of these generated clocks.

HCEXT-002

(Error) For generated clock: %s, the source network of this generated clock leaves and reenters the HyperScale block %s too many times.

Description

This error is issued when the source network of generated clock exits the block more than once. Essentially one re-entrance is acceptable but more than one re-entrance is prohibited. User is asked to fix this by creating auxilary generated clocks.

Feedback

HCEXT-003

(Error) For generated clock: %s, master clock does not reach the generated clock source pin %s.

Description

If there are other generated clocks defined between the master clock and the generated clock, the master clock is blocked and cannot reach the source of the generated clock, the waveform cannot be derived from the master clock at block level. It is recommanded that the generated clock use its immediate upstream clock as its master clock.

HCEXT-004

(Error) For generated clock %s inside HyperScale block %s erroneous situations (UITE-461, PTE-075, etc. messages in log file) are encountered.

Description

When a generated clock definition causes any of the following error/warning messages: UITE-461, PTE-004, PTE-023, PTE-024, PTE-025, PTE-075, it implies that there is a problem in definition of the generated clock so the behaviour of the clock would not be as expected. Therefore user needs to fix these erronous situations before extracting consistent block constraints.

What Next

If you are running HyperScale Constraint Extractor flow, please modify the generated clock definition at flat level such that erroneous message are eliminated.

HCEXT-005

(Warning) Definition of %s uses hierarchical pin %s inside HyperScale block: %s, Please move the constraint to the leaf driver or leaf load of the net.

Description

This message is issued when there is a constraint defined on a hierarchical pin inside HyperScale block. Because HyperScale model is a flattened block when instantiated at a top level, these constraints on hierarchical pins will be dropped if used for a top-level run. You need to avoid defining constraints on hierarchical pins or use "*write_script -leaf_pin_transfer*" for moving these constraints to the leaf load/driver pins. Also, it is important to note that this warning is only printed for those hierarchical pins that have leaf load/driver pins.

Feedback

HCEXT-006

(Information) Instance

Description

This message indicates the reference instance of a certain block used for constraint extraction. If the block has multiple instances to be characterized in the same MIM group, the internal constraints will be extracted from the reference instance only.

The reference instance will be the first instance specified by the "*-instances*" option in *characterize_context* command. If "-instances" is not specified, the reference instance will be the first one sorted by name alphabetically. If the MIM instances in the same group are not all merge-able, the reference instance will be chosen from the largest merge-able instance set with the same rules.

HCEXT-007

(Information) Instance "%s" is the reference instance of block "%s" and the merged context will be written.

Description

When using *write_context* command in the HyperScale flow, if the instance is not re-characterized by *characterize_context* command, the merged context including this instance will be written.

What Next

Please make sure you have characterized the right instance that you want to write context.

HCEXT-010

(Warning) Generated clock: %s with source(s) inside block: %s, is a multi-source generated clock. Source latency for this generated clock will be set to 0 by use of explicit set_clock_latency in the block constraints.

Description

PrimeTime assumes source latency of 0 for multi-source generated clocks. To guarantee consistency of block-level constraints, source latency for such generated clocks are explicity set to 0.

Feedback

HCEXT-011

(Warning) SI and Noise constraints are not yet fully supported. These constraints may have to be added manually.

Description

As of 2012.06, the supported SI and Noise constraints include *set_si_delay_analysis*, *set_si_aggressor_exclusion* and *set_si_noise_analysis*; other SI and Noise constraints are not supported. Examples of such constraints are *set_noise_margin*, *set_noise_derate*, etc. Until support for these constraints are added, the user needs to manually apply them to the block runs.

HCEXT-012

(Warning) For generated clock:%s, %s. Master pin will be moved to %s.

Description

This message is printed when the master pin of a generated clock is moved by the HyperScale Constraint Extractor. It might be needed to move the master pin of a generated clock because of one or both of the following reasons: First, if the master pin of generated clock is outside the block(i.e. a cross-boundary generated clock), master pin in this case needs to be moved to be able to define the generated clock at block level. Second, if the generated clock is re-entrant to the block. Master pin in this case needs to be moved to garauntee that the generated clock source network doesnt get broken at block level.

HCEXT-100

(error) %s.

Description

This message is issued when there are errors in hyperscale configuration. Either block/instance names don't match within current design, or the instances of multi-instance block are not merge-able. Please check set_hier_config. If block name is not valid, constraint extraction for that block will be skipped. If instance name is not a valid instance of the corresponding valid block, constraint extraction will ignore the instance for that block, and will extract constraints for the remaining valid instances in the group. If all instances in the group referred by '-instance' are invalid, constraint extraction will be skipped for that block. If both block and instance names are correct, but instances are not merge-able, by default in strict mode, no constraint will be extracted for that block; in normal mode, one reference instance in the group will be chosen for constraint extraction.

Feedback

What Next

Check set_hier_config

HCEXT-101

(Warning) %s.

Description

Generic warning message.

HCEXT-102

(Information) %s.

Description

Generic information message.

HCEXT-103

(Warning) Virtual clock '%s' is defined to lanch or capture timing pathes from/to the block '%s'.

Description

This message is printed when a non-generated clock is defined right on a hierarchical output pin of the target block. The HyperScale Constraint Extractor defines a virtual clock to lanch or capture timing pathes from/to the block.

What Next

It is recommanded to define such clocks on downstream leaf pins outside the block, not on the hierarchical output pins.

No action is required.

HIER-003

(Error) %s is not an abstracted hierarchical instance.

Description

The instance specified in the *report_clock -map* command is not hierarchical or abstracted.

See Also

- report_clock

HIER-004

(error) There are unresolved clocks %s.

Description

In hierarchical timing analysis, clocks from block level have to be mapped to clocks from the top level. If mapping fails for any clock, this error is issued. To view the details of the failed clock mapping, see the clock_mapping sections in the report created with the *report_constraints* command.

What Next

View the details of the failed clock mapping created with the *report_constraints* command.

HIER-005

(error) The option '%s' requires top-level HyperScale analysis.

Feedback

Description

The execution of the command has stopped because the shown command option requires data only available at the top level of the HyperScale analysis.

What Next

Check command options and the analysis settings.

See Also

- report_global_timing
- report_analysis_coverage

HIER-007

(information) Design is successfully linked and the program is setup for hierarchical analysis.

Description

When the *hyperscale_enable_analysis* variable is set to *true* and the hierarchical data configuration setup with the *set_hyperscale_config* command is successfully linked, PrimeTime performs the necessary setup for the automated hierarchical analysis flow.

In this flow, either due to incompatibilities of the feature with the hierarchical analysis flow or as a temporary limitation of the hierarchical analysis flow, the following set of commands are disabled:

```
create_ilm
    identify_interface_logic
    get_ilm_objects
    write_ilm_netlist
    write_ilm_parasitics
    write_ilm_script
    write_ilm_sdf
    create_si_context
    write_arrival_annotations
    characterize_context
    remove_context
    report_context
    write_context
```

The CMD-080 error message is issued if any of these commands are encountered.

What Next

This is an informational message.

Feedback

HIER-008

(Error) Unable to read the database file, %s, due to file format errors.

Description

The database file contains information from a previous run meant to improve the speed and capacity of subsequent PrimeTime runs. If the file has been corrupted, PrimeTime cannot correctly parse it.

What Next

The database file must be manually deleted and the information stored must be regenerated through another PrimeTime run.

HIER-009

(Warning) HyperScale data in %s has been generated using an incompatible version of PrimeTime

Description

HyperScale generated data can only be used by a HyperScale enabled run using a later compatible PrimeTime version.

What Next

Use compatible PrimeTime versions. Regenerate the HyperScale data using the same PrimeTime version used in the current run or use the same PrimeTime version in the current run that was used to generate the HyperScale data.

HIER-010

(warning) Database '%s' of block '%s' is dirty.

Description

This message indicate that the following mismatches have occurred during the block level timing analysis:

```
a. High level hierarchy has pins the low level hierarchy does not have
        b. Bus width mismatch between hierarchies
        c. Pin direction mismatch between hierarchies
```

These problems have to be fixed at the block level.

What Next

Fix these problems at the block level.

Feedback

HIER-012

(information) %s %s.

Description

Generic message.

What Next

This is an informational message.

HIER-013

(Error) %s %s.

Description

This is a generic message with problem as noted.

What Next

If you are running a hierarchical flow, you need to adjust the constraints to be compatible; otherwise, no action is required.

HIER-014

(information) Paths through hierarchical pin '%s' have partially satisfied exception (%s).

Description

In the F-2010.06 release, some exceptions that cross from chip level into hierarchical blocks have been ignored. The timing window at the indicated input port of a hierarchical block is captured conservatively for block level analysis.

What Next

This is only an informational message. No action is required.

- report_exceptions
- set_false_path
- set_multicycle_path
- set_max_delay

Feedback

- set_min_delay
- reset_path

HIER-015

(Warning) Object '%s' has been skipped for this operation as it is within the boundary of a HyperScale instance, or is marked as "dont_touch".

See Also

- set_dont_touch

HIER-016

(Warning) report_hyperscale %s provides useful information only when invoked after update_timing in a HyperScale block level flow.

HS

HS-001

(information) Loading block timing data for block instance %s.

Description

Updating progress informational message. No action required.

HS-002

(warning) ECO-driven context is generated for block instance %s.

Description

Hyperscale ECO flow warning message. No action required.

HS-003

(error) %s is not an proper HyperScale instance.

Description

The instance specified in is not HyperScale block.

Feedback

What Next

set_hier_config(2).

HS-004

(error) There are unresolved clocks %s.

Description

In HyperScale analysis, clocks from block level have to be mapped to clocks defined at top level in order to properly interpret the timing data and constraints. If this mapping fails for any clock, an error is issued. To see the details of failed clock mapping, please see clock_mapping sections in the report from *report_constraint*.

What Next

report_constraint(2).

HS-005

(error) %s.

Description

This is a severe error that can prevent HyperScale flow from executing properly.

What Next

Check to make sure all the configurations setup for the HyperScale analysi is correct.

For example, you must have at least one valid configuration using *set_hier_config* with neither the *-parent* nor the *-block* options, so it properly configures the storage to write analysis data generated for the current design itself.

See Also

- set_hier_config
- hier_enable_analysis

HS-006

(warning) %s, no data will be loaded from the directory.

Feedback

Description

This warning message is issued when the noted directory cannot be accessed to read necessary data for HyperScale analysis flow.

This message may only be ignored if it is encounted during the initial block level runs. Because the HyperScale context data have not been generated from a prior top level run. In that situation, PrimeTime HyperScale flow will just use the budgetory constraints user provided for the block IO boundary to do the block level run.

What Next

Please check whether the directory name is correctly specified, and ensure the directory exists with proper read permission, etc.

HS-007

(information) Design is successfully linked and set up for HyperScale analysis.

Description

When the *hier_enable_analysis* variable is set to true and the HyperScale data configuration set up with the *set_hier_config* command is successfully linked, the tool prepares for the automated HyperScale analysis flow.

In the HyperScale flow, the following commands are disabled. Using any of them triggers a CMD-080 error message.

```
write_arrival_annotations
    characterize_context
    remove_context
    report_context
    write_context
    write_script
    write_sdc
```

What Next

Please refer to documentation to understand guidelines and recommendations for proper use of HyperScale analysis.

HS-008

(Error) Unable to read %s for block %s, due to file format errors.

Feedback

Description

The HyperScale database contains information saved from a previous run meant to improve the performance and capacity of subsequent PrimeTime runs. If the data has been corrupted and PrimeTime cannot correctly load it, an error is issued.

What Next

The database needs to be manually deleted and the information will needs to be regenerated through the proper PrimeTime HyperScale run.

HS-009

(Error) The database %s configured for block %s was not generated with the expected version of PrimeTime, %s. It was generated using PrimeTime version %s.

Description

The database file contains information from a previous run meant to improve the performance and capacity of subsequent PrimeTime runs. It is required that the database be created with the same PrimeTime version, otherwise, PrimeTime cannot correctly load it.

What Next

The database need to be manually deleted and the information stored need to be regenerated through proper PrimeTime HyperScale run using the current version. An alternative would be to re-run with the PrimeTime version that was used to generate the database, if available.

HS-010

(warning) Database '%s' of block '%s' contains dirty data.

Description

This message indicate that there are following mismatches during the block level timing analysis: a. High level hierarchy has pins the low level hierarchy does not have b. Bus width mismatch between hierarchies c. Pin direction mismatch between hierarchies These problems have to be fixed at block level.

What Next

Fix these problems at block level.

Feedback

HS-011

(warning) Option '%s' requires HyperScale analysis flow.

Description

The command option requires HyperScale analysis flow to be switched on.

What Next

Check command options for correctness.

HS-012

(information) Computing path specific latency for HyperScale block.

Description

information message

HS-013

(Error) %s %s.

Description

This is a generic message for the problem noted.

What Next

If you are running HyperScale flow, please adjust the setup and constraints to be compatible; otherwise, no actions required.

HS-014

(information) Paths through hierarchical pin '%s' have partially satisfied exception (%s).

Description

For the D2010.06 release, some exceptions that cross from chip level into hierarchical blocks have been ignored. Timing window at the indicated input port of a hierarchical block is captured conservatively for block level analysis.

What Next

This is an informational message only. No action is required on your part.

Feedback

- reset_path

HS-015

(warning) %s '%s' is changed by the command%s and it is inside the boundary of a HyperScale block.

Description

The object is changed by the command triggering the warning because the object (or instance of the object in the case of a library object) is found inside a HyperScale block instance. This may result in potential accuracy degradation.

What Next

All commands that alter the timing or structure of HyperScale instances should be performed during the creation of that instance.

See Also

- report_hier_analysis
- hier_enable_analysis

HS-016

(Warning) Victim net '%s' has parasitic mismatch for one or more of its aggressor nets between top level and block level analysis.

See Also

- report_annotated_parasitics

Feedback

HS-017

(error) Clock '%s' referred in the context for instance '%s' at pin '%s' has no equivalent clock found in the context for instance '%s' of the same block.

Description

When *set_hier_config* is used to specify a single data storage path and scenario for multiple top level instances of the same reference block, the context data internally computed for these instances during HyperScale analysis are automatically merged into a single overall context for the block, this merged context is intended to cover all the instantiation specified. In order to automatically merge the context for two HyperScale block instances of the same block, it is required that the instances must have exact matching clocking scheme. Otherwise, their context data cannot be merged together and analysis must be done seperately to cover each clocking scheme. When merge fails with this error message, the context for the second instance noted is discarded and PrimeTime only saves the context covering the first instance noted.

What Next

Based on the knowledge and intention of the design and analysis setup, there are several options to deal with failed automatic context merging.

You can choose to modify the top level constraints if you ensured that this is a constraint setup problem at top level and the block should have the same clocks and similar contexts when instantiated multiple times.

You can choose to configure for seperate analysis to cover different context for the instances if you ensured that the top level constraint setup is correct and these instances of the same block are assumed to subject to different contexts for timing analysis.

See Also

- set_hier_config

HS-018

(information) %d HyperScale block instances are excluded.

Description

This information message shows the number of HyperScale blocks that are excluded when generating the report. No action required.

Feedback

HS-019

(warning) Failed to find a clock that matches top level virtual clock %s, and a virtual clock %s with period %f is created.

Description

In hierarchical timing analysis, when a top level virtual clock does not have a matched block level clock, but this clock is referred in context (e.g., set_input_delay), PrimeTime automatically creates a virtual clock. This can ensure context referring to this clock can be successfully applied at block level.

HS-020

(error) Hierarchy %s has derates on both libcells and itself.

Description

When the old precedence rules (i.e., derates of lib cells have higher precedence than derates of design, and lower precedence than derates of hierarchical cells) are used, a hierarchy cell has a timing derate that is set directly or inherited, and library cells also have timing derates, this error is issued. A hierarchical cell at top level becomes a design at block level, and if the priority of library cell is sandwiched between hierarchical cell and design, a cell in the hierarchical cell has different timing derates at block level and top level. That is why this error is issued. The correct way is to use the new precedence rules by setting *timing_derate_precedence_compatibility* to TRUE.

What Next

Set *timing_derate_precedence_compatibility* to TRUE.

HS-021

(warning) A clock %s wth period %f that is internal at block level is created.

Description

In hierarchical timing analysis, when none of the sources of a block level clock is in interface, and this clock is referred by constraints (e.g., input delay of side pins), this clock will be created as a virtual clock by PrimeTime at top level, and its name is instance_name/clock_name in order to uniquify it.

HS-022

(information) Parasitics reading is skipped in the mode of extracting block constraints.

Feedback

Description

In the constraints extraction mode, parasitics reading is skipped since parasitics does not affect constraints.

HS-023

(Information) Parasitics of HyperScale instance '%s' was already automatically loaded.

Description

Parasitics of HyperScale instances are automatically read by PrimeTime when these instances are instantiated at top level, and user-specified parasitics reading of these instances is automatically skipped. Note that if the *-path* option in *read_parasitics* includes multiple instances among which some are HyperScale instances and the others are not, the parasitics reading for those non-HyperScale instances are not skipped.

See Also

- read_parasitics

HS-024

(error) %s is not a HyperScale block.

Description

Generic message. The instance specified is not a HyperScale block but this command requires it to be a HyperScale block.

HS-025

(Information) Instance '%s' is merged with instance '%s'.

Description

When *set_hier_config* is used to specify a single data storage path and scenario for multiple top level instances of the same reference block, the context data internally computed for these instances during HyperScale analysis are automatically merged into a single overall context for the block, this merged context is intended to cover all the instantiation specified.

See Also

- set_hier_config

Feedback

HS-026

(error) Case value or set disable timing on pin '%s' in the context for instance '%s' is different from the case value or set disablt timing on pin '%s' in the context for instance '%s' of the same block.

Description

When *set_hier_config* is used to specify a single data storage path and scenario for multiple top level instances of the same reference block, the context data internally computed for these instances during HyperScale analysis are automatically merged into a single overall context for the block, this merged context is intended to cover all the instantiation specified. In order to automatically merge the context for two HyperScale block instances of the same block, it is required that the instances must have exact matching case values. Otherwise, their context data cannot be merged together and analysis must be done seperately. When merge fails with this error message, the context for the second instance noted is discarded and PrimeTime only saves the context covering the first instance noted.

What Next

Based on the knowledge and intention of the design and analysis setup, there are several options to deal with failed automatic context merging.

You can choose to modify the top level constraints if you ensured that this is a constraint setup problem at top level.

You can choose to configure for seperate analysis to cover different context for the instances if you ensured that the top level constraint setup is correct and these instances of the same block are assumed to subject to different contexts for timing analysis.

See Also

- set_hier_config

HS-027

(warning) Case value or set disable timing on pin '%s' in the context for instance '%s' is different from the case value or set disable timing on pin '%s' in the context for instance '%s' of the same block.

Description

When *set_hier_config* is used to specify a single data storage path and scenario for multiple top level instances of the same reference block, the context data internally computed for these instances during HyperScale analysis are automatically merged into a single overall context for the block, this merged context is intended to cover all

Feedback

the instantiation specified. When different case value or disable timing setting found on the same port of different instances, merged context will have the no case value and no disable timing.

What Next

Based on the knowledge and intention of the design and analysis setup, there are several options to deal with failed automatic context merging.

You can choose to modify the top level constraints if you ensured that this is a constraint setup problem at top level.

You can choose to configure for seperate analysis to cover different context for the instances if you ensured that the top level constraint setup is correct and these instances of the same block are assumed to subject to different contexts for timing analysis.

See Also

- set_hier_config

HS-028

(information) Instance '%s' of reference '%s' is the representative instance for scenario '%s' in HyperScale constraint extraction.

Description

When HyperScale block constraints are extracted, multiple instances of same block may share the same scenario, one of these instances is selected as the representative, and extracted block level constraints of this block of this scenario are the constraints related to this instance.

HS-029

(Error) %s.

Description

This error message is issued when the same directory is specified for multiple *set_hier_config* command using the *-path* option, and they are for different design blocks.

What Next

Please make sure you use unique directories to configure for different design blocks. Multiple instances of a same block may use the same directory.

Feedback

HS-030

(warning) The HyperScale block '%s' does not have noise information. Noise analysis for this block is skipped.

Description

This warning message is issued while performing top-level noise analysis using HyperScale blocks that did not receive noise analysis at the block level. Noise analysis for these HyperScale blocks is skipped at the top level. However, noise analysis is still performed on the rest of the top-level logic and on other HyperScale blocks with noise information.

What Next

If you want noise analysis to be performed on a HyperScale block, you need to perform noise analysis at the block level using *update_noise* or *report_noise*, just as you use *update_timing* or *report_timing* at the block level, and write the hierarchical interface data to generate noise information for the block model.

See Also

- set_hier_config
- update_noise
- update_timing
- write_hier_data

HS-031

(warning) %s '%s' referenced by the command%s is inside the boundary of a HyperScale block.

Description

The object (or instance of the object in the case of a library object) is found inside a HyperScale block instance. Altering the characteristics of the object may invalidate the instance of the model

What Next

All commands that alter the timing or structure of HyperScale instances should be performed during the creation of that instance.

Feedback

See Also

- report_hier_analysis
- hier_enable_analysis

HS-032

(Warning) Clock '%s' is an re-entrant clock for block '%s'.

Description

A clock defined inside a block goes outside of the block, and then reaches an input port of that block. This kind of clock is re-entrant clock. This clock should be defined as a multi-source clock at block level: the sources are the source inside the block and that input port.

When clocks are not defined in this way, clock definition scope violations are reported in *report_constraints*.

Sometimes multiple clocks corresponding to this same top level clock are defined at block level. This is not supported in HyperScale. The re-entrant clock has to defined as a multi-source clock at block level.

For example, suppose a clock *CLK* defined at *blk/u1/Z* comes back into the block *blk* at port *clk*, definition at top level:

```
create_clock -name top_CLK -period 10 blk/u1/Z
```

definition at block level:

```
create_clock -name blk_CLK -period 10 {u1/Z clk}
```

When one of the sources is missing at block level, a clock definition scope violation is reported at top level:

```
Clock: top_CLK (mapped to blk_CLK at block level)
    Instance: blk
    block_boundary_clock_definition

    Design   Clock Sources      : { blk/u1/Z blk/clk}
    Instance Clock Sources      : { blk/u1/Z}  (VIOLATED)
```

What Next

Correct the definition of that clock if clock definition scope violations are reported.

HS-033

(error) No corresponding clock for virtual clock '%s' with period %f.

Feedback

Description

When clock network of a clock at top level does not enter a block, but input/output delays on some ports of blocks are referring to it, this clock should be created as virtual clocks at block level. To check which ports are referring to this clock, please check input/output delay scope violations in the *report_constraint* report from top level.

What Next

Add the definition of that clock and its related constraints (e.g., uncertainty, clock groups) into block level constraints.

HS-034

(warning) Instance '%s' inside HyperScale block '%s' referenced to '%s' is resolved as black box in block level run, renamimg the black box reference as '%s'.

Description

In HyperScale top level run, if black box is created and it is carried on from the block level, this message will be issued.

What Next

Check the reference in the block design.

HS-035

(warning) Option '%s' is ignored in HyperScale analysis flow.

Description

The command option is ignored in HyperScale analysis flow.

What Next

Check command options for correctness.

HS-036

(Error) %s %s.

Description

This is a message related to context override at HyperScale block-level analysis.

Feedback

What Next

If you are running the HyperScale flow, adjust the setup and constraints to be compatible; otherwise, no actions are required.

HS-037

(Error) %s %s.

Description

This is a message related to model loading at HyperScale top level analysis.

What Next

If you are running HyperScale flow, please adjust the setup and constraints to be compatible; otherwise, no actions required.

HS-038

(warning) Found net connected to pin '%s' has %s, processing of this boundary pin is skipped.

Description

This is a message related to context capture for HyperScale or HyperScale Constraint Extractor. HyperScale constraint extractor and context capture automatically skip processing unbuffered hierarchical pins (HyperScale block ports) with large number of segments and leaf pins.

HS-039

(warning) The HyperScale %s for block '%s' in current config directory is different from the one used in the saved session, the restored session can only be used to generate reports and not re-perform any timing analysis.

Description

This message will be issued during restore_session if the saved session is a HyperScale session, and the HS block model or top context database for use in the original saved session changed at the time of the restore.It is not recommanded to re-time the design within the restored session if the message is issued.

What Next

Re run the design if timing update is needed.

Feedback

HS-040

(Error) Ignore user set clock mapping for clock '%s', because it doesn't exist in %s.

Description

This message is issued during update_timing after block model or top context is loaded, so that the user set clock mapping can be checked to see whether the clocks exist in block model or top context. If not, the clock map setting for that clcok will be ignored.

What Next

Check the clock names used in "set_clock_map -parent_clock_name/ block_clock_names", make sure the clock does exist in the context or model.

See Also

- set_clock_map

HS-041

(error) Failed writing HyperScale data because %s.

Description

This is a severe error that can prevent HyperScale flow from executing properly.

What Next

Check to make sure all the configurations setup for the HyperScale analysis is correct. And the HyperScale data are updated properly for hierarchical analysis.

For example, if you are trying to write out block session for top level analysis while there are still pending netlist changes in the block, HyperScale block abstraction cannot be written because it may not accurately represent the actual block after implementation and therefore not fully representing the block timing at top level analysis. It is required that users write these changes out and implement them with tools such as IC Compiler to obtain an updated netlist and physical data, perform block level analysis to generate data for further top level analysis.

See Also

- set_hier_config
- hier_enable_analysis

Feedback

HS-042

(error) You must specify at least two subblock instances to -instance option.

Description

ECO-driven context is generated only on HyperScale block ports that are connected to other HyperScale blocks specified in *-instance* option. So at least two HyperScale block instances need to be specified to *-instance* option.

What Next

Specify at least two HyperScale block instances to *-instance* option.

HS-044

(warning) Generated clock '%s' inside block instance '%s' refers to master clock '%s' that can not directly reach the block through boundary pin '%s', recommanded master clock(s) could be %s.

Description

Defining generated clock referring to master clock across other generated clock in between is not recommended. For best results in hierarchical analysis, chain of generated clocks rooted from the same master should be defined in a cascaded style such that each generated clock only refers to the closest clock or generated clock as its master, without cross the source network of other generated clock within the same chain.

What Next

Please update the noted generated clock defintion inside block by change the master to the recommended clock which can directly reach the block, or referring to other suitable generated clock on the same chain inside the same block.

HS-045

(Error) Generated clock '%s' inside block instance '%s' refers to master clock '%s' that can not directly reach the block through boundary pin '%s', no recommanded master clock(s) found on the same chain.

Description

When PrimeTime cannot automatically recommend a candidate master clock(s) on the same chain, it is often because the master clock network passed through sequential elements (e.g. a register cell) before entering the noted block port. This style of generated clock definition requires use of block constraints extracted from PrimeTime, or user must define the clocks with advanced senses to completely model the flat timing behavior. Refer

to *set_sense* command for more details. Alternative is to follow the workaround suggested in the below section.

What Next

After identifying the sequential elements between the closest clock source and block boundary port, there are 2 possible solutions recommended to update the constraints:

1. Move the closest clock (or generated clock) definition after the sequential element so that it can reach the block through only combinational logic.
2. Define an additional clock (or generated clock) after the last sequential element so it can reach the block through only combinational logic.

after either 1. or 2., then redefine the noted generated clock inside the block by referring to this moved or new clock as its master.

HS-046

(warning) Clock '%s' in block instance '%s' is defined on hierarchical pin '%s' that is on the same net of the block boundary pin '%s'.

Description

Defining clocks or generated clocks on hierarchical pins are generally not recommended for PrimeTime. This can potentially introduce timing correlation issues between block and top level analysis.

What Next

When clocks need to be defined on hierarchical pins, it is recommanded that the clock should not be defined on the hierarchical pin between the block boundary port and its connected leaf load pins; instead, please move the clock source pin onto the block boundary pin or the leaf pins.

HS-047

(information) Found clock '%s' reaching block boundary pin '%s' through both combinational and sequential paths.

Description

While characterizing the context around block boundary, it is found that a clock defined outside of the block reaching the specified block port (hierarchical pin) through both combinational logic paths and sequential logic paths. The two types of paths are converging at this same port. This is detected only when there is generated clock(s) downstream. Both the combinational and the sequential paths are considered as the source network for downstream generated clock and used for source latency computation.

This causes potential ambiguity in clock latency and CRPR context captured for the incoming clock outside of the block.

What Next

Check whether the clock network is expected to have both combinational and sequential logic paths converging at the block boundary. If only one of the source latency paths is valid, you can use command 'set_sense' to stop the unneeded propagation paths.

HS-048

(information) Found clock '%s' not used to define generated clocks in the fanout of pin '%s' on block port pin '%s'.

Description

This informational message is triggered by potentially asymmetric leaf branches through the same block boundary clock port. During context characterization around a block boundary, for any block port (hierarchical pin) top level clock enters through and with multiple leaf pin branches inside the block, PrimeTime generally expects these leaf pin branches are equivalent in terms of their fanout logic, such as using the same incoming clock to define generated clock downstream. However, when some branch(es) are used to specify generated clock(s) in their fanout while other branches do not use the incoming clock to specific generated clock(s) in their fanout. PrimeTime issues this message to inform users anout the difference, and check whether this difference among the branches are expected.

What Next

Check the leaf pins on the block port where the clock network enters, whether they are expected to be referred to by different generated clock(s) downstream of the same port.

HS-049

(Warning) These HyperScale data files might have been moved or deleted: "%s" in directory "%s".

Description

Failed to access the HyperScale data file. This may cause information loss.

What Next

Regenerate or retransmit the HyperScale data.

Feedback

HS-050

(Warning) The HyperScale data index file in "%s" is incomplete.

Description

The HyperScale data index file is incomplete. This may cause the HyperScale data file integrity check to be incomplete.

What Next

Regenerate or retransmit the HyperScale data.

HS-051

(Warning) These HyperScale data files might have been modified: "%s" in directory "%s".

Description

The size of HyperScale data file is different from when it was first generated. This change may cause information loss when reading HyperScale data.

What Next

Regenerate or retransmit the HyperScale data.

HS-052

(Warning) The value "%d" of hier_block_interface_model_latch_level is out of range. Please re-apply the value.

Description

This message is issued during HyperScale top level run, when the latch level value set by the user using *set hier_block_interface_model_latch_level* is out of the range. The maximum value depends on *timing_through_path_max_segments* which specifies the muximum number of latches for reporting paths through latches. If the value is larger than the maximum value define by *timing_through_path_max_segments*, Hyperscale will set it as the same value as defined by *timing_through_path_max_segments*. If the value is smaller than 0, Hyperscale will set it as 0.

What Next

Please make sure you have the correct latch level value which falls inside the range.

Feedback

HS-053

Description

This message is issued when PrimeTime detects very complex timing paths propagating through the pin noted, internally each unique class of path is tracked by a separate arrival or required time propagating through the hierarchical pin/port noted. This excessive data can result in large volume of context data captured on these pins, further cause increased memory and slower runtime both in capturing the context at top level and consumption of the context at block level.

The most usual factors can cause this excessive of path analysis complexity include: multiple clocks reaching launch/capture registers, complex reconvergent clock network and CRPR analysis, very large number of exceptions applied in the fanin or fanout of the block boundary, etc.

What Next

Please review the constraints relevant to the pins mentioned.

HS-054

(error) The object_list must be a design when using set_dont_override -include {timing_derate}.

Description

When overriding the timing derate in block level, the object_list must be a design instead of a port.

What Next

Using a design for object_list.

HS-055

(information) boundary_check and boundary_check_include options of report_constraint are invalid when boundary check variable is disabled.

Description

When timing_enable_hier_boundary_check is false, no boundaries can be reported.

What Next

Enable timing_enable_hier_boundary_check to report boundaries.

Feedback

HS-056

(Warning) %s.

Description

This warning message is generated when the HyperScale block MIM instances are re-characterized using *characterize_context* command in the HyperScale top flow. When all the instances are individually re-characterized, no merged context will be generated. Otherwise, the remaining instances which are not re-characterized will be generated in the merged context.

What Next

Please make sure you have characterized the right instance in the HyperScale top flow after linking.

HS-057

(Warning) Instance "%s" is the reference instance of block "%s" and the merged context will be written.

Description

When using *write_context* command in the HyperScale flow, if the instance is not re-characterized by *characterize_context* command, the merged context including this instance will be written.

What Next

Please make sure you have characterized the right instance that you want to write context.

HS-058

(information) Merged latency is the largest window for clock "%s" of port "%s".

Description

When *hier_context_merge_clock_latency_mode* is set to *largest_window*, and the noted clock is asynchronous to other clocks for the block, MIM context merging is using largest window to minimize clock window and pessimism in SI analysis. Also, when total clock latency is merged in the mode *largest_window*, the static latency will be automatically adjusted to use *match_total_latency* mode to ensure consistency.

What Next

No action is required for this informational message. Please check the merge mode if necessary.

Feedback

HS-059

(warning) Merged latency is the default mode min_max_value for clock "%s" of port "%s" because it has at least one synchronous clock.

Description

When *hier_context_merge_clock_latency_mode* is set to *largest_window*, and the noted clock is synchronous to at least one other clock in the block, MIM context merging is expected to use the default mode *min_max_value* to ensure bounding timing and conservative SI analysis at block level.

What Next

No action is required for this informational message. Please check the merge mode and clock domains if necessary.

HS-060

Description

This message is issued when PrimeTime detects no data arrival or required timing context captured on the specified pin. This could be due to unconstrained paths or reduced effort for required propagation due to excessive amount of unique paths (see HS-053).

In the block level run with context, the relevant ports will use the budget input/output delay values from user constraints, since no context is available on them.

What Next

Please review the constraints relevant to the pins mentioned as well as checking for HS-053 messages

HS-061

(warning) Merged latency is forced to use the largest window for clock "%s" of port "%s" while it is synchronous with at least one other clock.

Description

You receive this waning message when *hier_context_merge_clock_latency_mode* is set to *largest_window*, and the noted clock is synchronous to at least one other clocks in the block. It is recommended to use the default *min_max_value* mode to merge the context for different instances of the block in order to ensure the bounding timing analysis at the block level with the merged context, which may include extra pessimism. Also, when total clock latency is merged in the mode *largest_window*, the static latency will be automatically adjusted to use *match_total_latency* mode to ensure consistency.

Feedback

What Next

Please review the clock relationship and the context merge mode variable to ensure it is expected.

HS-062

(Warning) Apply logic value "%d" from context on port "%s", override existing setting "%s" on the port.

Description

This message is issued during HyperScale block level run, when the case value set by the user using *set_case_analysis* is different from the case value from the top context or the port does not have a case value.

What Next

Please make sure you want to override the block case value using top level context or you have a valid case value set.

HS-063

(error) -include model_constraints_data must be used with -netlist option.

Description

When using write_hier_data to write out the block constraints, the option model_constraints_data must be used with -netlist option.

What Next

Use -netlist option combined with -include model_constraints_data.

HS-064

(Warning) Remove logic value "%d" on port "%s", apply arrival data from context.

Description

This message is issued during HyperScale block level run, when the case value set by the user using *set_case_analysis* is different from the case value from the top context.

What Next

Please make sure you want to override the block case value using top level context.

Feedback

HS-065

(error) Found top level clock '%s' is mapped to block level clock '%s', but the top level clock is not reaching the block instance '%s' through the pin '%s'.

Description

When user clock mapping is applied between top level clock and block level clock, if the top level clock is not reaching the block instance, no source latency context will be applied for the block level clock.

What Next

Please check the connection between top level clock and block level clock and apply the right user clock mapping between top and block.

HS-066

(Warning) Found cross boundary data check constraints, ignored in context.

Description

This message is issued when doing the cross boundary required time data check which is currently not supported.

What Next

Please make sure the right data is passed in.

HS-068

(Warning) Found multiple clocks at top or block, not map block clock "%s" to top clock "%s", please use user clock map to map them.

Description

This message is issued when doing clock mapping at block level, there are more than one top clocks or more than one block clocks. We do not map them automatically and will leave for user clock map.

What Next

Please use *set_clock_map* command to manually map the clocks.

HS-070

(Warning) Not map top level clock "%s" to block level clock "%s" since one of them is ideal clock.

Feedback

Description

This message is issued when doing clock mapping at block level, top level clock is not ideal clock while block level clock is ideal clock or top level clock is ideal clock while block level clock is not ideal clock. We do not map them automatically and will leave for user clock map.

What Next

Please use *set_clock_map* command to manually map the clocks.

HS-071

(error) Found '%s' of operation condition loading from different top level contexts are different during HyperScale block level analysis.

Description

During HyperScale block level analysis, when loading different top level contexts for merging, the operation conditions of different top contexts must match.

What Next

Please check that the top level run which generates the top context has the same operation condition.

HS-072

(Warning) Not map top level virtual clock "%s" with block level real clock "%s".

Description

This message is issued when doing clock mapping at block level, top level clock is virtual clock while block level clock is real clock. We do not map them automatically and will leave for user clock map.

What Next

Please use *set_clock_map* command to manually map the clocks.

HS-074

(information) Clock '%s' is merged to clock '%s' in the reference design.

Feedback

Description

This infomation is given during HyperScale top level MIM (multiply instantiated modules) context merging flow, when the clocks (with different sources and clock names but all other attributes are the same) are entering the same port of the MIM instances.

What Next

No action is required.

HS-076

(Information) Set parasitics corner %s for corner domain %s and corner %s on cell %s.

Description

The HyperScale could set parasitics corner implicitly with the *set_hier_config* command.

What Next

No action is required.

See Also

- set_hier_config

HS-100

(information) HyperScale timing context around instance '%s' is successfully merged with instance '%s'.

Description

When *set_hier_config* is used to specify a single data storage path and scenario for multiple top level instances of the same reference block, the timing data internally computed for these instances during HyperScale analysis are automatically merged into a single overall context for the block, this merged context is intended to cover all the instantiation specified.

When merge succeeds with this message, the context for the instance noted is covered by a merged context noted. And a single context is written for all successfully merged instances for a single block level analysis.

What Next

No action is required.

Feedback

See Also

- set_hier_config

HS-101

(error) Found clock '%s' propagating to instance '%s' through pin '%s', but no matching clock reaching the equivalent pin on instance '%s' of the same block.

Description

When *set_hier_config* is used to specify a single data storage path and scenario for multiple top level instances of the same reference block, the context data internally computed for these instances during HyperScale analysis are automatically merged into a single overall context for the block, this merged context is intended to cover all the instantiation specified. In order to automatically merge the context for two HyperScale block instances of the same block, it is required that the instances must have exact matching clocking scheme. Otherwise, their context data cannot be merged together and analysis must be done seperately to cover each clocking scheme. When merge fails with this error message, the context for the second instance noted is discarded and PrimeTime only saves the context covering the first instance noted.

What Next

You can use *report_timing*, or *report_attribute* commands to verify the message.

Based on the knowledge and intention of the design and analysis setup, there are several options to deal with failed automatic context merging.

You can choose to modify the top level constraints if you ensured that this is a constraint setup problem at top level and the block should have the same clocks and similar contexts when instantiated multiple times.

You can choose to configure for seperate analysis to cover different context for the instances if you ensured that the top level constraint setup is correct and these instances of the same block are assumed to subject to different contexts for timing analysis.

See Also

- set_hier_config

HS-102

(warning) Found different %s between pin '%s' on instance '%s' and the equivalent pin '%s' on instance '%s' of the same block.

Feedback

Description

When *set_hier_config* is used to specify a single data storage path and scenario for multiple top level instances of the same reference block, the context data internally computed for these instances during HyperScale analysis are automatically merged into a single overall context for the block, this merged context is intended to cover all the instantiation specified.

When different case value or disable timing settings are found at the same port of different instances, merged context will have no case value or no disable timing set, and result in a more conservative analysis at block level.

What Next

You can use *report_disable_timing*, or *report_case_analysis* command to verify the message.

Based on the knowledge and intention of the design and analysis setup, there are several options to deal with failed automatic context merging.

You can choose to modify the top level constraints if you verify that this conflict is not expected and it represents a constraint setup problem at top level.

You can choose to configure for seperate analysis to cover different context for the instances if you ensured that the top level constraint setup is correct and these instances of the same block are assumed to subject to different contexts for timing analysis.

See Also

- set_hier_config

HS-103

(error) Failed to merge HyperScale timing context around instance '%s' with reference instance '%s'.

Description

When *set_hier_config* is used to specify a single data storage path and scenario for multiple top level instances of the same reference block, the context data internally computed for these instances during HyperScale analysis are automatically merged into a single overall context for the block, this merged context is intended to cover all the instantiation specified.

In order to automatically merge the context for two HyperScale block instances of the same block, it is required that the instances must be operated in a similar mode and environment, for example, one of the fundamental reqreuirments is that all the instances of the same block must have exactly matching clock and clock topology on the boundary.

Feedback

Otherwise, their context data cannot be merged together and analysis must be done seperately to cover each operating context seperately in order for the top level analysis to remain valid.

It is worth emphasize that ultimately only the users know the design intention and whether or not the different instances of a same physical block are truly operating similarly or equivalently on the same chip under the targeted timing analysis setup.

When merge fails with this error message, the context for the instance noted is discarded and PrimeTime only saves the context covering the reference instance noted. Reference instance is the first instance specified with the same HyperScale config.

What Next

Based on the knowledge and intention of the design and analysis setup, there are several options to deal with failed automatic context merging.

You can choose to modify the top level constraints if you ensured that this is a constraint setup problem at top level and the block should have the same clocks and similar contexts when instantiated multiple times.

You can choose to configure for seperate analysis to cover different context for the instances if you ensured that the top level constraint setup is correct and these instances of the same block are assumed to subject to different contexts for timing analysis.

HS-105

(Warning) Cross-boundary %s exceptions are not supported in PrimeTime HyperScale. The exception type will not be captured as part of the context.

Description

Some exception types are not supported in HyperScale across block boundaries in the current release. For supported exception types (false path, multicycle path), cross-boundary exceptions specified during top analysis will be captured during top-level analysis and applied during block-level analysis

This warning may be issued even when the exception cannot be satisfied across the boundary.

What Next

The exception will not be applied to other HyperScale blocks automatically. If this is ok, then no changes need to be performed by the user. If this exception is needed, separate exceptions can be specified during block analysis and during top analysis.

See Also

- set_hier_config

HS-106

(information) Instance '%s' is selected as the reference for context merging, %d other instances can be merged with it.

Feedback

Description

When *set_hier_config* is used to specify a single data storage path and label for multiple top level instances of the same reference block, the timing data internally computed for these instances during HyperScale analysis are automatically merged into a single overall context for the block, this merged context is intended to cover all the instantiation specified.

Before merging the context for these instances, a pre-analysis is performed to identify a referece instance to which the most number of instances can be merged together. The criteria used to determine whether contexts for 2 instances are mergable is the 2 instances have the same or equivalent clocks reaching their boundaries.

What Next

No action is required.

HS-111

(Warning) Directory '%s' is already used in configuration for an instance sets of block %s.

Description

This error message is issued when the same directory is specified for multiple *set_hier_config* command using the *-path* option, and they are for a same design block with different instance sets. This may cause failures in finding context data at block level run.

What Next

Please make sure you use unique directories to configure for different instance sets. Multiple instances of a same block using the same directory will not be allowed in a future release.

HS-112

(Error) Command is in conflict with an earlier set_hier_config command for block %s. Command will be ignored.

Description

This error message is issued in two situations:

1. A previous *set_hier_config* command without -instances was already set on a block. This means all instances of that block are represented by the HyperScale data in the same directory. Then a new *set_hier_config* command with -instances option for the same block is entered. Changing the directory for a portion of the instances is not allowed.
2. One or multiple *set_hier_config* commands with -instances options were previously set on a block. Then a new *set_hier_config* command without -instances option for the same block is entered. This is not meaningful and is not supported either.

Feedback

What Next

If you want to change the directory in the a previous *set_hier_config* command, repeat the previous *set_hier_config* with the new directory.

HS-113

(Information) The command overrides previous HyperScale config for some instances or all instances

Description

This message is issued when some or all instances specified or implied by a set_hier_config command have already been configured by previous set_hier_config commands. The new config will override previous ones for these instances.

What Next

No action required.

HS-114

(Error) %s context data at port '%s' because expected pin '%s' is not on the same net.

Description

This message is issued during context override at the HyperScale block level analysis, where there is a netlist mismatch found on the port net between current block design and HyperScale top level context data. A best-effort context override will be applied to the related port.

What Next

No action required. To ensure accurate context override, please use consistent block and top netlist.

HS-115

(Error) Missing capture clock for required context at clock port '%s' because no clock is mapped with '%s'.

Description

This message is issued during context override at the HyperScale block level analysis, where there is no mapped capture clock found on the output port between current block design and HyperScale top level context data. The context override will be failed on this port.

Feedback

What Next

Please use "report_clock -map" to check the clock mapping between HyperScale top and block level analysis. Source the clock_map.pt file from constraint extractor could help solve this problem.

HS-116

(Error) Ignore source latency context for clock '%s' at clock port '%s' because no mapped clock found.

Description

This message is issued during context override at the HyperScale block level analysis, where there is no mapped clock found in current block analysis for the clock lantency context characterized from HyperScale top level analysis. The source lantency context override for this clock will be failed.

What Next

Please use "report_clock -map" to check the clock mapping between HyperScale top and block level analysis. Source the clock_map.pt file from constraint extractor could help solve this problem.

HS-117

(Error) Ignore source latency context for virtual clock '%s' because no mapped clock found.

Description

This message is issued during context override at the HyperScale block level analysis, where there is no mapped clock found in current block analysis for the clock lantency context characterized from HyperScale top level analysis. The source lantency context override for this clock will be failed.

What Next

Please use "report_clock -map" to check the clock mapping between HyperScale top and block level analysis. Source the clock_map.pt file from constraint extractor could help solve this problem.

HS-118

(Error) Missing launch clock for arrival context at clock port %s because no clock is mapped with %s.

Feedback

Description

This message is issued during context override at the HyperScale block level analysis, where there is no mapped lauch clock found for the arrival context on the input port between current block design and HyperScale top level context data. The arrival context override associated with this clock will be failed.

What Next

Please use "report_clock -map" to check the clock mapping between HyperScale top and block level analysis. Source the clock_map.pt file from constraint extractor could help solve this problem.

HS-119

(information) Variable timing_save_pin_arrival_and_slack is set true. This is required for generating ECO-driven context or slack based context margin allocation.

Description

This is a generic message to issue for the change of variable value.

What Next

No action required.

HS-120

(Information) %s %s.

Description

This is a generic message to issue for specially pre-programmed features. In order to ensure QoR consistency of HyperScale block and top level analysis to align with flat timing analysis, selected settings are programmed with fixed value once HyperScale is enabled, such as wire_load_mode and wire_load_model.

```
Information: value 'top' is pre-programmed for command
 'set_wire_load_mode'
                in hierarchical flow enabled with
 'hier_enable_analysis'. (HS-120)

Information: value 'false' is pre-programmed for variable
 'auto_wire_load_selection'
                in hierarchical flow enabled with
 'hier_enable_analysis'. (HS-120)
```

What Next

No action required.

Feedback

HS-121

(Error) Found clock '%s' propagating to instance '%s', but no matching clock with equivalent pins of same '%s' on instance '%s' of the same block is found.

Description

When *set_hier_config* is used to specify a single data storage path and scenario for multiple top level instances of the same reference block, the context data internally computed for these instances during HyperScale analysis are automatically merged into a single overall context for the block, this merged context is intended to cover all the instantiation specified. In order to automatically merge the context for two HyperScale block instances of the same block, it is required that the instances must have exact matching clocking scheme. Otherwise, their context data cannot be merged together and analysis must be done seperately to cover each clocking scheme. This error message shows which clocking scheme is causing the merging can not proceed. When merge fails with this error message, the context for the second instance noted is discarded and PrimeTime only saves the context covering the first instance noted.

What Next

You can use *report_timing*, or *report_attribute* commands to verify the message.

Based on the knowledge and intention of the design and analysis setup, there are several options to deal with failed automatic context merging.

You can choose to modify the top level constraints if you ensured that this is a constraint setup problem at top level and the block should have the same clocks and similar contexts when instantiated multiple times.

Feedback

HS-152

(Warning) Port '%s' is connected with both input and output pins, this may impact the accuracy of model data associated with it in HyperScale block abstraction.

Description

You receive this message to warn you that HyperScale detected the noted port is connected with both input and output pins. This happens most often for unbuffered output port with net looping back into timing paths and end points internal to the block. This can result in potential accuracy degradation in in HyperScale block abstraction, because the timing paths looped back into the block are impacted by the port load external to the block; and the net arc delays between the outgoing and loop back branches may be different.

What Next

Please verify the connectivity of the noted port. It is recommended that the port be properly buffered to isolate impact from external loading effects to the internal loop back timing paths.

HS-153

(warning) Could not skip writing parasitics in HyperScale model.

Description

You receive this message to warn you that write_hier_data still generates parasitics files in HyperScale model data. It is not skipped since some parasitics file read in is not SPEF or GPD format.

What Next

Please verify that all parasitics files read in are SPEF or GPD format. Otherwise the parasitics file can not be skipped in HyperScale model.

HS-154

(error) Parasitics file '%s' used to block '%s', instance '%s' was either not read in or was a different version for this top level.

Description

You received this error message because the parasitics file used at hyperscale block level doesn't has a matching parasitics file at top level. This could be caused by that the parasitics in block level is skipped written in model and not being read in at top or top is reading in a different version of file.

Feedback

What Next

Check the parasitics file used at block and top and make sure the parasitics file used at hyperscale block is also available at hyperscale top.

Feedback

HS-162

(warning) Hierarchical pin '%s' is connected with both input and output pins, this may impact the accuracy of context data associated with it in context characterization.

Description

You receive this message to warn you that the noted the hierarchical pin is connected with both input and output pins. This happens most often for unbuffered output pin with net looping back into timing paths and end points internal to the block. This can result in potential accuracy degradation in context characterization, because the timing paths looped back into the block are impacted by the pin load external to the block; and the net arc delays between the outgoing and loop back branches may be different.

What Next

Please verify the connectivity of the noted pin. It is recommended that the pin be properly buffered to isolate impact from external loading effects to the internal loop back timing paths.

HS-163

(Error) write '%s' context is not supported when hier_characterize_context_mode is set to constraints_only.

Description

When hier_characterize_context_mode is set to constraints_only, the gbc format context is not supported in write_context. Besides, the boundary_only option can not be used when it is set to constraints_only. To use these functionalities, please set hier_characterize_context_mode to full_context.

HS-164

(Error) Must specify the '-path' option when '-session' is specified.

Description

User must specify the directory where session is located.

HS-165

(Error) command 'set_hier_config' usage without option '-block' has been made obsolete.

Feedback

HS-166

(Error) Must specify the '-path' option when '-block' is specified.

Description

User must specify the directory where block data is located.

HS-167

(Error) Must specify either '-block' option or '-instance' option when specifying the name for Multi-Instance(MIM) group.

Description

User must specify the block/instances that when creating a MIM group. Note that the number of instances (if specified) should be larger than 1.

HS-168

(Error) Must also specify '-block' option when '-path' option is specified.

Description

User must specify the block/instances for configuration.

HS-169

(Error) Cannot enable hier analysis after hier_characterize_context_mode is set to constraints_only, ignored.

Description

The constraints_only mode in hier_characterize_context_mode and hier analysis are mutually exclusive. You could only enable one of them at a time.

What Next

Disable the constraints_only mode or her analysis so that you could enable the other mode.

HS-170

(Error) Change flow type after timing update is not allowed.

Feedback

Description

HyperScale must be enabled or disabled before update_timing. Change flow type after timing update is not allowed.

What Next

Enable or Disable HyperScale before update_timing.

HS-171

(Warning) By setting this option, user intents to run hierarchical distributed analysis flow. If this is not user's intent, please remove all following options "-partitions", "-split", "-enable_mim" or "-exclude" in your run script and re-try.

HS-172

(Information) Found sense mismatch at pin '%s' for clock '%s'; top-level context expects '%s' sense. Clock sense at pin has been overridden.

Description

When the clock network of a clock at the top level enters a block, the logic between top clock source and the block entry pin can modify the sense of the clock signal, such as inverting the waveform through an odd number of inverters in the clock path.

To perform proper block-level timing analysis, you should specify the clock waveforms observed at the entry pin while maintaining the same period.

What Next

Check the clock definition of the block constraints for the noted clock, or inspect the logic between the top-level clock source and the block entry pin.

HS-173

(Error) Found sense mismatch at pin '%s' for clock '%s'; top-level context expects '%s' sense.

Description

When the clock network of a clock at the top level enters a block, the logic between top clock source and the block entry pin can modify the sense of the clock signal, such as inverting the waveform through an odd number of inverters in the clock path.

To perform proper block level timing analysis, you must specify the clock waveforms observed at the entry pin while maintaining the same period.

Feedback

What Next

Check the clock definition of the block constraints for the noted clock, or inspect the logic between the top-level clock source and the block entry pin.

HS-174

(information) Model data for block '%s' is '%s' '%s' for analysis.

Description

During linking process, although there is a message HS-007 indicates all Hyperscale models are successfully linked when 'hier_enable_analysis' is set to 'true', this message is used for each individual block level that is found and successfully loaded into the HyperScale top analysis. This would help isolate problematic individual HyperScale block models to help isolate the issue faster. Please cross check with the commands such as 'set_hier_config' and 'report_hier_analysis'.

What Next

Please refer to documentation to understand guidelines and recommendations for proper use of HyperScale analysis.

HS-175

(Warning) The pin '%s' is not connected to any port (maybe because of ECO changes); its context %s value will %s.

Description

When applying context, a boundary pin was found to be no longer connected to any I/O port of the block. This situation usually happens after ECO fixing that inserts or removes buffers directly connected to a port. In this case, PrimeTime decides whether to apply the value or discard it, as indicated in the warning message.

What Next

Check whether the netlist change is intended.

HS-176

(Warning) The pin '%s' is no longer connected to port '%s' (usually because of ECO changes on the port); Its context value will be applied to pin '%s' instead.

Feedback

Description

At block, ECO fixing (such as buffer insertion and removal) on I/O ports can sometimes cause the pin that context was initially captured on to no longer exist. In this case, the context value will be applied on the new load pin of the port as informed in the warning message.

What Next

Check whether the netlist change is intended.

HS-177

(error) Found supply net '%s' in instance '%s' has a different supply group than the equivalent supply net '%s' in instance '%s'%s%s of the same block.

Description

When *set_hier_config* is used to specify a single data storage path and scenario for multiple top level instances of the same reference block, the context data internally computed for these instances during HyperScale analysis are automatically merged into a single overall context for the block, this merged context is intended to cover all the instantiation specified. In order to automatically merge the context for two HyperScale block instances of the same block, it is required that the instances must have exact matching PG scheme. Otherwise, their context data cannot be merged together and analysis must be done seperately to cover each PG scheme. When merge fails with this error message, the context for the second instance noted is discarded and PrimeTime only saves the context covering the first instance noted.

What Next

You can use *get_supply_group*, or *report_supply_group* commands to verify the message.

Based on the knowledge and intention of the design and analysis setup, there are several options to deal with failed automatic context merging.

You can choose to modify the top level upf/PG netlist if you ensured that this is a PG setup problem at top level and the block should have the same PG and similar contexts when instantiated multiple times.

- set_hier_config

Feedback

HS-178

(Warning) '%s'. The timing/noise analysis results regarding the clock '%s' are valid for those matching DVFS scenarios and invalid for other non matching DVFS scenarios.

Description

When performing Hyperscale DVFS analysis, user needs to make sure that the Top and Block clock definitions to be consistent or compatible for all DVFS scenarios in order to have all Context and Model to be correctly applied. When failing to do so, only Context and Model with regard to those matching scenarios will be applied; Therefore the timing or noise results of those non-matching scenarios are unreliable or invalid.

What Next

You can use "report_clock -map" to see how the clocks are mapped with detailed scenario mapping information. Please correct the clock definitions to match all scenarios to acheive valid timing or noise results for all scenarios.

- set_clock_map
- report_clock
- create_clock

HS-179

(Error) Missing capture clock for required context at data port '%s' because no clock is mapped with '%s'.

Description

This message is issued during context override at the HyperScale block level analysis, where there is no mapped capture clock found on the output port between current block design and HyperScale top level context data. The context override will be failed on this port.

What Next

Please use "report_clock -map" to check the clock mapping between HyperScale top and block level analysis. Source the clock_map.pt file from constraint extractor could help solve this problem.

Feedback

HS-180

(Error) Ignore source latency context for clock '%s' at data port '%s' because no mapped clock found.

Description

This message is issued during context override at the HyperScale block level analysis, where there is no mapped clock found in current block analysis for the clock lantency context characterized from HyperScale top level analysis. The source lantency context override for this clock will be failed.

What Next

Please use "report_clock -map" to check the clock mapping between HyperScale top and block level analysis. Source the clock_map.pt file from constraint extractor could help solve this problem.

HS-182

(Error) Missing launch clock for arrival context at data port %s because no clock is mapped with %s.

Description

This message is issued during context override at the HyperScale block level analysis, where there is no mapped lauch clock found for the arrival context on the input port between current block design and HyperScale top level context data. The arrival context override associated with this clock will be failed.

What Next

Please use "report_clock -map" to check the clock mapping between HyperScale top and block level analysis. Source the clock_map.pt file from constraint extractor could help solve this problem.

HS-184

(Warning) Format SDC %s doesn't support "-preinvert" option. Option blocked for generated clock %s.

Description

You get this message because the -preinvert option is needed to model the generated clock indicated. Since the selected SDC version does not support this option it is being dropped which may lead to unexpected results when the SDC file is consumed.

Feedback

What Next

Please rerun the context or model generation leading to this message without the -sdc option to allow the -preinvert option to be written.

HS-185

(Information) Report exceed contents' limit.

Description

This message is issued when report content reach the limit, rest of contents will skip. For more content, user can extend the limit by 'set hier_pp_report_limit $number'.

What Next

Set bigger limit number if needed. Use 'set hier_pp_report_limit $number'

HS-186

(Warning) Cannot copy data file %s to destination folder in version compatible save session since there is no such file in original MODEL folder.

Description

You get this message because you try to save a version compatible session and copy the data file which is not existing in the orginal MODEL folder.

What Next

Please use the non version compatible save_session or double check the orginal MODEL folder.

ILM

ILM-001

(error) The interface logic on the current design '%s' has not been identified.

Description

You receive this error message because you have not performed the step to identify interface logic on the current design.

Feedback

What Next

Execute the *identify_interface_logic* command on the current design to set the attribute *is_interface_logic_pin* on pins that are part of the interface logic of the current design.

See Also

- identify_interface_logic

ILM-002

(warning) No object has been identified as belonging to the interface logic on the current design '%s'.

Description

You receive this warning message because you have attempted to identify interface logic on the current design. However, no pin has the attribute *is_interface_logic_pin* set to true.

What Next

Verify that the value given to the *-ignore_ports* option when calling the *identify_interface_logic* command does not include all the input and output ports on the design.

See Also

- identify_interface_logic

ILM-003

(warning) Update_timing has already been performed on the current design '%s'. The interface logic identified will be a function of the assertions applied on the design.

Description

You receive this message if you issue the *identify_interface_logic* command after either executing *update_timing* on the specified design, or issuing commands that caused *update_timing* to be executed. The recommended procedure is to execute *identify_interface_logic* before *update_timing*, so that the interface logic is independent of the assertions (*set_disable_timing*, *set_case_analysis*) defined on the design. Thus, you can change *set_disable_timing* and *set_case_analysis* statements without having to regenerate the interface model for the design.

This message warns you that, because update timing has already been performed, the interface logic identified is a function of the assertions applied on the design. In this case, timing arcs on the design could be disabled by the *set_disable_timing* and

Feedback

set_case_analysis commands, so that logic in the fanout/fanin of the disabled timing arcs would not be part of the interface logic on the current design.

What Next

If it is acceptable to you that the interface logic of the current design is a function of the assertions applied on the design, no action is required on your part. Otherwise, execute the *identify_interface_logic* command before executing *update_timing* on the current design.

ILM-004

(warning) No clocks have been defined on the current design '%s'. All clocks must be defined prior to identifying interface logic or extracting model.

Description

You receive this message if you issue the *identify_interface_logic* or *extract_model* command and have not defined any clocks for the current design. You must define all clocks in a design before executing the *identify_interface_logic* command. This message warns you that errors could result in identifying the interface logic on the current design.

What Next

Use the *create_clock* and *create_generated_clock* commands to define all clocks on the current design. Then reissue the *identify_interface_logic* command.

ILM-005

(warning) A wire-load mode other than "top" is set on the current design '%s'. The wire-load mode needs to be set to "top" for timing of the ILM to match the timing of the design.

Description

You have not defined a wire-load mode of "top" on the current design. This needs to be set for the ILM timing to match design timing in a pre-layout design flow. The reason for this is that ILM's are flattened representations of the original design and do not preserve design hierarchy.

What Next

To not encounter verify errors in a pre-layout design flow when comparing the ILM against the original design you need to ensure that a wire-load mode of "top" is set on the original design.

Feedback

ILM-006

(Information) Port '%s' belongs to the ignore list because it fans out to %d%% of the registers on the design.

Description

You receive this message if you execute the *identify_interface_logic* command with the *-auto_ignore* option, and the fanout of the specified input port has a larger percentage of the total number of registers than the percentage specified by the current value of the *ilm_ignore_percentage* variable (default 25). (For example, for the default value of 25, a port's fanout is ignored if the port fans out to 25% or more of the total number of registers in the design.) This message informs you that the specified port's fanout will be ignored.

What Next

This is an informational message only; if it is acceptable to you that the specified port is on the ignore list, no action is required on your part. Otherwise, you can query the current value of the *ilm_ignore_percentage* variable by executing the following:

```
pt_shell printvar ilm_ignore_percentage
```

If you want to set the variable to a higher or lower threshold percentage, execute the following:

```
pt_shell set ilm_ignore_percentage new_value
```

ILM-007

(Warning) -auto_ignore, -context_borrow, -latch_level options do not have any affect while generating a critical pins interface logic model.

Description

You receive this message if you execute the *identify_interface_logic* command with the *-critical_pins* option along with one of *-auto_ignore, -context_borrow or -latch_level* options. These options do not make sense while generating a critical pins interface logic, and will be ignored.

What Next

This is a warning message only, no action is required on your part. To get rid of the warning, rerun *identify_interface_logic* without specifying the above options.

Feedback

See Also

- identify_interface_logic

ILM-008

(Information) The use of -include_all_net_pins option to identify_interface_logic is recommended when you extract a critical pins ILM .

Description

You receive this message if you execute the *identify_interface_logic* command with the *-critical_pins* option (that means you are extracting a critical pins ILM), and did not issue the *-include_all_net_pins* option. This message informs you that the usage of *-include_all_net_pins* option is recommended when extracting a critical pins ILM. There can be certain constraints in the design that do not work properly if you do not give the *-include_all_net_pins* option.

What Next

This is an informational message only; if you know that this option does not affect your design, you can ignore this message. Otherwise, redo the *identify_interface_logic* command by giving the *-include_all_net_pins* option.

See Also

- identify_interface_logic

ILM-009

(Warning) There are some input/output delays defined with respect to an internal clock '%s'.

Description

You receive this message if the *write_ilm_script* command encounters input/output delays defined with respect to an internal (non-ilm) clock. The clock is deleted because none of the sources of the clock are ILOGIC pins.

What Next

Try to fix the input/output delays generated in the script to take care of this problem. Alternatively, rewrite your original delays with respect to ILM clocks.

See Also

- write_ilm_script

Feedback

ILM-010

(Error) -ignore_boundary_pins can only be used with -instances option.

Description

You receive this message if the *create_ilm* command is invoked with *-ignore_boundary_pins* option without using the *-instances* option. The *-ignore_boundary_pins* can be used to ignore the input boundary pins of an instance when an instance ILM is being extracted.

What Next

If you want to extract instance ILM, use the -instances option. Otherwise, drop the *-ignore_boundary_pins* option.

- write_arrival_annotations

ILM-020

(warning) Parasitics on port net %s can not be maintained.

Description

You receive this message to inform you that the create_si_context command cannot create port parasitics for the given net in the block wrapper being generated.

Feedback

What Next

No action required.

See Also

- create_si_context

ILM-021

(warning) Net connected to port %s is eliminated as aggressor in block wrapper.

Description

You receive this message to inform you that the create_si_context command removed the given port net as an aggressor to nets inside the block for which the wrapper is being generated.

What Next

No action required.

See Also

- create_si_context

ILM-022

(error) -validate is used in an old version of modeling.

Description

You receive this message to inform you -validate option is used in an old version of modeling. The version of modeling is specified by variable *hier_modeling_version*. If it is less than 2.0, -validate option cannot be used.

What Next

Set the variable *hier_modeling_version* to 2.0 to allow the automatic model validation.

ILM-023

(Warning) Clock %s in clock group %s is defined at a port. This clock group will be skipped in the instance script.

Feedback

Description

You receive this message to inform you: some clocks in a clock group are defined at ports, and they are assumed to be clocks at the top level, thus this clock group will not be written into the instance script. Users need to use *set_clock_groups* command at the top level to redefine this clock group.

ILM-024

(Warning) The master source pin of generated clock %s is a dangling hierarchical pin. Ignoring this clock.

Description

You receive this message to inform you: the master source pin of that generated clock is a hierarchical pin not connected to any leaf pins; since ILM is flat, this hierarchical pin does not exist in the ILM, and this clock is not created in the instance script of ILM.

ILM-025

(error) *create_ilm* is not supported when *set_advanced_analysis* is executed.

Description

You receive this message to inform you *create_ilm* is not supported when *set_advanced_analysis* is executed.

What Next

Do not execute *set_advanced_analysis* before *create_ilm*.

IMSA

IMSA-001

(error) Command option %s is not supported in IMSA mode.

Description

The command option is not supported in the Interactive Multi-Scenario Analysis (IMSA) mode. You enter this mode by restoring a session saved with the *save_session -only_timing_paths ...* command.

Feedback

What Next

Check your command options and remove the unsupported option. To exit the IMSA mode, use *remove_design command.*

INT

INT-1

(fatal) Unknown interrupt signal '%d' encountered.

INT-2

(information) Interrupting current command.

INT-3

(information) One more interrupt will exit process.

INT-4

(information) Process terminated by interrupt.

INT-5

(information) Preparing to interrupt optimization...

Description

This message indicates that a Control-c (SIGINT) was received by the process during the trials phase of compile, and compile is preparing to either print out a menu (interactive mode) or to write a checkpoint file (background mode). Compile must finish the current transform before the menu or checkpoint file can be written. It may take a few minutes to finish the current transform, so please wait until you see that the checkpoint file has been written before hitting Ctrl-C again.

What Next

No action is required on your part. If you want to abort the current compile, hit Control-c twice.

Feedback

INT-6

(information) Aborting optimization...

Description

This message indicates that two Control-c signals (SIGINT) were received by the process after the Delay Optimization phase of compile, so compile will abort. *compile* will end optimization and return the design in its current state.

What Next

No action is required on your part. If you want to abort the process, press Control-c three times.

INT-7

(information) Ignoring interrupt signal since the design is being mapped. One more interrupt will abort optimization without transferring the design...

Description

This message indicates that one Ctrl-C signal (SIGINT) was received by the process before the Delay Optimization phase of compile. Since the design is being mapped, compile will ignore the first interrupt signal. The second Ctrl-C will abort compile and not write out the design.

If you want to abort the process, then hit Ctrl-C three times in a row.

INT-8

(information) Aborting optimization without transferring the design...

Description

This message indicates that two Ctrl-C signals (SIGINT) were received by the process before the Delay Optimization phase of compile, so compile is going to abort. Compile will end optimization but not return the design in its current state because the design has not been fully mapped.

If you want to abort the process, then hit Ctrl-C three times in a row.

Feedback

INTERCONNECT

INTERCONNECT-001

(error) The field %s (line number %d) has already been specified for the current table. The current table will be ignored and the token will be treated as the begining of a new table.

Description

This error occurs when a field is specified more than once for a given table.

What Next

Correct the table syntax by ensuring that each field is only specified once for a given table.

INTERCONNECT-002

(error) The current table (line number %d) is missing one or more fields.

Description

This error occurs when a table is found without the required number of fields.

What Next

Correct the table syntax by adding the missing fields to the file.

INTERCONNECT-003

(Error) Expected to find a valid field name but found %s (line number %d).

Description

This error occurs when the parser cannot find a valid field name.

What Next

Correct the table syntax by ensuring that each field is specified in the format name: data where name is one of version, corner_name, object_spec, delay_type, layer_name, area, table_min_sigma, table_max_sigma, table_meanshift, table_stdev.

INTERCONNECT-004

(error) Cannot specify '%s' for field '%s' (line number %d).

Feedback

Description

The data found in the interconnect file is not valid for the given field.

What Next

Check the interconnect side-file spec to see allowed values for the field, and update the file appropriately.

INTERCONNECT-005

(error) The version '%s' is not valid. Allowable versions are '%s'

Description

An invalid version number has been specified.

What Next

Check the version number.

INTERCONNECT-006

(error) Size of %s table (%d) does not match the size of %s table (%d).

Description

The size of all tables must match the size of area and/or model_name tables.

What Next

Correct the size of the table.

INTERCONNECT-007

(error) Could not find the specified interconnect file.

Description

The interconnect file could not be found.

What Next

Correct the name and path of the interconnect file.

INTERCONNECT-008

(error) An interconnect file version must be specified.

Feedback

Description

The version number is used for backward compatibility purposes if the interconnect file format changes in the future. It can affect the analysis results.

What Next

Specify the version of the interconnect file on the first line of the interconnect file. For example:

```
version:1.0
```

INTERCONNECT-009

(error) Negative values are not allowed for %s.

Description

Negative values are not allowed for the area, sigma, and stdev tables.

What Next

Remove negative values from the interconnect file.

INTERCONNECT-010

(error) Cannot replace a table read with the new format with a table that has been read with the old format.

Description

Tables read with the new format take precedence over those read with the old format.

What Next

Update the tables to use the new format.

INTERCONNECT-011

(error) The min and max sigma tables must be of the same size and the corresponding area tables must be identical.

Description

Min and Max sigma tables read with the old format must have the same size and the corresponding area tables must be identical.

What Next

Fix the tables, or switch to the new side-file format.

INTERCONNECT-012

(error) The layer map could not be found. Any layer-specific via variation tables will be ignored.

Description

The SPEF's layer-map is needed to map the layer-name to the layer-id.

What Next

Check the SPEF for the missing layer-map.

INTERCONNECT-013

(warning) The layer-name %s could not be found in the layer-map; the corresponding tables will be ignored.

Description

The layer-name in the interconnect side-file must be in the SPEF's layer-map.

What Next

Check the SPEF for the missing layer-name or the interconnect side-file for the incorrect layer-name.

INTERCONNECT-014

(warning) The layer-name %s does not have a corresponding interconnect side-file. The design-level side-file will be used if available.

Description

No interconnect side-file has been read for the specified layer-name in the SPEF's layer-map.

What Next

Check for the missing interconnect side-file for the specified layer-name.

Feedback

INTERCONNECT-015

(error) Via model name %s cannot be mapped to any Via model read from parasitics. Ignoring 'model_name' row of the table.

Description

The Via model names specified in the IVM file should match with the Via model names defined in the parasitics file.

What Next

Check for inconsistency of the model names and fix it.

INTERCONNECT-016

(error) Failed to read IVM table from file '%s'. IVM table refers to via models, but parasitics data has no VIA_MODEL_NAME_MAP.

Description

To use model names in IVM table, the parasitics files read should have VIA_MODEL_NAME_MAP.

What Next

Check if the parasitics files read have VIA_MODEL_NAME_MAPs defined in the correct syntax. Look for any corresponding PARA-XXX errors and fix them.

IR

IR-001

(error) %s is not a valid supply voltage value for net %s

Description

This error indicates that an invalid supply voltage value is assigned to supply net in *-supply_net_voltages* option of *set_update_rail_options* command.

What Next

Please make sure the supply voltage value is a float number.

Feedback

LBDB

LBDB-1

(error) The '%s' function requires %d arguments.

Description

This message indicates that the number of arguments passed to the specified function or the complex attribute is wrong. The Library Compiler expects a specific number of arguments for various functions and complex attributes. For example, the define_cell_area and the capacitive_load_unit require two arguments. A common cause of this error is the argument's syntax definition. For example, the pin_equal complex attribute requires one quoted string as an argument instead of multiple strings

```
pin_equal("Q", "XQ");   wrong
        pin_equal("Q" "XQ");    wrong
        pin_equal("Q XQ");      correct
```

The following example shows an instance where this message occurs:

```
/* Try the wrong number of arguments to these functions. */
  define_cell_area(my_area,pad_slots,extra_junk);
  capacitive_load_unit(1, pf, pf);
```

The following is an example message:

```
Error: Line 23, The 'define_cell_area' function requires 2 arguments.
 (LBDB-1)
```

What Next

Change the technology library to correct the number of arguments. Refer to the "Library Compiler Reference Manual" for the syntax description.

LBDB-2

(error) The value of argument %d of the '%s' function\n \tis of the wrong type. A value of '%s' type is required.

Description

This message indicates that the wrong value type has been set to the specified function argument. A common cause of this error is the alteration of argument order. For example, the capacitive_load_unit attribute expects a floating-point value then a unit of string type.

```
capacitive_load_unit( pf, 1);    wrong
  capacitive_load_unit( 1, pf);    correct
```

Feedback

The following example shows an instance where this message occurs:

```
capacitive_load_unit( pf, 1);
```

In this case, the arguments of the capacitive_load_unit need to be switched.

The following is an example message:

```
Error: Line 17, The value of argument 1 of the 'capacitive_load_unit'
 function
        is of the wrong type. A value of 'floating-point' type is
 required. (LBDB-2)
```

What Next

Change the technology library to correct the arguments. Refer to the "Library Compiler Reference Manual" for the syntax description.

LBDB-3

(error) The '%s' value is invalid for the '%s' attribute.\n \tIts valid values are %s.

Description

This message indicates that the specified string value is not included in the list of accepted values. This error is often caused by a typo in the valid enumerated string value.

The following example shows an instance where this message occurs:

```
default_wire_load_mode : enclose;
```

In this case, the value should be 'enclosed'.

The following is an example message:

```
Error: Line 15, The 'enclose' value is invalid for the
 'default_wire_load_mode'
attribute.
        Its valid values are top, segmented and enclosed. (LBDB-3)
```

What Next

Change the technology library to correct the invalid value.

LBDB-4

(error) The %s '%s' cannot be specified during\n \tthe update_lib command.

Feedback

Description

Only library-level group statements can be added to an existing library using the update_lib command.

This message indicates that an invalid data (function, attribute, or group) has been found in the library to be added.

The following example shows an instance where this message occurs: Existing library

```
default_wire_load_mode      : top;
```

You cannot specify the default_wire_load_mode attribute to be added to an existing library.

The following is an example message:

```
Error: Line 8, The group 'default_wire_load_mode' cannot be specified
 during
        the update_lib command. (LBDB-4)
```

What Next

Check the "Library Compiler User Guide" for valid data that can be added to existing libraries. Change the library to be updated appropriately.

LBDB-5

(error) The library already has a '%s' attribute. It cannot be\n \toverwritten during the update_lib command.

Description

Only library-level group statements can be added to an existing library using the update_lib command.

This message indicates that an attribute has been found in the library to be added.

What Next

Remove the existing attribute from the technology file.

LBDB-6

(error) The library already has a '%s' group; it cannot be\n \toverwritten during the update_lib command because it is permanent.

Description

This message indicates that an existing group is being overwritten in the library; the existing group is permanent. You cannot overwrite existing groups because their

Feedback

definitions might already have affected subsequent group declarations in the library. You can, however, add new ones.

The following example shows an instance where this message occurs:

```
wire_load("05x05") {
        resistance : 0 ;
        capacitance : 1 ;
        area : 0 ;
        slope : 0.186 ;
        fanout_length(1,0.39) ;
    }
```

The following is an example message:

```
Error: Line 1, The library already has a '05x05' group; it cannot be
       overwritten during the update_lib command because it is permanent.
 (LBDB-6)
```

What Next

Change the library file to either remove the group or modify its name.

LBDB-7

(information) A total of %d repeated messages are omitted.

Description

Repeated messages on buses, bundles, pin "collections" have been removed, only those corresponding to the "first" pins are shown. For the following examples:

bus(a) { bus_type : bit7to0; ... }

bundle (b) { member (x, y, z) ... }

pin (c_4 c_3 c_2 c_1) { /* pin "collections" */ ... }

messages will be shown for pins a[7], x, and c_4. This is shown

Line 330, Cell 'fd1', pin 'a[7]', The attribute 'max_transition' is not specified. (LBDB-605)

but this is omitted:

Line 330, Cell 'fd1', pin 'a[6]', The attribute 'max_transition' is not specified. (LBDB-605)

Note that if you use command suppress_message to suppress a certain warning message, that message is not generated at all, and so is not counted here. Lastly, some repeated messages may still show up, but non-repeating messages are never blocked.

Feedback

What Next

To show all repeated messages, set the following variable before read_lib:

set lc_show_repeated_messages TRUE read_lib ...

LBDB-8

(information) The %s '%s' group has been successfully %s\n \tin the library.

Description

The *update_lib* command updates library groups in a given library. This message is for information purposes only and concerns cell and operating_conditions groups. However, if a wire-load model group is updated in a library, designs using that wire-load model must be reassigned a wire-load model.

The following is an example message:

```
Information: Line 1, The operating_conditions 'BCMIL' group has been
 successfully added
             in the library. (LBDB-8)
Information: Line 8, The cell 'lbdb8' group has been successfully added
             in the library. (LBDB-8)
```

What Next

Use *set_wire_load_model* to set the wire-load model on designs using the modified wire-load models.

LBDB-9

(error) The '%s' function requires %s arguments.

Description

This message indicates that the number of arguments passed to the specified function or the complex attribute is wrong. The Library Compiler expects a specific number of arguments for various functions and complex attributes. For example, the define_cell_area and the capacitive_load_unit require two arguments. A common cause of this error is the argument's syntax definition. For example, the pin_equal complex attribute requires one quoted string as an argument instead of multiple strings

```
pin_equal("Q", "XQ");   wrong
        pin_equal("Q" "XQ");    wrong
        pin_equal("Q XQ");      correct
```

Feedback

The following example shows an instance where this message occurs:

```
/* Try the wrong number of arguments to these functions. */
  define_cell_area(my_area,pad_slots,extra_junk);
  capacitive_load_unit(1, pf, pf);
```

The following is an example message:

```
Error: Line 23, The 'define_cell_area' function requires 2 arguments.
 (LBDB-9)
```

What Next

Change the technology library to correct the number of arguments. Refer to the "Library Compiler Reference Manual" for the syntax description.

LBDB-10

(error) Invalid character '%s' is detected in %s name.

Description

This message indicates that you specified an invalid name for the object. For cell, the name cannot contain '/' as it is a reserved character for hierarchy.

What Next

Change the library source file by correcting the name.

LBDB-11

(warning) The same '%s' attribute is defined twice and is ignored the second time.

Description

This message indicates that an attribute has been registered twice. The Library Compiler ignores the second value.

What Next

Make sure that the attribute is defined only once.

LBDB-12

(warning) The '%s' attribute is the wrong type for the '%s' object.

Feedback

Description

This message indicates that an attribute's value had a wrong type. The Library Compiler ignores the value.

What Next

Make sure that the attribute's value is of the correct type.

LBDB-13

(warning) The '%s' enum has been defined twice and is being ignored.

Description

This message indicates that an enumeration value registered with an attribute has been defined twice.

What Next

Make sure that the enumeration value is defined only once.

LBDB-14

(error) The library already has a '%s' group; the library\n \tcannot be overwritten unless the -overwrite option is specified.

Description

This message indicates that a group has already been added by the *update_lib* command, and you are trying to overwrite it using the *update_lib* command again without specifying the -overwrite option.

The following is an example message:

```
Error: Line 2, The library already has a 'lbdb14' group; the library
        cannot be overwritten unless the -overwrite option is specified.
 (LBDB-14)
```

What Next

Either specify the -overwrite option to the update_lib command if you want to overwrite the same group or change the name of the group.

LBDB-15

(warning) an illegal value of '%s' %f is found, it cannot be %s than \ '%s' value '%s %f'.

Feedback

Description

```
This message indicates that the values of capacitance models/attributes
 is not
correct. Note that when you encounter error LBDB-706 as well, then this
 screener
 is one cause for LBDB-706.

the capacitance values should meet the following rule:

Cmiller_rise = miller_cap_rise value
Cmiller_fall = miller_cap_fall value

pin_capacitance = rise_capacitance or fall_capacitance or if missing, use
 pin capacitance

1. Cmiller_rise/fall <= pin_capacitance;
```

The following example shows an instance where this message occurs:

```
pin(I)  {
    direction : input;
    rise_capacitance : 0.00263567;
    ...
    ccsn_first_stage () {
      miller_cap_rise : 0.0477054;
      ...
    }
    ...
  }
```

The following is an example message:

```
Warning: Line 364, Cell 'BUFFD0', pin 'I', an illegal value of
 'miller_cap_rise' 0.047705 is found, it cannot be more than
'capacitance' value '  0.002636'. (LBDB-15)
```

What Next

Change the value of the attributes to meet the screener rules.

LBDB-16

(warning) Found a duplicate %s attribute. Using the latest value.

Description

This message indicates an attribute has been defined twice. The first definition is ignored.

Feedback

The following example shows an instance where this message occurs:

```
pin(Q) {
      direction : output;
      function : "1";
      function : "1";
    }
```

The following is an example message:

```
Warning: Line 59, Found a duplicate function attribute. Using the latest
 value. (LBDB-16)
```

What Next

Remove the duplicate definition of the attribute.

LBDB-17

(error) The library already has a type named '%s'. Type \n \tgroups can never be overwritten.

Description

This message indicates that a type group already exists in the original library, and you are trying to overwrite it using the *update_lib* command again.

The following example shows an instance where this message occurs:

```
type(bus2) {
    base_type : array;
    data_type : bit;
    bit_width : 2;
    bit_from : 0;
    bit_to : 1;
    downto : false;
  }
```

The type named bus2 is defined in the library to be updated and the file used to update.

The following is an example message:

```
Error: Line 1, The Library already has a type named 'bus2'. Type
       groups can never be overwritten. (LBDB-17)
```

What Next

Either remove the type group from the added library or change the name of the group in the file used for update.

Feedback

LBDB-18

(warning) In the '%s' library, the environment attribute \n \t%s's value is out of range.

Description

This message indicates that the nominal source voltage value defined in the library using nom_voltage attribute is less than 0. The library compiler ignores the value and takes the default nominal voltage. For a CMOS library, the default nominal voltage value is 5 volts.

The following example shows an instance where this message occurs:

```
nom_voltage : -5;
```

The following is an example message:

```
Warning: Line 29, In the library 'lbdb18', the environment attribute
        nom_voltage's value is out of range. (LBDB-18)
```

What Next

Change the value of the nom_voltage attribute to be greater than zero.

LBDB-19

(warning) Can't find a pin named '%s' in the '%s' cell.

Description

This message indicates that one of the pin names in the list of the *pin_equal* or *pin_opposite* attribute or *gate_leakage* group is not defined in the cell. This often happens when there is a typo in the pin name.

The following example shows an instance where this message occurs:

```
cell(lbdb19) {
    area : 13;
    pin_opposite("Q","XQ");
    pin(Q, YQ) {
        direction : output;
        function : "1";
    }
  }

cell(lbdb19_1) {
    area : 13;
    pin(Q, YQ) {
        direction : input;
        function : "1";
    }
    leakage_current() {
```

Feedback

```
        gate_leakage(XQ) {
          input_high_value : 7.1;
          input_low_value : -8.7;
        }
    }
  }
```

The following is an example message:

```
Warning: Line 28, Can't find a pin named 'XQ' in the 'lbdb19' cell.
 (LBDB-19)
Warning: Line 218, Can't find a pin named 'XQ' in the 'lbdb19_1' cell.
 (LBDB-19)
```

What Next

Check to see if there is a typo in the pin name. Otherwise, declare the pin in the technology library.

LBDB-20

(warning) Cannot process 'pin_opposite' for the '%s' cell.

Description

This message indicates that the pins used in the list of the *pin_opposite* attribute are not found in the cell.

The following example shows an instance where this message occurs:

```
cell(lbdb20) {
    area : 13;
    pin_opposite("Q","XQ");
    pin(Q, YQ) {
        direction : output;
        function : "1";
    }
    pin(YQ) {
        direction : output;
        function : "0";
    }
  }
```

In this case, the pins defined in the cell are 'Q' and 'YQ'. However, the pins listed in the pin_opposite attribute are 'Q' and 'XQ'.

The following is an example message:

```
Warning: Line 28, Can't process 'pin_opposite' for the 'lbdb20' cell.
 (LBDB-20)
```

Feedback

What Next

Fix the pin names in the list of the pin_opposite attribute.

LBDB-23

(error) There is a missing timing arc between pins '%s' and\n \t'%s' in the '%s' cell.

Description

This message indicates there is a missing timing arc from an input or inout pin to an output pin.

For a combinational cell, the Library Compiler checks that

```
* An output port with a function statement has timing arcs to
          all functionally related inputs
        * An output port with a three_state attribute has timing arcs
          to all three_state related inputs
        * If all timing arcs are conditional, a default timing arc
          without any condition is required.
```

The following example shows an instance where this message occurs:

```
cell(lbdb23) {
    area : 1;
    pin(A) {
      direction : input;
      capacitance : 1;
    }
    pin(B) {
      direction : input;
      capacitance : 1;
    }
    pin(Z) {
      direction : output;
      function : "(A B)'";
      timing() {
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "A";
      }
    }
  }
```

In this case, a timing arc is missing between the pin 'Z' and 'B'. To fix the problem, add the following timing group:

```
timing() {
        intrinsic_rise : 1.0;
```

Feedback

```
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "B";
      }

The following is an example message:
Error: Line 12, There is a missing timing arc between pins 'A' and
        'Z' in the 'lbdb23' cell. (LBDB-23)
```

What Next

Add the missing timing group between the two pins.

LBDB-23w

(warning) There is a missing timing arc between pins '%s' and\n \t'%s' in the '%s' cell.

Description

This message indicates there is a missing timing arc from an input or inout pin to an output pin.

For a combinational cell, the Library Compiler checks that

```
* An output port with a function statement has timing arcs to
          all functionally related inputs
        * An output port with a three_state attribute has timing arcs
          to all three_state related inputs
        * If all timing arcs are conditional, a default timing arc
          without any condition is required.
```

The following example shows an instance where this message occurs:

```
cell(lbdb23) {
    area : 1;
    pin(A) {
      direction : input;
      capacitance : 1;
    }
    pin(B) {
      direction : input;
      capacitance : 1;
    }
    pin(Z) {
      direction : output;
      function : "(A B)'";
      timing() {
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
```

Feedback

```
        related_pin : "A";
      }
    }
  }
```

In this case, a timing arc is missing between the pin 'Z' and 'B'. To fix the problem, add the following timing group:

```
timing() {
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "B";
      }

The following is an example message:
Warning: Line 12, There is a missing timing arc between pins 'A' and
        'Z' in the 'lbdb23' cell. (LBDB-23w)
```

What Next

Add the missing timing group between the two pins.

LBDB-24

(warning) The '%s' symbol is used but is not defined.

Description

This message indicates that in a symbol library, you assigned an undefined symbol name to a special symbol.

The following example shows an instance where this message occurs:

```
logic_1_symbol : "mylogic_1";
```

In this example, the symbol 'my_logic_1' is not defined. To fix the problem, define the symbol:

```
symbol(mylogic_1) {
    line(0,0,0,1.5);
    line(0,1.5,.5,2);
    line(0,1.5,-.5,2);
    pin(a,0,0,RIGHT);
  }
```

The following is an example message:

```
Warning: Line 38, The 'mylogic_1' symbol is used but is not defined.
 (LBDB-24)
```

Feedback

What Next

Either define the symbol assigned to the special symbol, or correct the name if it is wrong.

LBDB-27

(error) An invalid attribute '%s' is found.

Description

This error message occurs when a bus *function*, *three_state*, or *state_function* attribute value is not valid.

This message is also used to notify you that it is not allowed to specify related_power_power or related_group_pin when a pin is short-pin and doesn't drive any timing arc in the cell.

This message is also used to notify you when the *level_shifter_enable_pin* attribute is not specified for the input pin of a level shifter cell, or when the *isolation_cell_enable_pin* attribute is not specified for the input pin of an isolation cell.

This message is also used to show that the attribute "antenna_diode_related_power_pins" and "antenna_diode_related_ground_pins" specify one or more pg pins that don't exist.

This message is also used to show that the *max_input_delta_overdrive_high* or *max_input_delta_underdrive_high* attribute is not specified for the input or inout pin, or is not specified for power switch, level shifter, macro(memory) or pad cell.

What Next

Correct the value of the attribute and rerun the command.

LBDB-27w

(warning) An invalid attribute '%s' is found.

Description

This warning message occurs when a bus *function*, *three_state*, or *state_function* attribute value is not valid.

This message is also used to notify you that it is not allowed to specify related_power_power or related_group_pin when a pin is short-pin and doesn't drive any timing arc in the cell.

This message is also used to notify you when the *level_shifter_enable_pin* attribute is not specified for the input pin of a level shifter cell, or when the *isolation_cell_enable_pin* attribute is not specified for the input pin of an isolation cell.

Feedback

This message is also used to show that the attribute "antenna_diode_related_power_pins" and "antenna_diode_related_ground_pins" specify one or more pg pins that don't exist.

This message is also used to show that the *max_input_delta_overdrive_high* or *max_input_delta_underdrive_high* attribute is not specified for the input or inout pin, or is not specified for power switch, level shifter, macro(memory) or pad cell.

What Next

Correct the value of the attribute and rerun the command.

LBDB-28

(error) The '%s' attribute is supplied with %d arguments.\n \tOnly %d arguments are expected.

Description

This message indicates that a command or an attribute got the wrong number of arguments.

The following example shows an instance where this message occurs:

```
define("lbdb28", "library", "string", "integer");
```

The following is an example message:

```
Error: Line 61, The 'define' attribute is supplied with 4 arguments.
        Only 3 arguments are expected. (LBDB-28)
```

What Next

Fix the arguments of the attribute.

LBDB-29

(information) The '%s' attribute for %s group is official liberty syntax/already defined, this user define syntax is ignored.

Description

This message indicates that the user's defined attribute has been already defined or it is reserved by Library Compiler. The Library Compiler ignores the second definition. If the attribute has already supported by Library Compiler, the information can be ignored.

The following example shows an instance where this message occurs:

```
define("lbdb29", "pin", "string");
  define("lbdb29", "pin", "integer");
  define("area", "cell", "float");
```

Feedback

The following is an example message:

```
Information: Line 62, The 'lbdb29' attribute for pin group is official
 liberty syntax/already defined, this user define syntax is ignored.
 (LBDB-29)
Information:Line 100, The 'area' attribute for cell group is official
 liberty syntax/already defined, the user define syntax is ignored
 (LBDB-29)
```

What Next

Users can ignore this information safely. or remove the redudant definition to eliminate the message.

LBDB-30

(warning) There is a sequential timing arc with the\n \t%s non-clock pin for a related_pin attribute.

Description

This message warns you if you specified any setup, hold, skew, removal, or edge-triggered timing arcs relative to a nonclock signal.

The following example shows an instance where this message occurs:

```
cell(lbdb30) {
    area : 9;
    pin(D) {
      direction : input;
      capacitance : 1;
      min_pulse_width_high : 1.0;
      min_pulse_width_low : 1.0;
      timing () {
        timing_type : rising_edge;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "CD";
      }
    }
    pin(CP) {
      direction : input;
      capacitance : 1;
    }
    pin(CD) {
      direction : input;
      capacitance : 1;
    }
    ff("IQ","IQN") {
      next_state : "D";
```

Feedback

```
      clocked_on : "CP";
      clear   : "CD'";
    }
  }
```

The following is an example message:

```
Warning: Line 1828, There is a sequential timing arc with the
        'CP' non-clock pin for a related_pin attribute. (LBDB-30)
```

What Next

Make sure the related_pin value is a clock pin, or modify the timing group.

LBDB-31

(information) The %s group has been successfully %s\n \tin the library.

Description

This message informs you that a group has been successfully added or overwritten in a library using the *update_lib* command.

The following is an example message:

```
Information: Line 1, The type group has been successfully added
        in the library. (LBDB-31)
```

What Next

No action is required.

LBDB-32

(warning) The '%s' group has been defined multiple times in\n \tthe '%s' library. Using the last definition encountered.

Description

The library contains more than one definition of a group. The Library Compiler issues this error message, ignores the previous definitions, and takes into consideration the last definition encountered.

The following example shows an instance where this message occurs:

```
wire_load_selection(lbdb32) {
    wire_load_from_area(27,100,"10x10");
    wire_load_from_area(10,25,"05x05");
  }
  wire_load_selection(lbdb32) {
    wire_load_from_area(27,10,"10x10");
```

Feedback

```
    wire_load_from_area(27,100,"10x10");
    wire_load_from_area(0,28,"05x05");
    wire_load_from_area(2,10,"15x10");
  }
```

The following is an example message:

```
Warning: Line 50, The 'lbdb32' group has been defined multiple times in
         the 'lib' library. Using the last definition encountered.
 (LBDB-32)
```

What Next

Change the group name if it is wrong, or delete the second definition.

LBDB-34

(error) There is a syntax error in the related_bus_pins attribute's value.

Description

This message indicates there is a syntax error in the value of the related_bus_pins attribute. This might be caused by a typo.

The following example shows an instance where this message occurs:

```
related_bus_pins : {ADDR} ;
```

In this case, the 'ADDR' name is between parentheses. To fix the error, place the name between quotes.

The following is an example message:

```
Error: Line 164, There is a syntax error in the related_bus_pins
 attribute's value. (LBDB-34)
```

What Next

Check the "Library Compiler User Guide" for the correct syntax of the value, and fix the technology library source file.

LBDB-35

(warning) Missing a timing arc of timing_type 'three_state_disable'\n \tbetween '%s' and '%s' pins in the '%s' cell.

Description

To describe the transition from 0->Z or 1->Z, use the timing arc with timing_type of *three_state_disable* for the pin with a three_state attribute.

Feedback

The following example shows an instance where this message occurs:

```
cell(BTS4)  {
        area : 3.0;
    pin(Z)  {
      direction : output;
      function : "A";
      three_state : "E";
      timing()  {
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "A";
      }
      timing()  {
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "E";
      }
    }
    pin(A)  {
      direction : input;
        capacitance : 1.0;
    }
    pin(E)  {
      direction : input;
        capacitance : 1.0;
    }
  }
```

The following is an example message:

```
Warning: Line 110, Missing a timing arc of timing_type
 'three_state_disable'
        between 'E' and 'Z' pins in the 'lbfb35' cell. (LBDB-35)
```

What Next

Add the missing timing group between the two pins.

LBDB-36

(error) The '%s' specifies wrong incorrect names.

Description

This error message occurs when incorrect variable names are specified for a ff, ff_bank, latch, latch_bank, or a statetable group. This message also occurs when the number of variables is either less or more than the required number.

Feedback

Examples of incorrect variable names include the following:

- `The group name`

- `An empty string`

The following example shows an instance where this message occurs: The following example causes an error because it uses the variable group name and an empty string:

```
statetable("A", "statetable") {
ff("IQ", "") {

Error: Line 213, The 'statetable' specifies wrong variable names.
 (LBDB-36)
```

What Next

Check the *Library Compiler User Guide* for the correct syntax, and fix the variable names of the group in the technology library.

LBDB-37

(warning) The '%s' layer is defined multiple times:\n \tDeleting the old definition.

Description

The symbol library contains more than one definition of a layer. The Library Compiler issues this warning message, deletes the previous definition, and takes into consideration the last definition encountered.

The following example shows an instance where this message occurs:

```
library("ds.sdb") {

  layer(lbdb37_layer) {
    set_font ("1_25.font");
    visible : TRUE ;
    line_width : 1 ;
    red : 65000 ;
    green : 33000 ;
    blue : 0 ;
  }

  layer(lbdb37_layer) {   /* A duplicate layer. */
    set_font ("1_25.font");
    visible : TRUE ;
    line_width : 1 ;
    red : 65000 ;
    green : 33000 ;
    blue : 0 ;
```

```
  }
 }
```

The following is an example message:

```
Warning: Line 32, The 'lbdb37_layer' layer is defined multiple times:
        Deleting the old definition. (LBDB-37)
```

What Next

In the symbol library file, change the layer name if it is wrong, or delete the second definition.

LBDB-39

(error) The '%s' symbol is defined multiple times.

Description

The symbol library contains more than one definition of a symbol. The Library Compiler issues this error message and deletes all the definitions.

The following example shows an instance where this message occurs:

```
symbol(lbdb39_dot) {
    line( -.25,-.25,.25,-.25);
    line(.25,.25,.25,-.25);
    line(.25,.25,-.25,.25);
    line( -.25,.25,-.25,-.25);
    line( -.25,-.25,.25,.25);
    line(.25,-.25,-.25,.25);
  }

  symbol(lbdb39_dot) {
    line( -.25,-.25,.25,-.25);
    line(.25,.25,.25,-.25);
    line(.25,.25,-.25,.25);
    line( -.25,.25,-.25,-.25);
    line( -.25,-.25,.25,.25);
    line(.25,-.25,-.25,.25);
  }
```

The following is an example message:

```
Error: Line 58, The 'lbdb39_dot' symbol is defined multiple times.
 (LBDB-39)
```

What Next

Change the symbol name if it is wrong, or delete the second definition.

Feedback

LBDB-40

(error) In the '%s' symbol, the '%s' and '%s' pins both\n \thave the '%s' direction and the same Y location.

Description

The symbol library contains more than one pin with the same direction and the same Y location.

The following example shows an instance where this message occurs:

```
symbol("lbdb40") {
    set_minimum_boundary(0 , 0 , 8000, 12000);
    pin("P0", 1000, 10000, LEFT);
    pin("P1", 8000, 10000, LEFT);
    pin("P2", 8000, 10000, LEFT);
    line(0, 0, 0, 12000);
    line(0, 12000, 8000, 12000);
    line(8000, 12000, 8000, 0);
    line(8000, 0, 0, 0);
  }
```

The following is an example message:

```
Error: Line 15, In the 'lbdb40' symbol, the 'P2' and 'P0' pins both
        have the 'LEFT' direction and the same Y location. (LBDB-40)
```

What Next

Change the direction or the Y location of any of the pins.

LBDB-41

(error) In the '%s' symbol, the '%s' and '%s' pins both\n \thave the '%s' direction and the same X location.

Description

The symbol library contains more than one pin with the same direction and the same X location.

The following example shows an instance where this message occurs:

```
symbol("lbdb41") {
    set_minimum_boundary(0 , 0 , 8000, 12000);
    pin("P0", 10000, 1000, DOWN);
    pin("P1", 10000, 8000, DOWN);
    pin("P2", 10000, 8000, DOWN);
    line(0, 0, 0, 12000);
    line(0, 12000, 8000, 12000);
```

```
    line(8000, 12000, 8000, 0);
    line(8000, 0, 0, 0);
  }
```

The following is an example message:

```
Error: Line 15, In the 'lbdb41' symbol, the 'P2' and 'P0' pins both
        have the 'DOWN' direction and the same X location. (LBDB-41)
```

What Next

Change the direction or the X location of any of the pins.

LBDB-42

(error) In the '%s' symbol, the '%s' pin '%s' and\n \tthe '%s' pin '%s' are uncorrectly positioned.

Description

This error indicates that one of the problems is encountered:

```
- Both pin P1 and P2 have same direction and same X and Y locations.
        - The pin P1 has a LEFT direction, the pin P2 has RIGHT
          direction, and P1 and P2 have the same Y location. However
          the X location of P2 is less or equal than to the X location
          of P1.
        - The pin P1 has a UP direction, the pin P2 has DOWN
          direction, and P1 and P2 have the same X location. However
          the Y location of P2 is greater or equal than to the Y location
          of P1.
```

The following example shows an instance where this message occurs:

```
symbol("lbdb41") {
    set_minimum_boundary(0 , 0 , 8000, 12000);
    pin("P0", 10000, 1000, DOWN);
    pin("P1", 10000, 8000, DOWN);
    pin("P2", 10000, 8000, DOWN);
    line(0, 0, 0, 12000);
    line(0, 12000, 8000, 12000);
    line(8000, 12000, 8000, 0);
    line(8000, 0, 0, 0);
  }
```

The following is an example message:

```
Error: Line 41, In the symbol 'lbdb42', the 'DOWN' pin 'P2' and
        the 'DOWN' pin 'P1' are uncorrectly positioned. (LBDB-42)
```

Feedback

What Next

Change the direction or the locations of any of the pins.

LBDB-43

(error) The '%s' pin is defined multiple times in the '%s' symbol.

Description

The symbol library contains more than one definition of a pin in the specified symbol. The Library Compiler issues this error message and deletes all the definitions.

The following example shows an instance where this message occurs:

```
symbol("lbdb43") {
    set_minimum_boundary(0 , 0 , 8000, 12000);
    pin("P0", 10000, 1000, DOWN);
    pin("P0", 10000, 1000, DOWN);
    line(0, 0, 0, 12000);
    line(0, 12000, 8000, 12000);
    line(8000, 12000, 8000, 0);
    line(8000, 0, 0, 0);
  }
```

The following is an example message:

```
Error: Line 44, The 'P0' pin is defined multiple times in the 'lbdb43'
 symbol. (LBDB-43)
```

What Next

Change the pin name if it is wrong, or delete the second definition.

LBDB-46

(error) Found an invalid rotation.

Description

This message indicates that the specified string value for the pin's rotation is not included in the list of accepted values. This error is often caused by a typo in the valid enumerated string value.

What Next

Change the symbol library to correct the invalid rotation value. The valid values of the rotation are ANY_ROTATION, LEFT, RIGHT, UP, or DOWN.

Feedback

LBDB-47

(error) The '%s' cell's pin '%s' has a timing arc that has\n \t%d matched timing arcs on the scaled_cell(%s,%s).

Description

Each timing arc in the regular cell should have a matched timing arc on the same pin in the scaled_cell group. This message indicates that more than one such matching timing arc has been found in the library source.

The following example shows an instance where this message occurs:

```
library(lbdb47) {
    operating_conditions(WCCOM) {
        process : 1.5 ;
        temperature : 70 ;
        voltage : 4.75 ;
        tree_type : "worst_case_tree" ;
    }

    cell(AND) {
      area : 1;
      pin(A B) {
        direction : input;
        capacitance : 1;
      }
      pin(Z) {
        direction : output;
        function : "A B";
        timing() {
          intrinsic_rise : 0.1;
          intrinsic_fall : 0.1;
          rise_resistance : 0.1;
          fall_resistance : 0.1;
          slope_rise : 0.0;
          slope_fall : 0.0;
          related_pin : "A B";
        }
      }
    }

    scaled_cell(AND,WCCOM) {
      area : 1;
      pin(A B) {
        direction : input;
        capacitance : 1;
      }
      pin(Z) {
        direction : output;
        function : "A B";
        timing() {
```

Feedback

```
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            rise_resistance : 0.1;
            fall_resistance : 0.1;
            slope_rise : 0.0;
            slope_fall : 0.0;
            related_pin : "A";
          }
          timing() {
            intrinsic_rise : 0.3;
            intrinsic_fall : 0.3;
            rise_resistance : 0.3;
            fall_resistance : 0.3;
            slope_rise : 0.0;
            slope_fall : 0.0;
            related_pin : "A ";
          }
        }
      }
    }
```

In this case, The timing arc between 'Z' and 'A' is defined once in the 'AND' cell and twice in the 'AND' scaled_cell. To fix the problem, remove one the timing arcs.

The following is an example message:

```
Error: Line 42, The 'AND' cell's pin 'Z' has a timing arc that has
       2 matched timing arcs on the scaled_cell(AND,WCCOM). (LBDB-47)
```

What Next

Find the duplicate timing group you do not need, and delete it.

LBDB-48

(error) The '%s' pin has a %s group whose related_pin\n \tis the port itself.

Description

It is not possible to have a timing arc or a power table whose starting point and ending point are the same.

The following example shows an instance where this message occurs:

```
cell(lbdb48) {
      area : 1.0;
      pin ( O ) {
        direction : output;
        function : "1";
        timing() {
          timing_sense : non_unate;
          related_pin : "O";
```

```
            rise_resistance : 0.1;
            fall_resistance : 0.1;
            intrinsic_rise : 5.0;
            intrinsic_fall : 0.0;
          }
        }
      }
```

The following is an example message:

```
Error: Line 43, The 'O' pin has a timing group whose related_pin
       is the port itself. (LBDB-48)
```

What Next

Check the timing arc or the internal power group, and make the appropriate correction.

LBDB-49

(error) No '%s' attribute has been specified for the\n \tlibrary. This attribute is needed in %s libraries.

Description

This message indicates that you did not specify any of the following attributes in the physical library.

```
* distance_unit
        * capacitance_unit
        * resistance_unit
```

The following example shows an instance where this message occurs: Add any of the following examples of attributes to the library:

```
distance_unit : "1um";
```

The following is an example message:

```
Warning: No 'distance_unit' attribute has been specified for the
         library. This attribute is needed in technology libraries.
 (LBDB-49)
```

What Next

Add the missing attribute to the library source file.

LBDB-50

(error) In the '%s' cell, the '%s' input pin has a 'function' attribute.

Feedback

Description

This message indicates that a pin declared as an input, implicitly by omitting the direction or explicitly where the direction is set to input, has a function attribute. Only output and inout ports can have a function attribute.

The following example shows an instance where this message occurs:

```
pin(Q) {
        function : "1";
    }
```

In this case, the direction of 'Q' is set implicitly to 'input' and 'Q' has a function statement defined. To fix the problem, either set the direction explicitly to 'output' or 'inout', or delete the function attribute.

The following is an example message:

```
Error: Line 55, In the 'lbdb50' cell, the 'Q' input pin has a 'function'
 attribute. (LBDB-50)
```

What Next

Either change the direction of the port or remove the function attribute.

LBDB-51

(warning) No '%s' attribute has been specified for the\n \t%s library. It is set to default value '%s'.

Description

This message indicates that you did not specify any of the following attributes in the physical library. And a default value has been assigned.

```
* time_unit
```

The following example shows an instance where this message occurs: Add any of the following examples of attributes to the library:

```
distance_unit : 1um ;
```

The following is an example message:

```
Warning: No 'time_unit' attribute has been specified for the
         library. It is set to default value '1ns'. (LBDB-51)
```

What Next

Make sure the default value is the desired value.

Feedback

LBDB-53

(error) The '%s' attribute, which expects values of %s type,\n \tis being supplied a value of %s type.

Description

This message indicate that the attribute has been supplied with the wrong value. Library Compiler ignores the value.

The following example shows an instance where this message occurs:

```
dont_touch : 1;
```

In this case, the 'dont_touch' attribute expects a boolean value such as true or false.

The following is an example message:

```
Error: Line 53, The 'dont_touch' attribute, which expects values of
 boolean  type,
       is being supplied a value of integer type. (LBDB-53)
```

What Next

Check the "Library Compiler User Guide" for the correct type of attribute, and change the value accordingly.

LBDB-54

(error) The define attribute has an invalid '%s' type.\n \tThe valid types are 'string', 'integer', 'float', and 'boolean'.

Description

This message indicates that an invalid type is specified for the define attribute. Library Compiler ignores the invalid type.

The following example shows an instance where this message occurs:

```
library(lbdb54) {
  define( "glorp","library","my_type" );
}
```

The following is an example message:

```
Error: Line 2, The define attribute has an invalid 'my_type' type.
       The valid types are 'string', 'integer', 'float', and 'boolean'.
 (LBDB-54)
```

Feedback

What Next

Change the type to string, integer, float, or boolean in the library.

LBDB-55

(error) The '%s' technology license is not installed.

Description

This message indicates that the specified technology license is missing during a read_lib command. Given the technology, the missing license feature is matched as follows:

```
* CMOS technology needs a Design-Compiler feature.
        * FPGA technology needs an FPGA-Compiler feature.
```

If your site is without a valid technology license, the library is read in, and all functional information is removed. All cells are black boxes, and optimization with this library is disabled.

The following is an example message:

```
Error: Line 2, The 'cmos' technology license is not installed. (LBDB-55)
```

What Next

Make sure that you have a license and that the license is properly installed before next trying to read the specified technology library.

LBDB-57

(error) The 'generic' technology can only be read by Synopsys.

Description

The generic technology library supplies simple combinational and sequential cells that are useful for technology-independent component instantiation. This message indicates that you specified 'generic' as the technology type in the technology library source file. This technology type is reserved for Synopsys generic technology library. Only Synopsys is allowed to compile a generic technology library.

What Next

Do not use 'generic' as the technology type in your technology library source. Choose the correct technology type from current supporting types, for example, CMOS or FPGA.

Feedback

LBDB-58

(warning) The '%s' pin is a multicell_pad_pin, but\n \tit has no connection_class information.

Description

This message indicates that you have a pin in a multicell pad with the multicell_pad_pin attribute defined but the connection_class attribute is missing.

If your library uses multicell pads, Design Compiler needs to know which pins on the various cells to connect to implement the pad properly. Two attributes give this information:

```
* The multicell_pad_pin attribute identifies the pins to
          connect to create a working multicell pad. Use this
          attribute to flag all the pins to connect on a pad or an
          auxiliary pad cell.
        * The connection_class attribute indicates the pins
          to be connected to pins on other cells.
```

The following example shows an instance where this message occurs:

```
cell (lbdb58) {
      pad_cell : true;
      area : 0.0;
      pin (A) {
        direction : input;
        capacitance : 1.0;
        fanout_load : 1.0;
      }
      pin (GZ) {
        direction : input;
        capacitance : 1.0;
        fanout_load : 1.0;
      }
      pin(Y) {
        direction : output;
        capacitance : 1.0;
        driver_type : open_drain;
        is_pad : true;
        multicell_pad_pin : true;
        slew_control : low;
        drive_current : 1.0;
        output_voltage  : STD_CMOS;     /* defined in the library */
        function : "A";
        three_state : "GZ";
        timing () {
          intrinsic_rise   : 0.0;
          rise_resistance  : 0.0;
          intrinsic_fall   : 1.0;
          fall_resistance  : 0.1;
          related_pin      : "A";
```

Feedback

```
        }
        timing () {
          intrinsic_rise   : 0.0;
          rise_resistance  : 0.0;
          intrinsic_fall   : 1.0;
          fall_resistance  : 0.1;
          related_pin      : "GZ";
        }
        max_transition : 0.1;
      }
    }
```

In this case, the 'Y' pin has the multicell_pad_pin attribute defined. To fix the problem, add the connection_class attribute.

The following is an example message:

```
Warning: Line 41, The 'Y' pin is a multicell_pad_pin, but
         has no connection_class information. (LBDB-58)
```

What Next

Add the connection_class attribute to the specified pin.

LBDB-59

(error) The '%s' found in the %s\n \tattribute is invalid.

Description

This message indicates that the specified pin, bus, or bundle name defined in a related_inputs or related_outputs attribute does not exist in the library.

The following example shows an instance where this message occurs:

```
/* Specify non-existence output pin */
  internal_power(lbdb59) {
    values("0.1, 1.2, 0.3, 0.4");
    related_outputs : "X";
  }
```

The following is an example message:

```
Error: Line 46, The 'X' found in the related_inputs or related_outputs
        attribute is invalid. (LBDB-59)
```

What Next

Add the port definition if it is missing in the library, or fix the name if it is a typographical error.

Feedback

LBDB-60

(warning) The wire_load or wire_load_table '%s' group has no\n \t'%s'. Using the default value of (%d, %3.1f).

Description

This message indicates that the specified attribute is not specified in the wire_load or wire_load_table group. The default value of the attribute is used. The missing attribute can be

```
* A fanout_length
        * A fanout_capacitance
        * A fanout_resistance
        * A fanout_area
```

The following example shows an instance where this message occurs:

```
wire_load_table("lbdb60") {
      fanout_length(1, 0.2) ;
      fanout_resistance(1, 0.17) ;
      fanout_area(1, 0.2) ;
    }
```

In this case, the fanout_capacitance is missing in the wire_load_table. If you do not want the default value, add the following attribute:

```
fanout_capacitance(1, 0.15);
```

The following is an example message:

```
Warning: Line 10, The wire_load or wire_load_table 'lbdb60' group has no
        'fanout_capacitance'. Using the default value of (1, 0.0).
 (LBDB-60)
```

What Next

If you do not want to apply the default to the attribute indicated in the warning message, specify the attribute in the indicated group.

LBDB-61

(warning) Template '%s' is defined in old library syntax.

Description

This message indicates that a special symbol in the symbol library file is written using an old library syntax.

Feedback

What Next

Check the "Library Compiler User Guide" for the correct syntax of symbols.

LBDB-62

(error) The '%s' symbol is a duplicate '%s' template.

Description

This message indicates that the specified symbol is a duplicate symbol in the symbol library file. Library Compiler ignores the duplicate symbol.

What Next

Remove the duplicate symbol from the symbol library, or change the name if it is a typo.

LBDB-66

(error) The '%s' attribute cannot be supplied a \n \tnonpositive value (%f).

Description

This message indicates that the specified attribute cannot have a nonpositive value.

The following example shows an instance where this message occurs:

```
capacitive_load_unit( -1,pf );
```

The following is an example message:

```
Error: Line 18, The 'capacitive_load_unit' attribute cannot be supplied a
       nonpositive value (-1.000000). (LBDB-66)
```

What Next

Change the value of the attribute to positive in the technology library file.

LBDB-69

(error) Missing a %s name.

Description

This message indicates that a group name is missing in the technology or symbol library file. The Library Compiler ignores the library.

Feedback

The following example shows an instance where this message occurs:

```
cell() {
    area : 9;
  }
```

The following is an example message:

```
Error: Line 63, Missing a cell name. (LBDB-69)
```

What Next

Add the group name to the technology or symbol library file.

LBDB-70

(Information) The '%s' group under %s group is official liberty syntax/already defined, this user define syntax is ignored.

Description

The technology library contains more than one definition of a define_group attribute with the same name. or the group has already supported by Library Compiler. The Library Compiler issues this information message and deletes all the definitions.

The information can be ignored if the group has already supported by Library Compiler.

The following example shows an instance where this message occurs:

```
define_group(lbdb70, cell);
    define_group(lbdb70, cell);
```

The following is an example message:

```
Information: Line 58, The 'lbdb70' group under cell group is official
 liberty syntax / already defined, this user define syntax is ignored.
 (LBDB-70)
```

What Next

Users can ignore this information safely. or remove the redudant definition to eliminate the message.

LBDB-72

(error) Undefined module_pin '%s' referenced in pin_association\n \t'%s' in %s '%s'.

Description

The name given to a pin_association group within a binding group or a state group names a pin that must be defined by a pin group within the module. This error arises when the

Feedback

name given to the pin_association group does not have a corresponding pin group on the module. For example, in the following synthetic library, the pin_association group named 'MY_B' attempts to bind the operator pin 'B' to the module pin 'MY_B'. However, the pin 'MY_B' is not defined for the module, which causes an error to occur.

```
library (example.sldb) {
   module (my_module) {
      design_library : "MYLIB";
      parameter(width) {
         hdl_parameter : TRUE;
      }
      pin (MY_A) {
         direction : input;
         bit_width : "width";
      }
      pin (MY_Z) {
         direction : output;
         bit_width : "width";
      }
      binding (b1) {
         bound_operator : "ADD_UNS_OP";
         pin_association(MY_A) { oper_pin : A ; }

         /* The following line creates an error: */
         pin_association(MY_B) { oper_pin : B ; }

         pin_association(MY_Z) { oper_pin : Z ; }
      }
   }
}
```

In this case you can fix the error by adding a pin group to the module:

```
pin (MY_B) {
         direction : input;
         bit_width : "width";
      }
```

What Next

Remove the pin_association group that refers to the nonexistent module pin. Alternately, you can add a module pin group with the name of the referenced pin in the pin_association group.

LBDB-73

(error) The '%s' cell has more than one sequential \n \tfunction (seq, latch, or ff) declaration.

Feedback

Description

This message indicates there is more than one declaration of a sequential function group.

What Next

Leave only one sequential function group declaration; remove the rest of the declarations.

LBDB-74

(error) The %s value, '%s', is either not defined or it is defined after this line.

Description

This error message occurs when the *default_operating_conditions* or *default_wire_load* attribute refers to an undefined the operating_conditions or wire_load group name in the library.

This message can also report the *related_power_rail* attribute references and the undefined power_rail values in the power_supply group.

The following example shows the 05x05 wire_load group defined after the *default_wire_load* attribute and the resulting error message:

```
default_wire_load : 05x05;
  wire_load("05x05") {
    resistance : 0 ;
    capacitance : 1 ;
    area : 0 ;
    slope : 0.186 ;
    fanout_length(1,0.39) ;
  }

Error: Line 57, The default_wire_load value, '05x05',
has not been defined or it is defined after this line. (LBDB-74)
```

What Next

Check your library to determine if you have defined the group name. If the group name exists in the library, make sure it is defined before it is used.

LBDB-75

(warning) There is an extra timing arc between '%s' and \n \t'%s' pins in the '%s' cell.

Description

Timing arcs are allowed for pins that are related to each other. To be related to each other, the input pin has to be in the *function* or *three_state* attribute of the output/input pin. This message is issued if the timing arc identified between pins does not fall into the

Feedback

categories described previously. Certain output transitions cannot result from a single input pin change when *function*, *three_state*, and *x_function* share input pin, because the x_function takes highest priority. This message is issued when such situation happens.

The following example shows an instance where this message occurs:

```
pin(Z) {
      direction : output;
      function : "B";
      timing() {
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "A";
      }
   }
```

In this case, you defined a timing arc between the 'A' and 'Z pins, even though the 'A' pin is not functionally related to the 'Z' pin. Either remove the timing arc or change the function statement of 'Z' to include 'A'.

This is another example involving x_function:

```
pin(out) {
      direction : output ;
      function : "a0&s0 | a1&s1 | a2&s2" ;
      max_capacitance : 0.09 ;
      min_capacitance : 0.01 ;
      output_voltage : default ;
      x_function : "!(s0&!s1&!s2|!s0&s1&!s2|!s0&!s1&s2)" ;

      timing() {
        related_pin : "s0" ;
        sdf_cond : "a0===1'b0 && a1===1'b0 && a2===1'b1" ;
        timing_sense : negative_unate ;
        timing_type : combinational ;
        when : "!a0&!a1&a2" ;
      }
```

In this case, 's0', 's1' and 's2' are used in both function and x_function, no isolated change on 's0' can cause 01 or 10 transition on 'out', a timing arc from 's0' to 'out' requires simontaneous change of 's1' or 's2', LBDB-75 will warn on a timing arc from 's0' to 'out', and similarly, warn on timing arc from 's1' or 's2' as well.

The following is an example message:

```
Warning: Line 73, There is an extra timing arc between 'A' and
        'Z' pins in the 'lbd75' cell. (LBDB-75)
```

Feedback

What Next

Check your library to see whether you have generated the timing group by mistake, whether the related_pin field is wrong or the function attribute value is not recognized.

LBDB-76

(error) The '%s' %s cannot be specified here.

Description

This message indicates that you specified an attribute outside its context. When processing the current context, Library Compiler flags invalid attributes.

It can also be used to indicate that you have specified an attribute/groups which conflicts with the other attributes/groups of the object. For example, if you specify 'io_type' attribute on a cell in the FPGA library which is based on fpga_isd information, the LBDB-76 will be issues and the 'io_type" attribute should be removed.

Another example is when ocv_centile_cell_rise|fall, ocv_centile_rise|fall_transition defined under a timing group, "sigma_type" attribute can NOT be defined for ocv_sigma_cell_rise|fall and ocv_sigma_rise|fall_transition under the same timing group.

The following example shows an instance where this message occurs:

```
pin(D) {
      direction : input;
      capacitance : 1.0;
      current_unit : "1mA";
    }
```

In this case, the 'current_unit' attribute is defined at the pin level. To fix the problem, move the attribute to the library context.

The following is an example message:

```
Error: Line 69, The 'current_unit' attribute cannot be specified here.
 (LBDB-76)
```

What Next

Change the technology library source file to either delete the specified attribute or move the attribute to its correct context.

LBDB-79

(error) The 'ripped_pin' name is not defined.

Feedback

Description

This message indicates that you specified an undefined pin name for the ripped_pin attribute in a symbol library file.

The following example shows an instance where this message occurs:

```
symbol("lbdb79") {
         ripped_pin : "bus_pin" ;
         ripped_bits_property : "EDIF_property" ;
         line(0 , 50, 50, 0);
         line(50, 0, 0, -50);
         line(-50, 0 , 100, 0);
         pin("wire_pin", 100 , 0 , ANY_ROTATION);
  }
```

In this case, the 'bus_pin' pin is not defined.

The following is an example message:

```
Error: Line 69, The 'ripped_pin' name is not defined. (LBDB-79)
```

What Next

Change the symbol library to either define the pin name before you use it in the ripped_pin attribute or fix the pin name if it is a typo.

LBDB-80

(error) The '%s' port name is either undefined or \n \tits group definition is invalid.

Description

This message indicates that the specified port name is either not defined in the library source file or Library Compiler did not read the port group definition successfully. This might often be caused by a problem in the pin bus or a bundle group definition.

The following example shows an instance where this message occurs:

```
cell (lbdb80) {
    area : 3.0;
    bus (D) {
      bus_type : BUS4;
      direction : input;
      capacitance : 1.0;
    }
    pin (CK) {
      direction : input;
      capacitance : 1.0;
    }
    ff_bank (IQ,IQN,4) {
      next_state : "D" ;
```

```
      clocked_on : "CK";
    }
    pin (Q) {
      direction : output ;
      function : "D[0] CK" ;
    }
  }
```

In this case, the 'BUS4' type is not defined in the library. Thus, the 'D' bus is not recognized, and the next_state value is considered to be not defined. Fix the problem by adding the 'BUS4' type group definition.

The following is an example message:

```
Error: Line 186, The 'D' port name is either undefined or
        its group definition is invalid. (LBDB-80)
```

What Next

Change the library source file to define the port.

LBDB-81

(error) The base type in the type group is invalid.

Description

This message indicates that the specified base_type name in the type group is invalid. This might be caused by a typo in the name. Library Compiler only supports the *array* base_type.

The following example shows an instance where this message occurs:

```
type(bus2) {
    base_type : afrray;
    data_type : bit;
    bit_width : 2;
    bit_from : 0;
    bit_to : 1;
    downto : false;
  }
```

In this case, there is a typo in the base_type value. change afrray to *array*.

The following is an example message:

```
Error: Line 30, The base type in the type group is invalid. (LBDB-81)
```

What Next

Check the "Library Compiler User Guide" and fix the name of the base_type.

Feedback

LBDB-82

(error) The data type in the type group is invalid.

Description

This message indicates that the specified data_type name in the type group is invalid. This might be caused by a typo in the name. Library Compiler only supports the *bit* data_type.

The following example shows an instance where this message occurs:

```
type(bus2) {
    base_type : array;
    data_type : int;    /* wrong */
    bit_width : 2;
    bit_from : 0;
    bit_to : 1;
    downto : false;
  }
```

In this case, the data_type value is invalid. change int to *bit*.

The following is an example message:

```
Error: Line 30, The data type in the type group is invalid. (LBDB-82)
```

What Next

Check the "Library Compiler User Guide" and fix the name of the data_type.

LBDB-83

(warning) The width value in the type group is invalid.\n \tIt is corrected.

Description

This message indicates that the specified *bit_width* value in the type group is invalid. This might be caused by a typo in the value. The Library Compiler ignores the invalid value and computes the real value from the bit_from and bit_to fields.

The following example shows an instance where this message occurs:

```
type(bus2) {
    base_type : array;
    data_type : bit;
    bit_width : 3;
    bit_from : 0;
    bit_to : 1;
    downto : false;
  }
```

Feedback

In this case, the bit_width value is 3. To fix the problem, change it to 2 (bit_to - bit_from + 1).

The following is an example message:

```
Error: Line 30, The width value in the type group is invalid.
        It is corrected. (LBDB-82)
```

What Next

Change the library file, and fix the value of the bit_width.

LBDB-86

(warning) The downto value in the type group is invalid.\n \tIt is corrected.

Description

This message indicates that the specified *downto* value in the type group is invalid. This might be caused by a typo in the value. The Library Compiler ignores the invalid value and computes the real value from the bit_from and bit_to fields.

The following example shows an instance where this message occurs:

```
type(bus2) {
    base_type : array;
    data_type : bit;
    bit_width : 2;
    bit_from : 0;
    bit_to : 1;
    downto : ffalse;
  }
```

In this case, the downto value has a typo, ffalse. To fix the problem, change ffalse to false. The Library Compiler corrects the value by setting to false bit_from value is less than the bit_to value. Otherwise, it is set to true.

The following is an example message:

```
Warning: Line 35, The downto value in the type group is invalid.
        It is corrected. (LBDB-86)
```

What Next

Change the library file, and fix the value of the downto field.

LBDB-87

(error) The type group is missing its 'data_type' field.

Feedback

Description

This message indicates that the data_type field is missing in the type group.

The following example shows an instance where this message occurs:

```
type(bus2) {
    base_type : array;
    bit_width : 2;
    bit_from : 0;
    bit_to : 1;
    downto : false;
  }
```

To fix the problem, add the data_type statement to the type group.

```
data_type : bit;
```

The following is an example message:

```
Error: Line 28, The type group is missing its 'data_type' field.
 (LBDB-87)
```

What Next

Change the library file, and add the data_type field to the type group.

LBDB-88

(error) The type group is missing its 'base_type' field.

Description

This message indicates that the base_type field is missing in the type group.

The following example shows an instance where this message occurs:

```
type(bus2) {
    data_type : bit;
    bit_width : 2;
    bit_from : 0;
    bit_to : 1;
    downto : false;
  }
```

To fix the problem, add the base_type statement to the type group.

```
base_type : array;
```

The following is an example message:

```
Error: Line 28, The type group is missing its 'base_type' field.
 (LBDB-88)
```

Feedback

What Next

Change the library file, and add the base_type field to the type group.

LBDB-89

(error) The '%s' library attribute must be defined\n \tto specify a %s value.

Description

This message indicates that an attribute needed by another group is missing in the library. Examples of attributes are

```
* The input_voltage value needs the voltage_unit attribute
          defined.
        * The slew_control value needs the time_unit attribute
          defined.
        * The drive_current value needs the current_unit attribute
          defined.
```

The following example shows an instance where this message occurs:

```
input_voltage(CMOS) {
    vil          : 0.8 ;
    vih          : 2.0 ;
    vimin        : -0.3 ;
    vimax        : VDD + 0.3 ;
   }
    cell(lbdb89) {
      area : 0.0;
      dont_touch : false;
      dont_use   : false;
      pad_cell : true;
      pin(PAD ) {
        is_pad : true;
        input_voltage : CMOS;
        direction   : input;
        capacitance : 3.0;
        fanout_load : 0.0;
      }
      pin(Y ) {
        direction   : output;
        function    : "PAD";
        max_fanout  : 16.0;
        timing() {
          intrinsic_fall  : 4.0;
          intrinsic_rise  : 4.0;
          fall_resistance : 0.0;
          rise_resistance : 0.0;
          related_pin  :"PAD ";
        }
```

```
      }
    }
```

In this case, add the voltage_unit to the library as follows:

```
voltage_unit : "1V";
```

The following is an example message:

```
Error: Line 14, The 'voltage_unit' library attribute must be defined
       to specify a input_voltage value. (LBDB-89)
```

What Next

Add the missing attribute to the library.

LBDB-90

(error) The type group is defined multiple times.

Description

This message indicates that the type group is defined multiple times in the technology library. This might be caused by a typo.

The following example shows an instance where this message occurs:

```
type(bus2) {
    base_type : array;
    data_type : bit;
    bit_width : 2;
    bit_from : 0;
    bit_to : 1;
    downto : false;
  }
  type(bus2) {
    base_type : array;
    data_type : bit;
    bit_width : 2;
    bit_from : 1;
    bit_to : 0;
    downto : true;
  }
```

In this case, rename the second type group to bus2_down.

The following is an example message:

```
Error: Line 36, The type group is defined multiple times. (LBDB-90)
```

Feedback

What Next

Change the library file by either removing the multiple definitions but one or renaming the type groups.

LBDB-91

(warning) The bus naming style format is invalid.\n \tUsing the default format.

Description

This message indicates that you specified an invalid bus_naming_style format. The value must include %s and %d. Library Compiler ignores the invalid value and uses the default style "%s[%d]".

The following example shows an instance where this message occurs:

```
bus_naming_style : "%s$%s";
```

The following is an example message:

```
Warning: Line 28, The bus naming style format is invalid.
        Using the default format. (LBDB-91)
```

What Next

Check the "Library Compiler User Guide" for the correct format of the bus_naming_style and fix the value.

LBDB-92

(error) The bus subscript is out of bounds.

Description

This message indicates that you specified a bus element whose index value falls outside the declared index range of the bus type.

The accessed bus element with an index outside the bus bounds is specified in function, three_state, ff, or latch statements.

The following example shows an instance where this message occurs:

```
type(bus2) {
    base_type : array;
    data_type : bit;
    bit_width : 2;
    bit_from : 0;
    bit_to : 1;
    downto : false;
```

Feedback

```
}
cell (lbdb92) {
  area : 31.0;
  bus (D) {
    bus_type : bus2;
    direction : input ;
    capacitance : 1.0 ;
  }
  pin (CK) {
    direction : input ;
    capacitance : 1.0 ;
  }
  ff_bank (IQ,IQN,2) {
    next_state : "D[3]" ;
    clocked_on : "CK" ;
  }
  bus (SO) {
    bus_type : bus2;
    direction : output ;
    function : "IQ" ;
  }
}
```

In this case, the 'D[3]' value assigned to next_state falls outside the bus2 range.

The following is an example message:

```
Error: Line 186, The bus subscript is out of bounds. (LBDB-92)
```

What Next

Either change the bounds of the bus definition so that all subelements that are accessed fall within the range, or correct any bus indexing errors in the source library.

LBDB-93

(error) The bus type is invalid.

Description

This message indicates that you specified a bus name whose bus_type is invalid. This might be caused by an invalid base_type in the type group or a typo in the name. Library Compiler only supports the *array* base_type for bus groups.

The following example shows an instance where this message occurs:

```
type(bus2) {
    base_type : list;
    data_type : bit;
    bit_width : 2;
    bit_from : 0;
    bit_to : 1;
```

Feedback

```
    downto : false;
  }
  cell (lbdb93) {
    area : 31.0;
    bus (D) {
      bus_type : bus2;
      direction : input ;
      capacitance : 1.0 ;
    }
    pin (CK) {
      direction : input ;
      capacitance : 1.0 ;
    }
  }
```

In this case, the 'list' base_type of the 'bus2' type is invalid. Fix the problem by changing the 'list' to 'array'.

The following is an example message:

```
Error: Line 177, The bus type is invalid. (LBDB-93)
```

What Next

Check the "Library Compiler User Guide" and fix the name of the base_type in the type group, or change the bus type name.

LBDB-94

(warning) The ':' character is used in this bus naming style;\n \tthis makes it impossible to specify ranges of buses using ':'.

Description

This message indicates that you specified a ':' in the string of the bus_naming_style. Library Compiler gets confused because the ':' is used to specify ranges of buses.

The following example shows an instance where this message occurs:

```
bus_naming_style : "%s:%d";
```

The following is an example message:

```
Warning: Line 28, The ':' character is used in this bus naming style;
         this makes it impossible to specify ranges of buses using ':'.
 (LBDB-94)
```

What Next

Change the value of the bus_naming_style attribute in the technology library.

Feedback

LBDB-95

(error) Buses have incompatible widths.

Description

This message indicates that you specified a function or a three_state attribute of a group of buses with a different width.

The following example shows an instance where this message occurs:

```
cell (lbdb95) {
    area : 3.0;
    bus (D) {
      bus_type : bus2;
      direction : input;
      capacitance : 1.0;
    }
    pin (CK) {
      direction : input;
      capacitance : 1.0;
    }
    ff_bank (IQ,IQN,4) {
      next_state : "D";
      clocked_on : "CK";
    }
    pin (SO) {
      direction : output;
      function : "D[0] CK";
    }
  }
```

In this case, the number of bits in the ff_bank, which is 4, is different from the width of the 'D' bus, which is 2. Make sure that both values are the same.

The following is an example message:

```
Error: Line 186, Buses have incompatible widths. (LBDB-95)
```

What Next

Change the library source file to make sure that all buses have the same width.

LBDB-96

(error) The bus type name is missing.

Description

This message indicates that you specified a bus with an invalid a bus_type.

Feedback

What Next

Check the library source file, and correct the bus_type to the bus in the library.

LBDB-97

(error) The bus type of a subelement is missing.

Description

This message indicates that you specified a subelement whose parent is missing a bus type.

What Next

Change the library, and fix the bus type.

LBDB-98

(error) The type group name is not defined.

Description

This message indicates that you specified a bus group with an undefined bus_type name in the technology library. This might be caused by a typo.

The following example shows an instance where this message occurs:

```
cell (lbdb98) {
    area : 3.0;
    bus (D) {
      bus_type : bus2;
      direction : input;
      capacitance : 1.0;
    }
   }
```

In this case, the 'bus2' is not defined in the library. To fix the problem, add the following type group:

```
type(bus2) {
    base_type : array;
    data_type : bit;
    bit_width : 2;
    bit_from : 0;
    bit_to : 1;
    downto : false;
  }
```

Feedback

The following is an example message:

```
Error: Line 177, The type group name is not defined. (LBDB-98)
```

What Next

Change the library file by adding the named type group.

LBDB-99

(error) The pin direction is inconsistent with the bus or\n \tthe bundle parent direction.

Description

This message indicates that you specified a member of a bus or a bundle whose direction is different from its parent's direction.

The following example shows an instance where this message occurs:

```
bundle(nets) {
      members(n0, n1, n2, n3);
      direction : inout;
      pin (n0) {
        direction : output;
      }
    }
```

In this case, the 'nets' direction is 'inout', but the 'n0' direction is 'output'.

The following is an example message:

```
Error: Line 199, The pin direction is inconsistent with the bus or
        the bundle parent direction. (LBDB-99)
```

What Next

Change the library to fix the direction of the element, the bus, or the bundle.

LBDB-101

(error) The piece number in piecewise linear mode is negative.

Description

This message indicates that you specified a negative piece number in either delay intercept attributes or pin resistance attributes in CMOS piecewise linear delay model library.

Feedback

The following example shows an instance where this message occurs:

```
piece_define("0 8 15");
        ...
  rise_delay_intercept(-11, "2.2");
```

In this case, the -11 piece number is invalid. To fix the problem, make the piece number 0, 1, or 2 as defined by the piece_define attribute.

The following is an example message:

```
Error: Line 172, The piece number in piecewise linear mode is negative.
 (LBDB-101)
```

What Next

Modify the piece number to match the number of ranges in the piece_define attribute.

LBDB-102

(warning) The '%s' piece is multiply\n \tdefined. Using the first one encountered.

Description

This message indicates that you specified either delay intercept attributes or pin resistance attributes for the same piece number multiple times in a CMOS piecewise linear delay model library. Library Compiler ignores the later definitions.

The following example shows an instance where this message occurs:

```
rise_delay_intercept(1, "2.2");
        rise_delay_intercept(1, "2.2");
```

The following is an example message:

```
Warning: Line 173, The 'rise_delay_intercept(1)' piece is multiply
        defined. Using the first one encountered. (LBDB-102)
```

What Next

Modify the piece number if it is a typo, or remove the second definition.

LBDB-103

(warning) The piece number is greater than the number\n \tdefined with piece_define.

Description

This message indicates that in a CMOS piecewise-linear delay model library you specified a piece number in either delay intercept attributes or pin resistance attributes greater than the number defined in the piece_define attribute.

Feedback

The following example shows an instance where this message occurs:

```
piece_define("0 8 15");
        ...
  rise_delay_intercept(3, "2.2");
```

In this case, the 3 piece number is invalid. To fix the problem, make the piece number 0, 1, or 2 as defined by the piece_define attribute.

The following is an example message:

```
Warning: Line 174, The piece number is greater than the number
        defined with piece_define. (LBDB-103)
```

What Next

Modify the piece number to match the number of ranges in the piece_define attribute.

LBDB-104

(warning) The piecewise linear model is multiply defined.\n Using the first one encountered.

Description

This message indicates that you specified the *piece_define* attribute multiple times in a CMOS piecewise linear delay model library. Library Compiler ignores the later definitions.

The following example shows an instance where this message occurs:

```
piece_define("0 8 15");
  piece_define("0 8 15 25");
```

The following is an example message:

```
Warning: Line 13, The piecewise linear model is multiply defined.
        Using the first one encountered. (LBDB-104)
```

What Next

Remove the second definition of the attribute.

LBDB-105

(warning) The timing arc has a negative %s\n \tspecified. Using the default value.

Description

This message indicates that you specified a negative drive resistance value of pin resistance attributes in a CMOS piecewise linear delay model library. Library Compiler

assigns the *default_rise_pin_resistance* or the *default_fall_pin_resistance* value to the timing arc or the value 0.0 if no default value exists.

The following example shows an instance where this message occurs:

```
rise_pin_resistance(0, "-11.1");
```

The following is an example message:

```
Warning: Line 183, The timing arc has a negative rise_pin_resistance(0)
        specified. Using the default value. (LBDB-105)
```

What Next

Make the drive resistance value positive in the pin resistance attribute.

LBDB-107

(warning) The %s '%s' is defined multiple times\n \tin the library. Using the last one encountered.

Description

This message indicates that the same name has been used for more than one object (for example, cells in a library or pins in a cell). Each object must have a unique name within its scope. In the case of a name conflict, Library Compiler ignores all except the last name encountered during the compilation. The compiled database contains the last object only.

The following example shows an instance where this message occurs:

```
statetable ( "D GN", "Q QB") {
        table : "L/H L : - - : L/H H/L,\
            -   H : - - : N   N";
      }

      statetable ( "D GN", "Q QB") {
        table : "L/H L : - - : L/H H/L,\
            -   H : - - : N   N";
      }
```

The following is an example message:

```
Warning: Line 987, The group 'statetable' is defined multiple times
        in the library. Using the last one encountered. (LBDB-107)
```

What Next

Update the library to give each object a unique name within its scope. Quite often, a typo is responsible for the name conflict.

Feedback

LBDB-110

(warning) In the piecewise linear model, the first piece must\n \thave 0 length.

Description

This message indicates that you specified the first piece range, in the piece_define attribute, not starting from zero. Library Compiler ignores the value, and resets it to zero.

The following example shows an instance where this message occurs:

```
piece_define("1 8 15");
```

The following is an example message:

```
Warning: Line 12, In the piecewise linear model, the first piece must
        have 0 length. (LBDB-110)
```

What Next

Change the first piece range to zero.

LBDB-111

(warning) In the piecewise linear model, a piece length\n \tsmaller than that of the previous piece has been found.

Description

This message indicates that in the piece_define attribute you specified a piece length smaller than the previous one. The Library Compiler ignores the value and resets it to the previous value.

The following example shows an instance where this message occurs:

```
piece_define("0 18 15");
```

The following is an example message:

```
Warning: Line 12, In the piecewise linear model, a piece length
        smaller than that of the previous piece has been found.
 (LBDB-111)
```

What Next

Change the piece ranges to be in ascending order.

Feedback

LBDB-112

(error) The timing arc has only one segment of\n \t'%s'. It must have at least two if \n\ \tpiece_define has more than one piece.

Description

This message indicates that in a CMOS piecewise linear delay model library you specified only one segment in either delay intercept attributes or pin resistance attributes. However, the *piece_define* defines more than one piece.

The following example shows an instance where this message occurs:

```
piece_define("0 8 15");
        ...
        rise_delay_intercept(0, "2.2");
```

In this case, only one rise_delay_intercept attribute is defined. To fix the problem, add two more rise_delay_intercept for piece 1 and 2.

```
rise_delay_intercept(1, "3.3");
        rise_delay_intercept(2, "4.4");
```

The following is an example message:

```
Error: Line 169, The timing arc has only one segment of
       'rise_delay_intercept'. It must have at least two if
        piece_define has more than one piece. (LBDB-112)
```

What Next

Modify the piece number to match the number of ranges in the piece_define attribute.

LBDB-117

(error) A list does not belong here.

Description

This message indicates that you specified a list to an attribute whose type is not a list.

The following example shows an instance where this message occurs:

```
library(lbdb117) {
  cell(c) {
    area : 1.0;
    pin( a ) {
      direction : input;
      capacitance : 1.0;
    }
    pin( b ) {
```

Feedback

```
      direction : output;
      timing() {
        intrinsic_rise : 0.48;
        intrinsic_fall : 0.77;
        rise_resistance : 0.1443;
        fall_resistance : {0.0523,0.0523};
        slope_rise : 0.0;
        slope_fall : 0.0;
        related_pin : "a";
      }
    }
  }
}
```

In this case, the 'fall_resistance' attribute has a value of type list. Fix the problem by assigning a single value to the attribute.

The following is an example message:

```
Error: Line 14, A list does not belong here. (LBDB-117)
```

What Next

Correctthe value of the specified attribute.

LBDB-119

(error) The '%s' pin on the %s could not be found on\n \tthe %s. There must be a one-to-one match.

Description

Each pin in the regular cell needs a matched pin in the scaled_cell group. This message indicates that a pin could not be matched in the library source.

The following example shows an instance where this message occurs:

```
library(lbdb119) {
    operating_conditions(WCCOM) {
        process : 1.5 ;
        temperature : 70 ;
        voltage : 4.75 ;
        tree_type : "worst_case_tree" ;
    }
    cell(AND) {
      area : 1;
      pin(A B) {
        direction : input;
        capacitance : 1;
      }
      pin(Z) {
        direction : output;
```

Feedback

```
        function : "A B";
        timing() {
          intrinsic_rise : 0.1;
          intrinsic_fall : 0.1;
          rise_resistance : 0.1;
          fall_resistance : 0.1;
          slope_rise : 0.0;
          slope_fall : 0.0;
          related_pin : "A B";
        }
      }
    }

    scaled_cell(AND,WCCOM) {
      area : 1;
      pin(A B C) {
        direction : input;
        capacitance : 1;
      }
      pin(Z) {
        direction : output;
        function : "A B";
        timing() {
          intrinsic_rise : 0.1;
          intrinsic_fall : 0.1;
          rise_resistance : 0.1;
          fall_resistance : 0.1;
          slope_rise : 0.0;
          slope_fall : 0.0;
          related_pin : "A B";
        }
      }
    }
  }
```

In this case, the 'C' pin exists in the scaled_cell but not in the parent cell.

The following is an example message:

```
Error: Line 100, The 'C' pin on the scaled_cell could not be found on
       the parent cell. There must be a one-to-one match. (LBDB-119)
```

What Next

Add the missing pin in the regular cell, or remove the extra pin in the scaled_cell.

LBDB-120

(warning) Layers are ignored inside symbols.

Feedback

Description

For a symbol library, Library Compiler ignores layer information within a symbol.

The following example shows an instance where this message occurs:

```
symbol(lbdb-120) {
    line( - flag_width / 2, - flag_height / 2, \
       - flag_width / 2, flag_height / 2) ;
    line( - flag_width / 2, flag_height / 2, \
         flag_width / 2, flag_height / 2) ;
    line( flag_width / 2, flag_height / 2, \
         flag_width / 2, - flag_height / 2) ;
    line( flag_width / 2, - flag_height / 2, \
         - flag_width / 2, - flag_height / 2) ;
    text( "Area", - string_length / 2 - char_width / 3, \
         - 0.75 / 2, "constraint_layer") ;
  }
```

In this case, the constraint_layer is used in the symbol.

The following is an example message:

```
Warning: Line 3453, Layers are ignored inside symbols. (LBDB-120)
```

What Next

Remove the layer information from the symbol.

LBDB-121

(error) The '%s' must be defined in a macro cell.

Description

This message is reported when the specified group is defined in a cell not of type macro.

The group pg_setting_definition must be defined in macro cell.

The following is an example message:

```
Error: Line 546, There 'pg_setting_definition" must be defined in a macro
 cell.(LBDB-121)
```

What Next

Change the cell type to macro.

LBDB-122

(error) The %s '%s' is missing required values.

Feedback

Description

This error indicates that the specified group is missing required attribute/group: 1) For a voltage_state_range_list group, at least one voltage_state_range is needed; 2) For a pg_setting_definition group, at least one pg_setting_value is needed; 3) For a pg_setting_definition group, default_pg_setting is needed; 4) For a pg_setting_value group, either pg_pin_condition or pg_setting_condition is needed; 5) For a pg_setting_transition group, either start_setting or end_setting is needed; 6) For a site group, width and height is needed; 7) For a routing_blockage group, either rectangle or polygon is needed; 8) For a routing_blockage group, layer_name is needed; 9) For a base_layer_density_view group, saved_layers is needed. 10) For a derived_layer group, one of and, or, xor, not and resize attribute is needed.

The following example shows an instance where this message occurs:

```
cell(CGNP) {
  area : 1;
  pg_setting_definition(read) {
  }
  ...
}
```

The following is an example message:

```
Error: Line 206, The pg_setting_definition 'read' is missing required
 values. (LBDB-122)
```

What Next

Define the missing group/attribute.

LBDB-123

(error) The state '%s' could not be found for the %s '%s'.

Description

This message indicates that the specified state for pg_pin or pg_setting could not be found in the library.

The following example shows an instance where this message occurs:

```
/* Specify non-existence pg pin state */
  pg_setting_value(lbdb59) {
    pg_pin_active_state(VDD, none);
  }
```

The following is an example message:

```
Error: Line 46, The state 'none' could not be found for the pg pin 'VDD'.
 (LBDB-123)
```

Feedback

What Next

Add the required state for the voltage name of the pg pin if it is missing in the library, or the pg setting in the cell, or fix the name if it is a typographical error.

LBDB-124

(error) The pg setting instance pg_setting(%s, %s) is invalid.

Description

The pg setting instance delaration must be referring to a pg_setting_definition and one of its pg_setting_value.

The following example shows an instance where this message occurs: The following example shows an incorrect pg setting instance:

```
cell(CGNP) {
  area : 1;
  pg_setting_definition(rw) {
    pg_setting_value(read) {
      ...
    }
  }
  mode_definition(rw) {
    mode_value(read) {
      ...
    }
    mode_value(write) {
        pg_setting(rw, write);
    }
  }
  ...
}
```

The following is an example message:

```
Error: Line 206, The pg setting instance pg_setting(rw, write) is
 invalid. (LBDB-124)
```

What Next

Check for consistency between mode group and pg setting definitions, and pg setting instance declarations.

LBDB-125

(warning) The %s '%s' in group %s is ignored.

Feedback

Description

This message indicates that you specified a redundant attribute or group in the specified group.

The following example shows an instance where this message occurs: The following example shows a redundant pg_pin_active_state for VBP in this pg_setting_value group.

```
cell (CC) {
    pg_setting_definition(PD) {
        pg_setting_value(PV) {
            pg_pin_condition : "VDD * !VSS" ;
            pg_pin_active_state(VDD, on);
            pg_pin_active_state(VBP, pon);
        }
    }
}
```

The following is an example message:

```
Warning: Line 639, The pg_pin_active_state VBP in group pg_setting_value
 is ignored. (LBDB-125)
```

What Next

Remove the redundant attribute from the parent group and rerun the command.

LBDB-126

(error) The '%s' construct is not valid\n \tin '%s' libraries.

Description

This message indicates that the specified construct is not valid in the specified library. In Library Compiler, certain constructs are valid only in certain types of libraries. For example, pin resistances are not valid when specified on timing arcs in nonlinear (table_lookup) libraries.

The following example shows an instance where this message occurs:

```
library(lbdb126) {
  delay_model : "generic_cmos";
  piece_define("0 8 15");

  cell(INVERTER) {
    area : 5.0;
    cell_power : 1.0;
    pin(A) {
      direction : input;
      capacitance : 1.0;
    }
```

Feedback

```
  }
}
```

In this case, the 'cell_power' construct is not valid in piecewise_cmos libraries.

The following is an example message:

```
Error: Line 155, The 'cell_power' construct is not valid
        in 'piecewise_cmos' libraries. (LBDB-126)
```

What Next

Remove the invalid construct from the library source file

LBDB-127

(error) The %s contains invalid variable '%s'.

Description

This message indicates that the Boolean condition contains invalid operand. For pg_pin_condition, only pg pin and signal pin are allowed; For pg_setting_condition, only other pg_setting_definition and signal pin are allowed;

The following example shows an instance where this message occurs: The following example shows an incorrect pg_pin_condition in this pg_setting_value group, while X is neither a pg pin nor pin of the cell.

```
cell (CC) {
    pg_setting_definition(PD) {
        pg_setting_value(PV) {
            pg_pin_condition : "VDD * !VSS * X" ;
            pg_pin_active_state(VDD, on);
        }
    }
}
```

The following is an example message:

```
Warning: Line 639, The pg_pin_condition contains incorrect variable 'X'.
 (LBDB-127)
```

What Next

Check the Boolean condition and remove invalid variable.

LBDB-128

(error) The '%s' and '%s' attributes are both defined for this\n \t%s group.

Feedback

Description

This error indicates some attributes are specified together in one group.

derived_layers groups require specification of either 1. and 2. or 3. not 4. xor 5. resize However, it is an error to specify more than one of them.

pg_setting_value groups require specification of either 1. pg_pin_condition and pg_pin_active_state 2. pg_setting_condition and pg_setting_active_state

However, it is an error to mix both the styles.

The following example shows an instance where this message occurs:

```
cell (CC) {
    pg_setting_definition(PD) {
        pg_setting_value(PV) {
            pg_pin_condition : "VDD * !VSS" ;
            pg_setting_condition : "PD1 * PD2";
        }
    }
}
```

The following is an example message:

```
Error: Line 104, The 'pg_pin_condition' and 'pg_setting_condition'
 attributes are both defined for this
       pg_setting_value group. (LBDB-128)
```

What Next

Check the library source file to make sure that the previous requirement is met.

LBDB-129

(error) The pg_setting_value '%s' contains circular pg_setting_active_state.

Description

The pg_setting_active_state in the pg_setting_value has circular reference. A circular reference occurs when an pg_setting_value is related to itself through other pg_setting_value. Under this situation, the pg_setting_condition can never be resolved. Therefore, Library Compiler flags them with errors.

The following example shows an instance where this message occurs:

```
cell(lbdb140) {
        pg_setting_definition(PD) {
            ...
        }
        pg_setting_definition(PD_1) {
            ...
```

Feedback

```
        }
        pg_setting_definition(PD_2) {
            ...
        }
        pg_setting_definition(PD_3) {
            pg_setting_value(PV8) {
                pg_setting_condition : "PD_4 + PD_1" ;
                pg_setting_active_state(PD_4, PV1);
                pg_setting_active_state(PD_1, PV1);
            }
        }
        pg_setting_definition(PD_4) {
            pg_setting_value(PV1) {
                pg_setting_condition : "PD * !PD_3" ;
                pg_setting_active_state(PD, PV1);
                pg_setting_active_state(PD_3, PV8);
            }
        }

    }
```

The following is an example message:

```
Warning: Line 263, The pg_setting_value 'PV8' contains circular
 pg_setting_active_state. (LBDB-129)
```

What Next

Check the library source file, and verify the questionable circular pg_setting_value.

LBDB-130

(error) The pg_setting_condition of '%s' is always %s.

Description

This error message indicates that the pg_setting_condition is always true or false, which means the pg_setting_value is always active or never active.

The following example shows an instance where this message occurs:

```
cell(lbdb140) {
        pg_setting_definition(PD) {
            pg_setting_value(PV1) {
                pg_pin_condition : "!VDD + VSS" ;
            }
        }
        pg_setting_definition(PD_2) {
            pg_setting_value(PV1) {
                pg_pin_condition : "VDD * !VSS" ;
            }
        }
```

Feedback

```
        pg_setting_definition(PD_3) {
            pg_setting_value(PV8) {
                pg_setting_condition : "PD_2 * PD" ;
                pg_setting_active_state(PD_2, PV1);
                pg_setting_active_state(PD, PV1);
            }
        }

    }
```

The following is an example message:

```
Warning: Line 263, The pg_setting_condition of 'PV8' is always false.
 (LBDB-130)
```

What Next

Check the Boolean condition, and verify the problematic expression.

LBDB-131

(error) The required state of %s with name '%s' has not been defined in the %s, or it is invalid.

Description

This message indicates that the pg_pin_active_state or pg_setting_active_state of the specified object is not defined in the group, or it's an invalid state.

The following is an example message:

```
Error: Line 57, The required state of pg pin with name 'VDD" has not been
 defined in the pg_setting_value, or it is invalid.(LBDB-131)
```

What Next

Add the correct state for this object.

LBDB-132

(error) In the '%s' cell, the %s pin '%s' cannot have\n \ta '%s' attribute.

Description

This message indicates that you specified a *clock* or a *prefer_tied* attribute on a inout pin.

The following example shows an instance where this message occurs:

```
cell(lbdb132) {
    area : 1;
    pin(A B C) {
```

Feedback

```
      direction : input;
      capacitance : 1;
    }
    pin(Z) {
      direction : inout;
      function : "A B";
      three_state : "C";
      clock : true;
      timing() {
        intrinsic_rise : 0.1;
        intrinsic_fall : 0.1;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "A B C";
      }
      timing() {
        timing_type : three_state_disable;
        intrinsic_rise : 0.1;
        intrinsic_fall : 0.1;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "C";
      }
    }
  }
```

In this case, the 'Z' pin whose direction is inout has a clok attribute set.

The following is an example message:

```
Error: Line 219, In the 'lbdb132' cell, the inout pin 'Z' cannot have
        a 'clock' attribute. (LBDB-132)
```

What Next

Remove the specified attribute, or change the direction of the pin to input.

LBDB-135

(error) The attribute '%s' is required for at least one output pin as the related PG pin has attribute '%s'.

Description

For a macro cell, if output pins' PG pin has attribute 'permit_power_down', it is a requirement that at least one output pin associated to the PG pin has attribute 'alive_during_partial_power_down'.

The following example shows an instance where this message occurs:

```
cell(els) {
      is_macro_cell : true;
```

Feedback

```
    pg_pin (VDD) {
      pg_type : primary_power;
      voltage_name : VDD;
    }
    pg_pin (VDDL) {
      pg_type : primary_power;
      permit_power_down : true;
      voltage_name : VDDL;
    }
    pg_pin (VSS) {
      pg_type : primary_ground;
      voltage_name : VSS;
    }

    pin(EN) {
      direction : input;
      related_power_pin : VDDL;
      related_ground_pin : VSS;
    }
    pin(Y1) {
      direction : output;
      related_power_pin : VDDL;
      related_ground_pin : VSS;
    }
    pin(Y2) {
      direction : output;
      related_power_pin : VDDL;
      related_ground_pin : VSS;
    }
  }
```

In this case, all the output pins' related PG pins have the attribute 'permit_power_down', but there is no attribute 'alive_during_partial_power_down' in output pins ('Y1' and 'Y2').

The following is an example message:

```
Error: Line 326, Cell 'els', The attribute
 'alive_during_partial_power_down' is required for at least one output
 pin as the related PG pin has attribute 'permit_power_down' (LBDB-135)
```

What Next

Add required attribute to the output signal pin.

LBDB-136

(warning) The '%s' attribute on the '%s' pin in\n \tthe '%s' cell is not valid on %s pins.\n \tThe attribute is ignored.

Feedback

Description

This message indicates that the attribute on the specified pin is invalid. The attribute is ignored.

The following example shows an instance where this message occurs:

```
cell(lbdb136) {
      area : 9;
      pin(D) {
        direction : input;
        capacitance : 1;
      }
      pin(CP) {
        direction : input;
        capacitance : 1;
      }
      pin(CD) {
        direction : input;
        capacitance : 2;
      }
      ff("IQ","IQN") {
        next_state : "D";
        clocked_on : "CP";
        clear   : "CD'";
      }
      pin(Q) {
        direction : output;
        function : "IQ";
        min_period : 0;
      }
```

In this case, the min_period attribute is defined for an output pin.

The following is an example message:

```
Warning: Line 1848, The  'min_period'  attribute on the 'Q' pin in
        the 'lbdb136' cell is not valid on output pins.
        The attribute is ignored. (LBDB-136)
```

What Next

Refer to the "Library Compiler User Guide" to determine the reason why the attribute is not valid. Make the correction.

LBDB-137

(error) The attribute '%s' is required as its related PG pin has attribute '%s'.

Feedback

Description

This message indicates that the required attribute on the specified pin is missing, since the related PG pin of the pin has specified attribute.

For an isolation cell, or macro cell with isolation enable pin, if the PG pin has attribute 'permit_power_down', it is a requirement that the output pin and isolation cell enable pin associated to the PG pin has attribute 'alive_during_partial_power_down'.

The following example shows an instance where this message occurs:

```
cell(els) {
      pg_pin (VDD) {
        pg_type : primary_power;
        voltage_name : VDD;
      }
      pg_pin (VDDL) {
        pg_type : primary_power;
        permit_power_down : true;
        voltage_name : VDDL;
      }
      pg_pin (VSS) {
        pg_type : primary_ground;
        voltage_name : VSS;
      }

      pin(EN) {
        isolation_cell_enable_pin : true;
        direction : input;
        related_power_pin : VDDL;
        related_ground_pin : VSS;
      }
      pin(Y) {
        direction : output;
        related_power_pin : VDDL;
        related_ground_pin : VSS;
      }
    }
```

In this case, the alive_during_partial_power_down is missing in pin EN and Y.

The following is an example message:

```
Error: Line 326, Cell 'els', pin 'EN', The attribute
 'alive_during_partial_power_down' is required as its related PG pin has
 attribute 'permit_power_down'. (LBDB-137)
Error: Line 346, Cell 'els', pin 'Y', The attribute
 'alive_during_partial_power_down' is required as its related PG pin has
 attribute 'permit_power_down'. (LBDB-137)
```

What Next

Add required attribute to the signal pin.

Feedback

LBDB-138

(warning) The timing arc is missing the piecewise data value\n \tfor '%s'. The value is interpolated if possible.\n \tOtherwise, the default value is used if it exists.

Description

This message indicates that you did not specify the definition of either delay intercept attributes or pin resistance attributes of piece number in a CMOS piecewise linear delay model library.

The following example shows an instance where this message occurs:

```
library(test) {
  delay_model : "generic_cmos";
  piece_define("0 8 15");

  cell(lbdb138) {
    area : 5.0;
    pin(A) {
      direction : input;
      capacitance : 1.0;
    }
    pin(Z) {
      direction : output;
      function : "A'";

      timing() {
        intrinsic_rise : 5.0;
        intrinsic_fall : 2.0;
        slope_rise : 1.0;
        slope_fall : 2.0;

        rise_delay_intercept(0, "1.1");
        rise_delay_intercept(1, "2.2");
        rise_delay_intercept(2, "3.3");

        fall_delay_intercept(0, "1.1");
        fall_delay_intercept(1, "2.2");
        fall_delay_intercept(2, "3.3");

        rise_pin_resistance(0, "1.1");
        rise_pin_resistance(1, "2.2");

        fall_pin_resistance(0, "4.4");
        fall_pin_resistance(1, "4.4");

        related_pin : "A";
      }
    }
  }
}
```

Feedback

In this case, the value of the rise_pin_resistance attribute is missing for index 2.

The following is an example message:

```
Warning: Line 165, The timing arc is missing the piecewise data value
        for 'rise_pin_resistance(2)'. The value is interpolated if
 possible
        Otherwise, the default value is used if it exists. (LBDB-138)
```

What Next

Add the missing attribute to the specified piece number.

LBDB-139

(error) Invalid delay model for the given technology.

Description

This message indicates that you specified an invalid value in the delay_model attribute.

The following example shows an instance where this message occurs:

```
delay_model : "lbdb139";
```

The following is an example message:

```
Error: Line 3, Invalid delay model for the given technology. (LBDB-139)
```

What Next

Refer to the "Library Compiler User Guide" for supported delay models. Change the value of the delay_model attribute to a valid one.

LBDB-140

(warning) The '%s' cell contains circular timing arcs.\n \tThe '%s' pin is in one of the cycles.

Description

The pin in the library cell has circular timing arcs. A circular timing arc occurs when an inout or output pin is related to itself through other inout or output pins. A change in one pin belonging to a circular timing arc continually loops around.

Circular timing arcs do not make sense and are probably mistakes. Therefore, the Library Compiler flags them with warnings.

The following example shows an instance where this message occurs:

```
cell(lbdb140) {
      area : 9;
```

Feedback

```
    pin(D) {
      direction : input;
      capacitance : 1;
    }
    pin(CP) {
      direction : input;
      capacitance : 1;
    }

    ff("IQ","IQN") {
      next_state : "D";
      clocked_on : "CP";
    }
    pin(Q) {
      direction : output;
      function : "IQ";
      timing() {
        timing_type : rising_edge;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "CP";
      }
    }
    pin(Q2) {
      direction : output;
      function : "IQ";
      timing() {
      intrinsic_rise : 1.0;
      intrinsic_fall : 1.0;
      rise_resistance : 0.1;
      fall_resistance : 0.1;
      related_pin : "Q3";
      }
    }
    pin(Q3) {
      direction : output;
      function : "IQ";
      timing() {
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "Q2";
      }
    }
  }
```

The following is an example message:

```
Warning: Line 263, The 'lbdb140' cell contains circular timing arcs.
        The 'Q2' pin is in one of the cycles. (LBDB-140)
```

Feedback

What Next

Check the library source file, and verify the questionable circular timing arcs.

LBDB-141

(warning) The timing arc is missing the piecewise data value for\n \t'%s'. The default value is used if it exists.

Description

This message indicates that you did not specify the definition of either delay intercept attributes or pin resistance attributes of the piece number defined in the piece_define in a CMOS piecewise linear delay model library.

The following example shows an instance where this message occurs:

```
library(test) {
  delay_model : "generic_cmos";
  piece_define("0");

  cell(lbdb138) {
    area : 5.0;
    pin(A) {
      direction : input;
      capacitance : 1.0;
    }
    pin(Z) {
      direction : output;
      function : "A'";

      timing() {
        intrinsic_rise : 5.0;
        intrinsic_fall : 2.0;
        slope_rise : 1.0;
        slope_fall : 2.0;

        rise_delay_intercept(0, "1.1");

        rise_pin_resistance(0, "1.1");
        fall_pin_resistance(0, "4.4");

        related_pin : "A";
      }
    }
  }
```

In this case, the value of the fall_delay_intercept attribute is missing for index 2.

Feedback

The following is an example message:

```
Warning: Line 170, The timing arc is missing the piece wise data value
 for
        'fall_delay_intercept(0)'. The default value is used if it
 exists. (LBDB-141)
```

What Next

Add the missing attribute to the specified piece number.

LBDB-142

(error) '%s' is an invalid value for the '%s'\n \tenumerated type attribute.

Description

This message indicated that you specified a value that is not part of the enumerated literals for the specified attribute.

The following example shows an instance where this message occurs:

```
voltage_unit : "1";
```

The following is an example message:

```
Error: Line 19, '1' is an invalid value for the 'voltage_unit'
        enumerated type attribute. (LBDB-142)
```

What Next

Refer to the "Library Compiler User Guide", and fix the invalid value.

LBDB-143

(error) An invalid string is provided. The invalid string is\n \teither a blank string or a string that begins with a digit\n \tthat is unquoted.

Description

A string begining with a digit must be enclosed in double quotes (""). In addition, blank strings are not valid in Library Compiler.

The following example shows an instance where this message occurs:

```
type(111) {
    base_type : array;
    data_type : bit;
    bit_width : 2;
    bit_from : 1;
    bit_to : 0;
```

Feedback

```
    downto : true;
  }
```

In this case, the 111 type name starts with a digit. To fix the problem, add quotes.

The following is an example message:

```
Error: Line 29, An invalid string is provided. The invalid string is
        either a blank string or a string that begins with a digit
        that is unquoted. (LBDB-143)
```

What Next

Check the library and correct the string. If the string begins with a digit, enclose the string in quotes. Remove any blank strings. For details on Library Compiler string rules, refer to the "Library Compiler Reference Manual".

LBDB-144

(error) The '%s' pin name does not match the '%s' bus name.

Description

This message indicates that you specified a bus element name different from the bus name given in the bus_naming_style. Library Compiler cannot extract the element name properly.

What Next

Make sure that the bus_naming_style string matches the specified bus name.

LBDB-145

(warning) The 'direction' attribute is missing in the %s '%s'.

Description

This message indicates that the direction attribute is missing in the bus or bundle group.

The following example shows an instance where this message occurs:

```
bundle(Q) {
      members(XQ, Q1);
/*      direction : output; */
      function : "1";
    }
```

The following is an example message:

```
Warning: Line 53, The 'direction' attribute is missing in the 'Q' bundle.
 (LBDB-145)
```

Feedback

What Next

Add the direction attribute to the bus or bundle port in the technology library.

LBDB-146

(error) The value for the update attribute must be "true" or "false".

Description

This message indicates that, in a symbol library, you specified an invalid value to the *update* attribute in either an *annotate_symbol* or an *annotate* group. This might be caused by a typo because the Library Compiler expects a quoted string.

The following example shows an instance where this message occurs:

```
annotate_symbol() {
      value( "ANN_PAGE_NUM", "ANN_NUM_PAGES") ;
      format : "sheet:  %s of %s" ;
      x : RIGHT_X ;
      y : LOW_Y ;
      layer_name : "template_text_layer" ;
      update : true;
    }
```

The following is an example message:

```
Error: Line 95, The value for the update attribute must be "true" or
 "false". (LBDB-146)
```

What Next

Check your symbol library file, and correct the value of the update attribute.

LBDB-147

(error) A value must be specified for the annotate or\n \tthe annotate_symbol group.

Description

This message indicates that, in a symbol library, you did not specify a value to either the *annotate* or the *annotate_symbol* group.

The following example shows an instance where this message occurs:

```
annotate_symbol() {
      format : "sheet:  %s of %s" ;
      x : RIGHT_X ;
      y : LOW_Y ;
      layer_name : "template_text_layer" ;
    }
```

Feedback

In this case, the value attribute is missing. To fix the problem, add the attribute,

```
value( "ANN_PAGE_NUM", "ANN_NUM_PAGES") ;
```

The following is an example message:

```
Error: Line 89, A value must be specified for the annotate or
        the annotate_symbol group. (LBDB-147)
```

What Next

Check your symbol library file, and add the value attribute.

LBDB-148

(error) The '%s' pin is not found in the annotate_symbol group.

Description

This message indicates that, in a symbol library, you specified an invalid pin_name value for the *pin_name* attribute in an *annotate_symbol*. This might be caused by a typo.

The following example shows an instance where this message occurs:

```
symbol("lbdb148") {
    set_minimum_boundary(0 , 0 , 8000, 12000);
    pin("P0", 10000, 1000, DOWN);

    line(0, 0, 0, 12000);
    line(0, 12000, 8000, 12000);
    line(8000, 12000, 8000, 0);
    line(8000, 0, 0, 0);
    annotate_symbol() {
      value( "ANN_PAGE_NUM", "ANN_NUM_PAGES") ;
      pin_name : "P2";
      format : "sheet:  %s of %s" ;
      x : RIGHT_X ;
      y : LOW_Y ;
      layer_name : "template_text_layer" ;
    }

  }
```

In this case, the 'P2' name does not exist in the 'lbdb148' symbol. Change the name to P0.

The following is an example message:

```
Error: Line 89, The 'P2' pin is not found in the annotate_symbol group.
 (LBDB-148)
```

Feedback

What Next

Check your symbol library file, and correct the value of the pin_name attribute.

LBDB-149

(error) The X value is invalid in the annotate or\n \tthe annotate_symbol group.

Description

This message indicates that, in a symbol library, you specified an invalid value to the *X* attribute in either an *annotate* or *annotate_symbol* group. This might be caused by a typo.

The following example shows an instance where this message occurs:

```
symbol("lbdb148") {
    set_minimum_boundary(0 , 0 , 8000, 12000);
    pin("P0", 10000, 1000, DOWN);

    line(0, 0, 0, 12000);
    line(0, 12000, 8000, 12000);
    line(8000, 12000, 8000, 0);
    line(8000, 0, 0, 0);
    annotate_symbol() {
      value( "ANN_PAGE_NUM", "ANN_NUM_PAGES") ;
      format : "sheet:  %s of %s" ;
      x : "";
      y : LOW_Y ;
      layer_name : "template_text_layer" ;
    }

  }
```

The following is an example message:

```
Error: Line 89, The X value is invalid in the annotate or
        the annotate_symbol group. (LBDB-149)
```

What Next

Check your symbol library file, and correct the value of the X attribute.

LBDB-150

(error) The format specification cannot have more than %d %%s specifications.

Description

This message indicates that, in a symbol library, the format attribute has more than 10 string specifications. Library Compiler accepts only 10.

Feedback

The following example shows an instance where this message occurs:

```
annotate_symbol() {
      value( "A1","A2","A3","A4","A5","A6","A7","A8","A9","A10" ) ;
      format : "sheet:  %s of %s %s of %s %s of %s %s of %s %s of %s %s
 of %s " ;
      x : RIGHT_X ;
      y : LOW_Y ;
      layer_name : "template_text_layer" ;
    }
```

The following is an example message:

```
Error: Line 101, The format specification cannot have more than 10 %s
 specifications. (LBDB-150)
```

What Next

Check your symbol library file, and reduce the number of specification in the format attribute.

LBDB-151

(error) The format specification has %d %%s specification(s),\n \tbut only %d value(s) is/are specified.

Description

This message indicates that, in a symbol library, the format specification does not match the number of values provided to either the *annotate* or the *annotate_symbol* group. This might be caused by a typo.

The following example shows an instance where this message occurs:

```
annotate_symbol() {
      value( "ANN_PAGE_NUM") ;
      format : "sheet:  %s of %s" ;
      x : RIGHT_X ;
      y : LOW_Y ;
      layer_name : "template_text_layer" ;
    }
```

In this case, the value attribute has only the string value, but the format refers to two %s. To fix the problem, either add the second string value in the value attribute or remove the second %s in the format attribute.

The following is an example message:

```
Error: Line 89, The format specification has 2 %s specification(s),
        but only 1 value(s) is/are specified. (LBDB-151)
```

Feedback

What Next

Check your symbol library file, and correct the value of either the value attribute or the format attribute.

LBDB-152

(error) The '%s' object type is invalid in the annotate\n \tor the annotate_symbol group.

Description

This message indicates that, in a symbol library, you specified an invalid object type for the *object_type* attribute in either an *annotate* or *annotate_symbolgroup. This might be caused by a typo. Library Compiler accepts the following object types:*

```
* pin
        * design
        * port
        * cell
        * net
```

The following example shows an instance where this message occurs:

```
symbol("lbdb152") {
    set_minimum_boundary(0 , 0 , 8000, 12000);
    pin("P0", 10000, 1000, DOWN);

    line(0, 0, 0, 12000);
    line(0, 12000, 8000, 12000);
    line(8000, 12000, 8000, 0);
    line(8000, 0, 0, 0);
    annotate_symbol() {
      value( "ANN_PAGE_NUM", "ANN_NUM_PAGES") ;
      format : "sheet:  %s of %s" ;
      x : "RIGHT_X";
      y : LOW_Y ;
      layer_name : "template_text_layer" ;
      object_type : "library";
    }

  }
```

The following is an example message:

```
Error: Line 89, The 'library' object type is invalid in the annotate
        or the annotate_symbol group. (LBDB-152)
```

What Next

Check your symbol library file, and correct the value of the object_type attribute.

Feedback

LBDB-153

(error) A syntax error is found before the library or phys_library group.\n \tThe compilation is terminated.

Description

This message follows lexical and syntax error messages issued when reading a library.

The following example shows an instance where this message occurs:

```
related_bus_pins : { ADDR";
```

In this case, a lexical error is encountered in the related_bus_pins value. Substitute the '{' for a "".

The following is an example message:

```
Error: A syntax error is found before the library or phys_library group.
        The compilation is terminated. (LBDB-153)
```

What Next

Fix all lexical and syntax errors.

LBDB-155

(warning) The %s_cell for the '%s' cell with '%s'\n \toperating_conditions is defined multiple times in the library.\n \tUsing the last one encountered.

Description

This message indicates that a scaled_cell with the same operating_conditions is defined multiple times in the library. This might be caused by a typo in the name of the operating_conditions. Library Compiler uses the last cell encountered.

The following example shows an instance where this message occurs:

```
library(lbdb155) {
    operating_conditions(WCCOM) {
        process : 1.5 ;
        temperature : 70 ;
        voltage : 4.75 ;
        tree_type : "worst_case_tree" ;
    }
    cell(IVV) {
      area : 1;
      pin(A) {
        direction : input;
        capacitance : 1;
      }
```

Feedback

```
    pin(Z) {
      direction : output;
      function : "A'";
      timing() {
        intrinsic_rise : 0.1;
        intrinsic_fall : 0.1;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        slope_rise : 0.0;
        slope_fall : 0.0;
        related_pin : "A";
      }
    }
  }

  scaled_cell(IVV,WCCOM) {
    area : 1;
    pin(A) {
      direction : input;
      capacitance : 1;
    }
    pin(Z) {
      direction : output;
      function : "A'";
      timing() {
        intrinsic_rise : 0.3;
        intrinsic_fall : 0.3;
        rise_resistance : 0.3;
        fall_resistance : 0.3;
        slope_rise : 0.0;
        slope_fall : 0.0;
        related_pin : "A";
      }
    }
  scaled_cell(IVV,WCCOM) {
    area : 1;
    pin(A) {
      direction : input;
      capacitance : 1;
    }
    pin(Z) {
      direction : output;
      function : "A'";
      timing() {
        intrinsic_rise : 0.3;
        intrinsic_fall : 0.3;
        rise_resistance : 0.3;
        fall_resistance : 0.3;
        slope_rise : 0.0;
        slope_fall : 0.0;
        related_pin : "A";
      }
    }
```

```
    }
  }
```

The following is an example message:

```
Warning: Line 327, The scaled_cell for the 'AND' cell with 'WCCOM'
         operating_conditions is defined multiple times in the library.
         Using the last one encountered. (LBDB-155)
```

What Next

Delete all the redundant scaled_cell groups, or fix the library if it is a typo.

LBDB-156

(error) The LSI rounding digit and cutoff attributes\n \thave incompatible values.

Description

This message indicates that you specified invalid values for either the *lsi_rounding_digit* or the *lsi_rounding_cutoff* attribute. Library Compiler issues this error when the lsi_rounding_digit value is greater than the lsi_rounding_cutoff value multiplied by 10.01 or the lsi_rounding_cutoff value is greater than the lsi_rounding_digit value.

The following example shows an instance where this message occurs:

```
lsi_rounding_digit : 0.1;
   lsi_rounding_cutoff : 0.003;
```

In this case, the lsi_rounding_digit 0.1 is greater than (0.003 * 10.01). To fix the problem, assign the value 0.01 to lsi_rounding_digit.

```
lsi_rounding_digit : 0.01;
```

The following is an example message:

```
Error: Line 10, The LSI rounding digit and cutoff attributes
        have incompatible values. (LBDB-156)
```

What Next

Check the library, and fix either the value of the lsi_rounding_digit or the lsi_rounding_cutoff attribute.

LBDB-157

(error) The '%s' cell name defined in the scaled_cell is not found.

Feedback

Description

This message indicates that the technology library has a scaled_cell defined without a parent cell defined. Library Compiler uses the scaled_cell group to supply an alternate set of values for an existing cell. The choice is based on the set of operating conditions used.

The following example shows an instance where this message occurs:

```
library(lbdb157) {
    operating_conditions(WCCOM) {
        process : 1.5 ;
        temperature : 70 ;
        voltage : 4.75 ;
        tree_type : "worst_case_tree" ;
    }

cell(IV) {
  area : 1;
  pin(A) {
    direction : input;
    capacitance : 1;
  }
  pin(Z) {
    direction : output;
    function : "A'";
    timing() {
      intrinsic_rise : 0.1;
      intrinsic_fall : 0.1;
      rise_resistance : 0.1;
      fall_resistance : 0.1;
      slope_rise : 0.0;
      slope_fall : 0.0;
      related_pin : "A";
    }
  }
}
scaled_cell(IVV,WCCOM) {    /* Typo in the cell name. */
  area : 1;
  pin(A) {
    direction : input;
    capacitance : 1;
  }
  pin(Z) {
    direction : output;
    function : "A'";
    timing() {
      intrinsic_rise : 0.3;
      intrinsic_fall : 0.3;
      rise_resistance : 0.3;
      fall_resistance : 0.3;
      slope_rise : 0.0;
      slope_fall : 0.0;
      related_pin : "A";
```

```
    }
  }
}
}
```

The following is an example message:

```
Error: Line 101, The 'IVV' cell name defined in the scaled_cell is not
 found. (LBDB-157)
```

What Next

Add the parent cell for the scaled_cell, or fix the scaled_cell name if it is a typo.

LBDB-158

(error) The '%s' operating conditions is not found.

Description

This message indicates that the technology library has a scaled_cell with an undefined operating conditions.

The following example shows an instance where this message occurs:

```
library(lbdb158) {
    operating_conditions(WCCOM) {
        process : 1.5 ;
        temperature : 70 ;
        voltage : 4.75 ;
        tree_type : "worst_case_tree" ;
    }

cell(IV) {
  area : 1;
  pin(A) {
    direction : input;
    capacitance : 1;
  }
  pin(Z) {
    direction : output;
    function : "A'";
    timing() {
      intrinsic_rise : 0.1;
      intrinsic_fall : 0.1;
      rise_resistance : 0.1;
      fall_resistance : 0.1;
      slope_rise : 0.0;
      slope_fall : 0.0;
      related_pin : "A";
    }
  }
```

Feedback

```
}
scaled_cell(IV,WCCOM1) {    /* Typo in the operating_conditions name. */
  area : 1;
  pin(A) {
    direction : input;
    capacitance : 1;
  }
  pin(Z) {
    direction : output;
    function : "A'";
    timing() {
      intrinsic_rise : 0.3;
      intrinsic_fall : 0.3;
      rise_resistance : 0.3;
      fall_resistance : 0.3;
      slope_rise : 0.0;
      slope_fall : 0.0;
      related_pin : "A";
    }
  }
}
}
```

The following is an example message:

```
Error: Line 305, The 'WCCOM1' operating conditions is not found.
 (LBDB-158)
```

What Next

Add the operating_conditions group if it is missing, or fix the operating_conditions name if it has a typo.

LBDB-159

(error) Incomplete EDIF properties are specified in the '%s' symbol.\n \tSpecify 'edif_cell_name', 'edif_view_name', and 'edif_name_property'.

Description

This message indicates that, in a symbol library, you specified incomplete attributes of the view identifier properties of the symbol for a cell. These attributes are *edif_cell_name*, *edif_view_name*, and *edif_name_property*. If Library Compiler encounters a symbol with any of these attributes, it must have all three of them declared.

The following example shows an instance where this message occurs:

```
symbol("lbdb159") {
    set_minimum_boundary(0 , 0 , 8000, 12000);
    pin("P0", 10000, 1000, DOWN);
```

Feedback

```
    line(0, 0, 0, 12000);
    line(0, 12000, 8000, 12000);
    line(8000, 12000, 8000, 0);
    line(8000, 0, 0, 0);
    edif_cell_name : "edifcell";
    edif_name_property : " edifproperty";
  }
```

In this case, the edif_view_name attribute is missing. To fix the problem, add

```
edif_view_name : "edifview";
```

The following is an example message:

```
Error: Incomplete EDIF properties are specified in the 'lbdb159' symbol.
       Specify 'edif_cell_name', 'edif_view_name', and
 'edif_name_property'. (LBDB-159)
```

What Next

Change the symbol definition for the cell in the source text file of the symbol library. Either delete the view identifier property attributes that are there so that the symbol has none of those attributes or add appropriate view identifier property attributes, so that the symbol has all three of those attributes.

LBDB-160

(error) It is not acceptable to set the technology to\n \t'%s' after it has been set to '%s'. The two\n \ttechnologies are incompatible.

Description

This message indicates that you specified incompatible values for the technology attribute and the delay_model attribute.

The following example shows an instance where this message occurs:

```
library(lbdb160) {
    /* wrong technology and delay model combination */
    technology("cmos");
    delay_model : generic_ecl;
}
```

The following is an example message:

```
Error: Line 4, It is not acceptable to set the technology to
        'generic_ecl' after it has been set to 'cmos'. The two
        technologies are incompatible. (LBDB-160)
```

Feedback

What Next

Check The Library Compiler User Guide Manual for compatible combinations, and fix either the value of the technology or the delay_model attribute.

LBDB-161

(error) The '%s' bus needs to have its bus_type specified first.\n \tThe %s '%s' was found before the bus_type.

Description

This message indicates that you specified a bus without its bus_type attribute, or Library Compiler rejected the bus_type value and considered it as not defined.

The following example shows an instance where this message occurs:

```
bus (D) {
/*    bus_type : bus2; */       /* remove the comment to fix the problem
 */
      direction : input;
      capacitance : 1.0;
    }
```

The following is an example message:

```
Error: Line 179, The 'D' bus needs to have its bus_type specified first.
       The attribute 'direction' was found before the bus_type.
 (LBDB-161)
```

What Next

Add the bus_type attribute to the library, or fix the value of the attribute.

LBDB-162

(error) An invalid area range is found in the wire_load_from_area attribute.

Description

This message indicates that you specified an invalid area range. The problem is caused by any of these reasons:

```
* The min_area value is greater than the max_area value.
        * The min_area value is less than zero.
        * The max_area value is less or equal to zero.
```

The following example shows an instance where this message occurs:

```
wire_load("05x05") {
    resistance : 0 ;
```

Feedback

```
    capacitance : 1 ;
    area : 0 ;
    slope : 0.186 ;
    fanout_length(1,0.39) ;
  }
  wire_load_selection(test) {
    wire_load_from_area(27,10,"10x10");          /* problem */
    wire_load_from_area(27,100,"10x10");
    wire_load_from_area(0,28,"05x05");
    wire_load_from_area(2,10,"15x10");
  }
```

In this case, the minimum area value 27 is greater than the maximum area value 10.

The following is an example message:

```
Error: Line 51, An invalid area range is found in the wire_load_from_area
 attribute. (LBDB-162)
```

What Next

Check the area values, and fix the problem.

LBDB-163

(warning) The '%s' attribute value is\n \t %s (%3.1f). Using %3.1f instead.

Description

This message indicates that you specified an attribute value that is out of the accepted range. The value is either less than the minimum value or greater than the maximum value.

The following example shows an instance where this message occurs:

```
k_volt_internal_power : -111.0;
```

In this case, the k_volt_internal attribute's value -111.0 is less than the minimum accepted value -100.0.

The following is an example message:

```
Warning: Line 9, The 'k_volt_internal_power attribute' attribute value is
         less than the minimum allowed  (-100.0). Using 0.0 instead.
 (LBDB-163)
```

What Next

Change the attribute value to satisfy the value range.

Feedback

LBDB-164

(error) The 'wire_load_from_area' range overlaps\n \tthe range in line %d.

Description

This message indicates that you specified an overlapping area range in two *wire_load_from_area* attributes.

The following example shows an instance where this message occurs:

```
wire_load("05x05") {
    resistance : 0 ;
    capacitance : 1 ;
    area : 0 ;
    slope : 0.186 ;
    fanout_length(1,0.39) ;
  }

  wire_load_selection(test) {
    wire_load_from_area(0,20,"05x05");
    wire_load_from_area(10,25,"05x05");
  }
```

In this case, the area range [0,20] overlaps the area range [10,25].

The following is an example message:

```
Error: Line 12, The 'wire_load_from_area' range overlaps
        the range in line 13. (LBDB-164)
```

What Next

Change the area range in the second *wire_load_from_area* attribute.

LBDB-165

(warning) A range gap is found in the 'wire_load_selection'.\n \tThe 'min_area' is extended from %f to %f.

Description

The wire_load_selection specified in this library has a gap. It means that two adjacent selector items are not overlapped. Library Compiler uses its built-in algorithm to fill the gap. It extends the lower bound of the selector that covers the bigger area toward the upper bound of the other selector item.

The following example shows an instance where this message occurs:

```
wire_load("05x05") {
    resistance : 0 ;
```

```
    capacitance : 1 ;
    area : 0 ;
    slope : 0.186 ;
    fanout_length(1,0.39) ;
  }

  wire_load_selection(test) {
    wire_load_from_area(0,20,"05x05");
    wire_load_from_area(25,50,"05x05");
  }
```

In this case, there is a gap in area range from 20 to 25. Library Compiler corrects the problem as if you had the declaration

```
wire_load_from_area(20,50,"05x05");
```

The following is an example message:

```
Warning: Line 13, A range gap is found in the 'wire_load_selection'.
        The 'min_area' is extended from 25.000000 to 20.000000.
 (LBDB-165)
```

What Next

Ignore the warning if the Library Compiler's algorithm satisfies your modeling requirement. Otherwise, fix the library source code to match your wire_load_selection model.

LBDB-166

(warning) A range does not start with 0.0 in the 'wire_load_selection'.\n \tThe 'min_area' is extended from %f to 0.0.

Description

The min_area value in the specified wire_load_selection attribute in this library does not start with 0.0. Library Compiler extends the lower bound of the selector to 0.0.

The following example shows an instance where this message occurs:

```
wire_load("05x05") {
    resistance : 0 ;
    capacitance : 1 ;
    area : 0 ;
    slope : 0.186 ;
    fanout_length(1,0.39) ;
  }

  wire_load_selection(test) {
    wire_load_from_area(10,25,"05x05");
  }
```

Feedback

The following is an example message:

```
Warning: Line 48, A range does not start with 0.0 in the
 'wire_load_selection'.
        The 'min_area' is extended from 10.000000 to 0.0. (LBDB-166)
```

What Next

Fix the library source code to set the min_area to 0.0.

LBDB-167

(error) The '%s' scaling factors group is not found.

Description

The message indicates that you specified an invalid name for the scaling_factors group. This might be caused either by a typo in the name or by the group not being defined.

The following example shows an instance where this message occurs:

```
scaling_factors("IO_PAD_SCALING") {
        k_volt_intrinsic_rise : 0.846 ;
    }
    cell (lbdb167) {
       area : 0 ;
       scaling_factors : IO_PAD_SCALE ;
    }

In this case, there is a typo in the name.

The following is an example message:
Error: Line 20, The 'IO_PAD_SCALE' scaling factors group is not found.
 (LBDB-167)
```

What Next

Add the scaling_factors group to the library, or correct the value of the scaling_factors if it is a typo.

LBDB-168

(error) The %s timing constraint has only one value.\n \tOnly one 'intrinsic_rise' or 'intrinsic_fall' can be specified.

Description

You specified invalid values for intrinsic_rise and intrinsic_fall in a timing group that describes a *recovery* or *removal* timing constraint. Library Compiler complains if each of these two constraints has

Feedback

```
* Both intrinsic_rise and intrinsic_fall values are assigned to zero.
        * Both intrinsic_rise and intrinsic_fall values are not
 specified.
        * Both intrinsic_rise and intrinsic_fall values are not zero.
```

The following example shows an instance where this message occurs:

```
pin(CD) {
      direction : input;
      capacitance : 2;
      timing() {
        timing_type : recovery_rising;
        /* both values are 0.0 */
        intrinsic_rise : 0.0;
        intrinsic_fall : 0.0;
        related_pin : "CP";
      }
      timing() {
        timing_type : removal_rising;
        /* both values not specified */
        related_pin : "CP";
      }
    }
```

The following is an example message:

```
Error: Line 56, The Recovery timing constraint has only one value.
        Only one 'intrinsic_rise' or 'intrinsic_fall' can be specified.
 (LBDB-168)
```

What Next

Inspect the datasheet of the cell in question. If the asynchronous control signal is high-active, define the recovery and the removal constraints as the intrinsic_fall. If the asynchronous control signal is low-active, define the recovery and the removal constraints as the intrinsic_rise. Remove the other field (intrinsic_rise or intrinsic_fall) from the library source file.

LBDB-169

(error) An invalid 'three_state_disable' timing type appears\n \ton the timing arc. Its parent output pin has no 'three_state' attribute.

Description

This message indicates that you specified a *three_state_disable* timing_arc on a port that has no *three_state* attribute.

Feedback

The following example shows an instance where this message occurs:

```
cell(AND) {
    area : 1;
    pin(A B) {
      direction : input;
      capacitance : 1;
    }
    pin(Z) {
      direction : output;
      function : "A B";
      timing() {
        intrinsic_rise : 0.1;
        intrinsic_fall : 0.1;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "A B" ;
      }
      timing() {
        timing_type : three_state_disable;
        intrinsic_rise : 0.1;
        intrinsic_fall : 0.1;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "A";
      }
    }
  }
```

The following is an example message:

```
Error: Line 44, An invalid 'three_state_disable' timing type appears
        on the timing arc. Its parent output pin has no 'three_state'
 attribute. (LBDB-169)
```

What Next

Either delete the timing arc or correct the port group definition to add the three_state attribute.

LBDB-170

(warning) The '%s' attribute's value is\n \t%s (%3.1f). Removing it.

Description

This message indicates that you specified an attribute value that is out of the accepted range. The value is either less than the minimum value or greater than the maximum value. Library Compiler ignores the value because it does not find a default value to replace it.

Feedback

The following example shows an instance where this message occurs:

```
pin(A) {
      direction : input;
      capacitance : 1;
      min_fanout : -1;
    }
```

In this case, the min_fanout attribute's value -1 is less than the minimum accepted value 0.0.

The following is an example message:

```
Warning: Line 283, The 'min_fanout' attribute value is
         less than the minimum allowed (0.0). Removing it. (LBDB-170)
```

What Next

Change the attribute value to satisfy the value range.

LBDB-171

(error) The '%s' wire load model is not defined, or \n \tit is defined after this line.

Description

This message indicates that you specified a "wire_load_from_area" that refers to a "wire_load" group that is not defined or has been defined in the library after the current line.

The following example shows an instance where this message occurs:

```
wire_load("05x05") {
    resistance : 0 ;
    capacitance : 1 ;
    area : 0 ;
    slope : 0.186 ;
    fanout_length(1,0.39) ;
  }

  wire_load_selection(test) {
    wire_load_from_area(27,100,"10x10");
    wire_load_from_area(10,25,"05x05");
  }
```

The following is an example message:

```
Error: Line 47, The '10x10' wire load model is not defined, or
        it is defined after this line. (LBDB-171)
```

Feedback

What Next

Check your library to see if you have defined the group. If you have done that, also check its position within the library to make sure it is defined before it is used.

LBDB-172

(warning) The '%s' attribute is not specified. Using %4.2f.

Description

This message indicates that an attribute is missing, and Library Compiler is reporting the default floating point or integer value it is setting. This message affects attributes with default values.

The following example shows an instance where this message occurs:

```
pin(D) {
      direction : input;
    }
```

The following is an example message:

```
Warning: Line 52, The 'capacitance' attribute is not specified. Using
 0.00. (LBDB-172)
```

What Next

Either add the missing attribute to the technology library or ignore the message.

LBDB-173

(error) The '%s' group requires one or more names.

Description

This message indicates you specified no name for a group that requires at least one name.

The following example shows an instance where this message occurs:

```
pin() {
      direction : input;
      capacitance : 1.0;
   }
```

In this case, a pin name is required.

The following is an example message:

```
Error: Line 286, The 'pin' group requires one or more names. (LBDB-173)
```

Feedback

What Next

Change your library to add the group name.

LBDB-174

(error) The '%s' group requires %s names.

Description

This error message occurs when a group is specified without its required number of names. This might be caused by a typographical error.

The following example shows an instance where this message occurs: In the following example, the ff group requires 2 names. To fix the problem, either remove the last element 2, or if it is a typographical error, change ff to ff_bank.

```
ff(IQ,IQN, 2)
```

What Next

See the *Library Compiler User Guide* for the correct syntax of the specified group, and match the number of group names.

LBDB-175

(warning) The bus_naming_style contains characters that\n \tare also used as delimiters in function, three_state, and related_pin\n \tattributes. Be sure to put spaces around the characters in the [%s] set\n \twhen supplying values for attributes of the types mentioned. \n \tAlso, surround subscripted pin names with double quotes in pin groups.

Description

This message indicates that you specified delimiter characters in the *bus_naming_style* attribute such as "() +*|&!^'".

The following example shows an instance where this message occurs:

```
bus_naming_style : %s&%d;
```

The following is an example message:

```
Warning: Line 28, The bus_naming_style contains characters that
        are also used as delimiters in function, three_state, and
 related_pin
        attributes. Be sure to put spaces around the characters in the
 [&] set
        when supplying values for attributes of the types mentioned.
        Also, surround subscripted pin names with double quotes in pin
 groups. (LBDB-175)
```

Feedback

What Next

Change the delimiter character, or follow the rules specified in the message.

LBDB-176

(error) Invalid bus syntax is detected in '%s'.

Description

This message indicates that you specified an invalid bus element. Library Compiler fails to extract the bus element information using the bus_naming_style attribute value.

What Next

Change the library by either fixing the bus_naming_style value or fixing the bus element representation.

LBDB-177

(warning) The attribute '%s' is not specified Using '%s'.

Description

This message indicates that an attribute is missing, and Library Compiler is reporting the default string value it is setting. This message affects attributes with default values.

What Next

Either add the missing attribute to the technology library or ignore the message.

LBDB-178

(error) Duplicated %s group. A group with similar '%s' attribute value is found at line %u

Description

This message indicates that this group conflicts with an earlier group because the attribute indicated has similar value in both of them.

The following example shows an instance where this message occurs:

```
receiver_capacitance() {
        receiver_capacitance_rise {
          segment : 1;
          ...
        }
        receiver_capacitance_rise {
          segment : 1;
```

```
        ...
      }
      receiver_capacitance_rise {
        segment : 3;
        ...
      }
      ...
    }
```

In this case, the second receiver_capacitance_rise group is in error because its 'segment' attribute conflicts with the first group.

The following is an example message:

```
Error: Line 20014, Duplicated 'receiver_capacitance_rise' group. A group
 with
similar 'segment' attribute value is found at line 19876
```

What Next

Change the library file by modify the indicated attribute.

LBDB-179

(error) The '%s' group requires the '%s' attribute.\n \tEither the attribute is missing or the attribute has an invalid value.

Description

This message indicates you specified a group without one of its required attributes. Library Compiler rejects the attribute definition if the attribute exists and has an invalid value.

The following example shows an instance where this message occurs:

```
memory() {
        type : random;
        address_width : 10;
        word_width : 8;
      }
```

In this case, the 'type' has an invalid value. To fix the problem, assign 'rom' or 'ram' to the type.

The following is an example message:

```
Error: Line 27, The 'memory' group requires the 'type' attribute.
        Either the attribute is missing or the attribute has an invalid
 value. (LBDB-179)
```

What Next

Change the library file by adding the missing attribute to the group.

Feedback

LBDB-180

(error) The '%s' attribute requires both\n \t'clear' and 'preset' attributes.

Description

This message indicates that you specified the 'clear_preset_var1' or the 'clear_preset_var2' attribute or both in a sequential model group without specifying both the 'clear' and the 'preset' attributes.

The following example shows an instance where this message occurs:

```
ff("IQ","IQN") {
        next_state : "D";
        clocked_on : "CP";
        clear : "CD'";
        clear_preset_var1: "L";
      }
```

In this case, the 'preset' attribute is missing in the ff group.

The following is an example message:

```
Error: Line 98, The 'clear_preset_var1' attribute requires both
        'clear' and 'preset' attributes. (LBDB-180)
```

What Next

Add the missing attribute to the group.

LBDB-181

(error) The '%s' group, with both 'clear' and 'preset' attributes,\n \trequires 'clear_preset_var1' and/or 'clear_preset_var2' attributes.

Description

This message indicates that you specified both the 'clear' and the 'preset' attribute in a sequential model group without specifying both the 'clear_preset_var1' or the 'clear_preset_var2' attributes.

The following example shows an instance where this message occurs:

```
ff("IQ","IQN") {
        next_state : "D";
        clocked_on : "CP";
        preset : "SD'";
        clear : "CD";
```

In this case, the 'clear_preset_var1' and or 'clear_preset_var2' attributes are missing.

Feedback

The following is an example message:

```
Error: Line 93, The 'ff' group, with both 'clear' and 'preset'
 attributes,
         requires 'clear_preset_var1' and/or 'clear_preset_var2'
 attributes. (LBDB-181)
```

What Next

Add either 'clear_preset_var1' or 'clear_preset_var2' to the sequential group.

LBDB-182

(error) Invalid %s name '%s' is detected. This name must be\n \tunique among all pin names, bus names, bundle names, and rail connection names.

Description

This message indicates a duplicate pin, bus, bundle, a rail_connection, or a voltage_state_range name in the library.

The following example shows an instance where this message occurs:

```
pin(D) {
      direction : input;
      capacitance : 1.0;
    }
    pin(D) {
      direction : input;
      capacitance : 1.0;
    }
```

The following is an example message:

```
Error: Line 56, Invalid pin name 'D' is detected. This name must be
        unique among all pin names, bus names, and bundle names.
 (LBDB-182)
```

What Next

Change the name of the pin, bus, bundle, rail_connection, voltage_state_range in the technology library.

LBDB-183

(error) Missing '%s' group with '%s' attribute of '%s' value.

Feedback

Description

This message indicates that a group with a specific attribute value is missing. This problem is associated with certain type of information that requires data to be given in a series of groups. These groups are "tagged" with a specific attribute with a consecutive value.

The following example shows an instance where this message occurs:

```
receiver_capacitance() {
        receiver_capacitance_rise {
          segment : 1;
          ...
        }
        receiver_capacitance_rise {
          segment : 3;
          ...
        }
        receiver_capacitance_rise {
          segment : 4;
          ...
        }
        ...
      }
```

In the example above, receiver_capacitance_rise with segment = 2 is missing.

The following is an example message:

```
Error: Line 20073, Missing 'receiver_capacitance_rise' group with
 'segment' attribute of value '2'.
```

What Next

Fix the library by adding the missing group.

LBDB-186

(error) Invalid '%s' pin name is detected in the '%s' bundle.

Description

This message indicates that you specified an invalid pin name in a bundle group.

What Next

Change the library source file by correcting the pin name.

Feedback

LBDB-187

(error) The '%s' bundle needs to have its 'members' specified first.\n \tThe '%s' %s is found before a 'members'.

Description

This message indicates that you specified the members attribute in a bundle group after another attribute. The *members* attribute has to be first in the bundle group.

The following example shows an instance where this message occurs:

```
bundle (DD) {
        direction : input;
        members(D1, D2);
        capacitance : 1;
      }
```

The following is an example message:

```
Error: Line 94, The 'DD' bundle needs to have its 'members' specified
 first.
       The 'direction' attribute is found before a 'members'. (LBDB-187)
```

What Next

Change the library source file by specifying the members attribute first in the bundle group.

LBDB-188

(error) The 'members' attribute is defined multiple times.

Description

This message indicates that you specified the *members* attribute in a bundle group more than once. Library Compiler expects only one *members* attribute in the bundle group.

The following example shows an instance where this message occurs:

```
bundle (DD) {
        direction : input;
        members(D1, D2);
        members(D3, D4);
        capacitance : 1;
      }
```

The following is an example message:

```
Error: Line 95, The 'members' is defined multiple times. (LBDB-188)
```

Feedback

What Next

Change the library source file by specifying only one members attribute in a bundle group.

LBDB-189

(warning) Level shifters are required for this library.\n \tA level shifter is a buffer or inverter with differing\n \tconnection_class values specified between input and output\n \tpins. Design Compiler cannot produce valid designs using this\n \tlibrary if a level shifter component is not provided.

Description

This warning message occurs when your library contains connection classes that cannot be used without level shifters. Design Compiler uses these components to shift a net from one connection class to another and does so to remove connection class violations from your design. Multi-input or multi-output cells with differing connection classes on inputs and outputs are not considered level shifters. Following this warning message, a list appears of those connection classes that do not have valid shifters between them.

This warning alerts you to situations where Design Compiler might not be able to validate your design for connection class. For example, suppose that Library Compiler warns that you are missing a level shifter with an input connection class of "a" and an output connection class of "b". If there is a pin or port in your design with a connection class of "b" connected to a driver with a connection class of "a", Design Compiler might be unable to validate this connection without a level shifting component that converts voltage levels from an input connection class of "a" to an output connection class of "b".

There are cases where this message can be too restrictive. For example, consider the case where you, the designer, know that all inputs to your design will only have connection class "a" and that all outputs will only have connection class "c". Meanwhile, for the purposes of our example, assume that all "internal" logic in the design will have connection class "b". If you defined a library with two level shifters (one with "a" on the input and "b" on the output, and the other with "b" on the input and "c" on the output), Design Compiler can validate the design because it can convert voltage levels from the inputs at level "a" to internal logic at level "b", and from internal logic at level "b" to the outputs at level "c". In this case, the warnings that you receive about missing level shifters would be too restrictive. However, you have an output that is at level "a", and is driven by internal logic at level "b", Design Compiler is not be able to validate the design unless it can replace the component driving the output port with a component that has level "a" on its output pin.

Be aware of the current limitations in the connection class validation and be advised that you can construct a library with connection rule restrictions that are too difficult for Design Compiler to solve. Future versions of the software might remove these restrictions, but Library Compiler currently informs you of the limitations on validating a design for connection class violations.

Feedback

The following example shows an instance where this message occurs:

```
cell(lbdb189) {
      /* Should only be connected to IO Cells only */
      area : 0.0;
      dont_touch : false;
      dont_use   : false;
      pad_cell : true;
      pin(PAD ) {
        is_pad : true;
        input_voltage : CMOS;
        direction   : input;
        capacitance : 1.0;
        fanout_load : 0.0;
      }
      pin(Y ) {
        connection_class : "iopcl";
        direction   : output;
        function    : "PAD";
        max_fanout  : 1.0;
        timing() {
          intrinsic_fall  : 1.0;
          intrinsic_rise  : 1.0;
          fall_resistance : 0.0;
          rise_resistance : 0.0;
          related_pin  :"PAD ";
        }
      }
    }
```

The following is an example message:

```
Warning: Line 1, Level shifters are required for this library.
        A level shifter is a buffer or inverter with differing
        connection_class values specified between input and output
        pins. Design Compiler cannot produce valid designs using this
        library if a level shifter component is not provided. (LBDB-189)
```

What Next

If this message appeared because you omitted some level shifting components from your library, add the components.

LBDB-190

(warning) %s level shifter with input connection class '%s' \n and output connection class '%s' is needed.

Feedback

Description

This message indicates that a (noninverting or inverting) level shifter is needed between the two connection classes. See the man page for error LBDB-189 for more information on how this message can occur.

The following example shows an instance where this message occurs:

```
cell(IOPCLBUF) {
      /* Should only be connected to IO Cells only */
      area : 0.000000;
      dont_touch : false;
      dont_use   : false;
      pad_cell : true;
      pin(PAD ) {
        is_pad : true;
        input_voltage : CMOS;
        direction   : input;
        capacitance : 35.000000;
        fanout_load : 0.000000;
      }
      pin(Y ) {
        connection_class : "iopcl";
        direction   : output;
        function    : "PAD";
        max_fanout  : 16.000000;
        timing() {
          intrinsic_fall  : 3.925000;
          intrinsic_rise  : 3.925000;
          fall_resistance : 0.000000; /* delay included in intrinsic */
          rise_resistance : 0.000000; /* delay included in intrinsic */
          related_pin  :"PAD ";
        }
      }
    }
```

The following is an example message:

```
Warning: Line 1, Noninverting level shifter with input connection class
 'iopcl'
and output connection class 'default' is needed. (LBDB-190)
```

What Next

If you obtained this message because you omitted a level shifting component from your library, add the level shifting component.

LBDB-191

(error) The inout '%s' pin, bus, or bundle has\n \tno 'three_state' function.

Feedback

Description

The pin whose direction is specified as 'inout' has only a 'function' statement. The 'three_state' statement is also required by an "inout" pin.

The following example shows an instance where this message occurs:

```
pin(Z) {
      direction : inout;
      function : "A B";
    }
```

The following is an example message:

```
Error: Line 356, The inout 'Z' pin, bus, or bundle has
        no 'three_state' function. (LBDB-191)
```

What Next

If the pin is actually an output pin, change the direction attribute to 'output'. Otherwise, add the 'three_state' statement to the pin.

LBDB-192

(error) Illegal interdependence data specified in pin "%s".

Description

timing arc with "interdependence_id" attribute is treated as interdependence data in pin. they are used for setup/hold pessimism reduction. There are some rules to specified the id for interdependence data (These rules applies to timing arcs with same condition):

1. Interdependece data can not be the first timing arc in this pin. This it to prevent potential backward compatibility issue.
2. Interdependece data should be in pair. That is, if there is a setup_rising interdependence data with id = 1 in the pin, a hold_rising interdependence data with same id = 1 is needed. Same case for timing type = setup_falling / hold_falling.
3. For one timing_type arcs, the interdependence id should be unique. E.g. If there are two setup_rising interdependence data with same id = 1, this error is issued.
4. The interdependence id starts from 1, and if multiple interdependence data defined for the pin, the id should be consecutive. E.g. id = 1,2,3 is okay, but 1, 2, 4 is not.

The following example shows an instance where this message occurs:

```
pin(D) {
        direction : input;
        timing() {
            timing_type : setup_rising;
```

Feedback

```
            fall_constraint("template") {
            ...
            }
            rise_constraint("template") {
            ...
            }
            related_in: "CLK";
        }
        timing() {
            timing_type : setup_rising;
            interdependence_id : 1;
            fall_constraint("template") {
            ...
            }
            rise_constraint("template") {
            ...
            }
            related_in: "CLK";
        }
        timing() {
            timing_type : hold_rising;
            fall_constraint("template") {
            ...
            }
            rise_constraint("template") {
            ...
            }
            related_in: "CLK";
        }
        timing() {
            timing_type : hold_rising;
            interdependence_id : 2;
            fall_constraint("template") {
            ...
            }
            rise_constraint("template") {
            ...
            }
            related_in: "CLK";
        }
    }
```

The following is an example message:

```
Error: Line 356, Illegal interdependence data specified in pin
 "D".(LBDB-192)
```

What Next

Check the id value for interdependence data in the pin group, make sure all above requirments are satisfied.

Feedback

LBDB-193

(error) Interdependence data is defined for wrong timing type arc in pin "%s".

Description

Timing group with "interdependence_id" attribute is treated as interdependence data in pin. they are used to for setup/hold pessimism reduction. For now, It's only supported for these timing types: setup_rising, hold_rising, setup_falling, hold_falling.

The following example shows an instance where this message occurs:

```
pin(D) {
        direction : input;
        timing() {
            timing_type : setup_rising;
            fall_constraint("template") {
            ...
            }
            rise_constraint("template") {
            ...
            }
            related_in: "CLK";
        }
        timing() {
            timing_type : skew_rising; // not support type
            interdependence_id : 1;
            fall_constraint("template") {
            ...
            }
            rise_constraint("template") {
            ...
            }
            related_in: "CLK";
        }
        timing() {
            timing_type : hold_rising;
            fall_constraint("template") {
            ...
            }
            rise_constraint("template") {
            ...
            }
            related_in: "CLK";
        }
        timing() {
            timing_type : hold_rising;
            interdependence_id : 2;
            fall_constraint("template") {
            ...
            }
            rise_constraint("template") {
```

```
            ...
            }
            related_in: "CLK";
        }
    }
```

The following is an example message:

```
Error: Line 356, Interdependence data is defined for wrong timing type
 arc in pin "D".(LBDB-193)
```

What Next

Check the interdependence data in the pin group, make sure they are defined for constraint arcs with right timing type.

LBDB-200

(error) The cell has both the 'pad_cell' and the 'auxiliary_pad_cell' attributes.

Description

This message indicates that you specified both the *pad_cell* and the *auxiliary_pad_cell* attributes in the same cell.

The following example shows an instance where this message occurs:

```
cell(lbdb200){
      area : 0.000000;
      pad_cell : true;
      auxiliary_pad_cell : true;
    }
```

The following is an example message:

```
Error: Line 3577, The cell has both the 'pad_cell' and the
 'auxiliary_pad_cell' attributes. (LBDB-200)
```

What Next

Remove either the pad_cell attribute or the auxiliary_pad_cell attribute.

LBDB-201

(error) A nonpad '%s' cell has a '%s' attribute.

Description

This message indicates that you specified a pad_type attribute in a nonpad cell.

Feedback

The following example shows an instance where this message occurs:

```
cell(lbdb201){
      area : 0.0;
      pad_type : clock;
      pin(Z)  {
        direction : output
        function : "A"
      }
      pin(A) {
        direction : input;
        capacitance : 1.0;
    }
  }
```

The following is an example message:

```
Error: Line 3577, A nonpad 'lbdb201' cell has a 'pad_type' attribute.
 (LBDB-201)
```

What Next

Check the "Library Compiler User Guide" for information on pad cells. Either remove the invalid attribute or add the pad_type, the pad_cell, or the auxiliary_pad_cell attribute.

LBDB-202

(error) A nonpad '%s' cell has a '%s' pin/pg_pin with a '%s' attribute.

Description

This error message occurs when a pad pin/pg_pin attribute is specified in a nonpad cell.

The following example shows an instance where this message occurs: In the following example, there is an *is_pad* attribute at the pin level, but there is no pad attribute at the cell level, so the *read_lib* command issues the error message:

```
cell(lbdb202){
      area : 0.0;
      pin(Z)  {
        is_pad : true;
        direction : output
        drive_current : 2.0;
        function : "A"
      }
      pin(A) {
        direction : input;
        capacitance : 1.0;
    }
  }
```

Feedback

The following is an example message: The following is an example of the error message:

```
Error: Line 3581, A nonpad 'lbdb202' cell has a 'Z' pin/pg_pin
       with a 'is_pad' attribute. (LBDB-202)
```

What Next

Either remove the invalid attribute or add the *pad_cell* attribute. See the Library Compiler documentation for information on pad cells.

- read_lib

LBDB-203

(error) The nonpad '%s' pin has a '%s' attribute.

Description

This message indicates that you specified a pad cell with pad_type and pad_cell attributes defined and a nonpad pin with a hysteresis attribute.

The following example shows an instance where this message occurs:

```
cell(lbdb203){
    area : 0.0;
    pad_type : clock;
    pad_cell : true;
    pin(Z)  {
      direction : output;
      hysteresis : true;
      function : "A";
    }
    pin(A) {
      direction : input;
      capacitance : 1.0;
    }
  }
```

The following is an example message:

```
Error: Line 3584, The nonpad 'Z' pin has a 'hysteresis' attribute.
 (LBDB-203)
```

What Next

Refer to the "Library Compiler User Guide" for information on pad cells. Either remove the pad cell attributes or add the pad pin attributes.

Feedback

LBDB-204

(error) The '%s' %s pin cannot have a '%s' attribute.

Description

This message indicates that you specified a pad pin attribute on a pin with an invalid direction.

The following example shows an instance where this message occurs:

```
cell(lbdb204){
    area : 0.0;
    pad_cell : true;
    pin(Z)  {
      direction : output;
      is_pad : true;
      hysteresis : true;
      function : "A";
    }
    pin(A) {
      direction : input;
      capacitance : 1.0;
    }
  }
```

The following is an example message:

```
Error: Line 3584, The 'Z' output pin cannot have a 'hysteresis'
 attribute. (LBDB-204)
```

What Next

Refer to the "Library Compiler User Guide" for information on pad cells. Either change the pin's direction or move the attribute to the correct pin.

LBDB-205

(warning) The '%s' pad pin is missing a '%s' attribute.

Description

This message indicates that you specified an output or inout pad pin without a *drive_current* attribute.

The following example shows an instance where this message occurs:

```
cell(lbdb205){
    area : 0.0;
    pad_cell : true;
    pin(Z)  {
```

```
      direction : output;
      is_pad : true;
      hysteresis : true;
      function : "A";
    }
    pin(A) {
      direction : input;
      capacitance : 1.0;
    }
  }
```

The following is an example message:

```
Warning: Line 3596, The 'Z' pad pin is missing a 'drive_current'
 attribute. (LBDB-205)
```

What Next

Refer to the "Library Compiler User Guide" for information on pad cells and pins. Add the missing attribute to the pin.

LBDB-206

(error) The '%s' pad cell has no pad pins.

Description

This message indicates that you specified a pad cell with pad_type and pad_cell attributes defined but you did not specify pad pin attributes associated with any pin in the cell.

The following example shows an instance where this message occurs:

```
cell(lbdb206){
    area : 0.0;
    pad_type : clock;
    pad_cell : true;
    pin(Z)  {
      direction : output
      function : "A"
    }
    pin(A) {
      direction : input;
      capacitance : 1.0;
    }
  }
```

The following is an example message:

```
Error: Line 3575, The 'lbdb206' pad cell has no pad pins. (LBDB-206)
```

Feedback

What Next

Refer to the "Library Compiler User Guide" for information on pad cells. Remove either the pad cell attributes or add the pad pin attributes.

LBDB-207

(warning) The '%s' pad cell has more than one pad pin. \n

Description

This message indicates that you specified more than one pad pin in a pad cell.

The following example shows an instance where this message occurs:

```
cell(lbdb207) {
    area : 0.0;
    pad_cell : true;
    bond_pads : 1;
    driver_sites : 1;
    pin(PAD ) {
      direction : input;
      is_pad : true;
      input_voltage : CMOS;
      capacitance : 1.0;
    }
    pin(PAD1 ) {
      direction : input;
      is_pad : true;
      input_voltage : CMOS;
      capacitance : 1.0;
    }
    pin(Y ) {
      direction : output;
      function : "PAD PAD1";
      timing() {
        intrinsic_fall : 1.0;
        intrinsic_rise : 1.0;
        fall_resistance : 0.50;
        rise_resistance : 0.50;
        related_pin :"PAD PAD1";
      }
    }
  }
```

In this case, there are two pad pins: 'PAD' and 'PAD1'.

The following is an example message:

```
Warning: Line 33, The 'lbdb207' pad cell has more than one pad pin.
 (LBDB-207)
```

Feedback

What Next

Refer to the "Library Compiler User Guide" for information on pad cells.

LBDB-208

(error) The %s '%s' pad cell cannot be a 'clock' pad.

Description

This message indicates you specified an output pad pin with the is_pad attribute on a clock pad. Library Compiler accepts clock pads only on input pins.

The following example shows an instance where this message occurs:

```
cell(lbdb208) {
    area : 0.0;
    pad_cell : true;
    pad_type : clock;
    pin(PAD ) {
      direction : input;
      capacitance : 1.0;
    }
    pin(Y ) {
      direction : output;
      is_pad : true;
      function : "PAD";
      output_voltage : CMOS_OUT;
      timing() {
        intrinsic_fall : 1.0;
        intrinsic_rise : 1.0;
        fall_resistance : 0.0;
        rise_resistance : 0.0;
        related_pin :"PAD";
      }
    }
  }
```

The following is an example message:

```
Error: Line 65, The output 'lbdb208' pad cell cannot be a 'clock' pad.
 (LBDB-208)
```

What Next

Refer to the "Library Compiler User Guide" for information on pad cells. Check the library source file, and specify the is_pad attribute to an input pin.

Feedback

LBDB-209

(error) A '%s' attribute cannot be specified on a\n \tpin unless a pull_up or pull_down driver_type is specified.

Description

This message indicates that you specified a *pulling_resistance* or a *pulling_current* attribute on a pin without specifying the pullup or pulldown driver type.

The following example shows an instance where this message occurs:

```
pin(A) {
      direction : output;
      pulling_resistance : 100;
      ...
    }
```

In this case, the driver_type is missing. To fix the problem, add the statement,

```
driver_type : pull_up;
```

The following is an example message:

```
Error: Line 355, A 'pulling_resistance' attribute cannot be specified on
 a
       pin unless a pull_up or pull_down driver_type is specified.
 (LBDB-209)
```

What Next

Change the library file by either adding the driver_type attribute to the specified pin or removing the pulling_resistance or pulling_current attribute.

LBDB-210

(error) The pulling_current value cannot be 0.0.

Description

This message indicates that you specified a zero value for the *pulling_current* attribute.

The following example shows an instance where this message occurs:

```
pulling_current : 0.0;
```

The following is an example message:

```
Error: Line 357, The pulling_current value cannot be 0.0. (LBDB-210)
```

Feedback

What Next

Change the value of the attribute to a nonzero value.

LBDB-211

(error) The '%s' driver_type cannot be specified on a\n \tpin that already has a %s driver_type specified.

Description

This message indicates that you specified an incompatible set of driver types on a pin. Library Compiler fails if the driver_type value includes the following combinations:

```
* pull_up and pull_down
        * pull_up and bus_hold
        * pull_down and bus_hold
        * open_drain and open_source
        * open_drain and bus_hold
        * open_source and bus_hold
```

The following example shows an instance where this message occurs:

```
cell(lbdb211) {
    area : 2;
    pin(A) {
      direction : input;
      capacitance : 1.0;
    }
    pin(Z2) {
      direction : output;
      function : "A";
      driver_type : "pull_up pull_down";
      timing() {
        intrinsic_rise : 0.1;
        intrinsic_fall : 0.1;
        related_pin : "A";
      }
    }
  }
```

The following is an example message:

```
Error: Line 84, The 'pull_down' driver_type cannot be specified on a
       pin that already has a 'pull_up' driver_type specified. (LBDB-211)
```

What Next

Refer to the "Library Compiler User Guide" for driver_type information. Remove the incompatible values of the driver_type attribute.

Feedback

LBDB-212

(error) The 'open_%s' driver_type cannot be specified on\n \tan input pin.

Description

This message indicates that you specified an invalid *open_source* or *open_drain* driver_type value on an input_pin.

The following example shows an instance where this message occurs:

```
cell(lbdb212) {
    area : 2;
    pin(A) {
      direction : input;
      capacitance : 1.0;
      driver_type : "open_drain";
    }
    pin(Z2) {
      direction : output;
      function : "A";
      timing() {
        intrinsic_rise : 0.1;
        intrinsic_fall : 0.1;
        related_pin : "A";
      }
    }
  }
```

The following is an example message:

```
Error: Line 78, The 'open_drain' driver_type cannot be specified on
       an input pin. (LBDB-212)
```

What Next

Refer to the "Library Compiler User Guide" for driver_type information. Remove the invalid value of the driver_type attribute.

LBDB-213

(error) The '%s' area attribute cannot be specified\n \ton a pin of a cell that is not a pad cell.

Description

This message indicates that you specified a user-defined cell area value for pad cells and applied it to a nonpad cell.

Feedback

The following example shows an instance where this message occurs:

```
define_cell_area(my_area,pad_slots);

    cell(NON_PAD_CELL) {
      area : 1;
      my_area : 10;
    }
```

The following is an example message:

```
Error: Line 29, The 'my_area' area attribute cannot be specified
       on a pin of a cell that is not a pad cell. (LBDB-213)
```

What Next

Change the library file, and either make the cell a pad cell or remove the pad information from the cell.

LBDB-214

(error) The '%s' area attribute of '%s' type\n \tcannot be specified on a pin of a cell that is not a pad cell\n \tor an auxiliary pad cell.

Description

This message indicates that you specified a user-defined cell area value for pad cells or auxiliary pad cells and applied it to a nonpad cell.

The following example shows an instance where this message occurs:

```
define_cell_area(your_area,pad_driver_sites);

    cell(NON_PAD_CELL) {
      area : 1;
      your_area : 10;
    }
```

The following is an example message:

```
Error: Line 29, The 'your_area' area attribute of 'pad_driver_sites' type
       cannot be specified on a pin of a cell that is not a pad cell
       or an auxiliary pad cell. (LBDB-214)
```

What Next

Change the library file and either make the cell a pad cell or remove the pad information from the cell.

Feedback

LBDB-215

(error) The '%s' attribute cannot be specified\n \ton the '%s' input pin.

Description

This message indicates that you specified an invalid attribute on an input pin. Library Compiler fails if the following attributes are associated with an input pin.

```
* A driver_type attribute whose value is bus_hold
        * A slew_control attribute
        * An edge_rate_rise attribute
        * An edge_rate_fall attribute
        * An edge_rate_rise_load attribute
        * An edge_rate_fall_load attribute
        * A reference_resistance attribute
```

The following example shows an instance where this message occurs:

```
pin(B) {
            direction : input;
            capacitance : 1.0;
            fanout_load : 1.0;

            edge_rate_breakpoint_r0 : 0.000;
            edge_rate_breakpoint_f0 : 0.000;
            edge_rate_breakpoint_r1 : 0.010;
            edge_rate_breakpoint_f1 : 0.010;

            edge_rate_rise : 1.0;
            edge_rate_load_rise : 1.0;
            edge_rate_fall     : 1.0;
            edge_rate_load_fall : 1.0;
         }
```

The following is an example message:

```
Error: Line 110, The 'edge_rate_rise' attribute cannot be specified
       on the 'B' input pin. (LBDB-215)
```

What Next

Check the library source file, and delete the invalid attribute from the input pin.

LBDB-216

(error) The '%s' scaled_cell's '%s' pin has a different\n \tnumber of timing arcs than the corresponding pin on the '%s' cell.

Feedback

Description

This message indicates that a timing group is missing in one of the output pins of either the specified cell or the scaled_cell.

The following example shows an instance where this message occurs:

```
library(lbdb216) {
    operating_conditions(WCCOM) {
        process : 1.5 ;
        temperature : 70 ;
        voltage : 4.75 ;
        tree_type : "worst_case_tree" ;
    }
    cell(IVV) {
      area : 1;
      pin(A) {
        direction : input;
        capacitance : 1;
      }
      pin(Z) {
        direction : output;
        function : "A'";
        timing() {
          intrinsic_rise : 0.1;
          intrinsic_fall : 0.1;
          rise_resistance : 0.1;
          fall_resistance : 0.1;
          slope_rise : 0.0;
          slope_fall : 0.0;
          related_pin : "A";
        }
      }
    }

    scaled_cell(IVV,WCCOM) {
      area : 1;
      pin(A) {
        direction : input;
        capacitance : 1;
      }
      pin(Z) {
        direction : output;
        function : "A'";
      }
    }
  }
```

In this case, add the following timing group to the 'Z' pin in the scaled_cell to fix the problem.

```
timing() {
          intrinsic_rise : 0.3;
```

```
          intrinsic_fall : 0.3;
          rise_resistance : 0.3;
          fall_resistance : 0.3;
          slope_rise : 0.0;
          slope_fall : 0.0;
          related_pin : "A";
        }
```

The following is an example message:

```
Error: Line 40, The 'WCCOM' scaled_cell's 'Z' pin has a different
       number of timing arcs than the corresponding pin on the 'IVV'
 cell. (LBDB-216)
```

What Next

Add the missing timing group to the specified output pin in either the cell or the scaled_cell.

LBDB-217

(error) The '%s' cell's '%s' pin has a timing arc without\n \ta counterpart on the scaled_cell(%s,%s).

Description

Each timing arc in the regular cell needs a matched timing arc on the same pin in the scaled_cell group. This message indicates that a matching timing arc is not found in the library source file.

The following example shows an instance where this message occurs:

```
library(lbdb217) {
    operating_conditions(WCCOM) {
        process : 1.5 ;
        temperature : 70 ;
        voltage : 4.75 ;
        tree_type : "worst_case_tree" ;
    }
    cell(AND) {
      area : 1;
      pin(A B) {
        direction : input;
        capacitance : 1;
      }
      pin(Z) {
        direction : output;
        function : "A B";
        timing() {
          intrinsic_rise : 0.1;
          intrinsic_fall : 0.1;
```

```
            rise_resistance : 0.1;
            fall_resistance : 0.1;
            slope_rise : 0.0;
            slope_fall : 0.0;
            related_pin : "A B";
          }
        }
      }

      scaled_cell(AND,WCCOM) {
        area : 1;
        pin(A B) {
          direction : input;
          capacitance : 1;
        }
        pin(Z) {
          direction : output;
          function : "A B";
          timing() {
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            rise_resistance : 0.1;
            fall_resistance : 0.1;
            slope_rise : 0.0;
            slope_fall : 0.0;
            related_pin : "A";
          }
          timing() {
            intrinsic_rise : 0.3;
            intrinsic_fall : 0.3;
            rise_resistance : 0.3;
            fall_resistance : 0.3;
            slope_rise : 0.0;
            slope_fall : 0.0;
            related_pin : "A ";
          }
        }
      }
    }
```

In this case, The timing arc between 'Z' and 'A' is defined once in the 'AND' cell and twice in the 'AND' scaled_cell. To fix the problem, remove one of the timing arcs.

The following is an example message:

```
Error: Line 42, The 'AND' cell's 'Z' pin has a timing arc without
       a counterpart on the scaled_cell(AND,WCCOM). (LBDB-217)
```

What Next

Find the missing timing group in the scaled_cell and add it, or remove one of the extra timing groups in the cell.

Feedback

LBDB-218

(warning) The 'direction' of the '%s' scaled_cell pin \n \tdoes not match that of the same pin name on the '%s' cell.\n \tResetting the scaled_cell pin's direction to match both directions.

Description

This message indicates that a direction attribute of a scaled_cell pin is different from the same pin on the primary cell. Library Compiler matches the direction of the scaled_cell pin to the direction of the primary pin.

The following example shows an instance where this message occurs:

```
cell(AND) {
    area : 1;
    pin(A B C) {
      direction : input;
      capacitance : 1;
    }
    pin(Z) {
      direction : inout;
      function : "A B";
      three_state : "C";
      timing() {
        intrinsic_rise : 0.1;
        intrinsic_fall : 0.1;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "A B C";
      }
      timing() {
        timing_type : three_state_disable;
        intrinsic_rise : 0.1;
        intrinsic_fall : 0.1;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "C";
      }
    }
    }
    scaled_cell(AND,WCCOM) {
      area : 1;
      pin(A B C) {
        direction : input;
        capacitance : 1;
      }
      pin(Z) {
        direction : output;
        function : "A B";
        timing() {
          intrinsic_rise : 0.1;
          intrinsic_fall : 0.1;
```

```
            rise_resistance : 0.1;
            fall_resistance : 0.1;
            slope_rise : 0.0;
            slope_fall : 0.0;
            related_pin : "A B";
          }
        }
    }
```

The following is an example message:

```
Warning: Line 313, The 'direction' of the 'Z' scaled_cell pin
         does not match that of the same pin name on the 'AND' cell.
         Resetting the scaled_cell pin's direction to match both
 directions. (LBDB-218)
```

What Next

Check the library source file, and make sure the directions are the same.

LBDB-219

(error) The (%s,%s) scaled_cell has duplicate\n \ttiming arcs for the '%s' pin. It is unclear\n \twhich arc corresponds to the arcs in the '%s' cell.

Description

This message indicates that a scaled_cell has duplicate timing arcs between two pins. Library Compiler fails to recognize the equivalent timing arc in the primary cell.

What Next

Check the library source file, and remove the second timing arc.

LBDB-220

(error) The '%s' %s_voltage group has no '%s' attribute\n \tspecified. This attribute is essential in defining valid voltages.

Description

This message indicates that an input_voltage or an output_voltage group has one of its attributes missing. For an input_voltage group, Library Compiler fails if any of the vil, vih, vimin, or vimax attributes is missing. For an output_voltage group, Library Compiler fails if any of the vol, voh, vomin, or vomax attributes is missing.

The following example shows an instance where this message occurs:

```
output_voltage(CMOS_OUT) {
    vil : 1.5;
```

```
    vih : 3.5;
    vimin : -0.3;
    vimax : VDD + 0.3;
  }
```

In this case, either there is a typo where the output_voltage is specified instead of input_voltage, or the vol, voh, vomin, and vomax are not specified for the output_voltage.

The following is an example message:

```
Error: Line 31, The 'CMOS_OUT' output_voltage group has no 'vol'
 attribute
       specified. This attribute is essential in defining valid voltages.
 (LBDB-220)
```

What Next

Check the library source file, and add the missing attribute to the voltage group.

LBDB-221

(warning) The '%s' %s_voltage group has a %s value,\n \twhich is %s %s.

Description

This message indicates that an *input_voltage* or an *output_voltage* has inconsistent values for its attributes. Library Compiler issues warnings in these cases:

```
* vil value is less than vimin value.
        * vih value is greater than vimax value.
        * vol value is less than vomin value.
        * voh value is greater than vomax value.
```

The following example shows an instance where this message occurs:

```
input_voltage(CMOS) {
    vil : -1.5;
    vih : 3.5;
    vimin : -0.3;
    vimax : VDD + 0.3;
  }
```

In this case, the vil value is less than the vimin value.

The following is an example message:

```
Warning: Line 25, The 'CMOS' input_voltage group has a vil value,
        which is less than vimin. (LBDB-221)
```

Feedback

What Next

Change the specified attribute value to be consistent with the minimum or the maximum values.

LBDB-222

(error) The fpga_family attribute is required when\n \tthe fpga_cell_type attribute is specified.

Description

This message indicates that in an fpga cell you specified an *fpga_cell_type* attribute without the *fpga_family* attribute.

The following example shows an instance where this message occurs:

```
cell( lbdb222 ) {
        area : 1;
        fpga_cell_type : CLB;

        pin( K ) {
            direction : input;
            capacitance : 0.0;
        }
        ...
    }
```

In this case, to fix the problem, add the statement to the cell.

```
fpga_family : "x4000";
```

The following is an example message:

```
Error: Line 28, The fpga_family attribute is required when
        the fpga_cell_type attribute is specified. (LBDB-222)
```

What Next

Add the missing fpga_family attribute to the cell.

LBDB-223

(error) The fpga_cell_type attribute is required when\n \tthe fpga_family attribute is specified.

Description

This message indicates that in an fpga cell you specified an *fpga_family* attribute without the *fpga_cell_type* attribute.

The following example shows an instance where this message occurs:

```
cell(lbdb223) {
        area : 1;
        fpga_family : "x4000";

        pin( K ) {
            direction : input;
            capacitance : 0.0;
        }
        ...
    }
```

In this case, to fix the problem, add the statement to the cell.

```
fpga_cell_type : CLB;
```

The following is an example message:

```
Error: Line 28, The fpga_cell_type attribute is required when
        the fpga_family attribute is specified. (LBDB-222)
```

What Next

Add the missing fpga_cell_type attribute to the cell.

LBDB-224

(error) The fpga_timing_type is required on all arcs \n \twhen fpga_cell_type and fpga_family are specified.

Description

This message indicates that you did not specify *fpga_timing_type* groups in a cell with the *fpga_family* and the *fpga_cell_type* attributes.

The following example shows an instance where this message occurs:

```
cell(INV) {
      fpga_family : "x4000";
      fpga_cell_type : CLB;
      area : 1;
      pin(X) {
        function : "A'";
        direction : output;
        timing() {
          intrinsic_rise  : 0.1;
          intrinsic_fall  : 0.1;
          rise_resistance : 1.0;
          fall_resistance : 1.0;
          related_pin : "A";
        }
```

```
      }
      pin(A) {
        direction : input;
        capacitance :  0.1;
        fanout_load :  0.1;
      }
    }
```

To fix the problem, add the attribute to the timing group.

```
timing() {
          fpga_timing_type : ICK;
          intrinsic_rise  : 0.1;
          intrinsic_fall  : 0.1;
          rise_resistance : 1.0;
          fall_resistance : 1.0;
          related_pin : "A";
        }
```

The following is an example message:

```
Error: Line 208, The fpga_timing_type is required on all arcs
        when fpga_cell_type and fpga_family are specified. (LBDB-224)
```

What Next

Add the missing fpga_timing_type groups to all the pins of the cell.

LBDB-225

(error) The fpga_timing_type is invalid when the fpga_cell_type\n \tand the fpga_family attributes are not defined on a cell.

Description

This message indicates that you specified fpga_timing_type in a timing group of a pin without defining the fpga_family and the fpga_cell_type attributes at the cell level.

The following example shows an instance where this message occurs:

```
cell(lbdb225) {
      area : 1;
      pin(X) {
        function : "A'";
        direction : output;
        timing() {
          fpga_timing_type : ICK;
          intrinsic_rise  : 0.1;
          intrinsic_fall  : 0.1;
          rise_resistance : 1.0;
          fall_resistance : 1.0;
          related_pin : "A";
```

```
        }
      }
      pin(A) {
        direction : input;
        capacitance :  0.1;
        fanout_load :  0.1;
      }
    }
```

To fix the problem, add the sample statements at the cell level.

```
fpga_family : "x4000";
      fpga_cell_type : CLB;
```

The following is an example message:

```
Error: Line 30, The fpga_timing_type is invalid when the fpga_cell_type
        and the fpga_family attributes are not defined on a cell.
 (LBDB-225)
```

What Next

Add the missing attribute to the library file.

LBDB-226

(error) The FPGA CLB cell type from the x2000 family requires\n \tA, B, C, D, K, X, and Y pins.

Description

This message indicates that you specified an incomplete CLB FPGA cell with missing pins from the x2000 family.

The following example shows an instance where this message occurs:

```
cell(lbdb226) {
      fpga_family : "x2000";
      fpga_cell_type : CLB;
      area : 1;
      pin(X) {
        function : "A'";
        direction : output;
        timing() {
          fpga_timing_type : ICK;
          intrinsic_rise  : 0.1;
          intrinsic_fall  : 0.1;
          rise_resistance : 1.0;
          fall_resistance : 1.0;
          related_pin : "A";
        }
      }
```

Feedback

```
      pin(A) {
        direction : input;
        capacitance :  0.1;
        fanout_load :  0.1;
      }
    }
```

The following is an example message:

```
Error: Line 22, The FPGA CLB cell type from the x2000 family requires
        A, B, C, D, K, X, and Y pins. (LBDB-226)
```

What Next

Add the missing pins to the cell.

LBDB-227

(error) The FPGA IOB cell type from the x2000 family requires\n \tO, T, K, I, and PAD pins.

Description

This message indicates that you specified an incomplete IOB FPGA cell with missing pins from the x2000 family.

The following example shows an instance where this message occurs:

```
cell(lbdb227) {
      fpga_family : "x2000";
      fpga_cell_type : IOB;
      area : 1;
      pin(X) {
        function : "A'";
        direction : output;
        timing() {
          fpga_timing_type : ICK;
          intrinsic_rise  : 0.1;
          intrinsic_fall  : 0.1;
          rise_resistance : 1.0;
          fall_resistance : 1.0;
          related_pin : "A";
        }
      }
      pin(A) {
        direction : input;
        capacitance :  0.1;
        fanout_load :  0.1;
      }
    }
```

Feedback

The following is an example message:

```
Error: Line 22, The FPGA IOB cell type from the x2000 family requires
        O, T, K, I, and PAD pins. (LBDB-227)
```

What Next

Add the missing pins to the cell.

LBDB-228

(error) The FPGA CLB cell type from the x3000 family requires \n \tA, B, C, D, E, K, EC, DI, RD, X, Y, and GSR pins.

Description

This message indicates that you specified an incomplete CLB FPGA cell with missing pins from the x3000 family.

The following example shows an instance where this message occurs:

```
cell(lbdb228) {
      fpga_family : "x3000";
      fpga_cell_type : CLB;
      area : 1;
      pin(X) {
        function : "A'";
        direction : output;
        timing() {
          fpga_timing_type : ICK;
          intrinsic_rise  : 0.1;
          intrinsic_fall  : 0.1;
          rise_resistance : 1.0;
          fall_resistance : 1.0;
          related_pin : "A";
        }
      }
      pin(A) {
        direction : input;
        capacitance :  0.1;
        fanout_load :  0.1;
      }
    }
```

The following is an example message:

```
Error: Line 22, The FPGA CLB cell type from the x3000 family requires
        A, B, C, D, E, K, EC, DI, RD, X, Y, and GSR pins. (LBDB-228)
```

What Next

Add the missing pins to the cell.

Feedback

LBDB-229

(error) The FPGA IOB cell type from the x3000 family requires \n \tO, T, IK, OK, I, Q, PAD, and GSR pins.

Description

This message indicates that you specified an incomplete IOB FPGA cell with missing pins from the x3000 family.

The following example shows an instance where this message occurs:

```
cell(lbdb229) {
      fpga_family : "x3000";
      fpga_cell_type : IOB;
      area : 1;
      pin(X) {
        function : "A'";
        direction : output;
        timing() {
          fpga_timing_type : ICK;
          intrinsic_rise  : 0.1;
          intrinsic_fall  : 0.1;
          rise_resistance : 1.0;
          fall_resistance : 1.0;
          related_pin : "A";
        }
      }
      pin(A) {
        direction : input;
        capacitance :  0.1;
        fanout_load :  0.1;
      }
    }
```

The following is an example message:

```
Error: Line 22, The FPGA IOB cell type from the x3000 family requires
        O, T, IK, OK, I, Q, PAD, and GSR pins. (LBDB-229)
```

What Next

Add the missing pins to the cell.

LBDB-230

(error) The FPGA CLB cell type from the x4000 family requires\n \tF1-F4, G1-G4, C1-C4, K, X, Y, XQ, YQ, GSR, CIN, and COUT pins.

Feedback

Description

This message indicates that you specified an incomplete CLB FPGA cell with missing pins from the x4000 family.

The following example shows an instance where this message occurs:

```
cell(lbdb230) {
      fpga_family : "x4000";
      fpga_cell_type : CLB;
      area : 1;
      pin(X) {
        function : "A'";
        direction : output;
        timing() {
          fpga_timing_type : ICK;
          intrinsic_rise  : 0.1;
          intrinsic_fall  : 0.1;
          rise_resistance : 1.0;
          fall_resistance : 1.0;
          related_pin : "A";
        }
      }
      pin(A) {
        direction : input;
        capacitance :  0.1;
        fanout_load :  0.1;
      }
    }
```

The following is an example message:

```
Error: Line 22, The FPGA CLB cell type from the x4000 family requires
        F1-F4, G1-G4, C1-C4, K, X, Y, XQ, YQ, GSR, CIN, and COUT pins.
 (LBDB-230)
```

What Next

Add the missing pins to the cell.

LBDB-231

(error) The FPGA IOB cell type from the x4000 family requires\n \tO, T, IK, OK, I1, I2, PAD, and GSR pins.

Description

This message indicates that you specified an incomplete IOB FPGA cell with missing pins from the x4000 family.

Feedback

The following example shows an instance where this message occurs:

```
cell(lbdb231) {
      fpga_family : "x4000";
      fpga_cell_type : IOB;
      area : 1;
      pin(X) {
        function : "A'";
        direction : output;
        timing() {
          fpga_timing_type : ICK;
          intrinsic_rise  : 0.1;
          intrinsic_fall  : 0.1;
          rise_resistance : 1.0;
          fall_resistance : 1.0;
          related_pin : "A";
        }
      }
      pin(A) {
        direction : input;
        capacitance :  0.1;
        fanout_load :  0.1;
      }
    }
```

The following is an example message:

```
Error: Line 22, The FPGA IOB cell type from the x4000 family requires
        O, T, IK, OK, I1, I2, PAD, and GSR pins. (LBDB-231)
```

What Next

Add the missing pins to the cell.

LBDB-232

(error) The attribute '%s' cannot be %s while the pin has %s.

Description

The first specified attribute in the pin cannot be the value with the second specified attribute on the same pin has been defined.

For example, the *is_unconnected* attribute cannot be specified on a pin with *related_power_pin* or *related_ground_pin* attribute, or the pin is a feedthrough pin, i.e. in a *short* path.

The following example shows an instance where this message occurs:

```
cell(Block) {
    area : 2;
    pin(A) {
```

Feedback

```
      direction : input;
      capacitance : 1.0;
      related_power_pin : VDD ;
      related_ground_pin : VSS ;
      is_unconnected : true ;
    }
    ...

  }
```

The following is an example message:

```
Error: Line 84, The  attribute 'is_unconnected' cannot be true while
 the pin has related_power_pin/related_groud_pin or is feedthrough.
 (LBDB-232)
```

What Next

Check the specification of the cell, remove the attribute that incorrecly defined.

LBDB-233

(warning) The attribute '%s' should be defined while\n \tthe pin has no power supply and is not a feedthrough pin.

Description

The specified attribute in the pin should be defined when the pin has no related_power_pin/related_ground_pin and is not a feedthrough pin if it should be unconnected.

Library Compiler will derive the attribute automatically during read_lib.

The following example shows an instance where this message occurs:

```
cell(Block) {
    area : 2;

    pin(Z) {
      direction : output;
      function : "A";
    }
  }
```

The following is an example message:

```
Warning: Line 84, The attribute 'is_unconnected' should be defined while
     the pin has no power supply and is not a feedthrough pin. (LBDB-233)
```

What Next

Adding related power/ground pin if the pin should not be unconnected.

Feedback

LBDB-235

(error) This %s voltage or power supply group is not defined.

Description

This message indicates the specified voltage or the power supply associated with the signal level is not defined in the library source file. The voltage can either be input or output.

The following example shows an instance where this message occurs:

```
pin(PAD ) {
        is_pad : true;
        input_voltage : lbdb235;
        direction   : input;
        capacitance : 35.000000;
        fanout_load : 0.000000;
      }
      pin(PAD1 ) {
        is_pad : true;
        input_signal_level : VDD1;
        direction   : input;
        capacitance : 35.000000;
        fanout_load : 0.000000;
      }
```

In this case, the 'lbdb235' input_voltage is not defined. To fix the problem, add the following input_voltage:

```
input_voltage(lbdb235) {
    vil         : 0.8 ;
    vih         : 2.0 ;
    vimin       : -0.3 ;
    vimax       : VDD + 0.3 ;
   }
```

In addition, the 'VDD1' input_signal_level is not defined. To fix the problem, add the following power_supply group:

```
power_supply() {
    default_power_rail : VDD0;
    power_rail (VDD1, 5.0);
   }
```

The following is an example message:

```
Error: Line 23, This input voltage or power supply group is not defined.
 (LBDB-235)
Error: Line 30, This input voltage or power supply group is not defined.
 (LBDB-235)
```

Feedback

What Next

Add the missing voltage or the power supply to the library file.

LBDB-236

(error) An %s pin cannot specify an %s attribute.

Description

This message indicates that there is a mismatch between the direction of a pin and the voltage attribute. Library Compiler fails if you specify an input_voltage to an output pin and an output_voltage to an input pin.

The following example shows an instance where this message occurs:

```
cell(lbdb236) {
    area : 0.0;
    pad_cell : true;
    pad_type : clock;
    pin(PAD ) {
      direction : input;
      is_pad : true;
      input_voltage : CMOS;
      capacitance : 1.0;
    }
    pin(Y ) {
      direction : output;
      is_pad : true;
      function : "PAD";
      input_voltage : CMOS;
      timing() {
        intrinsic_fall : 1.0;
        intrinsic_rise : 1.0;
        fall_resistance : 0.1;
        rise_resistance : 0.1;
        related_pin :"PAD";
      }
    }
  }
```

In this case, the 'Y' pin has an input_voltage specified. To fix the problem, change the voltage to an output_voltage attribute.

The following is an example message:

```
Error: Line 71, An output pin cannot specify an input_voltage attribute.
 (LBDB-236)
```

Feedback

What Next

Check the library source file, and fix the invalid attribute, either the direction of the pin or the voltage attribute.

LBDB-236w

(warning) An %s pin cannot specify an %s attribute.

Description

This message indicates that there is a mismatch between the direction of a pin and the voltage attribute. Library Compiler fails if you specify an input_voltage to an output pin and an output_voltage to an input pin.

The following example shows an instance where this message occurs:

```
cell(lbdb236) {
    area : 0.0;
    pad_cell : true;
    pad_type : clock;
    pin(PAD ) {
      direction : input;
      is_pad : true;
      input_voltage : CMOS;
      capacitance : 1.0;
    }
    pin(Y ) {
      direction : output;
      is_pad : true;
      function : "PAD";
      input_voltage : CMOS;
      timing() {
        intrinsic_fall : 1.0;
        intrinsic_rise : 1.0;
        fall_resistance : 0.1;
        rise_resistance : 0.1;
        related_pin :"PAD";
      }
    }
  }
```

In this case, the 'Y' pin has an input_voltage specified. To fix the problem, change the voltage to an output_voltage attribute.

The following is an example message:

```
Warning: Line 71, An output pin cannot specify an input_voltage
 attribute. (LBDB-236w)
```

What Next

Check the library source file, and fix the invalid attribute, either the direction of the pin or the voltage attribute.

LBDB-238

(warning) No '%s' attribute has been specified for the\n \tlibrary. This attribute is needed in %s libraries.

Description

This message indicates that you did not specify any of the following attributes in the technology library.

```
* time_unit
        * capacitance_load_unit
        * pulling_resistance_unit
        * voltage_unit
        * current_unit
        * leakage_power_unit
```

The following example shows an instance where this message occurs: Add any of the following examples of attributes to the library:

```
capacitive_load_unit(0.042000,pf) ;
    voltage_unit  : "1V";
    current_unit  : "1mA";
    pulling_resistance_unit : "1kohm";
    time_unit : "1ns";
    leakage_power_unit : "1nW";
```

The following is an example message:

```
Warning: No 'capacitive_load_unit' attribute has been specified for the
         library. This attribute is needed in technology libraries.
 (LBDB-238)
```

What Next

Add the missing attribute to the library source file.

LBDB-239

(error) The '%s' driver_type cannot coexist\n \twith the '%s' attribute on the '%s' pin.

Feedback

Description

The *driver_type* specified in the pin cannot coexist with the attribute on the same pin. For example, a pin with a *bus_hold driver_type* is tied to a DC source. A function attribute or *three_state* attribute cannot be specified on a *bus_hold* pin.

The following example shows an instance where this message occurs:

```
cell(lbdb239) {
    area : 2;
    pin(A) {
      direction : input;
      capacitance : 1.0;
    }
    pin(Z2) {
      direction : output;
      function : "A";
      driver_type : "bus_hold";
      timing() {
        intrinsic_rise : 0.1;
        intrinsic_fall : 0.1;
        related_pin : "A";
      }
    }
  }
```

The following is an example message:

```
Error: Line 84, The  'bus_hold' driver_type cannot coexist
        with the 'function' attribute on the 'Z2' pin. (LBDB-239)
```

What Next

Check the specification of the cell, and make the appropriate change to the *driver_type* attribute or other attributes in the faulty pin group.

LBDB-240

(error) The '%s' cell area attribute has already been defined.

Description

This message indicates that the user-defined cell area is specified twice.

The following example shows an instance where this message occurs:

```
define_cell_area(my_area,pad_slots);
    define_cell_area(my_area,pad_slots);
```

Feedback

The following is an example message:

```
Error: Line 24, The 'my_area' cell area attribute has already been
 defined. (LBDB-240)
```

What Next

Remove the second definition of the cell area attribute.

LBDB-241

(warning) Multiple cell area definitions (%s, %s) map\n \tonto the same '%s' area. Using the last one encountered.

Description

This message indicates that you specified multiple defined_cell_area attributes with the same area kind. Library Compiler uses the last one encountered.

The following example shows an instance where this message occurs:

```
define_cell_area(my_area,pad_slots);
    define_cell_area(your_area,pad_slots);
```

The following is an example message:

```
Warning: Line 24, Multiple cell area definitions (your_area, my_area) map
        onto the same 'pad_slots' area. Using the last one encountered.
 (LBDB-241)
```

What Next

Delete the redundant define_cell_area definitions.

LBDB-242

(warning) This '%s' timing arc has the same timing_type and\n \trelated_pin attributes as the timing arc on the line %d.

Description

This message indicates that on the same pin you defined two timing groups with the same timing_type and related_pin attributes. Design Compiler considers the timing arcs as two separate arcs.

The following example shows an instance where this message occurs:

```
pin(QN) {
    direction : output;
    function : "IQN";
    timing() {
```

Feedback

```
      timing_type : rising_edge;
      intrinsic_rise : 1.0;
      intrinsic_fall : 1.0;
      rise_resistance : 0.1;
      fall_resistance : 0.1;
      related_pin : "CP";
    }
    timing() {
      timing_type : rising_edge;
      intrinsic_rise : 2.0;
      intrinsic_fall : 2.0;
      rise_resistance : 0.1;
      fall_resistance : 0.1;
      related_pin : "CP P";
    }
    timing() {
      timing_type : setup_rising;
      intrinsic_rise : 1.0;
      intrinsic_fall : 1.0;
      rise_resistance : 0.1;
      fall_resistance : 0.1;
      related_pin : "CP";
    }
  }
```

In this case, the 'QN' pin has the 'CP' related_pin and the 'rising_edge' timing_type multiply defined.

The following is an example message:

```
Warning: Line 591, This 'QN' timing arc has the same timing_type and
         related_pin attributes as the timing arc on the line 583.
 (LBDB-242)
```

What Next

If it is a typo, change the library file, and delete the redundant timing groups.

LBDB-243

(warning) The '%s' combinational cell has a '%s' pin with\n \ta sequential timing arc containing the '%s' timing_type.

Description

This message indicates that you specified one of the cell's timing arcs as sequential, while the function of this cell is combinational. Library Compiler warns you if any of the following timing types is defined on a combinational cell:

```
* rising_edge
       * falling_edge
```

```
        * preset
        * clear
        * setup_rising
        * setup_falling
        * hold_rising
        * hold_falling
        * recovery_rising
        * recovery_falling
        * skew_rising
        * skew_falling
        * removal_rising
        * removal_falling
```

The following example shows an instance where this message occurs:

```
cell(lbdb243) {
    area : 1;
    pin(A B) {
      direction : input;
      capacitance : 1;
    }
    pin(Z) {
      direction : output;
      function : "A B";
      timing() {
        timing_type : rising_edge;
        intrinsic_rise : 0.1;
        intrinsic_fall : 0.1;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "A B";
      }
    }
  }
```

In this case, the 'Z' pin has an invalid 'rising_edge' timing_type.

The following is an example message:

```
Warning: Line 84, The 'lbdb243' combinational cell has a 'Z' pin with
         a sequential timing arc containing the 'rising_edge'
 timing_type. (LBDB-243)
```

What Next

Change the library source file, and fix the timing_type of the specified pin.

LBDB-246

(warning) The default_wire_load_selection is not defined.\n \tBy default, the '%s' wire_load_selection group is used.

Feedback

Description

The *default_wire_load_selection* attribute is undefined in this library. The *default_wire_load_selection* attribute is required when multiple wire_load_selection groups are specified in a library. If there is only one wire_load_selection group defined in a library, Library Compiler automatically sets the *default_wire_load_selection* attribute to the only available wire_load_selection group.

The following example shows an instance where this message occurs:

```
wire_load("05x05") {
    resistance : 0 ;
    capacitance : 1 ;
    area : 0 ;
    slope : 0.186 ;
    fanout_length(1,0.39) ;
  }
  wire_load_selection(test) {
    wire_load_from_area(27,10,"10x10");
    wire_load_from_area(27,100,"10x10");
    wire_load_from_area(0,28,"05x05");
    wire_load_from_area(2,10,"15x10");
  }
```

The following is an example message:

```
Warning: Line 50, The default_wire_load_selection is not defined.
        By default, the 'test' wire_load_selection group is used.
 (LBDB-246)
```

What Next

Set the *default_wire_load_selection* attribute to avoid this warning message, or ignore this message.

LBDB-247

(error) The default_wire_load_selection is not defined.\n \tThe default_wire_load_selection attribute is required when more than one\n \twire_load_selection group is specified.

Description

The *default_wire_load_selection* attribute is undefined in this library. Library Compiler requires this attribute because there is more than one wire_load_selection group specified.

The following example shows an instance where this message occurs:

```
wire_load("05x05") {
    resistance : 0 ;
    capacitance : 1 ;
    area : 0 ;
```

```
    slope : 0.186 ;
    fanout_length(1,0.39) ;
  }

  wire_load_selection(test) {
    wire_load_from_area(0,25,"05x05");
  }
  wire_load_selection(test1) {
    wire_load_from_area(0,27,"05x05");
  }
```

To fix the problem, add this statement to the library:

```
default_wire_load_selection : test;
```

The following is an example message:

```
Error: Line 0, The default_wire_load_selection is not defined.
        The default_wire_load_selection attribute is required when more
 than one
        wire_load_selection group is specified. (LBDB-247)
```

What Next

Set the *default_wire_load_selection* attribute to be one of the wire_load_selection groups.

LBDB-250

(warning) The '%s' pin already has a 'pulling_resistance' value.\n \tThe 'pulling_current' causes the 'pulling_resistance' value to be overwritten.

Description

This message indicates you specified both the *pulling_resistance* and the *pulling_current* attributes on the same pin. Library Compiler uses the pulling_current value and the nominal voltage to overwrite the pulling_resistance value.

The following example shows an instance where this message occurs:

```
pin(Y) {
        direction : output;
        capacitance : 1.0;
        driver_type : pull_up;
        is_pad : true;
        slew_control : low;
        drive_current : 1.0;
        output_voltage  : CMOS_OUT;
        function : "A";
        three_state : "GZ";
        pulling_resistance : 1000;
        pulling_current : 10;
     }
```

Feedback

The following is an example message:

```
Warning: Line 93, The 'Y' pin already has a 'pulling_resistance' value.
        The 'pulling_current' causes the 'pulling_resistance' value to be
 overwritten. (LBDB-250)
```

What Next

If you do not want the pulling_resistance value overwritten, delete the pulling_current attribute.

LBDB-251

(warning) The '%s' pin has a 'hysteresis' attribute but\n \tno 'input_voltage' attribute. Both attributes are needed.

Description

This message indicates that you specified the hysteresis attribute, but you did not specify the input_voltage attribute in a pad cell.

The following example shows an instance where this message occurs:

```
pin(PAD ) {
      direction : input;
      is_pad : true;
      hysteresis : true;
      capacitance : 1.0;
    }
```

To fix the problem, add this statement to the 'PAD' pin:

```
input_voltage : CMOS; /* CMOS is defined in the library */
```

The following is an example message:

```
Warning: Line 53, The 'PAD' pin has a 'hysteresis' attribute but
        no 'input_voltage' attribute. Both attributes are required.
 (LBDB-251)
```

What Next

Add the input_voltage attribute to the pin in the pad cell.

LBDB-252

(error) The '%s' %s group already exists and\n \tcannot be overwritten.

Feedback

Description

This message indicates that you multiply defined either an input_voltage or an output_voltage group. Library Compiler does not allow the overwriting of existing voltage groups.

The following example shows an instance where this message occurs:

```
input_voltage(CMOS) {
    vil : 1.5;
    vih : 3.5;
    vimin : -0.3;
    vimax : VDD + 0.3;
  }

  input_voltage(CMOS) {
    vil : 2.5;
    vih : 4.5;
    vimin : -0.3;
    vimax : VDD + 0.3;
  }
```

The following is an example message:

```
Error: Line 31, The 'CMOS' input_voltage group already exists and
       cannot be overwritten. (LBDB-252)
```

What Next

Delete the second specification of the voltage group.

LBDB-253

(error) The '%s' pin does not have all the %s slew rate attributes\n \tdefined. The '%s' attribute is missing.\n \tAll %s slew-rate attributes must be specified together as a group.

Description

This message indicates that not all slew rate attributes are specified in a pin. Library Compiler expects the following rise slew rate attributes defined together:

```
* rise_current_slope_before_threshold
        * rise_time_before_threshold
        * rise_current_slope_after_threshold
        * rise_time_after_threshold
```

and the following fall slew rate defined together:

```
* fall_current_slope_before_threshold
        * fall_time_before_threshold
        * fall_current_slope_after_threshold
        * fall_time_after_threshold
```

Feedback

The following example shows an instance where this message occurs:

```
cell(lbdb253) {
    area : 0.0;
    pad_cell : true;
    bond_pads : 1;
    driver_sites : 1;
    pin(PAD) {
      is_pad : true;
      direction : output;
      output_voltage : CMOS_OUT;
      function : "Y ";
      drive_current : 1.0;
      slew_control : high;
      rise_time_before_threshold : 1.0;
      rise_current_slope_after_threshold : -0.1;
      rise_time_after_threshold : 1.0;
      fall_current_slope_before_threshold : -0.1;
      fall_time_before_threshold : 1.0;
      fall_current_slope_after_threshold : 0.1;
      fall_time_after_threshold : 1.0;
      timing() {
        intrinsic_fall : 1.0;
        intrinsic_rise : 1.0;
        fall_resistance : 0.1;
        rise_resistance : 0.1;
        related_pin :"Y";
      }
    }
    pin(Y ) {
      direction : input;
      capacitance : 1.0;
    }
  }
```

In this case, the 'rise_current_slope_before_threshold' attribute is not specified for the 'PAD' pin.

The following is an example message:

```
Error: Line 88, The 'PAD' pin does not have all the rise slew rate
 attributes
        defined. The 'rise_current_slope_before_threshold' attribute is
 missing.
        All rise slew-rate attributes must be specified together as a
 group. (LBDB-253)
```

What Next

Check the library source file, and add the missing slew rate attribute.

Feedback

LBDB-254

(error) The '%s' edge rate related attribute \n \tcannot be specified on the '%s' output pin.

Description

This message indicates that you specified an edge rate attribute on an output pin.

The following example shows an instance where this message occurs:

```
pin(Z) {
            direction : output;
            function : "(A & B)";
            max_fanout : 25;

            edge_rate_breakpoint_r0 : 0.0;
            edge_rate_breakpoint_f0 : 0.0;
            edge_rate_breakpoint_r1 : 0.1;
            edge_rate_breakpoint_f1 : 0.1;

            edge_rate_rise : 1.0;
            edge_rate_load_rise : 1.0;
            edge_rate_fall : 0.1;
            edge_rate_load_fall : 1.0;
        }
```

The following is an example message:

```
Error: Line 120, The 'edge_rate_breakpoint_r0' edge rate related
 attribute
        cannot be specified on the 'Z' output pin. (LBDB-254)
```

What Next

Delete the attribute from the output pin group.

LBDB-255

(error) The 'vhdl_name' attribute of '%s' is invalid VHDL or\n \tconflicts with another 'vhdl_name' attribute.

Description

This message indicates that the cell or port *vhdl_name* attribute is either invalid VHDL (reserved VHDL name) or another cell or port has already been set to the same name.

The following example shows an instance where this message occurs:

```
cell(lbdb255) {
    area : 2;
    pin(A) {
```

```
      vhdl_name : "pinvhdl";
      direction : input;
      capacitance : 1;
    }
    pin(B) {
      vhdl_name : "pinvhdl" ;
      direction : input;
      capacitance : 1;
    }
    pin(Z) {
      direction : output;
      function : "A^B";
      timing() {
        timing_sense : positive_unate;
        intrinsic_rise : 0.1;
        intrinsic_fall : 0.1;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "A";
      }
      timing() {
        timing_sense : non_unate;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "A B";
      }
    }
  }
```

In this case, both the 'A' and 'B' pin have the same value in the vhdl_name attribute.

The following is an example message:

```
Error: Line 93, The 'vhdl_name' attribute of 'pinvhdl' is invalid VHDL or
        conflicts with another 'vhdl_name' attribute. (LBDB-255)
```

What Next

If the attribute is invalid VHDL, change the library by fixing the value of the vhdl_name attribute. If the value of the attribute is redundant, either delete the second attribute or change its value.

LBDB-256

(warning) The 'vhdl_name' attribute of '%s' is invalid VHDL or\n \tconflicts with another 'vhdl_name' attribute. Renamed to '%s'.

Feedback

Description

This message indicates that the cell or port 'vhdl_name' attribute is either invalid VHDL or another cell or port has already been set to the same name.

Because this is an update_lib cell, the name is automatically renamed to a valid one.

The following example shows an instance where this message occurs:

```
cell (lbdb256) {
  area : 1;
  pin(IN) {
    vhdl_name : "port_X";
    direction : input;
    capacitance : 1;
  }
  pin(Z) {
    vhdl_name : "port_X";       /* rename after warning */
    direction : output;
    function : "IN'";
    timing () {
      intrinsic_rise : 0.1;
      intrinsic_fall : 0.1;
      rise_resistance : 0.1;
      fall_resistance : 0.1;
      related_pin : "IN";
    }
  }
}
```

The following is an example message:

```
Warning: Line 9, The 'vhdl_name' attribute of 'port_X' is invalid VHDL or
        conflicts with another 'vhdl_name' attribute. Renamed to
 'port_Xb'. (LBDB-256)
```

What Next

Change the file to update by changing the value of the vhdl_name attribute if you are not satisfied with the renamed value.

LBDB-257

(warning) The '%s' wire_load_selection group has been specified\n \twhile the default_wire_load_mode is %s 'top'. This causes \n \tthe 'wire_load_selection' group to work only for the top-level design.

Description

The 'default_wire_load_mode' is defined as, or defaults to, 'top', which causes the 'wire_load_selection' group to only work for the top-level design.

Feedback

The following example shows an instance where this message occurs:

```
default_wire_load_mode : 'top';
  wire_load_selection(test) {
    wire_load_from_area(27,100,"10x10");
    wire_load_from_area(10,25,"05x05");
  }
```

The following is an example message:

```
Warning: The 'test' wire_load_selection group has been specified
        while the default_wire_load_mode is default to 'top'. This causes
        the 'wire_load_selection' group to work only for the top-level
 design. (LBDB-257)
```

What Next

Set the default_wire_load_mode to 'segmented' or 'enclosed' modes to work with wire_load_selection group.

LBDB-258

(error) The '%s' driver_type cannot be specified\n \ton a inout pin without a three_state attribute.

Description

This message indicates that you specified a pull_up or a pull_down driver_type on an inout pin lacking a three_state attribute.

The following example shows an instance where this message occurs:

```
pin(A) {
      direction : inout;
      driver_type : pull_up;
      capacitance : 1;
      pulling_resistance : 100;
    }
```

The following is an example message:

```
Error: Line 354, The 'pull_up' driver_type cannot be specified
        on a inout pin without a three_state attribute. (LBDB-258)
```

What Next

Either delete the driver_type or add the three_state attribute.

LBDB-259

(error) The '%s' refers to a nonexistent or empty '%s'.

Feedback

Description

This message indicates that you specified a nonexistent or empty template group on a propagation delay in a nonlinear delay library.

The following example shows an instance where this message occurs:

```
fall_propagation(lbdb259_template) {
                values ("1, 2, 3, 4", "5, 6, 7, 8", \
                        "9, 10, 11, 12", "13, 14, 15, 16");
        }
```

To fix the problem, add the following group to the library file,

```
lu_table_template(lbdb259_template) {
        variable_1 : input_net_transition;
        variable_2 : output_net_length;
        index_1 ("0.1, 1.2, 2.3, 3.4");
        index_2 ("0.1, 1.2, 2.3, 3.4");
  }
```

The following is an example message:

```
Error: Line 111, The 'lbdb259_template' refers to a nonexistent or empty
 'lu_table_template'. (LBDB-259)
```

What Next

Check the library source file, and either add the lu_table_template group if it is missing or correct the template name if it is a typo.

LBDB-259w

(warning) The '%s' refers to a nonexistent or empty '%s'.

Description

This message indicates that you specified a nonexistent or empty template group on a propagation delay in a nonlinear delay library.

The following example shows an instance where this message occurs:

```
fall_propagation(lbdb259_template) {
                values ("1, 2, 3, 4", "5, 6, 7, 8", \
                        "9, 10, 11, 12", "13, 14, 15, 16");
        }
```

To fix the problem, add the following group to the library file,

```
lu_table_template(lbdb259_template) {
        variable_1 : input_net_transition;
        variable_2 : output_net_length;
```

```
        index_1 ("0.1, 1.2, 2.3, 3.4");
        index_2 ("0.1, 1.2, 2.3, 3.4");
  }
```

The following is an example message:

```
Warning: Line 111, The 'lbdb259_template' refers to a nonexistent or
 empty 'lu_table_template'. (LBDB-259w)
```

What Next

Check the library source file, and either add the lu_table_template group if it is missing or correct the template name if it is a typo.

LBDB-260

(error) The '%s' in '%s' and '%s' \n \tin '%s' of the '%s' lu_table_template represent \n \tthe same unallowable meaning.

Description

This message indicates that the two variables in the lu_table_template represent the same unallowable meaning. Library Compiler fails if both the values of variable_1 and variable_2 are from the following set:

```
* total_output_net_capacitance
        * output_net_length
        * output_net_wire_cap
        * output_net_pin_cap
```

The following example shows an instance where this message occurs:

```
lu_table_template(lbdb260) {
        variable_1 : output_net_length;
        variable_2 : total_output_net_capacitance;
        index_2 ("0.1, 1.2, 2.3, 3.4");
  }
```

The following is an example message:

```
Error: Line 57, The 'output_net_length' in variable_1 and
 'total_output_net_capacitance'
        in variable_2 of the 'lbdb260' lu_table_template represent
        the same unallowable meaning. (LBDB-260)
```

What Next

Check the lu_table_template, and make the correction to either variable_1 or variable_2.

Feedback

LBDB-261

(error) The %s has already been specified for '%s'%s. A duplicate is not allowed.

Description

This message indicates that attribute or group information is specified multiple times. Library Compiler does not allow duplicate information.

What Next

Check the library source file, and, if there is a duplicate, change either name of duplicated group or delete one group/attribute.

Examples

The following example shows an instance where this message occurs:

```
lu_table_template(lbdb261_template) {
        variable_1 : constrained_pin_transition;
        variable_2 : related_pin_transition;
        index_1 ("0.1, 1.2, 2.3, 3.4");
        index_2 ("0.1, 1.2, 2.3, 3.4");
        index_2 ("0.1, 1.2, 2.3, 3.4");
  }
```

Examples

```
Error: Line 43, The 'index_2' has already been specified for
 'lbdb261_template' at line 30. A duplicate is not allowed.(LBDB-261)
```

LBDB-261w

(warning) The %s has already been specified for '%s'%s. Using the last definition encountered.

Description

This message indicates that attribute or group information is specified multiple times. Library Compiler does not allow duplicate information and use last definition.

What Next

Check the library source file, and, if there is a duplicate, change either name of group/attribute or delete one group/attribute.

EXMAPLES

The following example shows two function definition are same

Feedback

```
pin(Q) {
             direction : output;
             function : "1";
             function : "1";
        }
```

Examples

```
Warning: Line 43, The  attribute 'function'  has already been specified
 for group 'pin' at line 58. Using the last definition encountered.
 (LBDB-261w)
```

LBDB-262

(error) The '%s' attribute has an invalid sequence of\n \tdata '%f , %f'. The values must be in\n \tmonotonically increasing order.

Description

This message indicates that the set of data is not specified in monotonically increasing order.

The following example shows an instance where this message occurs:

```
lu_table_template(one_dimension) {
        variable_1 : input_net_transition;
        variable_2 : output_net_length;
        index_1 ("0.1");
        /* index does not in monotically increasing order */
        index_2 ("0.1, 4.2, 2.3, 3.4");
  }
```

The following is an example message:

```
Error: Line 22, The 'index_2' attribute has an invalid sequence of
        data '4.200000 , 2.300000'. The values must be in
        monotonically increasing order. (LBDB-262)
```

What Next

Check your library and correct the order of the values. If the message shows identical values and the library file reveals tiny differences, you hit the resolution limit of single-precision floating-point numbers. Consider increasing the spacing between data points.

Feedback

If the error happens inside an output_current_rise or output_current_fall group, please refer to the latest version of "CCS Timing Library Characterization Guidelines" and try the following:

1. Reduce or set tstart = 0 (see Figure 4 in the Guidelines), and re-characterize the library.
2. If that does not work, further reduce the reference_time value. Subtract the same amount from all entries in index_3 (time) in the same vector group. Apply the same modifications to all vector groups having the same input_net_transition value (index_1 or index_2), within the same output_current_rise or output_current_fall group. Make sure no adjusted numbers become negative.

LBDB-262w

(warning) The '%s' attribute has an invalid sequence of\n \tdata '%f , %f'. The values must be in\n \tmonotonically increasing order.

Description

This message indicates that the set of data is not specified in monotonically increasing order.

The following example shows an instance where this message occurs:

```
lu_table_template(one_dimension) {
        variable_1 : input_net_transition;
        variable_2 : output_net_length;
        index_1 ("0.1");
        /* index does not in monotically increasing order */
        index_2 ("0.1, 4.2, 2.3, 3.4");
  }
```

The following is an example message:

```
Warning: Line 22, The 'index_2' attribute has an invalid sequence of
        data '4.200000 , 2.300000'. The values must be in
        monotonically increasing order. (LBDB-262w)
```

What Next

Check your library and correct the order of the values. If the message shows identical values and the library file reveals tiny differences, you hit the resolution limit of single-precision floating-point numbers. Consider increasing the spacing between data points.

Feedback

If the warning happens inside an output_current_rise or output_current_fall group, please refer to the latest version of "CCS Timing Library Characterization Guidelines" and try the following:

1. Reduce or set tstart = 0 (see Figure 4 in the Guidelines), and re-characterize the library.
2. If that does not work, further reduce the reference_time value. Subtract the same amount from all entries in index_3 (time) in the same vector group. Apply the same modifications to all vector groups having the same input_net_transition value (index_1 or index_2), within the same output_current_rise or output_current_fall group. Make sure no adjusted numbers become negative.

LBDB-263

(error) The '%s' attribute has a value '%f',\n which is less than '%f', the minimum required value of this attribute.

Description

The value specified is less than the required minimum value for this attribute.

The following example shows an instance where this message occurs:

```
lu_table_template(invalid_template) {
        variable_1 : constrained_pin_transition;
        variable_2 : output_net_length;
        /* index value can not be less than zero */
        index_1 ("-0.1, 1.2, 2.3, 3.4");
        index_2 ("0.1, 1.2, 2.3, 3.4");
  }
```

The following is an example message:

```
Error: Line 35, The 'index_1' attribute has a value '-0.100000',
        which is less than '0.000000', the minimum required value
        of this attribute. (LBDB-263)
```

What Next

Check the library source file and correct the problem. Find the minimum value for this attribute in the error message or in the Library Compiler reference manual.

LBDB-264

(error) The '%s' is invalid in this look-up table.

Feedback

Description

This message indicates that the specified index is not allowed in the current table because the current table is one dimensional.

The following example shows an instance where this message occurs:

```
lu_table_template(lbdb264) {
        variable_1 : constrained_pin_transition;
        index_2 ("0.1, 1.2, 2.3, 3.4");
  }
```

To fix the problem, change index_2 to index_1.

The following is an example message:

```
Error: Line 46, The 'index_2' is invalid in this delay look-up table.
 (LBDB-264)
```

What Next

Check the library source file to determine whether you have the *variable_2* attribute specified before *index_2* or whether you are specifying *index_2* in a one-dimensional table or template.

LBDB-265

(error) You cannot mix a cell delay table with\n \ta propagation delay table in the same timing group.

Description

You can define cell delay table or propagation delay table within a timing group, but you cannot mix them together. For example, *cell_rise* and *propagation_fall* cannot be defined in a timing group. The same applies to *cell_fall* and *propagation_fall*.

The following example shows an instance where this message occurs:

```
cell (INVB) {
    area : 0.1;
    pin(Q) {
      direction : output;
      function :  "!A";
      timing() {
        related_pin : "A";
        rise_transition(fivebyfive) {
          index_1("0.000,0.200,0.400,0.600,0.800");
          index_2("0.100,0.200,0.300,0.400,0.500");
          values("0.100000, 0.100000, 0.100000, 0.100000, 0.100000", \
            "0.100000, 0.100000, 0.100000, 0.100000, 0.100000", \
            "0.100000, 0.100000, 0.100000, 0.100000, 0.100000", \
```

Feedback

```
            "0.100000, 0.100000, 0.100000, 0.100000, 0.100000", \
            "0.100000, 0.100000, 0.100000, 0.100000, 0.100000");
        }
        cell_rise(fivebyfive_prime) {
          index_1("0.000,0.200,0.400,0.600,0.800");
          values("-0.100000, -0.200000, 0.300000, 0.400000, 0.500000");
        }
        rise_propagation(fivebyfive_prime) {
          index_1("0.000,0.200,0.400,0.600,0.800");
          values("-0.100000, -0.200000, 0.300000, 0.400000, 0.500000");
        }
        fall_transition(fivebyfive) {
          index_1("0.000,0.200,0.400,0.600,0.800");
          index_2("0.100,0.200,0.300,0.400,0.500");
          values("0.100000, 0.100000, 0.100000, 0.100000, 0.100000", \
            "0.100000, 0.100000, 0.100000, 0.100000, 0.100000", \
            "0.100000, 0.100000, 0.100000, 0.100000, 0.100000", \
            "0.100000, 0.100000, 0.100000, 0.100000, 0.100000", \
            "0.100000, 0.100000, 0.100000, 0.100000, 0.100000");
        }
        cell_fall(fivebyfive) {
          index_1("0.000,0.200,0.400,0.600,0.800");
          index_2("0.100,0.200,0.300,0.400,0.500");
          values("0.100000, 0.100000, 0.100000, 0.100000, 0.100000", \
            "0.100000, 0.100000, 0.100000, 0.100000, 0.100000", \
            "0.100000, 0.100000, 0.100000, 0.100000, 0.100000", \
            "0.100000, 0.100000, 0.100000, 0.100000, 0.100000", \
            "0.100000, 0.100000, 0.100000, 0.100000, 0.100000");
        }
      }
      max_transition : 1.0;
    }
    pin(A) {
      direction : input;
      capacitance : 1.0;
    }
  }
```

The following is an example message:

```
Error: Line 1110, You cannot mix a cell delay table with
        a propagation delay table in the same timing group. (LBDB-265)
```

What Next

Make your selection, and use either a cell delay table or a propagation delay table.

LBDB-266

(error) The '%s' attribute is needed in the specification.\n No default can be applied to this attribute.

Feedback

Description

This error message occurs when the identified attribute is missing in the specification.

What Next

Check your library, add the missing attribute, and run the command again.

For example, the *index_1* attribute is missing from the following specification:

```
lu_table_template(lbdb266_template) {
        variable_1 : constrained_pin_transition;
        index_2 ("0.1, 1.2, 2.3, 3.4");
  }
```

In the following example, since the *va_rise_constraint* is referring to a template that contains the *related_out_total_output_net_capacitance* related output loading variable, the *related_output_pin* attribute is required under the timing group.

```
lu_table_template(va_sup_hld_1) {
   variable_1 : related_out_total_output_net_capacitance;
   index_1("2.0, 3.0");
   variable_2 : constrained_pin_transition;
   index_2("3.0, 4.0");
 }
 ...
    timing () {
       timing_based_variation() {
         va_parameters(var1, var2);
         nominal_va_values(10.0, 20.0);
         va_rise_constraint(va_sup_hld_1) {
                        va_values(10.0, 19.0);
               ...
         }
   ...}
  ...}
 ...
```

LBDB-266w

(warning) The '%s' attribute is needed in the specification.\n No default can be applied to this attribute.

Description

This warning message occurs when the identified attribute is missing in the specification.

What Next

Check your library, add the missing attribute, and run the command again.

Feedback

For example, the *index_1* attribute is missing from the following specification:

```
lu_table_template(lbdb266_template) {
        variable_1 : constrained_pin_transition;
        index_2 ("0.1, 1.2, 2.3, 3.4");
  }
```

In the following example, since the *va_rise_constraint* is referring to a template that contains the *related_out_total_output_net_capacitance* related output loading variable, the *related_output_pin* attribute is required under the timing group.

```
lu_table_template(va_sup_hld_1) {
   variable_1 : related_out_total_output_net_capacitance;
   index_1("2.0, 3.0");
   variable_2 : constrained_pin_transition;
   index_2("3.0, 4.0");
 }
 ...
    timing () {
       timing_based_variation() {
         va_parameters(var1, var2);
         nominal_va_values(10.0, 20.0);
         va_rise_constraint(va_sup_hld_1) {
                        va_values(10.0, 19.0);
               ...
         }
   ...}
  ...}
 ...
```

LBDB-267

(error) The '%s' is missing for this timing arc.

Description

All four delay look-up tables

```
* rise_propagation/cell_rise
        * fall_propagation/cell_fall
        * rise_transition
        * fall_transition
```

are required in the timing arc if the *delay_model* is *table_lookup*. If the *timing_type* is 'clear', define both fall tables. Defining the rise tables is optional. If the *timing_type* is 'preset', define both rise tables. Defining the fall tables is optional.

The following example shows an instance where this message occurs:

```
pin ( Y )    {
      direction : output;
      function : " (A+B)' ";
```

Feedback

```
      timing ()      {
        related_pin : A ;
        rise_propagation(prop) {
          values("0.100000, 0.100000, 0.100000",  \
                 "0.100000, 0.100000, 0.100000",  \
                 "0.100000, 0.100000, 0.100000",  \
                 "0.100000, 0.100000, 0.100000",  \
                 "0.100000, 0.100000, 0.100000");
        }
        rise_transition(tran) {
          values("0.000000, 0.10000");
        }
        fall_transition(tran) {
          values("0.000000, 0.100000");
        }
      }
    }
```

To fix the problem, add the attribute to the timing group,

```
fall_propagation(prop) {
          values("0.100000, 0.100000, 0.100000",  \
                 "0.100000, 0.100000, 0.100000",  \
                 "0.100000, 0.100000, 0.100000",  \
                 "0.100000, 0.100000, 0.100000",  \
                 "0.100000, 0.100000, 0.100000");
        }
```

The following is an example message:

```
Error: Line 144, The 'fall_propagation' is missing for this timing arc.
 (LBDB-267)
```

What Next

Check the library source file to see if you missed the look-up table or put it in the wrong place.

LBDB-268

(error) The '%s' cannot be specified in a timing arc with\n \tthe '%s' timing_type.

Description

This message indicates that the timing arc with the indicated timing_type is not compatible with a *table_lookup* delay model.

The following example shows an instance where this message occurs:

```
rise_constraint(basic_template) {
                values ("1, 2, 3, 4", "5, 6, 7, 8", \
```

```
                        "9, 10, 11, 12", "13, 14, 15, 16");
        }
```

The following is an example message:

```
Error: The 'rise_constraint' cannot be specified in a timing arc with
        the 'combinational' timing_type. (LBDB-268)
```

LBDB-269

(error) You have both '%s' and '%s'\n \tspecified in this timing group.

Description

You cannot specify both cell delay and propagation delay information in a timing group as indicated in the error message. For example, *cell_rise* and *propagation_fall* cannot be defined in a timing group. The same applies to *cell_fall* and *propagation_fall*.

You can use *intrinsic_rise* and *intrinsic_fall* to define default delay values when the delay model is a table_lookup.

The following example shows an instance where this message occurs:

```
cell (INVB) {
    area : 0.1;
    pin(Q) {
      direction : output;
      function :  "!A";
      timing() {
        related_pin : "A";
        rise_transition(fivebyfive) {
          index_1("0.000,0.200,0.400,0.600,0.800");
          index_2("0.100,0.200,0.300,0.400,0.500");
          values("0.100000, 0.100000, 0.100000, 0.100000, 0.100000", \
                 "0.100000, 0.100000, 0.100000, 0.100000, 0.100000", \
                 "0.100000, 0.100000, 0.100000, 0.100000, 0.100000", \
                 "0.100000, 0.100000, 0.100000, 0.100000, 0.100000", \
                 "0.100000, 0.100000, 0.100000, 0.100000, 0.100000");
        }
        cell_rise(fivebyfive_prime) {
          index_1("0.000,0.200,0.400,0.600,0.800");
          values(\
                 "-0.100000, -0.200000, 0.300000, 0.400000, 0.500000");
        }
        rise_propagation(fivebyfive_prime) {
          index_1("0.000,0.200,0.400,0.600,0.800");
          values(\
                 "-0.100000, -0.200000, 0.300000, 0.400000, 0.500000");
        }
        fall_transition(fivebyfive) {
          index_1("0.000,0.200,0.400,0.600,0.800");
          index_2("0.100,0.200,0.300,0.400,0.500");
```

Feedback

```
          values("0.100000, 0.100000, 0.100000, 0.100000, 0.100000", \
                 "0.100000, 0.100000, 0.100000, 0.100000, 0.100000", \
                 "0.100000, 0.100000, 0.100000, 0.100000, 0.100000", \
                 "0.100000, 0.100000, 0.100000, 0.100000, 0.100000", \
                 "0.100000, 0.100000, 0.100000, 0.100000, 0.100000");
        }
        cell_fall(fivebyfive) {
          index_1("0.000,0.200,0.400,0.600,0.800");
          index_2("0.100,0.200,0.300,0.400,0.500");
          values("0.100000, 0.100000, 0.100000, 0.100000, 0.100000", \
                 "0.100000, 0.100000, 0.100000, 0.100000, 0.100000", \
                 "0.100000, 0.100000, 0.100000, 0.100000, 0.100000", \
                 "0.100000, 0.100000, 0.100000, 0.100000, 0.100000", \
                 "0.100000, 0.100000, 0.100000, 0.100000, 0.100000");
        }
      }
      max_transition : 1.0;
    }
    pin(A) {
      direction : input;
      capacitance : 1.0;
    }
  }
```

The following is an example message:

```
Error: Line 1110, You have both 'rise_propagation' and 'cell_rise'
        specified in this timing group. (LBDB-269)
```

What Next

Make your selection to use either a cell delay table or a propagation delay table.

LBDB-270

(error) The '%s' has a count of %d, which does not match\n \tthe size %d specified.

Description

The specification of the index implied the size of each axis of the look-up table. The syntax of *values* complex attribute should be organized in groups of floating-point values equal to the size of index_2. The total number of groups should be equal to the size of index_1. For a one-dimensional table, the size of index_2 is *1*.

The following example shows an instance where this message occurs:

```
lu_table_template(basic_template) {
        variable_1 : input_net_transition;
        variable_2 : output_net_length;
        index_1 ("0.1, 1.2, 2.3, 3.4");
        index_2 ("0.1, 1.2, 2.3, 3.4");
  }
```

Feedback

```
rise_propagation(basic_template) {
      values ("1, 2, 3, 4", "5, 6, 7, 8", \
              "9, 10, 11", "13, 14, 15, 16");
}
```

The following is an example message:

```
Error: Line 160, The 'values' have a count of 3, which does not match
        the size 4 specified. (LBDB-270)
```

What Next

Check the library source file, and correct the problem by grouping the values together in the required format.

LBDB-271

(error) The '%s' has zero elements.

Description

This message indicates that one of the lu_table_template index complex attributes contains no value.

The following example shows an instance where this message occurs:

```
lu_table_template(missing_index) {
        variable_1 : output_net_length;
        index_1("");
  }
```

The following is an example message:

```
Error: Line 64, The 'index_1' has zero elements. (LBDB-271)
```

What Next

Check the library source file, and either add the missing value to the index attribute or delete the attribute if it is not used.

LBDB-272

(warning) The '%s' attribute has a '%f' value,\n \twhich is less than '%f' the minimum recommended value of this attribute.

Description

This message indicates that the value assigned for the specified attribute is lower than the recommended minimum value. However, Library Compiler will maintain the values as is.

Feedback

The following example shows an instance where this message occurs:

```
lu_table_template(basic_template) {
        variable_1 : input_net_transition;
        variable_2 : output_net_length;
        index_1 ("0.1, 1.2, 2.3, 3.4");
        index_2 ("0.1, 1.2, 2.3, 3.4");
  }
  ...
        fall_transition(basic_template) {
                values ("-1, 2, 3, 4", "5, 6, 7, 8", \
                        "9, 10, 11, 12", "13, 14, 15, 16");
        }
```

The following is an example message:

```
Warning: Line 123, The 'values' attribute has a '-1.000000' value,
        which is less than '0.000000' the minimum recommended value of
        this attribute. (LBDB-272)
```

What Next

Check the library source file, and make sure the value is correct. Refer to the "Library Compiler Reference Manual" for the attribute value requirements.

LBDB-273

(error) The fanout_length complex attribute allows only 2\n \tor 5 arguments, and you specified %d arguments.

Description

This message indicates that the *fanout_length* complex attribute has an invalid number of arguments. The attribute can have either the two standard arguments,

```
* fanout
        * length
```

or five arguments created automatically from the back-annotation information,

```
* fanout
        * length
        * average capacitance
        * standard deviation
        * number of nets
```

The following example shows an instance where this message occurs:

```
wire_load("05x05") {
    resistance : 0 ;
    capacitance : 1 ;
    area : 0 ;
```

Feedback

```
    slope : 0.186 ;
    fanout_length(1,0.39, 0.1) ;
  }
```

The following is an example message:

```
Error: Line 43, The fanout_length complex attribute allows only 2
        or 5 arguments, and you specified 3 arguments. (LBDB-273)
```

What Next

Refer to the "Library Compiler User Guide" manual for more information about the fanout_length attribute. Check the library source file, and correct the format of the attribute.

LBDB-274

(warning) The '%s' attribute has a '%f' value,\n \twhich is less than '%f' the minimum required value of this attribute.\n \tThe value is changed to the minimum value.

Description

This message indicates that the value assigned for the specified attribute is lower than the required minimum value. Therefore, Library Compiler uses the minimum value for the attribute.

The following example shows an instance where this message occurs:

```
lu_table_template(basic_template) {
        variable_1 : output_pin_transition;
        variable_2 : connect_delay;
        index_1 ("0, 1");
        index_2 ("0, 1");
  }
  ...
        fall_transition_degradation(basic_template) {
                values ("-1, 2", "5, 8");
        }
```

The following is an example message:

```
Warning: Line 123, The 'values' attribute has a '-1.000000' value,
        which is less than '0.000000' the minimum required value of
        this attribute. The value is changed to the minimum value.
 (LBDB-274)
```

What Next

Check the library source file, and correct the value if the minimum value is not acceptable. Refer to the "Library Compiler Reference Manual" for the attribute value requirements.

Feedback

LBDB-275

(warning) The '%s' attribute has size 1, which is not \n \tused for any purpose with its associated variable.

Description

This message indicates that the size of one of the *lu_table_template* attributes has size 1. Library Compiler expects the size of each dimension to be larger than *1*.

The following example shows an instance where this message occurs:

```
lu_table_template(lbdb275) {
        variable_1 : input_net_transition;
        variable_2 : output_net_length;
        index_1 ("0.1");
        index_2 ("0.1, 0.2, 0.3, 0.4");
  }
```

The following is an example message:

```
Warning: Line 20, The 'index_1' attribute has size 1, which is not
        used for any purpose with its associated variable. (LBDB-275)
```

What Next

Check the library source file, and delete this dimension if it is not needed.

LBDB-276

(error) The '%s' refers to an invalid '%s'.

Description

This message indicates that the specified name refers to an invalid *lu_table_template* group. First, Library Compiler issues all the errors that make the group invalid and issues this message when the template is used.

The following example shows an instance where this message occurs:

```
lu_table_template(lbdb276_template) {
        variable_1 : constrained_pin_transition;
        variable_2 : output_net_length;
        index_1 ("-0.1, 1.2, 2.3, 3.4");
        index_2 ("0.1, 1.2, 2.3, 3.4");
  }

          rise_transition(invalid_template) {
                values ("1, 2, 3, 4", "5, 6, 7, 8", \
                        "9, 10, 11, 12");
          }
```

Feedback

```
In this case, the index_1 value is less than zero, so the look-up
table becomes invalid. The rise_transition timing information refers
to an invalid table.
```

The following is an example message:

```
Error: Line 165, The 'lbdb276_template' refers to an invalid
 'lu_table_template'. (LBDB-276)
```

What Next

Check the library source file, and correct the errors in the look-up table template to which this table refers.

LBDB-278

(error) The 'timing' group with '%s' timing_type \n \tneeds at least one look-up table.

Description

This message indicates that in a nonlinear delay library, you did not specify a look-up table (rise_constraint or fall_constraint) for timing checks in a timing group. To be complete, Library Compiler expects at least one look-up table for the timing check groups.

The following example shows an instance where this message occurs:

```
pin ( D )    {
      direction : input;
      capacitance : 1;
      timing ()      {
        related_pin : CK ;
        timing_type : setup_rising ;
      }
  }
```

To fix the problem, define the template group and the rise_constraint group to the timing group,

```
lu_table_template(constraint) {
    variable_1 : constrained_pin_transition;
    index_1("0, 1, 2, 3, 4");
    variable_2 : related_pin_transition;
    index_2("0, 1, 2, 3, 4");
  }
  pin ( D )    {
      direction : input;
      capacitance : 1;
      timing () {
        related_pin : CK ;
        timing_type : setup_rising ;
        rise_constraint(constraint) {
```

Feedback

```
          values("1.0000, 1.0000, 1.0000, 1.0000, 1.0000",  \
                 "1.0000, 1.0000, 1.0000, 1.0000, 1.0000",  \
                 "1.0000, 1.0000, 1.0000, 1.0000, 1.0000",  \
                 "1.0000, 1.0000, 1.0000, 1.0000, 1.0000",  \
                 "1.0000, 1.0000, 1.0000, 1.0000, 1.0000");
        }
      }
  }
```

The following is an example message:

```
Error: Line 63, The 'timing' group with 'setup_rising' timing_type
        needs at least one look-up table. (LBDB-278)
```

What Next

Check the library source file, and correct the timing group. Add either a rise_constraint or fall_constraint table to the group.

LBDB-279

(error) The 'timing' group with '%s' timing_type \n \tneeds one look-up table.

Description

This message indicates that you specified more than one table for the specified timing group. This group needs only one table, either *constraint_rise* or *constraint_fall*.

The following example shows an instance where this message occurs:

```
pin(cd) {
      direction : input;
      capacitance : 0.065
      timing() {
        related_pin : "cp";
        timing_type : recovery_rising;
        rise_constraint(constraint_template) {
          values("1, 2", "3, 4");
        }
        fall_constraint(scalar) {
          values("1");
        }
      }
    }
```

In this case, the 'cd' pin has both the rise_constraint and fall_constraint attribute. To fix the problem, delete the fall_constraint table.

The following is an example message:

```
Error: Line 61, The 'timing' group with 'recovery_rising' timing_type
        needs one look-up table. (LBDB-279)
```

Feedback

What Next

Check the library source file, and correct the timing group. Delete from the group either the *constraint_rise* table or the *constraint_fall* table.

LBDB-280

(error) The '%s' look-up table cannot use\n \t'%s' as its template. The look-up table is not\n \tcompatible with the template.

Description

This message indicates that the specified look-up table is not compatible with the specified template. Variable types described in a look-up table template must be compatible with the usage of that template. For example, a template references variable types used for constraint checking ('related_pin_transition' and 'constrained_pin_transition') cannot be referenced in a cell delay description ('cell_rise' or 'cell_fall').

The following example shows an instance where this message occurs:

```
lu_table_template(basic_template) {
    variable_1 : input_net_transition;
    index_1("0, 1, 2, 3, 4");
    variable_2 : output_net_length;
    index_2("0, 1, 2");
  }
  lu_table_template(constraint) {
    variable_1 : constrained_pin_transition;
    index_1("0, 1, 2, 3, 4");
    variable_2 : related_pin_transition;
    index_2("0, 1, 2, 3, 4");
  }

        rise_constraint(basic_template) {
                values ("1, 2, 3, 4", "5, 6, 7, 8", \
                        "9, 10, 11, 12", "13, 14, 15, 16");
        }
```

To fix the problem, change the template value of the rise_constraint group from basic_template to constraint.

The following is an example message:

```
Error: Line 126, The 'rise_constraint' look-up table cannot use
        'basic_template' as its template. The look-up table is not
        compatible with the template. (LBDB-280)
```

Feedback

What Next

Refer to the "Library Compiler User Guide" for more information about look-up tables. Change the library source file by referencing a different template in the look-up table description.

LBDB-281

(error) The '%s' template has variables which\n \tshould not be used together.

Description

This message indicates that you specified two incompatible variables in the same template.

The following example shows an instance where this message occurs:

```
lu_table_template(invalid_template) {
        variable_1 : constrained_pin_transition;
        variable_2 : output_net_length;
        index_1 ("0.1, 0.2, 0.3, 0.4");
        index_2 ("0.1, 0.2, 0.3, 0.4");
  }
```

The following is an example message:

```
Error: Line 32, The 'invalid_template' template has variables which
        should not be used together. (LBDB-281)
```

What Next

Refer to the "Library Compiler User Guide" for more information on defining CMOS nonlinear timing model templates. Check the library source file to see if you made a mistake when you entered the variables strings.

LBDB-282

(error) The '%s' attribute has a '%f' value\n \tthat is larger than the maximum allowed value of '%f'.

Description

This message indicates that for the specified attribute, you defined a value that is larger than the maximum allowed value. The error message includes the maximum value for this attribute.

The following example shows an instance where this message occurs:

```
default_min_porosity : 91.0;
```

Feedback

The following is an example message:

```
Error: Line 53, The 'default_min_porosity' attribute has a '91.000000'
 value
        that is larger than the maximum allowed value of '90.000000'.
 (LBDB-282)
```

What Next

Refer to the "Library Compiler User Guide" for the maximum value required for the attribute, and correct the value in the library source file.

LBDB-283

(error) The '%s' layer name is invalid.

Description

This message indicates that you specified an invalid name for the current attribute or function. The name should match a name previously defined in the resource group.

If the value is in the related_layer attribute and the layer is not valid. It may be because it is not one of the neighboring contact layer.

The following example shows an instance where this message occurs:

```
same_net_min_spacing(dummy, metal1, 0.1, TRUE);
```

The following is an example message:

```
Error: Line 104, The 'dummy' layer name is invalid.  (LBDB-283)
```

What Next

Check your library to see if you have an error in either previous layer definition or the current attribute / function.

LBDB-284

(error) Missing 'routing_layers' attribute for this library\n \twhich is needed for specifying 'routing_track'.

Description

This message indicates that you specified a *routing_track* group without specifying the *routing_layers* attribute. Library Compiler expects the *routing_layers* complex attribute to be defined before you can specify the *routing_track* group. The *routing_track* group has a name to refer to a specific routing layer in the *routing_layers* complex attribute.

Feedback

The following example shows an instance where this message occurs:

```
routing_track(metal2) {
        tracks : 2;
        total_track_area : 0.2;
   }
```

To fix the problem, add the attribute to the library,

```
routing_layers(metal1,metal2);
```

The following is an example message:

```
Error: Line 65, Missing 'routing_layers' attribute for this library,
        which is needed for specifying 'routing_track'. (LBDB-284)
```

What Next

Check the library source file to see if you are missing the *routing_layers* attribute, which should be placed in the library before the *routing_track* group can be identified.

LBDB-285

(error) In this 'routing_track' group, 'tracks' is 0 and\n \t'total_track_area' is %f, which is inconsistent.

Description

This message indicates that for a *routing_track* group, you specified the *total_track_area* attribute without specifying the *tracks* attribute. If you do not have tracks in a routing layer, you cannot have *total_track_area* for that layer either.

The following example shows an instance where this message occurs:

```
routing_layers(metal1,metal2);

   routing_track(metal2) {
        /* missing tracks */
        total_track_area : 1.5;
   }
```

To fix the problem, add the tracks attribute to the routing_track group,

```
tracks : 1;
```

The following is an example message:

```
Error: Line 266, In this 'routing_track' group, 'tracks' is 0 and
        'total_track_area' is 1.500000, which is inconsistent. (LBDB-285)
```

Feedback

What Next

Check your library to see if it is missing the *tracks* attribute in this group. Do not have the *total_track_area* other than '0', or this group is not needed.

LBDB-286

(error) No 'routing_track' information in the '%s' library.

Description

This message indicates that, in the library, you specified the *default_min_porosity* attribute without specifying the *routing_track* group in any of the cells.

The following is an example message:

```
Error: Line 1, No 'routing_track' information in the 'lbdb286' library.
 (LBDB-286)
```

What Next

Remove the *default_min_porosity* attribute or add *routing_track* information into the library.

LBDB-287

(warning) No routability information in the '%s' %s.

Description

This message indicates that one of the two cases occurred:

```
* You have the routing_layers attribute in a library and
          do not have routing_track group in the cell.
        * You have the default_min_porosity attribute in a
          library and do not have the routing_track information
          in a cell.
```

The following example shows an instance where this message occurs:

```
default_min_porosity : 0.0;
    routing_layers(metal1,metal2);

cell(AN2) {
  area : 2;
  pin(A) {
    direction : input;
    capacitance : 1;
  }
  pin(B) {
    direction : input;
    capacitance : 1;
```

```
  }
  pin(Z) {
    direction : output;
    function : "A B";
    timing() {
      intrinsic_rise : 0.1;
      intrinsic_fall : 0.1;
      rise_resistance : 0.1;
      fall_resistance : 0.1;
      related_pin : "A";
    }
    timing() {
      intrinsic_rise : 0.1;
      intrinsic_fall : 0.1;
      rise_resistance : 0.1;
      fall_resistance : 0.1;
      related_pin : "B";
    }
  }
}
```

In this case, The library has the *default_min_porosity* attribute, but the 'AN2' cell has no *routing_track* information.

The following is an example message:

```
Warning: Line 63, No routability information in the 'AN2' cell.
 (LBDB-287)
```

What Next

Check the library source file to remove the *routing_layers* attribute if the warning fits the first case. For the second case, check the cell to make sure it does not have any *routing_track* information on all routing layers (all of them are completely obstructed in this cell) when you have the *default_min_porosity* attribute.

LBDB-288

(error) The '%f' 'total_track_area' value is larger than\n \tthe '%f' cell area value.

Description

This message indicates that you specified a larger value for the *total_track_area* than the *cell area* value. The *total_track_area* value of a particular routing layer cannot be larger than the *cell area* value.

The following example shows an instance where this message occurs:

```
cell(IVP) {
  area : 1;
   routing_track(metal2) {
```

Feedback

```
        tracks : 1;
        total_track_area : 1.5;
    }
  pin(A) {
    direction : input;
    capacitance : 1;
  }
  pin(Z) {
    direction : output;
    function : "A'";
    timing() {
      intrinsic_rise : 0.1;
      intrinsic_fall : 0.1;
      rise_resistance : 0.1;
      fall_resistance : 0.1;
      slope_rise : 0.0;
      slope_fall : 0.0;
      related_pin : "A";
    }
  }
}
```

The following is an example message:

```
Error: Line 242, The 1.500000 'total_track_area' value is larger than
        the '1.000000' cell area value. (LBDB-288)
```

What Next

Check to see if you have entered the wrong information for either of these two attributes.

LBDB-289

(error) '%s' has been used more than one time in the\n \tspecification.

Description

This message indicates that you specified the same routing layer name more than once in the routing_layers attribute. Library Compiler expects unique names.

The following example shows an instance where this message occurs:

```
routing_layers(metal2,metal2);
```

The following is an example message:

```
Error: Line 55, 'metal2' has been used more than one time in the
        specification. (LBDB-289)
```

What Next

Check to see if you entered the wrong information for this attribute.

Feedback

LBDB-290

(error) '%s' should have at least one entry in it.

Description

This message indicates that you specified an attribute without any entries. This complex attribute must contain at least one entry.

The following example shows an instance where this message occurs:

```
routing_layers();
```

The following is an example message:

```
Error: Line 18, 'routing_layers' should have at least one entry in it.
 (LBDB-290)
```

What Next

Check to see if you have entered the required information for this complex attribute.

LBDB-291

(warning) No routability information for the '%s' layer.\n \tIt is assumed to be completely obstructed.

Description

The *routing_track* group of the indicated layer is not in the cell. It is assumed to be completely obstructed.

The following example shows an instance where this message occurs:

```
library(small_cmos1) {
    default_min_porosity : 0.0;
    routing_layers(metal1,metal2);

    cell(AN2) {
       area : 2;
       routing_track(metal2) {
         tracks : 2;
         total_track_area : 0.2;
       }
       pin(A) {
         direction : input;
         capacitance : 1;
       }
       pin(B) {
         direction : input;
         capacitance : 1;
```

```
        }
        pin(Z) {
          direction : output;
          function : "A B";
          timing() {
             intrinsic_rise : 0.1;
             intrinsic_fall : 0.1;
             rise_resistance : 0.1;
             fall_resistance : 0.1;
             related_pin : "A";
          }
          timing() {
             intrinsic_rise : 0.1;
             intrinsic_fall : 0.1;
             rise_resistance : 0.1;
             fall_resistance : 0.1;
             related_pin : "B";
          }
        }
    }
}
```

In this case, 'metal1' is not used in any routing_track group.

The following is an example message:

```
Warning: Line 240, No routability information for the 'metal1' layer.
        It is assumed to be completely obstructed. (LBDB-291)
```

What Next

If the previous statement is not true, enter the *routing_track* information for the indicated layer. Otherwise, it is all right.

LBDB-292

(error) The '%s' should be the %d%s attribute in the library.

Description

This message indicates that you specified the technology and delay_model in unacceptable order. For the Library Compiler to work correctly, the defined attribute must appear in this library at the indicated place in the error message.

The following example shows an instance where this message occurs:

```
library(lib) {
  technology : "cmos";
  delay_model : "generic_cmos";
}
```

Feedback

In this case, the delay_model attribute comes after the technology attribute. To fix the problem, switch the order of definition of the two attributes.

The following is an example message:

```
Error: Line 5, The 'delay_model' should be the 1st attribute in the
 library. (LBDB-292)
```

What Next

Modify the library source file to move the defined attribute to the correct place, as indicated in the error message.

LBDB-292w

(warning) The '%s' should be the %d%s attribute in the library.

Description

This message indicates that you specified the technology and delay_model in unacceptable order. For the Library Compiler to work correctly, the defined attribute must appear in this library at the indicated place in the warning message.

The following example shows an instance where this message occurs:

```
library(lib) {
  technology : "cmos";
  delay_model : "generic_cmos";
}
```

In this case, the delay_model attribute comes after the technology attribute. To fix the problem, switch the order of definition of the two attributes.

The following is an example message:

```
Warning: Line 5, The 'delay_model' should be the 1st attribute in the
 library. (LBDB-292w)
```

What Next

Modify the library source file to move the defined attribute to the correct place, as indicated in the warning message.

LBDB-293

(error) In this 'routing_track' group, the 'tracks' value\n \tis %d and the 'total_track_area' value is '0.0'. This is\n \tinconsistent.

Feedback

Description

This message indicates that you specified the *tracks* attribute without specifying the *total_track_area* attribute in a *routing_track* group. If you have tracks in a routing layer, you need to have the *total_track_area* for that layer too.

The following example shows an instance where this message occurs:

```
routing_track(metal2) {
        tracks : 2;
        /* missing total_track_area */
   }
```

The following is an example message:

```
Error: Line 205, In this 'routing_track' group, the 'tracks' value
        is 2 and the 'total_track_area' value is '0.0'. This is
        inconsistent. (LBDB-293)
```

What Next

Check the library source file to see if it is missing the *total_track_area* attribute in this group, and add it. Otherwise, set the *tracks* value to 0 or remove the routing_track group.

LBDB-294

(warning) The UP or DOWN X pin coordinate does not lay on a grid.

Description

This warning message appears when the library symbol has a pin that is not on a grid and is off by 0.01.

The following example shows an instance where this message occurs:

```
library(lbdb294) {
 SCALE = 1.0 / 8.0;

  symbol("gndsym") {
    set_minimum_boundary(0 * SCALE, 0 * SCALE, 40 * SCALE, 40 * SCALE);
    line(5 * SCALE, 10 * SCALE, 35 * SCALE, 10 * SCALE);
    line(0 * SCALE, 20 * SCALE, 40 * SCALE, 20 * SCALE);
    line(15 * SCALE, 2 * SCALE, 25 * SCALE, 2 * SCALE);
    line(20 * SCALE, 20 * SCALE, 20 * SCALE, 40 * SCALE);
    pin("gnd", 20 * SCALE, 40 * SCALE, ANY_ROTATION);
  }
}
```

In this case, the "gnd" pin has the Y coordinate off the grid.

Feedback

The following is an example message:

```
Warning: Line 24, The UP or DOWN X pin coordinate does not lay on a grid.
 (LBDB-294)
```

What Next

Check the symbol library file, and correct the X coordinate.

LBDB-295

(warning) The LEFT or RIGHT Y pin coordinate does not lay on a grid.

Description

This warning message appears when the library symbol has a pin that is not on a grid and is off by 0.01.

The following example shows an instance where this message occurs:

```
library(lbdb295) {
 SCALE = 1.0 / 8.0;

  symbol("gnd") {
    set_minimum_boundary(0 * SCALE, 0 * SCALE, 40 * SCALE, 40 * SCALE);
    line(5 * SCALE, 10 * SCALE, 35 * SCALE, 10 * SCALE);
    line(0 * SCALE, 20 * SCALE, 40 * SCALE, 20 * SCALE);
    line(15 * SCALE, 2 * SCALE, 25 * SCALE, 2 * SCALE);
    line(20 * SCALE, 20 * SCALE, 20 * SCALE, 40 * SCALE);
    pin("Z", 128 * SCALE, 4 * SCALE, ANY_ROTATION);
    pin("gnd", 20 * SCALE, 40 * SCALE, ANY_ROTATION);
  }
}
```

In this case, the "Z" pin has the Y coordinate off the grid.

The following is an example message:

```
Warning: Line 24, The LEFT or RIGHT Y pin coordinate does not lay on a
 grid. (LBDB-295)
```

What Next

Check the symbol library file, and correct the Y coordinate.

LBDB-296

(warning) The '%s' pin of the '%s' auxiliary pad cell\n \tshould not have a function attribute.

Feedback

Description

This message indicates that you specified a function attribute on a auxiliary pad cell.

Cells with a 'auxiliary_pad_cell' attribute are used together with other cells with a 'pad_cell' attribute to build a logical pad. They can also provide the pull-up, pull-down, buffer, or inverter functionality. They should not have real 'logic'. Design Compiler will not work correctly if you decompose your pad cell this way.

The following example shows an instance where this message occurs:

```
cell(lbdb296) {
      auxiliary_pad_cell : true;
      area : 1;
      general_drivers : 0;
      input_drivers : 8;
      pin(A) {
        direction : input;
        capacitance : 1;
      }
      pin(Z) {
        direction : output;
        function : "A'";
        timing() {
          intrinsic_rise : 0.1;
          intrinsic_fall : 0.1;
          rise_resistance : 0.1;
          fall_resistance : 0.1;
          related_pin : "A";
        }
      }
    }
```

The following is an example message:

```
Warning: Line 64, The 'Z' pin of the 'lbdb296' auxiliary pad cell
        should not have a function attribute. (LBDB-296)
```

What Next

Check the technology source library. Either

```
1. remove the 'function' attribute from the cell under the
      following conditions:
        * If the cell is a buffer, no action is required.
        * If the cell is an inverter, invert the functionality of your
          'pad_cell', which is to be connected to this cell to form a
          pad cell, accordingly.
or
   2. remove the 'auxiliary_pad_cell' attribute, and model this cell
      as a regular cell but with the right 'connection_class' on the
      pin so it can be connected to the 'pad_cell' to form a pad as
      intended.
```

Feedback

LBDB-297

(error) The '%s' pin is reserved and should not be used as a pin name.

Description

Library Compiler uses several keywords internally for a sequential cell. The keywords are

```
* next_state
        * clocked_on
        * clocked_on_also
        * data_in
        * enable
        * enable_also
        * preset
        * clear
        * force_00
        * force_01
        * force_10
        * force_11
        * the variable1 and variable2 used in ff/latch/ff_bank/latch_bank

The following example shows an instance where this message occurs:
  pin(preset) {
    direction : input;
    capacitance : 1;
  }
```

The following is an example message:

```
Error: Line 182, The 'preset' pin is reserved and should not be used as a
 pin name. (LBDB-297)
```

What Next

Modify your library to change the name of the pin.

LBDB-298

(error) The '%s' attribute has a value %d, which is\n \tless than the minimum required value of this attribute %d.

Description

This message indicates that the value specified is less than the required minimum value for this attribute.

Feedback

The following example shows an instance where this message occurs:

```
wire_load_table("40x40") {
      fanout_area(-11, 0.1);
   }
```

The following is an example message:

```
Error: Line 84, The 'fanout_area' attribute has a value -11, which is
        less than the minimum required value of this attribute 1.
 (LBDB-298)
```

What Next

Check the library source file, and correct the value of the attribute. If the minimum value for this attribute is not displayed in the error message, refer to the *Library Compiler User Guide Manual* for minimum attribute values.

LBDB-299

(error) The library is missing 'operating_conditions' groups and 'default_operating_conditions' attribute.

Description

This error message occurs when the *default_operating_conditions* is undefined and there is no operating_conditions groups defined.

What Next

If you do not want Library Compiler to create the default operating_conditions for you, please check your library to define the relative operating_condition group and set it as the default_operating_conditions with the library-level attribute "default_operating_conditions".

LBDB-300

(error) The '%s' related_outputs for the internal_power group has\n \tbeen specified. A duplicate is not allowed.

Description

This message indicates that you include the same output pin in more than one internal_power group.

The following example shows an instance where this message occurs:

```
internal_power(test_input) {
    values("0.1, 1.2, 2.3, 3.4");
    related_outputs : "Z";
   }
```

```
   internal_power(test_input) {
    values("0.1, 1.2, 2.3, 3.4");
    related_outputs : "Z";
   }
```

The following is an example message:

```
Error: Line 41, The 'Z' related_outputs for the internal_power group has
        been specified. A duplicate is not allowed. (LBDB-300)
```

What Next

Check the library source file, and delete the duplicate information from one of the internal_power groups.

LBDB-301

(information) No internal_power information for the '%s' cell.

Description

This message indicates that you did not define an internal_power group for the specified cell. Library Compiler expects at least one internal_power group so the internal power of the cell can be calculated.

The following example shows an instance where this message occurs:

```
cell(lbdb301) {
  area : 2;
  pin(A) {
    direction : input;
    capacitance : 1;
  }
  pin(B) {
    direction : input;
    capacitance : 1;
  }
  pin(Z) {
    direction : output;
    function : "A B";
    timing() {
      intrinsic_rise : 1.0;
      intrinsic_fall : 1.0;
      rise_resistance : 0.1;
      fall_resistance : 0.1;
      slope_rise : 0.0;
      slope_fall : 0.0;
      related_pin : "A B";
    }
  }
  cell_leakage_power : 1;
}
```

Feedback

In this case, the 'lbdb301' cell is missing the internal_power group. To fix the problem, add this statement:

```
internal_power(output_by_cap_and_trans) {
     values(" 5.000000 ,  15.000000 ,  0.300000 ", \
            " 1.000000 ,  5.000000 ,  0.000000 ", \
            " 0.000000 ,  0.000000 ,  0.000000 ");
     related_outputs : "Z";
     related_inputs : "A B";
  }
```

The following is an example message:

```
Information: Line 191, No internal_power information for the 'lbdb301'
 cell. (LBDB-301)
```

What Next

If you want to include the internal power of this cell in your design, add the required information into the library.

LBDB-302

(error) The '%s' specified in the '%s' is an\n \t%s pin.

Description

This message indicates that you specified either an input pin in a *related_outputs* attribute or an output pin in a *related_inputs* attribute.

The following example shows an instance where this message occurs:

```
cell(lbdb302) {
  area : 2;
  pin(A) {
    direction : input;
    capacitance : 1;
  }
  pin(B) {
    direction : input;
    capacitance : 1;
  }
  pin(Z) {
    direction : output;
    function : "A B";
    timing() {
      intrinsic_rise : 1.0;
      intrinsic_fall : 1.0;
      rise_resistance : 0.1;
      fall_resistance : 0.1;
      slope_rise : 0.0;
      slope_fall : 0.0;
```

```
      related_pin : "A B";
    }
  }
  cell_leakage_power : 1;
  internal_power(output_by_cap_and_trans) {
     values(" 5.000000 ,  15.000000 ,  0.300000 ", \
            " 1.000000 ,  5.000000 ,  0.000000 ", \
            " 0.000000 ,  0.000000 ,  0.000000 ");
     /* bad related port */
     related_outputs : "A";
     related_inputs : "Z B";
  }
}
```

In this case, both the related_outputs and the related_inputs attributes have a wrong pin name. To fix the problem, change the name from 'A' to 'Z' in the related_outputs attribute and 'Z' to 'A' in the related_inputs attribute.

The following is an example message:

```
Error: Line 272, The 'A' specified in the 'related_outputs' is an
        input pin. (LBDB-302)
Error: Line 273, The 'Z' specified in the 'related_inputs' is an
        output pin. (LBDB-302)
```

What Next

Check the library source file, and make the necessary correction.

LBDB-303

(error) You cannot specify more than one input pin or one bit\n \tof a bus or bundle input pin in the 'related_input'.

Description

This message indicates that you specified more than one input pin or one bit of an input pin, in the case of bus and bundle groups, in the *related_input* attribute. Library Compiler allows only one input pin or one bit of a bus or bundle in the attribute.

The following example shows an instance where this message occurs:

```
cell(lbdb303) {
  area : 2;
  pin(A) {
    direction : input;
    capacitance : 1;
  }
  pin(B) {
    direction : input;
    capacitance : 1;
```

Feedback

```
  }
  pin(Z) {
    direction : output;
    function : "A+B";
    timing() {
      intrinsic_rise : 1.0;
      intrinsic_fall : 1.0;
      rise_resistance : 0.1;
      fall_resistance : 0.1;
      slope_rise : 0.0;
      slope_fall : 0.0;
      related_pin : "A B";
    }
  }
  cell_leakage_power : 1;
  internal_power(output_by_cap_and_trans) {
     values(" 5.000000 ,  15.000000 ,  0.300000 ", \
            " 1.000000 ,  5.000000 ,  0.000000 ", \
            " 0.000000 ,  0.000000 ,  0.000000 ");
     related_outputs : "Z";
     /* more than one related input */
     related_input : "A B";
  }
}
```

In this case, the related_input attribute has two 'A' and 'B' input pins.

The following is an example message:

```
Error: Line 315, You cannot specify more than one input pin or one bit
        of a bus or a bundle input pin in the 'related_input'. (LBDB-303)
```

What Next

Check the "Library Compiler User Guide" for more information on power analysis, and correct the problem. Make sure that the related_input attribute has only one input pin or one bit of an bus or bundle input pin and the related_inputs attribute has more than one pin.

LBDB-304

(error) You can specify '%s'\n but not both, because they are mutually exclusive.

Description

This message indicates that you specified a *related_input* attribute with a *related_outputs* attribute in an internal_power group. Library Compiler allows either a *related_input* attribute or the pair *related_outputs*, *related_inputs* attributes, but not both, since the

Feedback

information provided is mutually exclusive. Library Compiler supports the related_input, related_inputs, and the related_outputs attributes in the table as follows:

```
* A one dimensional table uses only related_outputs.
        * A one dimensional table uses only related_input.
        * A one dimensional table uses both related_inputs and
          related_outputs.
        * A two dimensional table uses both related_inputs and
          related_outputs.
```

The following example shows an instance where this message occurs:

```
cell(lbdb304) {
  area : 2;
  pin(A) {
    direction : input;
    capacitance : 1;
  }
  pin(B) {
    direction : input;
    capacitance : 1;
  }
  pin(Z) {
    direction : output;
    function : "A+B";
    timing() {
      intrinsic_rise : 1.0;
      intrinsic_fall : 1.0;
      rise_resistance : 0.1;
      fall_resistance : 0.1;
      slope_rise : 0.0;
      slope_fall : 0.0;
      related_pin : "A B";
    }
  }
  cell_leakage_power : 1;
  internal_power(output_by_cap_and_trans) {
     values(" 5.000000 ,  15.000000 ,  0.300000 ", \
            " 1.000000 ,  5.000000 ,  0.000000 ", \
            " 0.000000 ,  0.000000 ,  0.000000 ");
     related_outputs : "Z";
     related_input : "A B";
  }
}
```

In this case, there is a typo. To fix the problem, add the character s to the related_input attribute name.

The following is an example message:

```
Error: Line 309, You can specify 'related_outputs/related_inputs or
 related_input'
        but not both, because they are mutually exclusive. (LBDB-304)
```

Feedback

What Next

Check the library and correct the related_inputs attribute if it is a typo or delete the unnecessary information from the library.

LBDB-305

(error) In the context, the '%s' valid value of the\n \t'%s' template is '%s'.\n \tYou specified '%s'.

Description

This message indicates that you specified an invalid value for the variable_1 in the power_lut_template given the specified information in the internal_power group. Library Compiler expects

```
* A related_input attribute in an internal_power group for a
          input_transition_time value in variable_1 of the corresponding
          power_lut_template
        * A related_outputs attribute in an internal_power group for a
          total_output_net_capacitance value in variable_1 of the
          corresponding power_lut_template
```

The following example shows an instance where this message occurs:

```
power_lut_template(lbdb305_input) {
    variable_1 : input_transition_time;
    index_1 ("1.0, 2.0");
  }

cell(lbdb305) {
  internal_power(lbdb305_input) {
    index_1("1.0, 2.0");
    values("1.0, 2.0");
    related_outputs : "Z";
  }
}
```

The following is an example message:

```
Error: Line 27, In the context, the 'variable_1' valid value of the
        'lbdb305_input' template is 'total_output_net_capacitance'.
        You specified 'input_transition_time'. (LBDB-305)
```

What Next

Refer to the "Library Compiler Reference Manual Volume 1" for more information on power modeling and analysis. Correct the attribute's value or its reference in the library.

Feedback

LBDB-306

(warning) The '%s' preferred input voltage does not exist in this library.

Description

This message indicates that you specified a input_voltage name to the *preferred_input_pad_voltage* attribute that is not described in the library or is defined after this attribute.

The following example shows an instance where this message occurs:

```
preferred_input_pad_voltage : "lbdb306";
  input_voltage(lbdb306) {
    vil : 1.5;
    vih : 3.5;
    vimin : -0.3;
    vimax : VDD + 0.3;
  }
```

in this case, the 'lbdb306' input_voltage is defined after the preferred_input_pad_voltage attribute.

The following is an example message:

```
Warning: Line 25, The 'lbdb306' preferred input voltage does not exist in
 this library. (LBDB-306)
```

What Next

Check the preferred input pad voltage to be sure it is correct. If the input_voltage exists, make sure that the attribute is defined before the preferred_input_pad_voltage attribute. Otherwise, add the preferred input pad voltage to the library description.

LBDB-307

(warning) The '%s' preferred output voltage does not exist in this library.

Description

This message indicates that you specified an output_voltage name to the *preferred_output_pad_voltage* attribute that is not described in the library or is defined after this attribute.

The following example shows an instance where this message occurs:

```
preferred_output_pad_voltage : "lbdb307" ;
  output_voltage(lbdb307) {
    vol : 1.5;
    voh : 3.5;
    vomin : -0.3;
```

Feedback

```
    vomax : VDD + 0.3;
  }
```

in this case, the 'lbdb307' output_voltage is defined after the preferred_output_pad_voltage attribute.

The following is an example message:

```
Warning: Line 24, The 'lbdb307' preferred output voltage does not exist
 in this library. (LBDB-307)
```

What Next

Check the preferred output pad voltage to be sure it is correct. If the output_voltage exists, make sure that the attribute is defined before the preferred_output_pad_voltage attribute. Otherwise, add the preferred output pad voltge to the library description.

LBDB-308

(warning) Incomplete set of pads to support the '%s'\n \tpreferred output pad slew rate control.

Description

This message indicates that in the library you specified the *preferred_output_pad_slew_rate_control* attribute but you did not define a complete set of pads to support it. Library Compiler expects at least one of the following set of pad cells in the library with the given slew rate control value:

```
* One output pad
        * One bidirectional pad
        * One three state pad
```

The following example shows an instance where this message occurs:

```
library (lbdb308) {
  preferred_output_pad_slew_rate_control : high;
  output_voltage(GENERAL) {
    vol          : 0.33 ;
    voh          : 3.7 ;
    vomin        : -0.3 ;
    vomax        : VDD + 0.3 ;
  }
  cell(OUTBUF) {
    area : 0.000000;
    dont_touch : false;
    dont_use   : false;
    pad_cell : true;
    pin(D ) {
      direction   : input;
      capacitance : 1.0;
```

Feedback

```
    }
    pin(PAD ) {
      is_pad : true;
      output_voltage : GENERAL;
      drive_current : 4.0;
      slew_control : high;
      direction   : output;
      function    : "D";
      timing() {
        intrinsic_fall  : 1.0;
        intrinsic_rise  : 1.0;
        fall_resistance : 0.1;
        rise_resistance : 0.1;
        related_pin  :"D";
      }
    }
  }
  cell(BBHS) {
    area : 0.000000;
    dont_touch : false;
    dont_use   : false;
    pad_cell : true;
    pin(E D ) {
      direction   : input;
      capacitance : 1.0;
    }
    pin(Y ) {
      direction   : output;
      timing() {
        intrinsic_fall  : 1.0;
        intrinsic_rise  : 1.0;
        fall_resistance : 0.1;
        rise_resistance : 0.1;
        related_pin  :"PAD ";
      }
    }
    pin(PAD ) {
      is_pad : true;
      input_voltage : CMOS;
      output_voltage : GENERAL;
      drive_current : 4.0;
      slew_control : high;
      direction   : inout;
      function    : "D";
      three_state : "E'";
      timing() {
        intrinsic_fall  : 1.0;
        intrinsic_rise  : 1.0;
        fall_resistance : 0.1;
        rise_resistance : 0.1;
        related_pin  :"E D";
      }
    }
```

```
  }
}
```

In this case, the 'lbdb308' library has an output pad cell and a bidirectional pad cell, but it is missing a three_state pad cell.

The following is an example message:

```
Warning: Line 2, Incomplete set of pads to support the 'high'
        preferred output pad slew rate control. (LBDB-308)
```

What Next

Check the preferred output pad slew rate control to be sure it is correct, and add pads to the library containing the preferred output pad slew rate control value.

LBDB-309

(warning) In the '%s' gate, cannot degenerate the \n \t'%s' output due to excessive function size.

Description

This message appears when the Library Compiler has determined that degenerating the given output is potentially too difficult. This determination is based on an evaluation of the function complexity at this output port.

What Next

Either remove the *fpga_complex_degenerate* attribute from the library cell in question, or set the *fpga_degenerate_output* attribute to FALSE on this particular output. In either case, these actions delete the warning; they do not cause the degeneration software to attempt to degenerate the gate.

LBDB-310

(information) Degenerating %d-input gates from '%s' component\n \tof the '%s' output.

Description

This message indicates that the Library Compiler is starting to create degenerate functions based on the component named.

The following example shows an instance where this message occurs:

```
cell(lbdb310) {
    area : 1.0;
    fpga_complex_degenerate : true ;
    pin(D0 D1 D2 D3 S00 S01 S10 S11) {
      direction   : input;
```

```
      capacitance : 1.0;
    }
    pin(Y) {
      direction : output;
      function :
 "(D0!(S00&S01)+D1(S00&S01))!(S10+S11)+(D2!(S00&S01)+D3(S00&S01))(S10+S11
)";
      timing() {
        rise_resistance : 0.5;
        fall_resistance : 0.5;
        related_pin  :  "D0 D1 D2 D3 S00 S01 S10 S11" ;
      }
    }
  }
```

The following is an example message:

```
Information: Degenerating 2-input gates from the 'lbdb310' component
        of the 'Y' output. (LBDB-310)
```

What Next

No action is required.

LBDB-311

(information) Degenerated %d %d-input gates from the '%s' component.\n \tA total of %d components have been degenerated from the '%s' output.

Description

This message indicates that the Library Compiler has finished creating n-input degenerate functions based on the component and output named. The message tells you how the library size is growing and how long the degeneration process is taking.

The following example shows an instance where this message occurs:

```
cell(lbdb311) {
    area : 1.0;
    fpga_complex_degenerate : true ;
    pin(D0 D1 D2 D3 S00 S01 S10 S11) {
      direction   : input;
      capacitance : 1.0;
    }
    pin(Y) {
      direction   : output;
      function :
 "(D0!(S00&S01)+D1(S00&S01))!(S10+S11)+(D2!(S00&S01)+D3(S00&S01))(S10+S11
)";
      timing() {
        rise_resistance : 0.5;
        fall_resistance : 0.5;
```

Feedback

```
        related_pin  :  "D0 D1 D2 D3 S00 S01 S10 S11" ;
      }
    }
  }
```

The following is an example message:

```
Information: Degenerated 2 1-input gates from the 'lbdb311' component.
        A total of 2 components have been degenerated from the 'Y'
 output. (LBDB-311)
```

What Next

No action is required.

LBDB-312

(warning) Unable to do fpga complex degeneration on the '%s' gate because it %s.

Description

This message occurs when you have defined *fpga_complex_degenerate* on a component for which this feature is not currently supported. Library Compiler issues this message for the following cells:

```
* Sequential devices: latches and flip flops
        * I/O pads
        * Cells with dont_use attribute
        * Cells with three_state attribute
```

What Next

Remove the *fpga_complex_degenerate* attribute for this component, or set the attribute to FALSE.

LBDB-315

(error) The '%s' attribute is incorrectly specified in the context.

Description

The attribute indicated in the error message is not valid, because it is not compatible with the template to which this internal_power group refers. For example, the *related_input* attribute cannot be specified in a two-dimensional table.

The following example shows an instance where this message occurs:

```
power_lut_template(output_by_cap_and_trans) {
  variable_1 : total_output_net_capacitance;
  variable_2 : input_transition_time;
```

Feedback

```
  index_1 ("0.0, 5.0, 20.0");
  index_2 ("0.1, 1.00, 5.00");
}

cell(lbdb315) {
  area : 2;
  pin(A) {
    direction : input;
    capacitance : 1;
  }
  pin(B) {
    direction : input;
    capacitance : 1;
  }
  pin(Z) {
    direction : output;
    function : "A+B";
    timing() {
      intrinsic_rise : 1.0;
      intrinsic_fall : 1.0;
      rise_resistance : 0.1;
      fall_resistance : 0.1;
      slope_rise : 0.0;
      slope_fall : 0.0;
      related_pin : "A B";
    }
  }
  cell_leakage_power : 1;
  internal_power(output_by_cap_and_trans) {
     values(" 5.000000 ,  15.000000 ,  0.300000 ", \
            " 1.000000 ,  5.000000 ,  0.000000 ", \
            " 0.000000 ,  0.000000 ,  0.000000 ");
     related_outputs : "Z";
     related_input : "A";
  }
}
```

The following is an example message:

```
Error: Line 315, The 'related_input' attribute is incorrectly specified
 in the context. (LBDB-315)
```

What Next

Refer to the Library Compiler manuals and the Design Power Reference manual for power modeling and analysis. Modify the library to correct the problem.

LBDB-316

(error) Arithmetic overflow or exception is encountered\n \ton the '%s' attribute with the '%s' value.

Feedback

Description

This message indicates that you specified an attribute's value that causes an arithmetic overflow or an exception. Library Compiler cannot handle the value.

The following example shows an instance where this message occurs:

```
fall_propagation ( table4x6 ) {
   index_1 ("2.00e+02 2.50e+02 3.50e+02 4.00e+02 ") ;
   index_2 ("4.48e-02 8.96e-02 1.34e-01 1.79e-01 2.24e-01 2.69e-01 ");
   values ("7.45e+01 9.56e+01 1.15e+02 1.34e+02 1.52e+02 1.71e+02 ", \
           "9.38e+01 1.20e+02 1.45e+02 1.67e+02 1.89e+02 2.10e+02 ", \
           "1.01e+02 1.32e+02 1.58e+02 1.83e+02 2.07e+02 2.29e+02 ", \
           "1.04e+02 1.43e-93 1.43e-93 1.43e-93 2.75e+226 9.30e+254 " ) ;
}
```

The following is an example message:

```
Error: Line 85, Arithmetic overflow or exception is encountered
        on the 'values' attribute with the '2.75e+226' value. (LBDB-316)
```

What Next

Check the library source file, and correct the problem.

LBDB-317

(error) It is invalid to specify the '%s' attribute\n \ton a pin within the bus or bundle group.

Description

This message indicates that you specified a function attribute on a pin within a bus or a bundle group.

The following example shows an instance where this message occurs:

```
bundle (qn) {
    members(qn2);
    direction : output;
    function : "iq";
    pin (qn2) {
      function : "q2";
    timing() {
       related_pin   : "q2";
       intrinsic_rise :  0.1;
       intrinsic_fall :  0.1;
       rise_resistance : 1.0;
       fall_resistance : 1.0;
    }
  }
```

The following is an example message:

```
Error: Line 67, It is invalid to specify the 'function' attribute
        on a pin within the bus or bundle group. (LBDB-317)
```

What Next

Check the library source file, and correct the problem.

LBDB-318

(warning) the user specified timing sense '%s' is different \n \tfrom the function calculated timing_sense '%s'.

Description

```
In timing group of a pin, timing_sense should match the function of the
 pin.
```

The following example shows an instance where this message occurs:

```
cell(INV) {
  pin (Y) {
    timing () {
      related_pin : "A";
      timing_sense : positive_unate;
    }
    function : "!A"
  }
  ...
}
```

If timing_sense is specified, the Library Compiler calculates the value for it from the pin's logic function. And issues this warning if specified timing_sense is different from the calculated one. The user sepcified timing_sense will be stored in .db.

For example, the value calculated for an AND gate is positive_unate, the value for a NAND gate is negative_unate, and the value for an XOR gate is non_unate. For the above example, the value for an INV is negative_unate.

If timing_sense is not specified, the Library Compiler calculates and derives the value for it from the pin's logic function. The derived timing_sense will be stored in .db.

A function is unate if a rising (or falling) change on a positive unate input variable causes the output function variable to rise (or fall) or not change. A rising (or falling) change on a negative unate input variable causes the output function variable to fall (or rise) or not change. For a nonunate variable, further state information is required to determine the effects of a particular state transition.

The following is an example message:

```
Warning: Line 123, Cell 'INV', pin 'Y', the user specified timing sense
'positive_unate' is different from the function calculated timing_sense
'negative_unate'. (LBDB-318)
```

What Next

Correct the value of the timing_sense.

LBDB-319

(Information) Voltage '%s' is used but not declared. A legacy value of '%g' is assumed.

Description

This message indicates that the Voltage 'VDD'(or 'VCC', 'VSS') is used in the expression, but not declared in voltage_map. Thus a legacy value of '5'(or '5', '0') is assumed.

The following example shows an instance where this message occurs:

```
library (lbdb319) {
    voltage_map ( IOVDD1, 1.32 );
    voltage_map ( COREVDD1, 0.875 );
    voltage_map ( IOCOREGND1, 0 );
    input_voltage(cmos11) {
        vil : 0.35 * VDD ;
        vih : 0.65 * VDD ;
        vimin : -0.3 ;
        vimax : 1.32 ;
    }
}
```

The following is an example message:

```
Information: Line 34, Voltage 'VDD' is used but not declared. A legacy
 value of '5' is assumed. (LBDB-319)
```

What Next

No action is required.

LBDB-353

(warning) A nonsequential timing arc is specified with\n \trespect to the '%s' clock pin.

Description

The cell has the *interface_timing* attribute set to TRUE. The interface timing policy requires that all timing arcs defined with respect to a clock pin be sequential (noncombinational) in nature.

Feedback

The following example shows an instance where this message occurs:

```
cell (lbdb353) {
    area    :   0.0;
    interface_timing : TRUE;
    pin (I1)    {
      direction   :   input;
      capacitance :   1.0;
      fanout_load :   1.0;
      timing () {
        timing_type : setup_rising;
        intrinsic_rise : 1.0;
        intrinsic_fall :  1.0;
        related_pin : "CLK";
      }
      timing () {
        timing_type : hold_rising;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        related_pin : "CLK";
      }
    }
    pin (CLK)    {
      direction   :   input;
      capacitance :   1.0;
      fanout_load :   1.0;
      clock : true;
      timing () {
        timing_type : skew_rising;
        intrinsic_rise : 1.0;
        related_pin : "CLK1";
      }
    }

    pin (CLK1)    {
      direction   :   input;
      capacitance :   1.0;
      fanout_load :   1.0;
      timing () {
        timing_type : skew_falling;
        intrinsic_rise : 1;
        related_pin : "CLK";
      }
    }
    pin(Q){
      direction   :   output;
      timing () {
        intrinsic_rise   : 1.0;
        rise_resistance  : 0.1;
        intrinsic_fall   : 1.0;
        fall_resistance  : 0.1;
        related_pin      : "CLK";
      }
```

```
    }
  }
```

In this case, the 'Q' pin is missing the timing_type attribute in its timing group.

The following is an example message:

```
Warning: Line 62, A nonsequential timing arc is specified with
        respect to the 'CLK' clock pin. (LBDB-353)
```

What Next

Make sure that all arcs with a clock pin as a related_pin are sequential.

LBDB-354

(warning) A sequential timing arc is specified with respect\n \tto the '%s' nonclock pin.

Description

The cell has the *interface_timing* attribute set to TRUE. The interface timing policy requires that all sequential timing arcs (except for clear and preset) be defined with respect to a pin that is labeled as a clock.

The following example shows an instance where this message occurs:

```
cell (lbdb354) {
    area    :   0.0;
    interface_timing : TRUE;
    pin (I1)    {
      direction   :   input;
      capacitance :   1.0;
      fanout_load :   1.0;
      timing () {
        timing_type : setup_rising;
        intrinsic_rise : 1.0;
        intrinsic_fall :  1.0;
        related_pin : "CLK";
      }
      timing () {
        timing_type : hold_rising;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        related_pin : "CLK";
      }
    }
    pin (CLK)    {
      direction   :   input;
      capacitance :   1.0;
      fanout_load :   1.0;
      clock : true;
      timing () {
```

```
        timing_type : skew_rising;
        intrinsic_rise : 1.0;
        related_pin : "CLK1";
      }
    }

    pin (CLK1)    {
      direction   :   input;
      capacitance :   1.0;
      fanout_load :   1.0;
      timing () {
        timing_type : skew_falling;
        intrinsic_rise : 1;
        related_pin : "CLK";
      }
    }
    pin(Q){
      direction   :   output;
      timing () {
        intrinsic_rise   : 1.0;
        rise_resistance  : 0.1;
        intrinsic_fall   : 1.0;
        fall_resistance  : 0.1;
        related_pin      : "CLK";
      }
    }
  }
```

In this case, the 'CLK' pin has a timing group with a timing_group value skew_rising related to the 'CLK1' pin.

The following is an example message:

```
Warning: Line 40, A sequential timing arc is specified with respect
        to the 'CLK1'  nonclock pin. (LBDB-354)
```

What Next

Make sure that all sequential arcs are defined with respect to a clock pin.

LBDB-355

(warning) A skew constraint is specified for the nonclock '%s' pin.

Description

A skew constraint is specified for a pin that is not a clock. All clock pins must have the *clock* attribute set to TRUE.

Feedback

The following example shows an instance where this message occurs:

```
cell (lbdb355) {
    area    :   0.0;
    interface_timing : TRUE;
    pin (I1)    {
      direction   :   input;
      capacitance :   1.0;
      fanout_load :   1.0;
      timing () {
        timing_type : setup_rising;
        intrinsic_rise : 1.0;
        intrinsic_fall :  1.0;
        related_pin : "CLK";
      }
      timing () {
        timing_type : hold_rising;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        related_pin : "CLK";
      }
    }
    pin (CLK)    {
      direction   :   input;
      capacitance :   1.0;
      fanout_load :   1.0;
      clock : true;
      timing () {
        timing_type : skew_rising;
        intrinsic_rise : 1.0;
        related_pin : "CLK1";
      }
    }

    pin (CLK1)    {
      direction   :   input;
      capacitance :   1.0;
      fanout_load :   1.0;
      timing () {
        timing_type : skew_falling;
        intrinsic_rise : 1;
        related_pin : "CLK";
      }
    }
    pin(Q){
      direction   :   output;
      timing () {
        intrinsic_rise   : 1.0;
        rise_resistance  : 0.1;
        intrinsic_fall   : 1.0;
        fall_resistance  : 0.1;
        related_pin      : "CLK";
      }
```

```
    }
  }
```

In this case, the 'CLK1' pin has skew constraint timing group on the nonclock 'CLK' pin. Because Library Compiler failed to recognize the 'CLK' pin.

The following is an example message:

```
Warning: Line 52, A skew constraint is specified for the nonclock 'CLK1'
 pin. (LBDB-355)
```

What Next

Make sure that skew constraints are defined for clock pins only. Check the library source file, and either set the *clock* attribute to TRUE on the pin, or remove the skew constraint.

LBDB-356

(warning) Multiple %s constraints are specified between\n \tthe '%s' pin and the '%s' clock pin.

Description

Design Compiler takes the worst case constraint when multiple constraints are specified.

The following example shows an instance where this message occurs:

```
cell (lbdb356) {
    area    :   0.0;
    interface_timing : TRUE;
    pin (I1)    {
      direction   :   input;
      capacitance :   1.0;
      fanout_load :   1.0;
      timing () {
        timing_type : setup_rising;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        related_pin : "CLK";
      }
      timing () {
        timing_type : hold_rising;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        related_pin : "CLK";
      }
      timing () {
        timing_type : hold_falling;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        related_pin : "CLK";
      }
```

Feedback

```
    }
    pin (CLK)    {
      direction   :   input;
      capacitance :   1.0;
      fanout_load :   1.0;
      clock : true;
    }
    pin(Q){
      direction   :   output;
      timing () {
        timing_type      : rising_edge;
        intrinsic_rise   : 1.0;
        rise_resistance  : 0.1;
        intrinsic_fall   : 1.0;
        fall_resistance  : 0.1;
        related_pin      : "CLK";
      }
    }
  }
```

In this case, the 'I1' pin has two hold constraints.

The following is an example message:

```
Warning: Line 31, Multiple setup or hold constraints are specified
        between the 'I1' pin and the 'CLK' clock pin. (LBDB-356)
```

What Next

PrimeTime supports multiple setup/hold constraints.

LBDB-357

(warning) The '%s' cell has the interface_timing attribute,\n \tbut has no clock pin.

Description

According to interface timing specification policy, a library cell with the interface timing attribute set to TRUE must have at least one pin labeled as a clock.

The following example shows an instance where this message occurs:

```
cell (lbdb357) {
    area    :   0.0;
    interface_timing : TRUE;
    pin (I1)    {
      direction   :   input;
      capacitance :   1.0;
      fanout_load :   1.0;
    }
    pin(Q){
      direction   :   output;
```

Feedback

```
      function : "I1'";
      timing () {
        intrinsic_rise   : 1.0;
        rise_resistance  : 0.1;
        intrinsic_fall   : 1.0;
        fall_resistance  : 0.1;
        related_pin      : "I1";
      }
    }
  }
```

The following is an example message:

```
Warning: Line 6, The 'combo' cell has the interface_timing attribute,
        but has no clock pin. (LBDB-357)
```

What Next

If the cell is combinational, remove the *interface_timing* attribute set on the cell. If the cell is sequential in nature, add the *clock* attribute to all clock pins of the cell. If the cell does not have a clock pin (like a RAM), choose the control pin with respect to which setups and holds are measured, and label it as a clock.

LBDB-358

(error) It is not legal to specify the attribute '%s' in\n \tthe '%s' group in this context.

Description

The indicated attribute cannot be specified in the indicated group because of the context. This situation can arise if the group can have several types and the attribute can only appear when the group is of specific type.

What Next

Check your library to see if you have specified the wrong information for the group or if the attribute should be deleted from the group.

LBDB-366

(warning) The '%s' attribute in char_config group is required for NLPM library. \n No default can be applied to this attribute.

Description

From 2017.06 release, user will see LBDB-366 Warning when the library contains internal_power group, but NO internal_power_calculation attribute defined in library-level char_config group.

Feedback

The internal_power_calculation attribute takes enumerated values:

```
exclude_switching_on_rise
  exclude_switching_on_rise_and_fall
  include_switching
```

This attribute is critical for tools like PTPX to determine the meaning of internal_power table values.

What Next

Please define internal_power_calculation attribute in library-level char_config group when library contains NLPM data.

LBDB-370

(error) The library contains a '%s' group,\n \tbut has no contain '%s' group.

Description

This message indicates that you specified only one transition degradation table in the library. Libraries that contain transition degradation tables must have tables for both rise and fall transitions.

The following example shows an instance where this message occurs:

```
rise_transition_degradation(trans_deg) {
        values("0.0, 0.6", \
               "1.0, 1.6");
}
```

In this case, the 'fall_transition_degradation' group is missing. To fix the problem, add this group to the library,

```
fall_transition_degradation(trans_deg) {
        values("0.0, 0.8", \
               "1.0, 1.8");
}
```

The following is an example message:

```
Error: Line 46, The library contains a 'rise_transition_degradation'
 group,
        but has no 'fall_transition_degradation' group. (LBDB-370)
```

What Next

Add the missing table group to the library description.

Feedback

LBDB-371

(error) The '%s' lut group is missing the mandatory '%s' attribute.

Description

This message indicates that you specified a lut group without the input_pins attribute in a FPGA library.

The following example shows an instance where this message occurs:

```
cell(lut5) {
    area : 1.0;
    lut(lbdb371) {
      /*      input_pins : "a b c d e"; */
    }
    pin(a b c d e) {
      direction : input;
      capacitance : 0.0;
    }
    pin(o) {
      direction : output;
      function : "lbdb371";
      timing() {
        related_pin : "a b c d e";
      }
    }
  }
```

The following is an example message:

```
Error: Line 98, The 'lbdb371' lut group is missing the mandatory
 'input_pins' attribute. (LBDB-371)
```

What Next

Check the library source file, and add the missing attribute.

LBDB-372

(error) The '%s' lut group attribute has an invalid '%s' value.

Description

This message indicates that you specified a lut group with an invalid value for the input_pins attribute in a FPGA library.

The following example shows an instance where this message occurs:

```
cell(lut5) {
    area : 1.0;
```

Feedback

```
    lut(R) {
    input_pins : "";
    }
    pin(a b c d e) {
      direction : input;
      capacitance : 0.0;
    }
    pin(o) {
      direction : output;
      function : "R";
      timing() {
        related_pin : "a b c d e";
      }
    }
  }
```

The following is an example message:

```
Error: Line 98, The 'input_pins' lut group attribute has an invalid ''
 value. (LBDB-372)
```

What Next

Check the library source file, and correct the value of the input_pins attribute.

LBDB-373

(error) The '%s' cell has more than one lut group defined.

Description

This message indicates that you specified more than one lut group in the FPGA library.

The following example shows an instance where this message occurs:

```
cell(lbdb373) {
    area : 1.0;
    lut(R) {
      input_pins : "a b c d e";
    }
    lut(R1) {
      input_pins : "a b c d e";
    }
    pin(a b c d e) {
      direction : input;
      capacitance : 0.0;
    }
    pin(o) {
      direction : output;
      function : "R";
      timing() {
        related_pin : "a b c d e";
```

```
      }
    }
  }
```

The following is an example message:

```
Error: Line 96, The 'lbdb373' cell has more than one lut group defined.
 (LBDB-373)
```

What Next

Check the library source file, and delete the extra lut groups.

LBDB-374

(error) The '%s' input port is not in the '%s' lut.

Description

This message indicates that you did not specify an input port in lut group.

The following example shows an instance where this message occurs:

```
cell(lbdb374) {
    area : 1.0;
    lut(R) {
      input_pins : "a b c d e";
    }
    pin(a b c d e f) {
      direction : input;
      capacitance : 0.0;
    }
    pin(o) {
      direction : output;
      function : "R";
      timing() {
        related_pin : "a b c d e";
      }
    }
  }
```

The following is an example message:

```
Error: Line 101, The 'f' input port is not in the 'lbdb374' lut.
 (LBDB-374)
```

What Next

Check the library source file, and either add the input port to the lut group or delete the port.

Feedback

LBDB-375

(error) The '%s' port is incorrectly listed as an input in the\n \t'%s' lut.

Description

This message indicates that you specified a noninput port in the lut group.

The following example shows an instance where this message occurs:

```
cell(lbdb375) {
    area : 1.0;
    lut(R) {
      input_pins : "a b c d e o";
    }
    pin(a b c d e) {
      direction : input;
      capacitance : 0.0;
    }
    pin(o) {
      direction : output;
      function : "R";
      timing() {
        related_pin : "a b c d e";
      }
    }
  }
```

The following is an example message:

```
Error: Line 98, The 'o' port is incorrectly listed as an input in the
        'lbdb375' lut. (LBDB-375)
```

What Next

Check the library source file, and delete the noninput port from the lut group.

LBDB-376

(error) The '%s' port is invalid in a cell containing a lut group.

Description

This message indicates that you specified an invalid port in a cell containing a lut group. Ports in a cell with a lut are either input or output.

The following example shows an instance where this message occurs:

```
cell(lbdb376) {
    area : 1.0;
    lut(R) {
      input_pins : "a b c d e ";
```

Feedback

```
    }
    pin(a b c d e) {
      direction : input;
      capacitance : 0.0;
    }
    pin(f) {
      direction : inout;
      capacitance : 0.0;
    }
    pin(o) {
      direction : output;
      function : "R";
      timing() {
        related_pin : "a b c d e";
      }
    }
  }
```

The following is an example message:

```
Error: Line 105, The 'f' port is invalid in a cell containing a lut
 group. (LBDB-376)
```

What Next

Check the library source file, and correct the direction of the port.

LBDB-377

(error) The '%s' lut group is invalid in a multiple output cell.

Description

This message indicates that you specified more than one output port in a cell containing a lut group.

The following example shows an instance where this message occurs:

```
cell(lbdb377) {
    area : 1.0;
    lut(R) {
      input_pins : "a b c d e ";
    }
    pin(a b c d e) {
      direction : input;
      capacitance : 0.0;
    }
    pin(f) {
      direction : output;
      function : "R";
      timing() {
        related_pin : "a b c d e";
```

```
      }
    }
    pin(o) {
      direction : output;
      function : "R";
      timing() {
        related_pin : "a b c d e";
      }
    }
  }
```

In this case, both 'f' and 'o' are output ports.

The following is an example message:

```
Error: Line 98, The 'R' lut group is invalid in a multiple output cell.
 (LBDB-377)
```

What Next

Check the library source file, and delete the extra output ports.

LBDB-378

(error) The '%s' lut group is invalid in a cell with no outputs.

Description

This message indicates that you did not specify any output port in a cell containing a lut group.

The following example shows an instance where this message occurs:

```
cell(lbdb378) {
    area : 1.0;
    lut(R) {
      input_pins : "a b c d e ";
    }
    pin(a b c d e) {
      direction : input;
      capacitance : 0.0;
    }
  }
```

In this case, the 'lbdb378' has no output port.

The following is an example message:

```
Error: Line 98, The 'R' lut group is invalid in a cell with no outputs.
 (LBDB-378)
```

Feedback

What Next

Check the library source file, and either add the output port or delete the lut group.

LBDB-379

(error) The '%s' output port on the '%s' cell has no\n \tfunction attribute, or the function attribute is invalid with\n \tthe lut group on this cell.

Description

This message indicates that either you specified an invalid function attribute on the output port a cell containing a lut group, or you did not define the function attribute.

The following example shows an instance where this message occurs:

```
cell(lbdb379) {
    area : 1.0;
    lut(R) {
      input_pins : "a b c d e ";
    }
    pin(a b c d e) {
      direction : input;
      capacitance : 0.0;
    }
    pin(o) {
      direction : output;
      timing() {
        related_pin : "a b c d e";
      }
    }
  }
```

In this case, The function attribute is missing in the 'o' port. To fix the problem, add the statement

```
function : "R";
```

The following is an example message:

```
Error: Line 113, The 'o' output port on the 'lbdb379' cell has no
        function attribute, or the function attribute is invalid with
        the lut group on this cell. (LBDB-379)
```

What Next

Check the library source file, and either add or correct the function attribute.

Feedback

LBDB-380

(error) The '%s' name is invalid for a lut group in the '%s'\n \tcell because a port on the design has the same name.

Description

This message indicates that there is a name conflict between the specified lut group name and a port name. The names of the lut groups must be unique and must not conflict with existing port names.

The following example shows an instance where this message occurs:

```
cell(lbdb380) {
    area : 1.0;
    lut(R) {
      input_pins : "a b c d e";
    }
    pin(a b c d e) {
      direction : input;
      capacitance : 0.0;
    }
    pin(R) {
      direction : output;
      function : "R";
      timing() {
        related_pin : "a b c d e";
      }
    }
  }
```

The following is an example message:

```
Error: Line 98, The 'R' name is invalid for a lut group in the 'lbdb380'
        cell because a port on the design has the same name. (LBDB-380)
```

What Next

Change the name of the lut group so that it is unique.

LBDB-381

(error) The '%s' lut cell has %d input port(s). A lut\n \tcell must have at least 1 but no more than 9 input ports.

Description

This message indicates that the specified lut cell has either too many or too few input ports. lut cells must have at least 1 but not more than 9 input ports.

Feedback

The following example shows an instance where this message occurs:

```
cell(lbdb381) {
    area : 1.0;
    lut(R) {
      input_pins : "a b c d e f g h i j";
    }
    pin(a b c d e f g h i j) {
      direction : input;
      capacitance : 0.0;
    }
    pin(o) {
      direction : output;
      function : "R";
      timing() {
        related_pin : "a b c d e f g h i j";
      }
    }
  }
```

The following is an example message:

```
Error: Line 98, The 'lbdb381' lut cell has 10 input port(s). A lut
        cell must have at least 1 but no more than 9 input ports.
 (LBDB-381)
```

What Next

Edit the lut cell description in your library so that the cell has at least 1 but not more than 9 input ports.

LBDB-382

(error) The '%s' cell is an invalid lut cell. Only\n \tsimple combinational cells are valid.

Description

This message indicates that the specified cell is not a simple combinational cell, which is the only valid type of lut cell.

The following example shows an instance where this message occurs:

```
cell(lbdb382) {
    area : 1.0;
    lut(R) {
      input_pins : "D CP";
    }
    pin(D CP ) {
      direction : input;
      capacitance : 0.0;
    }
    ff("IQ","IQN") {
```

Feedback

```
      next_state : "D";
      clocked_on : "CP";
    }
    pin(o) {
      direction : output;
      function : "R";
      timing() {
        related_pin : "D CP";
      }
    }
  }
```

The following is an example message:

```
Error: Line 96, The 'lbdb382' cell is an invalid lut cell. Only
        simple combinational cells are valid. (LBDB-382)
```

What Next

Remove the lut construct from this cell description, or modify the cell so that it is a simple combinational cell.

LBDB-383

(error) The '%s' attribute is invalid on\n \tthe '%s' lut cell.

Description

This message indicates that the specified attribute is not valid on the specified lut cell.

The following example shows an instance where this message occurs:

```
cell(lbdb383) {
    area : 1.0;
    fpga_lut_output : true;
    lut(R) {
      input_pins : "A B C D";
    }
    pin(A B C D) {
        direction : input;
        capacitance : 0.0;
    }
    pin(Z) {
        direction : output;
        function : "R";
        timing() {
            intrinsic_rise : 5.0;
            intrinsic_fall : 5.0;
            related_pin : "A B C D";
        }
    }
}
```

The following is an example message:

```
Error: Line 25, The 'fpga_lut_output' attribute is invalid on
        the 'lbdb383' lut cell.  (LBDB-383)
```

What Next

Remove the offending attribute from the lut cell.

LBDB-384

(error) The lut marker cell attribute\n \t'%s' is invalid on the '%s' cell.

Description

This message indicates that a lut marker cell attribute has been found on the specified cell, identifying it as a lut marker cell. However, the cell is not a valid candidate for a lut marker cell because it is not a single output buffer cell with 0 area.

Lut marker cells delimit the boundaries of luts and must be single-output buffer cells with 0 area.

The following example shows an instance where this message occurs:

```
cell(lbdb384) {
    area : 0.0;
    fpga_lut_insert_before_sequential : true;
    pin(A) {
      direction : input;
      capacitance : 0.0;
    }
    pin(Z) {
      direction : output;
      function : "A";
      timing() {
        intrinsic_rise : 0.0;
        intrinsic_fall : 0.0;
        related_pin : "A";
      }
    }
  }
```

The following is an example message:

```
Error: Line 126, The lut marker cell attribute
        'fpga_lut_insert_before_sequential' is invalid on the 'lbdb384'
 cell. (LBDB-384)
```

What Next

Either remove the lut marker cell attribute from the cell, or edit the cell description to make it a valid marker cell; that is, a single output buffer cell with 0 area.

Feedback

LBDB-385

(error) The lut marker '%s' cell is functionally invalid.\n \tLut marker cells must be single output buffers.

Description

This message indicates that the specified marker cell is not a single output buffer, which is the only valid lut marker cell type.

The following example shows an instance where this message occurs:

```
cell(lbdb385) {
    area : 0.0;
    fpga_lut_output : true;
    pin(A) {
      direction : input;
      capacitance : 0.0;
    }
    pin(Z1) {
      direction : output;
      function : "A";
      timing() {
        intrinsic_rise : 0.0;
        intrinsic_fall : 0.0;
        related_pin : "A";
      }
    }
    pin(Z2) {
      direction : output;
      function : "A";
      timing() {
        intrinsic_rise : 0.0;
        intrinsic_fall : 0.0;
        related_pin : "A";
      }
    }
  }
```

In this case, there are two output ports in the cell.

The following is an example message:

```
Error: Line 143, The lut marker 'lbdb385' cell is functionally invalid.
        Lut marker cells must be single output buffers. (LBDB-385)
```

What Next

Remove the marker cell attribute from the cell, or change the cell's functionality so that it is a single output buffer.

Feedback

LBDB-386

(warning) The lut marker '%s' cell has a nonzero\n \t'%s' attribute. Marker cells must have \n \tzero area and zero delay.

Description

This message indicates that the specified area or delay value in the library is nonzero, which is invalid for lut marker cells.

The following example shows an instance where this message occurs:

```
cell(lbdb386) {
    area : 0.0;
    fpga_lut_output : true;
    pin(A) {
      direction : input;
      capacitance : 0.0;
    }
    pin(Z) {
      direction : output;
      function : "A";
      timing() {
        intrinsic_rise : 1.0;
        intrinsic_fall : 0.0;
        related_pin : "A";
      }
    }
  }
```

In this case, the 'intrinsic_rise' value is 1.0. Change the value to zero to fix the problem.

The following is an example message:

```
Warning: Line 169, The lut marker 'lbdb386' cell has a nonzero
        'intrinsic rise delay' attribute. Marker cells must have
        zero area and zero delay. (LBDB-386)
```

What Next

Change the offending nonzero value (area or delay, as appropriate) to zero.

LBDB-387

(warning) The '%s' library has more than one lut output marker cell.

Description

This message indicates that the specified library has too many lut output marker cells. Each library can have only one lut output marker cell.

Feedback

The following example shows an instance where this message occurs:

```
library(lbdb387) {
  ...
  cell(marker1) {
    area : 0.0;
    fpga_lut_output : true;
    pin(A) {
      direction : input;
      capacitance : 0.0;
    }
    pin(Z) {
      direction : output;
      function : "A";
      timing() {
        intrinsic_rise : 0.0;
        intrinsic_fall : 0.0;
        related_pin : "A";
      }
    }
  }

  cell(marker2) {
    area : 0.0;
    fpga_lut_output : true;
    pin(A) {
      direction : input;
      capacitance : 0.0;
    }
    pin(Z) {
      direction : output;
      function : "A";
      timing() {
        intrinsic_rise : 0.0;
        intrinsic_fall : 0.0;
        related_pin : "A";
      }
    }
  }
}
```

The following is an example message:

```
Warning: Line 56, The 'lbdb387' library has more than one lut output
 marker cell. (LBDB-387)
```

What Next

Check the library source file, and remove the duplicate output marker cells.

Feedback

LBDB-388

(error) The '%s' attribute cannot be specified in a\n \ttiming arc that is not a timing constraint.

Description

This message indicates that an attribute has been incorrectly specified. The specified attribute is allowed only on timing arcs that are timing constraints (for example, setup and hold).

The following example shows an instance where this message occurs:

```
pin(Q) {
      direction : output;
      function : "IQ";
      timing() {
        timing_type : falling_edge;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        when_end : "D0";
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "CK2";
      }
    }
```

In this case, the 'falling_edge' timing_type value is not a constraint.

The following is an example message:

```
Error: Line 94, The 'when_end' attribute cannot be specified in a
        timing arc that is not a timing constraint. (LBDB-388)
```

What Next

Check the library source file, and make the appropriate correction. For example, change the timing type to be a timing constraint.

LBDB-389

(error) This timing arc has either '%s' or '%s'\n \tattribute but not both.

Description

This message indicates that in a timing group, you defined only one attribute from the following sets:

```
* when attribute and sdf_cond attribute
        * when_start attribute and sdf_cond_start attribute
        * when_end attribute and sdf_cond_end attribute
```

Feedback

To define a state dependent timing arc, Library Compiler expects both attributes defined.

The following example shows an instance where this message occurs:

```
pin(Z) {
        direction : output;
        function : "A^B";
        timing() {
          when : "B'";
          timing_sense : positive_unate;
          intrinsic_rise : 0.1;
          intrinsic_fall : 0.1;
          rise_resistance : 0.1;
          fall_resistance : 0.1;
          related_pin : "A";
        }
```

In this case, only the 'when' attribute is specified. To fix the problem, add the statement,

```
sdf_cond : "!B";
```

The following is an example message:

```
Error: Line 88, This timing arc has either 'when' or 'sdf_cond'
        attribute but not both. (LBDB-389)
```

What Next

Complete your specification by adding appropriate attributes to the timing group.

LBDB-390

(warning) The when and/or sdf_cond attributes in this\n \ttiming arc are ignored.

Description

This message indicates that you specified, in addition to the *when_start*, *when_end*, *sdf_cond_start*, or *sdf_cond_end* attributes in the timing (constraint) group, the *when* and *sdf_cond* attributes. Library Compiler ignores the *when* and *sdf_cond* attributes.

The following example shows an instance where this message occurs:

```
timing() {
      timing_type : setup_rising;
      intrinsic_rise : 1.0;
      intrinsic_fall : 1.0;
      sdf_edges : start_edge;
      when : " CD * SD ";
      sdf_cond : " SIG_2 == 1'b1 ";
      when_end : " CD * SD * Q' ";
      sdf_cond_end : " SIG_0 == 1'b1";
```

Feedback

```
      related_pin : "CP";
    }
```

In this case, both the when and sdf_cond pair and the when_end and sdf_cond_end are specified.

The following is an example message:

```
Warning: Line 836, The when and/or sdf_cond attributes in this
        timing arc are ignored. (LBDB-390)
```

What Next

Remove the redundant *when* and/or *sdf_cond* attributes from the timing group.

LBDB-391

(warning) The '%s' attribute on pin '%s' is not valid.\n \tThe attribute is ignored.

Description

This message indicates that the attribute on the specified pin is invalid. The attribute is ignored. This situation occurs when other information specified on the same pin is incompatible with the attribute. For example, the *min_period* attribute is ignored if the *minimum_period* group is also specified on the same pin.

The following example shows an instance where this message occurs:

```
pin (CLK) {
    direction : input ;
    capacitance : 0 ;
    min_pulse_width_low  : 3 ;
    min_pulse_width_high : 3 ;
    min_period : 5.0;
    minimum_period() {
      constraint : 1.0;
      when : "D PRE";
      sdf_cond : "cond_1 == 1'b1";
    }
  }
```

The following is an example message:

```
Warning: Line 183, The 'min_period' attribute on the 'CLK' pin is not
 valid.
        The attribute is ignored. (LBDB-391)
```

What Next

Refer to the *Library Compiler Reference Manual* to determine the reason why the attribute is not valid. Change the library source file and make the correction.

Feedback

LBDB-392

(error) The ECL Technology is obsolete with v3.4b. Compilation terminated abnormally.

Description

This error occurs when the ECL Technology is used. This technology is supported up to v3.4a but not for subsequent releases.

The following example shows an instance where this message occurs:

```
library(lbdb392) {
  technology(ecl);
  delay_model : "generic_ecl" ;
}
```

The following is an example message:

```
Error: The ECL Technology is obsolete with v3.4b. Compilation terminated
 abnormally. (LBDB-392)
```

What Next

Use the supported technologies.

LBDB-393

(error) Too many values entered for the driver_type attribute.

Description

This error occurs when more than two values entered for a driver_type attribute in defining a simple attribute.

The following example shows an instance where this message occurs:

```
pin(y) {
      direction : inout;
      function : 1;
      three_state : "a";
      driver_type : "open_source pull_down resistive";
      timing() {
        timing_type : three_state_disable;
        related_pin : "a";
      }
      timing() {
        related_pin : "a";
      }
    }
```

In the driver_type line, three driver_types are specified for this pin.

Feedback

The following is an example message:

```
Error: Line 458, Too many values entered for the driver_type attribute.
 (LBDB-393)
```

What Next

Only inout pin allows for two driver_type values. Other pins can have only one value. During passing, we first catch the case where more than two are entered.

LBDB-394

(error) The driver type %s is incompatible with the %s pin %s.

Description

Valid driver-type (programmable or non-programmable) and pin combinations (Y means valid):

non-programmable input output inout programmable
==========
pull_up Y Y Y pull_up_function pull_down Y Y Y pull_down_function open_drain N Y Y open_drain_function open_source N Y Y open_source_function bus_hold N N Y bus_hold_function resistive N Y Y resistive_function resistive_0 N Y Y resistive_0_function resistive_1 N Y Y resistive_1_function open_drain_with_pull_up N N Y open_drain_with_pull_down N N Y open_source_with_pull_up N N Y open_source_with_pull_down N N Y
==========

The following example shows an instance where this message occurs:

```
pin(a) {
      direction : input;
      capacitance : "1";
      driver_type : "open_source pull_up";
    }
```

The following is the example message:

```
Error: Line 177, The driver type open_source_with_pull_up is incompatible
        with the input pin a. (LBDB-394)
```

The following example shows another instance where this message occurs followed by the example message:

```
pin(A3) {
  direction : input;
  pull_up_function : "!A1 * !A2 * !A3";
  pull_down_function : "A1 * A2 * !A3";
  bus_hold_function : "A1 * !A2 * !A3";
  open_drain_function : "!A1 * A2 * !A3";
```

Feedback

```
  open_source_function : "!A1 * !A2 * A3";
  resistive_function : "A1 * A2 * A3";
  resistive_0_function : "A1 * !A2 * A3";
  resistive_1_function : "!A1 * A2 * A3";
  ...
 }
```

In this case, only pull_up_function and pull_down_function can be specified under an input pin. To avoid the error, please remove the rest of 6 programmable driver types.

The following is the example message:

```
Error: Line 217, The driver type open_drain_function is incompatible with
 the input pin A3. (LBDB-394)
```

What Next

When single pull_up/down applys to an inout pin, it is for the input behavior; other single types applying to an inout pin are for the output behavior. Always comply with the above rules.

LBDB-395

(warning) The timing arc with timing_type '%s'\n can only be specified on a pin with 'input' or 'inout' direction.

Description

The timing_type non_seq_setup_rising, non_seq_setup_falling, non_seq_hold_rising and non_seq_hold_falling can only be specified on a timing arc on the input or the inout pins.

The following example shows an instance where this message occurs:

```
pin(Z) {
          direction : output;
          timing() {
            timing_type : non_seq_setup_rising;
            ...
          }
        }
```

The following is an example message: Warning: Line 144, The timing arc with timing_type 'non_seq_setup_rising' can only be specified on a pin with 'input' or 'inout' direction. (LBDB-395)

What Next

Check the timing arc and make the correction to either the direction of the pin or delete the timing arc or move it to the appropriate place.

Feedback

LBDB-396

(warning) The 'related_output_pin' attribute is only needed\n when the delay table refers to a template which uses the\n output loading of the related_output_pin in one of its dimension.

Description

This can happen when the 'related_output_pin' is not needed in this timing arc or the template name used by this table is wrong or the template itself should use the output loading of the related_output_pin in one of its dimension.

The following example shows an instance where this message occurs:

```
lu_table_template(prop) {
          variable_1 :  output_net_length;
          index_1 ("1, 5, 10");
        }

        cell(A) {

          pin(O) {
            timing() {
              related_output_pin : "Z";
              rise_propagation(prop) {
                ...
              }
            }
          }
        }
```

The following is an example message: Warning: Line 144, The 'related_output_pin' attribute is only needed when the delay table refers to a template which uses the output loading of the related_output_pin in one of its dimension. (LBDB-396)

The timing arc is a rise_propagation table which refers to the template 'prop'. In the template, the only variable it depends on is the loading of the output pin. There is not dependency on the loading of pin 'Z' and there is no need to put the 'related_output_pin' in the timing group.

What Next

Check the table or the template to see if the related_output_pin attribute is actually needed here. If not, just delete the attribute.

LBDB-397

(error) There can only be one pin in the 'related_output_pin'\n attribute and the pin should be single bit.

Feedback

Description

The "related_output_pin" attribute is used for figuring out the output loading to index into the table. It is not possible to determine which output pin to use for this purpose if there is more than one pin specified in the attribute. Multiple bits specification also have the same problem.

The following example shows an instance where this message occurs:

```
timing() {
          related_output_pin : "Z1 Z2";
          ...
        }
```

The following is an example message: Error: Line 144, There can only be one pin in the 'related_output_pin' attribute and the pin should be single bit. (LBDB-397)

There are two pins, Z1 and Z2, in the related_output_pin attribute. It is not possible to figure out which pin should be used to figuring out the loading to index into the timing table.

What Next

Check the 'related_output_pin' attribute and make the correction according to the real electrical characteristics.

LBDB-398

(error) The pin '%s' specified in the 'related_output_pin'\n attribute is not an output or inout pin.

Description

The pin specified in the 'related_output_pin' attribute should have the direction 'output' or 'inout'.

The following example shows an instance where this message occurs:

```
pin(A) {
          direction : input;
          ...
        }
        pin(B) {
          timing() {
            related_output_pin : "A";
            ...
          }
        }
```

The following is an example message: Error: Line 144, The pin 'A' specified in the 'related_output_pin' attribute is not an output or inout pin. (LBDB-398)

Feedback

Pin 'A' is an input pin and cannot be put into the 'related_output_pin' attribute.

What Next

Check the 'related_output_pin' attribute to see if you have put the wrong pin in it or you forgot to put the correct pin direction on the pin specified in the 'related_output_pin' attribute.

LBDB-399

(error) The timing_type '%s' is not supported\n with the 'related_output_pin' attribute.

Description

The timing_type supported with the 'related_output_pin' attribute are: 'setup_rising', 'setup_falling', 'hold_rising', 'hold_falling', 'non_seq_setup_rising', 'non_seq_setup_falling', 'non_seq_hold_rising', 'non_seq_hold_falling', 'skew_rising', 'skew_falling', 'removal_rising', 'removal_falling', 'recovery_rising' and 'recovery_falling'.

The following example shows an instance where this message occurs:

```
timing() {
          timing_type : rising_edge;
          related_output_pin : "A";
          ...
        }
```

The following is an example message: Error: Line 144, The timing_type 'rising_edge' is not supported with the 'related_output_pin' attribute.. (LBDB-399)

What Next

You may either put the wrong timing_type for the timing group or delete the timing group if it is not supported or the 'related_output_pin' attribute is not needed.

LBDB-400

(warning) The '%s' operating condition has been defined \n \tmultiple times in the '%s' library. \n \tDesign Compiler will use the first definition only.

Description

The library contains more than one definition of an operating condition. Library Compiler issues this error message, records all definitions, but Design Compiler will only use the first definition encountered.

The following example shows an instance where this message occurs:

```
operating_condition(P1V1) {
    ...
```

Feedback

```
  }
  operating_condition(P1V1) {
    ...
  }
```

The following is an example message:

```
Warning: Line 50, The 'P1V1' operating condition has been defined
        multiple times in the 'sample-library' library.
        Design compiler will use the first one only. (LBDB-400)
```

What Next

Change the operating condition name if it is wrong, or delete all extra definitions.

LBDB-401

(error) The '%s' is missing for this timing check.

Description

Both rise and fall constraint values are required in the nochange timing check.

The following example shows an instance where this message occurs:

```
pin ( EN )    {
      direction : input;
      timing ()      {
        timing_type : nochange_high_high;
        related_pin : CP ;
        rise_constaint(cons) {
          values("0.100000, 0.100000, 0.100000",  \
                 "0.100000, 0.100000, 0.100000",  \
                 "0.100000, 0.100000, 0.100000",  \
                 "0.100000, 0.100000, 0.100000",  \
                 "0.100000, 0.100000, 0.100000");
        }
      }
    }
```

To fix the problem, add the attribute to the timing group,

```
fall_constraint(cons) {
          values("0.100000, 0.100000, 0.100000",  \
                 "0.100000, 0.100000, 0.100000",  \
                 "0.100000, 0.100000, 0.100000",  \
                 "0.100000, 0.100000, 0.100000",  \
                 "0.100000, 0.100000, 0.100000");
        }
```

Feedback

The following is an example message:

```
Error: Line 104, The 'fall_constraint' is missing for this timing check.
 (LBDB-401)
```

What Next

Check the library source file to see if you missed the rise or fall constraint value. Otherwise, use setup or hold check instead.

LBDB-402

(error) The '%s' is missing for this internal_power group.

Description

Internal_power groups require specification of either (1) both the rise_power and fall_power attributes; or (2) the power attribute.

The following example shows an instance where this message occurs:

```
pin ( EN )    {
      direction : input;
      internal_power ()      {
        rise_power(power_1d_temp) {
          values("0.100000, 0.100000, 0.100000");
        }
      }
    }
```

To fix the problem, add the attribute to the internal_power group.

```
fall_power(power_1d_temp) {
          values("0.100000, 0.100000, 0.100000");
        }
```

The following is an example message:

```
Error: Line 104, The 'fall_power' is missing for this internal_power
 group. (LBDB-402)
```

What Next

Check the library source file to see if you missed the rise_power, fall_power, or power attribute.

LBDB-403

(error) The '%s' and '%s' attributes are both defined for this\n \tinternal_power group.

Feedback

Description

Internal_power groups require specification of either 1 both the rise_power and fall_power attributes; or 2. the power attribute.

However, it is an error to mix both the specifications.

The following example shows an instance where this message occurs:

```
pin ( EN )    {
      direction : input;
      internal_power ()      {
        power(power_1d_temp) {
          values("0.100000, 0.100000, 0.100000");
        }
        rise_power(power_1d_temp) {
          values("0.100000, 0.100000, 0.100000");
        }
      }
    }
```

To fix the problem, remove the rise_power attribute from the internal_power group, or remove power attribute and add the following fall_power attribute from the internal_power group.

```
fall_power(power_1d_temp) {
          values("0.100000, 0.100000, 0.100000");
        }
```

The following is an example message:

```
XXX
Error: Line 104, The 'rise_power' and 'power' attributes are both defined
 for this
       internal_power group. (LBDB-403)
```

What Next

Check the library source file to make sure that the previous requirement is met.

LBDB-404

(error) The '%s' lookup table in the input-associated\n \tinternal_power group cannot use '%s' as its template.

Description

The rise_power, fall_power, or power lookup tables in a input-associated internal_power group must use 1-dimensional template with input_transition_time as its variable.

Feedback

The following example shows an instance where this message occurs:

```
power_lu_template(ok_temp) {
    variable_1 : input_transition_time;
    index_1("0, 1, 2, 3");
  }
  power_lu_template(err_temp) {
    variable_1 : total_output_net_capacitance;
    index_1("0, 1, 2, 3");
  }

        power(err_temp) {
                values ("1, 2, 3, 4");
        }
```

To fix the problem, change the template value of the power attribute from err_temp to ok_temp.

The following is an example message:

```
Error: Line 126, The 'power' lookup table in the input-associated
       internal_power group cannot use 'err_temp' as its template.
 (LBDB-404)
```

What Next

Refer to the *Library Compiler User Guide* for more information about lookup tables. Change the library source file by referencing a different template in the lookup table description.

LBDB-405

(error) The 1-dimensional '%s' lookup table in the\n \tinout-associated internal_power group cannot use '%s' as its template.

Description

The 1-dimensional rise_power, fall_power, or power lookup tables in an inout-associated internal_power group must use a template with input_transition_time or total_output_net_capacitance as its variable.

The following example shows an instance where this message occurs:

```
power_lu_template(ok_temp) {
    variable_1 : input_transition_time;
    index_1("0, 1, 2, 3");
  }
  power_lu_template(ok2_temp) {
    variable_1 : total_output_net_capacitance;
    index_1("0, 1, 2, 3");
  }
```

Feedback

```
power_lu_template(err_temp) {
  variable_1 : output_net_length;
  index_1("0, 1, 2, 3");
}

      power(err_temp) {
              values ("1, 2, 3, 4");
      }
```

To fix the problem, change the template value of the power attribute from err_template to ok_temp or ok2_temp.

The following is an example message:

```
Error: Line 126, The 1-dimensional 'power' lookup table in the
       inout-associated internal_power group cannot use
       'basic_template' as its template. (LBDB-405)
```

What Next

Refer to the *Library Compiler User Guide* for more information about lookup tables. Change the library source file by referencing a different template in the lookup table description.

LBDB-406

(error) The 1-dimensional '%s' lookup table in the\n \t%s-associated internal_power group cannot use '%s' as its template.

Description

The 1-dimensional rise_power, fall_power, or power lookup tables in an output- associated internal_power group must use a template with total_output_net_capacitance as its variable.

The following example shows an instance where this message occurs:

```
power_lu_template(err_temp) {
    variable_1 : input_transition_time;
    index_1("0, 1, 2, 3");
  }
  power_lu_template(ok_temp) {
    variable_1 : total_output_net_capacitance;
    index_1("0, 1, 2, 3");
  }

      power(err_temp) {
              values ("1, 2, 3, 4");
      }
```

To fix the problem, change the template value of the power attribute from err_template to ok_temp.

The following is an example message:

```
Error: Line 126, The 1-dimensional 'power' lookup table in the
        output-associated internal_power group cannot use 'err_temp' as
 its template. (LBDB-406)
```

What Next

Refer to the *Library Compiler User Guide* for more information about lookup tables. Change the library source file by referencing a different template in the lookup table description.

LBDB-407

(error) The 2-dimensional '%s' lookup table in the\n \t%s-associated internal_power group cannot use '%s' as its template.

Description

The 2-dimensional rise_power, fall_power, or power lookup tables in an output-associated internal_power group must use a template with input_transition_time and total_output_net_capacitance as its variables.

The following example shows an instance where this message occurs:

```
power_lu_template(ok_temp) {
    variable_1 : input_transition_time;
    index_1("0, 1, 2, 3");
    variable_2 : total_output_net_capacitance;
    index_2("0, 1, 2, 3");
  }
  power_lu_template(err_temp) {
    variable_1 : total_output_net_capacitance;
    index_1("0, 1, 2, 3");
    variable_2 : constrained_pin_transition;
    index_2("0, 1, 2, 3");
  }

        power(err_temp) {
                values ("1, 2, 3, 4", "5, 6, 7, 8", \
                        "9, 10, 11, 12", "13, 14, 15, 16");
        }
```

To fix the problem, change the template value of the power attribute from err_temp to ok_temp.

Feedback

The following is an example message:

```
Error: Line 126, The 2-dimensional 'power' lookup table in the
        output-associated internal_power group cannot use 'err_temp' as
 its template. (LBDB-407)
```

What Next

Refer to the *Library Compiler User Guide* for more information about lookup tables. Change the library source file by referencing a different template in the lookup table description.

LBDB-408

(error) The 3-dimensional '%s' lookup table in the\n \t%s-associated internal_power group cannot use '%s' as its template.

Description

The 3-dimensional rise_power, fall_power, or power lookup tables in an output-associated internal_power group must use a template with input_transition_time, total_output_net_capacitance and equal_or_opposite_output_net_capacitance as its variables.

The following example shows an instance where this message occurs:

```
power_lu_template(ok_temp) {
    variable_1 : input_transition_time;
    index_1("0, 1, 2");
    variable_2 : total_output_net_capacitance;
    index_2("0, 1, 2");
    variable_3 : equal_or_opposite_output_net_capacitance;
    index_3("0, 1, 2");
  }
  power_lu_template(err_temp) {
    variable_1 : total_output_net_capacitance;
    index_1("0, 1, 2");
    variable_2 : constrained_pin_transition;
    index_2("0, 1, 2");
    variable_3 : equal_or_opposite_output_net_capacitance;
    index_3("0, 1, 2");
  }

        power(err_temp) {
                values ("1,  2,  3",  "4,  5,  6",  "7, 8, 9", \
                      "10, 11, 12", "13, 14, 15", "16, 17, 18", \
                       "19, 20, 21", "22, 23, 24", "25, 26, 27");
        }
```

To fix the problem, change the template value of the power attribute from err_temp to ok_temp.

Feedback

The following is an example message:

```
Error: Line 126, The 3-dimensional 'power' lookup table in the
        output-associated internal_power group cannot use 'err_temp' as
 its template. (LBDB-408)
```

What Next

Refer to the *Library Compiler User Guide* for more information about lookup tables. Change the library source file by referencing a different template in the lookup table description.

LBDB-409

(error) The %d-dimensional template used in '%s' lookup table\n \tis incompatible with the template used in '%s' lookup table.

Description

Both rise_power and fall_power lookup tables must have the same dimension. One exception is when the internal_power is an arc from a tri-state pin (that is related_pin is a tri-state pin), the dimension of rise_power and fall_power can be different.

The following example shows an instance where this message occurs:

```
power_lu_template(1d_temp) {
    variable_1 : total_output_net_capacitance;
    index_1("0, 1, 2, 3");

  power_lu_template(2d_temp) {
    variable_1 : input_transition_time;
    index_1("0, 1, 2, 3");
    variable_2 : total_output_net_capacitance;
    index_2("0, 1, 2, 3");
  }

        rise_power(1d_temp) {
                values ("1, 2, 3, 4");
        }
        fall_power(2d_temp) {
                values ("1, 2, 3, 4", "5, 6, 7, 8", \
                        "9, 10, 11, 12", "13, 14, 15, 16");
        }
```

To fix the problem, use 1-dimensional or 2-dimensional lookup tables on both rise_power and fall_power attributes.

Feedback

The following is an example message:

```
Error: Line 126, The %d-dimensional template used in '%s' lookup table
        is incompatible with the template used in '%s' lookup table.
 (LBDB-409)
```

What Next

Refer to the *Library Compiler User Guide* for more information about lookup tables. Change the library source file by referencing a different template in the lookup table description.

LBDB-410

(error) The '%s' attribute is missing from the internal_power\n \tgroup.

Description

The related_pin or related_bus_pins attributes are required in an internal_power group with a 2-dimensional or 3-dimensional lookup table. The equal_or_opposite_output attribute is required in an internal_power group with a 3-dimensional look-up table.

The following example shows an instance where this message occurs:

```
internal_power() {
        power(power_2d) {
                values ("1, 2, 3, 4", "5, 6, 7, 8", \
                        "9, 10, 11, 12", "13, 14, 15, 16");
        }
    }
```

To fix the problem, add the following line into the internal_power group.

```
related_pin : "A";
```

The following is an example message:

```
Error: Line 126, The 'related_pin or related_bus_pins' attribute is
 missing
        from the internal_power group. (LBDB-410)
```

What Next

Change the library source file by specifying related_pin, related_bus_pins, or equal_or_opposite_output attribute in the internal_power group as needed.

LBDB-411

(error) The internal_power group associated with pin '%s'\n \tcannot coexist with the cell-associated internal_power group in line %d.

Feedback

Description

It is not allowed to use cell-associated and pin-associated internal_power group for the same pin.

The following example shows an instance where this message occurs:

```
cell(AN2) {
        internal_power(power_1d_temp) {
            related_input : "A";
            values("0.100000, 0.100000, 0.100000");
        }
        pin (A) {
            direction : input;
            internal_power () {
                power(power_1d_temp) {
                    values("0.100000, 0.100000, 0.100000");
                }
            }
        }
        ...
    }
```

To fix the problem, remove internal_power group associated with cell group or pin group.

The following is an example message:

```
Error: Line 126, The internal_power group associated with pin 'A'
        cannot co-exist with the cell-associated internal_power group in
 line 120. (LBDB-411)
```

What Next

Refer to the *Library Compiler User Guide* for more information about power modeling. Change the library source file by using either the cell-associated style or pin-associated style internal_power on the specified pin.

LBDB-412

(error) There is a missing internal_power relation between\n \tpins '%s' and '%s' in the '%s' cell.

Description

This message indicates there is a missing internal_power relation from an input or inout pin to an output pin.

For a combinational cell, the Library Compiler checks that

```
* An output port with a function statement has internal_power relation
          to all functionally related inputs
```

Feedback

```
        * An output port with a three_state attribute has timing arcs
          to all three_state related inputs
```

However, Library Compiler will not check if internal_power information is completely missing in this output.

The following example shows an instance where this message occurs:

```
cell(AN2) {
    pin(A, B) {
      direction : input;
      capacitance : 1;
    }
    pin(Z) {
      direction : output;
      function : "A B";
      internal_power () {
        power (power_2d_temp) {
            values ("1, 2, 3, 4", "5, 6, 7, 8", \
                    "9, 10, 11, 12", "13, 14, 15, 16");
        }
        related_pin : "A";
      }
      timing() {
        ...
      }
    }
  }
```

In this case, an internal_power group is missing between the pin 'Z' and 'B'. To fix the problem, add the following internal_power group:

```
internal_power () {
        power (power_2d_temp) {
            values ("1, 2, 3, 4", "5, 6, 7, 8", \
                    "9, 10, 11, 12", "13, 14, 15, 16");
        }
        related_pin : "B";
      }

The following is an example message:
Error: Line 12, There is a missing internal_power relation between
        pins 'B' and 'Z' in the 'AN2' cell. (LBDB-412)
```

What Next

Add the missing internal_power group between the two pins.

Feedback

LBDB-413

(error) There is an extra internal_power group between '%s' and\n \t'%s' pins in the '%s' cell.

Description

Internal_power groups are allowed for pins that are related to each other. To be related to each other, the input pin has to be in the *function* or *three_state* attribute of the output or input pin. This message is issued if the internal_power group identified between pins does not fall into the categories previously described.

The following example shows an instance where this message occurs:

```
pin(Z) {
      direction : output;
      function : "B";
      internal_power () {
        power (power_2d_temp) {
            values ("1, 2, 3, 4", "5, 6, 7, 8", \
                    "9, 10, 11, 12", "13, 14, 15, 16");
        }
        related_pin : "A B";
      }
      timing() {
        ...
      }
   }
```

In this case, you defined a internal_power group between the 'A' and 'Z pins, even though the 'A' pin is not functionally related to the 'Z' pin. Remove the internal_power group or change the function statement of 'Z' to include 'A'.

The following is an example message:

```
Warning: Line 73, There is an extra internal_power group between 'A' and
        'Z' pins in the 'AN2' cell. (LBDB-413)
```

What Next

Check your library to see whether you have generated the internal_power group by mistake, whether the related_pin field is wrong, or the function attribute value is not recognized.

LBDB-414

(error) In this internal_power group, the '%s' output pin in\n \tthe '%s' attribute is not functionally equivalent or opposite to the '%s' pin.

Feedback

Description

If an output is specified in the related_pin, related_bus_pins, or equal_or_opposite_output attributes, this output must be functionally equivalent or opposite of the output pin which owns the internal_power.

The following example shows an instance where this message occurs:

```
cell(AN2) {
    pin(A, B) {
      direction : input;
      capacitance : 1;
    }
    pin(Z) {
      direction : output;
      function : "A B";
      internal_power () {
        power (power_3d_temp) {
                values ("1, 2, 3", "4, 5, 6", "7, 8, 9", \
                        "10, 11, 12", "13, 14, 15", "16, 17, 18"\
                        "19, 20, 21", "22, 23, 24", "25, 26, 27");
        }
        related_pin : "A B";
        equal_or_opposite_output : "Y";
      }
      timing() {
        ...
      }
    }
    pin(Y) {
      direction : output;
      function : "A + B";
      timing() {
        ...
      }
    }
  }
```

To fix the problem, remove equal_or_opposite_output attribute from the internal_power group and use 2-dimensional lookup table; or make sure 'Y' is functionally equivalent or opposite to 'Z'.

The following is an example message:

```
Error: Line 126, In this internal_power group, the 'Y' output pin in
        the 'equal_or_opposite_output' attribute is not functionally
 equivalent
        or opposite to the 'Z' pin. (LBDB-414)
```

Feedback

What Next

Refer to the *Library Compiler User Guide* for more information about lookup tables. Change the library source file by referencing a different template in the lookup table description.

LBDB-415

(error) The '%s' attribute cannot be specified in this\n \tinternal_power group.

Description

This message indicates you specified an attribute outside its context.

```
(1) An internal_power group with 1-dimensional look-up tables cannot
 specify
    related_pin, related_bus_pins, or equal_or_opposite_output
 attributes.
(2) An internal_power group with 2-dimensional look-up tables cannot
 specify
    an equal_or_opposite_output attribute.
```

One exception is when the internal_power is an arc from a tri-state pin (that is related_pin is a tri-state pin), the checker is diabled.

The following example shows an instance where this message occurs:

```
internal_power() {
        power(power_1d_temp) {
                values ("1, 2, 3, 4");
        }
        related_pin : "A";
    }
```

In this case, the 'related_pin' attribute is not allowed in 1-dimensional lookup table. To fix the problem, remove the related_pin attribute from internal_power group.

The following is an example message:

```
Error: Line 69, The 'related_pin or related_bus_pins' attribute cannot be
        specified in this internal_power group. (LBDB-415)
```

What Next

Change the technology library source file to delete the specified attribute or move the attribute to its correct context.

LBDB-416

(error) The '%s' cell is missing cell_leakage_power attribute.

Feedback

Description

This message indicates there is one or more state-dependent leakage_power attribute, but no cell_leakage_power attribute specified as default value. When at least one state-dependent leakage power is specified in a cell, the cell must have also cell_leakage_power attribute defined.

The following example shows an instance where this message occurs:

```
cell(AN2) {
      leakage_power () {
        when : "A";
        value : 1.0;
      }
      ...
  }
```

In this case, a cell_leakage_power attribute is missing. To fix the problem, add the following attribute to the cell group:

```
cell_leakage_power : 0.5;

The following is an example message:
Error: Line 12, The 'AN2' cell is missing cell_leakage_power attribute.
 (LBDB-416)
```

What Next

Add the missing timing group between the two pins.

LBDB-417

(error) Pin '%s' has a timing arc that appears on only one of\n \tthe scaled cell (%s,%s) and the cell '%s'.

Description

Timing arcs with the same pin pair and type must match by number between the scaled cell and the regular cell.

The following example shows an instance where this message occurs:

```
library(alib) {
    operating_conditions(WCCOM) {
        process : 1.5 ;
        temperature : 70 ;
        voltage : 4.75 ;
        tree_type : "worst_case_tree" ;
    }
    cell(AND) {
      area : 1;
```

Feedback

```
    pin(A B) {
      direction : input;
      capacitance : 1;
    }
    pin(Z) {
      direction : output;
      function : "A B";
      timing() {
        intrinsic_rise : 0.1;
        intrinsic_fall : 0.1;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        slope_rise : 0.0;
        slope_fall : 0.0;
        related_pin : "A B";
      }
    }
  }

  scaled_cell(AND,WCCOM) {
    area : 1;
    pin(A) {
      direction : input;
      capacitance : 1;
    }
    pin(B) {
      direction : input;
      capacitance : 1;
      timing() {
        intrinsic_rise : 0.3;
        intrinsic_fall : 0.3;
        rise_resistance : 0.3;
        fall_resistance : 0.3;
        slope_rise : 0.0;
        slope_fall : 0.0;
        related_pin : "A";
      }
    }
    pin(Z) {
      direction : output;
      function : "A B";
      timing() {
        intrinsic_rise : 0.3;
        intrinsic_fall : 0.3;
        rise_resistance : 0.3;
        fall_resistance : 0.3;
        slope_rise : 0.0;
        slope_fall : 0.0;
        related_pin : "A B";
      }
    }
  }
}
```

In this case, The timing arc between 'B' and 'A' is defined only on the 'AND' scaled cell and not on the 'AND' scaled_cell. To fix the problem, remove one of the timing arcs.

The following is an example message:

```
Error: Ling 30, Pin 'A' has a timing arc that appears on only one of
        the scaled cell (AND,WCCM) and the cell 'AND'. (LBDB-417)
```

What Next

Find the timing group in the scaled_cell and remove the extra timing groups or add more timing groups in the parent cell.

LBDB-418

(warning) The cell_degradation constraint is missing\n \tin this timing group in cell '%s'.

Description

This message informs the user that Library Compiler finds the cell_degradation constraint being described in at least one, but not all, timing arcs of the cell. If the cell_degradation constraint is specified in a cell, all timing arcs of the following types should specify cell_degradation constraint: combinational rising_edge falling_edge clear preset three_state_enable However, the cell_degradation constraint should not be defined in timing groups of the following timing types: setup_rising setup_falling hold_rising hold_falling recovery_rising recovery_falling removal_rising removal_falling skew_rising skew_falling non_seq_setup_rising non_seq_setup_falling non_seq_hold_rising non_seq_hold_falling nochange_high_high nochange_high_low nochange_low_high nochange_low_low

The following example shows an instance where this message occurs:

```
cell (DFF) {
  pin (D) {
    direction : input;
    ...
    timing () {  /* no warning */
      timing_type : setup_rising;
      related_pin : CP;
      rise_constraint (constr) {
        ...
      }
      rise_constraint (constr) {
        ...
      }
    }
  }
  pin (CP) {
    direction : input;
    ...
```

Feedback

```
  }
  pin (Q) {
    direction : output;
    timing () {  /* cell_degradation is defined */
      related_pin : CP;
      timing_type : rising_edge;
      cell_degradation (celldeg) {
        ...
      }
      cell_rise (delay) {
        ...
      }
      cell_fall (delay) {
        ...
      }
      ...
    }
    ...
  }
  pin (QN) {
    direction : output;
    timing () {  /* cell_degradation is NOT defined  --- LIBG-206 --- */
      related_pin : CP;
      timing_type : rising_edge;
      cell_rise (delay) {
        ...
      }
      cell_fall (delay) {
        ...
      }
      ...
    }
    ...
  }
  ...

}
```

In this case, the warning message will be issued on CP-to-QN timing arc.

The following is an example message:

```
Warning: Line 202, The cell_degradation constraint is missing
         in this timing group in cell 'DFF'. (LBDB-418)
```

What Next

Do either one of the following modification to the cell description: (1) Remove all cell_degradation constraints specified in the cell. (2) Make sure all delay arcs of the above timing types specify cell_degradation constraints.

Feedback

LBDB-419

(warning) Found the obsolete and unsupported 'state' group in the'%s' cell;\n \tplease use 'ff' group or 'latch' group or 'statetable' instead.

Description

The *state* group is not supported after v3.0. Instead, the sequential function should now be described in *ff* or *latch* group or *statetable*.

The following is an example message:

```
Warning: Line 159, Found the obsolete and unsupported 'state' group in
 the 'lbdbl419' cell;
        please use 'ff' group or 'latch' group or 'statetable' instead.
 (LBDB-419)
```

What Next

If you have access to the technology library source file change the *state* group to *ff* or *latch* group. Otherwise contact the vendor and inform them about the problem.

LBDB-420

(error) The index number '%d' must be less than\n \tthe address width '%d'.

Description

This message indicates an index in the column_address or row_address attribute is greater than the address_width value.

The following example shows an instance where this message occurs:

```
memory() { /* Indicate this is a memory cell */
        type : ram;
        address_width : 4;
        word_width : 2;
        column_address : "0 6 "; /* index 6 > addr_width 4 */
      }
```

The following is an example message:

```
Error: Line 127, The index number '6' must be less than
        the address width '4'.  (LBDB-420)
```

What Next

Correct the index in the technology library.

Feedback

LBDB-421

(error) The column or row address width '%d' must be less than\n \tor equal to the address width '%d'.

Description

This message indicates the width of the column_address or row_address attribute is greater than the address_width value.

The following example shows an instance where this message occurs:

```
memory() { /* Indicate this is a memory cell */
        type : ram;
        address_width : 4;
        word_width : 2;
        column_address : "0:4 "; /* col width 5 > addr_width 4 */
      }
```

The following is an example message:

```
Error: Line 127, The column/row address width '5' must be less than or
        equal to the address width '4'.  (LBDB-421)
```

What Next

Reduce the number of indices in the column_address or row_address or correct the address_width value in the technology library.

LBDB-423

(error) Address pins are not all used by column_address and row_address attributes.

Description

This message indicates not all indices in the column_address and row_address attributes are used.

The following example shows an instance where this message occurs:

```
memory() { /* Indicate this is a memory cell */
        type : ram;
        address_width : 4;
        word_width : 2;
        column_address : "0 1";
        row_address : "3";              /* missing the index 2 */
      }
```

Feedback

The following is an example message:

```
Error: Line 122, Address pins are not all used by column_address and
 row_address attributes. (LBDB-423)
```

What Next

Correct the index in the technology library.

LBDB-424

(warning) The number of address pins that overlap between column and row is '%d'.

Description

This message indicates that there are overlapping indices in the column_address and row_address attributes.

The following example shows an instance where this message occurs:

```
memory() { /* Indicate this is a memory cell */
        type : ram;
        address_width : 4;
        word_width : 2;
        column_address : "0:2";
        row_address : "2:3";            /* the index 2 is overlapping */
      }
```

The following is an example message:

```
Warning: Line 122, The number of address pins that overlap between column
 and row is 1. (LBDB-424)
```

What Next

Correct the index overlapping in the technology library.

LBDB-425

(warning) Removing duplicate indices in the attribute.

Description

This message indicates an index in the column_address or row_address attribute is duplicated.

The following example shows an instance where this message occurs:

```
memory() { /* Indicate this is a memory cell */
        type : ram;
        address_width : 4;
```

Feedback

```
        word_width : 2;
        column_address : "0 3 3";
      }
```

The following is an example message:

```
Warning: Line 126, Removing duplicate indices in the attribute.
 (LBDB-425)
```

What Next

Correct the index in the technology library.

LBDB-426

(error) The '%s' is missing for this inout pin.

Description

Both input_signal_level and the output_signal_level values are required in an inout pin.

The following example shows an instance where this message occurs:

```
pin ( BIDIR )    {
      direction : inout;
      input_signal_level : VDD1;
      }
    }
```

To fix the problem, add the attribute to the pin group,

```
output_signal_level : VDD2;
```

The following is an example message:

```
Error: Line 104, The 'output_signal_level' is missing for this inout pin.
 (LBDB-426)
```

What Next

Check the library source file to see if you missed the input_signal_level or the output_signal_level attributes. Otherwise, change the direction of the pin to input or output.

LBDB-426w

(warning) The '%s' is missing for this inout pin.

Description

Both input_signal_level and the output_signal_level values are required in an inout pin.

Feedback

The following example shows an instance where this message occurs:

```
pin ( BIDIR )    {
      direction : inout;
      input_signal_level : VDD1;
      }
    }
```

To fix the problem, add the attribute to the pin group,

```
output_signal_level : VDD2;
```

The following is an example message:

```
Warning: Line 104, The 'output_signal_level' is missing for this inout
 pin. (LBDB-426w)
```

What Next

Check the library source file to see if you missed the input_signal_level or the output_signal_level attributes. Otherwise, change the direction of the pin to input or output.

LBDB-427

(error) All power supplies defined in the power_supply group\n \tmust exist in this operating_conditions group.

Description

This message indicates that one or more power_rail attributes are missing in an operating_conditions group even though they were defined in the power_supply group.

The following example shows an instance where this message occurs:

```
power_supply() {
        default_power_rail : VDD0;
        power_rail(VDD1, 5.0);
        power_rail(VDD2, 3.3);
    }

    operating_conditions(MPSS) {
        process : 1.5 ;
        temperature : 70 ;
        voltage : 4.75 ;
        tree_type : "worst_case_tree" ;
        power_rail(VDD2, 2.9);
    }
```

To fix the problem, add the attribute to the operating_conditions group,

```
power_rail(VDD1, 4.9);
```

Feedback

The following is an example message:

```
Error: Line 14, All power supplies defined in the power_supply group
        must exist in this operating_conditions group. (LBDB-427)
```

What Next

Check the library source file to see if you missed a power_rail attribute and correct it.

LBDB-428

(error) All the pins in the '%s' cell with multiple power supplies\n \tmust have signal level attributes.

Description

Either the input_signal_level or the output_signal_level attribute is missing in a pin within a multiple power supply cell.

The following example shows an instance where this message occurs:

```
power_supply() {
        default_power_rail : VDD0;
        power_rail(VDD1, 5.0);
        power_rail(VDD2, 3.3);
    }

cell(lbdb428) {
  area : 2;
  pad_cell : true;
  rail_connection(PV1, VDD1);
  rail_connection(PV2, VDD2);
  pin(A) {
    direction : input;          /* missing input_signal_level attribute
 */
    capacitance : 1;
  }
  pin(Z) {
    direction : output;
    function : "A";
    output_signal_level : VDD2;
    timing() {
      intrinsic_rise : 0.48;
      intrinsic_fall : 0.77;
      rise_resistance : 0.1443;
      fall_resistance : 0.0523;
      slope_rise : 0.0;
      slope_fall : 0.0;
      related_pin : "A";
    }
  }
```

Feedback

```
}
}
```

To fix the problem, add the attribute to the 'A' pin group,

```
input_signal_level : VDD1;
```

The following is an example message:

```
Error: Line 96, All the pins in the 'lbdb428' cell with multiple power
 supplies
       must have signal level attributes. (LBDB-428)
```

What Next

Check the library source file to see if you missed the input_signal_level or the output_signal_level attributes.

LBDB-429

(warning) The timing arc from '%s' to '%s' is dormant.

Description

A timing arc from an input pin to an output pin is dormant if the signal change on the input pin can never cause the change on the output without simultaneous changes on any other input pins.

The following example shows an instance where this message occurs:

```
cell(a_cell) {
    pin(y) {
      function : "!a b"
      three_state : "!a !b | a b"
      timing() {
        related_pin : a;
      }
    }
  }
```

In this example, if only pin 'a' is changed, pin 'y' will not have the signal transitions between '0' and '1'. The combinational timing arc between 'a' and 'y' is dormant.

The following is an example message:

```
Warning: Line 50000, The timing arc from 'a' to 'y' is dormant.
 (LBDB-429)
```

Feedback

What Next

This is caused by the input sharing between 'function', 'three_state', and 'x_function'. The signal transition is not physically possible and generally the timing arc should not be specified.

LBDB-430

(error) The '%s' rail_connection in a cell with multiple power\n \tsupplies is missing an internal_power table.

Description

This error message indicates that an output pin, regardless of the output_signal_level value, is missing an internal_power table for designated rail_connection.

The following example shows an instance where this message occurs:

```
power_supply() {
        default_power_rail : VDD0;
        power_rail(VDD1, 5.0);
        power_rail(VDD2, 3.3);
    }

cell(lbdb428) {
  area : 2;
  pad_cell : true;
  rail_connection(PV1, VDD1);
  rail_connection(PV2, VDD2);
  pin(A) {
    direction : input;
    capacitance : 1;
    input_signal_level : VDD1;
    internal_power () {
      power_level : VDD1;
      power(power_out1_d) {
        values (" 0.693418, 0.691911, 0.689730, 0.691771, 0.695229,
 0.696524");
      }
    }
  }
  pin(Z) {
    direction : output;
    function : "A";
    output_signal_level : VDD2;
    internal_power () {
      power_level : VDD2;
      power(power_out1_d) {
        values (" 0.693418, 0.691911, 0.689730, 0.691771, 0.695229,
 0.696524");
      }
```

Feedback

```
    }
    timing() {
      intrinsic_rise : 0.48;
      intrinsic_fall : 0.77;
      rise_resistance : 0.1443;
      fall_resistance : 0.0523;
      slope_rise : 0.0;
      slope_fall : 0.0;
      related_pin : "A";
    }
  }
}
}
```

To fix the problem, add the internal_power to the 'Z' pin.

```
internal_power () {
      power_level : VDD1;
      power(power_out1_d) {
        values (" 0.693418, 0.691911, 0.689730, 0.691771, 0.695229,
 0.696524");
      }
    }
```

The following is an example message:

```
Error: Line 96,  The 'VDD1' rail_connection in a cell with multiple power
        supplies is missing an internal_power table. (LBDB-430)
```

What Next

Check the library source file to see if you missed the power_level attribute or there is a typo in the name of the power_supply.

LBDB-431

(error) The value for attribute '%s' is empty.

Description

This error message indicates that an value field is null or empty.

The following example shows an instance where this message occurs:

```
cell(GND_G_A) {
  area             : 1 ;
  cell_footprint   : GND_G ;
  dont_touch       : true ;
  dont_use         : true ;
  cell_leakage_power : 0.00;

  pin(PAD) {
```

Feedback

```
    direction             : output ;
    function              : "0" ;
    capacitance           : 0.000000 ;

    max_capacitance       : 999.989990 ;
  }

  internal_power(POWER_IO_A) {
    values ("0.00000  ,0.00000  ",\
           "0.00000  ,0.00000  ");
    related_inputs  : "";
    related_outputs : "PAD";
  }
}
```

To fix the problem, fill up value for related_inputs or remove related_inputs.

```
internal_power () {
      values ("0.00000  ,0.00000  ",\
           "0.00000  ,0.00000  ");
        related_inputs  : "";
        related_outputs : "PAD";
      }
```

The following is an example message:

```
Error: Line 722,  The value for attribute 'related_outputs' is
        empty. (LBDB-431)
```

What Next

Check the library source file to see if you missed giving the value. If so, fill it up with appropriate value.

LBDB-432

(error) The non-Zero %d scalar value is not allowed in internal_power\n \tgroup within a cell group.

Description

This error message indicates that a non zero scalar value was defined in an internal_power group within a cell group.

The following example shows an instance where this message occurs:

```
cell(LBDB-432) {
  area             : 1 ;

  internal_power(scalar) {
        values("2.0");
        related_input : "";
```

Feedback

```
  }

   ....
}
```

To fix the problem, change the values to zero or move the internal_power to a pin group.

```
internal_power (scalar) {
      values ("0.00000");
        related_input  : "";
      }
```

The following is an example message:

```
Error: Line 174, The non-Zero 2.0 scalar value is not allowed in
 internal_power
        group within a cell group. (LBDB-432)
```

What Next

Check the library source file to see if it was a typo. If so, change the value to zero for no power consumption or move the internal power to a pin group.

LBDB-433

(error) The '%s' integrated gated clock cell has a '%s' pin with\n \ta combinational timing arc containing the '%s' timing_type.

Description

This message indicates that you specified one of the cell's timing arcs as combinational, which should be sequential. While the function of this cell is integrated clock gated cell, the timing arc on the clock gate enable pin from the clock gate clock pin should be sequential timing type setup, hold or nochnage.

The following example shows an instance where this message occurs:

```
cell(CGNP) {
  area : 1;
  clock_gating_integrated_cell : "none_posedge";
  dont_use : true;
  pin(EN) {
    direction : input;
    capacitance : 0.017997;
    clock_gate_enable_pin : true;
    timing() {
      intrinsic_rise : 0.48;
      intrinsic_fall : 0.77;
      rise_resistance : 0.1443;
      fall_resistance : 0.0523;
      slope_rise : 0.0;
```

Feedback

```
      slope_fall : 0.0;
      related_pin : "EN";
    }
    timing() {
      intrinsic_rise : 0.22;
      intrinsic_fall : 0.22;
      rise_resistance : 0.1443;
      fall_resistance : 0.0523;
      slope_rise : 0.0;
      slope_fall : 0.0;
      related_pin : "CP";
    }
  }
  pin(CP) {
    direction : input;
    capacitance : 0.031419;
    clock_gate_clock_pin : true;
    min_pulse_width_low  : 0.319;
  }
  pin(Z) {
    direction : output;
    function : "CP + EN'";
    max_capacitance : 0.500;
    clock_gate_out_pin : true;
    timing() {
      intrinsic_rise : 0.48;
      intrinsic_fall : 0.77;
      rise_resistance : 0.1443;
      fall_resistance : 0.0523;
      slope_rise : 0.0;
      slope_fall : 0.0;
      related_pin : "EN";
    }
    timing() {
      intrinsic_rise : 0.22;
      intrinsic_fall : 0.22;
      rise_resistance : 0.1443;
      fall_resistance : 0.0523;
      slope_rise : 0.0;
      slope_fall : 0.0;
      related_pin : "CP";
    }
    internal_power (){
      rise_power(li4X3){
        index_1("0.0150, 0.0400, 0.1050, 0.3550");
        index_2("0.050, 0.451, 1.501");
        values("0.141, 0.148, 0.256",\
        "0.162, 0.145, 0.234",\
        "0.192, 0.200, 0.284",\
        "0.199, 0.219, 0.297");
      }
      fall_power(li4X3){
        index_1("0.0150, 0.0400, 0.1050, 0.3550");
```

Feedback

```
        index_2("0.050, 0.451, 1.500");
        values("0.117, 0.144, 0.246",\
        "0.133, 0.151, 0.238",\
        "0.151, 0.186, 0.279",\
        "0.160, 0.190, 0.217");
      }
      related_pin : "CP EN" ;
    }
  }
}
```

The following is an example message:

```
Error: Line 206, The 'CGNP' integrated gated clock cell has a 'EN' pin
 with
        a combinational timing arc containing the 'combinational'
 timing_type. (LBDB-433)
```

What Next

Change the library source file, and fix the timing_type of the specified pin.

LBDB-434

(error) The '%s' integrated gated clock cell has a '%s' pin with\n \ta sequential timing arc containing the '%s' timing_type.

Description

This message indicates that you specified one of the cell's timing arcs as sequential, which should be combinational. While the function of this cell is integrated clock gated cell, the timing arc on the clock gate output pin from the clock gate clock/enable/test pin should be combinational timing type.

The following example shows an instance where this message occurs:

```
cell(CGNP) {
  area : 1;
  clock_gating_integrated_cell : "none_posedge";
  dont_use : true;
  pin(EN) {
    direction : input;
    capacitance : 0.017997;
    clock_gate_enable_pin : true;
    timing() {
      timing_type : nochange_high_low;
      intrinsic_rise : 0.4;
      intrinsic_fall : 0.4;
      related_pin : "CP";
    }
    timing() {
```

Feedback

```
      timing_type : nochange_low_low;
      intrinsic_rise : 0.4;
      intrinsic_fall : 0.4;
      related_pin : "CP";
    }
  }
  pin(CP) {
    direction : input;
    capacitance : 0.031419;
    clock_gate_clock_pin : true;
    min_pulse_width_low  : 0.319;
  }
  pin(Z) {
    direction : output;
    function : "CP + EN'";
    max_capacitance : 0.500;
    clock_gate_out_pin : true;
    timing() {
      timing_type : nochange_high_low;
      intrinsic_rise : 0.4;
      intrinsic_fall : 0.4;
      related_pin : "CP";
    }
    timing() {
      intrinsic_rise : 0.48;
      intrinsic_fall : 0.77;
      rise_resistance : 0.1443;
      fall_resistance : 0.0523;
      slope_rise : 0.0;
      slope_fall : 0.0;
      related_pin : "EN";
    }
    timing() {
      intrinsic_rise : 0.22;
      intrinsic_fall : 0.22;
      rise_resistance : 0.1443;
      fall_resistance : 0.0523;
      slope_rise : 0.0;
      slope_fall : 0.0;
      related_pin : "CP";
    }
    internal_power (){
      rise_power(li4X3){
        index_1("0.0150, 0.0400, 0.1050, 0.3550");
        index_2("0.050, 0.451, 1.501");
        values("0.141, 0.148, 0.256",\
        "0.162, 0.145, 0.234",\
        "0.192, 0.200, 0.284",\
        "0.199, 0.219, 0.297");
      }
      fall_power(li4X3){
        index_1("0.0150, 0.0400, 0.1050, 0.3550");
        index_2("0.050, 0.451, 1.500");
```

Feedback

```
        values("0.117, 0.144, 0.246",\
        "0.133, 0.151, 0.238",\
        "0.151, 0.186, 0.279",\
        "0.160, 0.190, 0.217");
      }
      related_pin : "CP EN" ;
    }
  }
}
```

The following is an example message:

```
Error: Line 206, The 'CGNP' integrated gated clock cell has a 'Z' pin
 with
        a sequential timing arc containing the 'nochange_high_low'
 timing_type. (LBDB-434)
```

What Next

Change the library source file, and fix the timing_type of the specified pin.

LBDB-435

(error) The '%s' integrated gated clock cell has a '%s' pin without\n \tspecified timing arcs.

Description

This message indicates that you specified one of the cell's pin without timing arcs, while the function of this cell is integrated clock gated cell.

The following example shows an instance where this message occurs:

```
cell(CGNP) {
  area : 1;
  clock_gating_integrated_cell : "none_posedge";
  dont_use : true;
  pin(EN) {
    direction : input;
    capacitance : 0.017997;
    clock_gate_enable_pin : true;
  }
  pin(CP) {
    direction : input;
    capacitance : 0.031419;
    clock_gate_clock_pin : true;
    min_pulse_width_low  : 0.319;
  }
  pin(Z) {
    direction : output;
    function : "CP + EN'";
    max_capacitance : 0.500;
    clock_gate_out_pin : true;
```

Feedback

```
      timing() {
        timing_type : nochange_high_low;
        intrinsic_rise : 0.4;
        intrinsic_fall : 0.4;
        related_pin : "CP";
      }
      timing() {
        timing_type : nochange_low_low;

          "0.160, 0.190, 0.217");
        }
        related_pin : "CP EN" ;
      }
    }
  }
```

Feedback

The following is an example message:

```
Error: Line 206, The 'CGNP' integrated gated clock cell has a 'Z' pin
 without
        specified timing arcs. (LBDB-435)
```

What Next

Change the library source file, and add the missing timing arc of the specified pin.

LBDB-436

(error) Illegal timing_model_type value '%s'.

Description

Currently the timing_model_type attribute can only take the value "stamp".

The following example shows an instance where this message occurs:

```
cell(CGNP) {
  area : 1;
  timing_type_model : stml;
  ...
}
```

The following is an example message:

```
Error: Line 206, Illegal timing_model_type value 'stml'. (LBDB-436)
```

What Next

Change or delete the attribute.

LBDB-437

(warning) The generated_clock(%s) group is defined \n \tmultiple times.

Description

This message indicates that you specified the same generated_clock group multiple times. Only the last one is retained.

The following example shows an instance where this message occurs:

```
cell(CGNP) {
  area : 1;

  generated_clock(clock_A) {
    ...
  }
```

```
  generated_clock(clock_A) {
    ...
  }
  ...
}
```

The following is an example message:

```
Warning: Line 206, The generated_clock(clock_A) group is defined
        multiple times. (LBDB-437)
```

What Next

Change the group name, or delete the duplicated group.

LBDB-438

(error) The master pin is not specified in the generated_clock\n \tgroup.

Description

The master_pin attribute must be specified for a generated clock.

The following example shows an instance where this message occurs:

```
cell(CGNP) {
  area : 1;
  generated_clock(clockA) {
    clock_pin : CK;
    divided_by : 2;
  }
  ...
}
```

The following is an example message:

```
Error: Line 206, The master pin is not specified in the generated_clock
        group. (LBDB-438)
```

What Next

Add the master_pin attribute.

LBDB-439

(error) The clock pin is not specified in the generated_clock\n \tgroup.

Description

The clock_pin attribute must be specified for a generated clock.

Feedback

The following example shows an instance where this message occurs:

```
cell(CGNP) {
  area : 1;
  generated_clock(clockA) {
    master_pin : CK;
    divided_by : 2;
  }
  ...
}
```

The following is an example message:

```
Error: Line 206, The clock pin is not specified in the generated_clock
        group. (LBDB-439)
```

What Next

Add the clock_pin attribute.

LBDB-440

(error) The generated_clock divisor is less than 1.

Description

The divisor in the generated_clock group must be an integer greater than or equal to 1.

The following example shows an instance where this message occurs:

```
cell(CGNP) {
  area : 1;
  generated_clock(clockA) {
    clock_pin : CLK1;
    master_pin : CLK;
    divided_by : 0;
  }
  ...
}
```

The following is an example message:

```
Error: Line 206, The generated_clock divisor is less than 1. (LBDB-440)
```

What Next

Change the divisor value.

LBDB-441

(error) The generated_clock multiplier is less than 1.

Feedback

Description

The multiplier in the generated_clock group must be an integer greater than or equal to 1.

The following example shows an instance where this message occurs:

```
cell(CGNP) {
  area : 1;
  generated_clock(clockA) {
    clock_pin : CLK1;
    master_pin : CLK;
    multiplied_by : 0;
  }
  ...
}
```

The following is an example message:

```
Error: Line 206, The generated_clock multiplier is less than 1.
 (LBDB-441)
```

What Next

Change the multiplier value.

LBDB-442

(error) The generated_clock edge is less than 0.

Description

The edge1, edge2, and edge3 parameter in the edges complex attribute in the generated_clock group must be non-negative integers.

The following example shows an instance where this message occurs:

```
cell(CGNP) {
  area : 1;
  generated_clock(clockA) {
    clock_pin : CLK1;
    master_pin : CLK;
    edges(-1, 2, 3);
  }
  ...
}
```

The following is an example message:

```
Error: Line 206, The generated_clock edge is less than 0. (LBDB-442)
```

Feedback

What Next

Change the violating edge value.

LBDB-443

(warning) The mode_definition(%s) group is defined\n \tmultiple times.

Description

This message indicates that you specified the same mode_definition group multiple times. Only the last one is retained.

The following example shows an instance where this message occurs:

```
cell(CGNP) {
  area : 1;

  mode_definition(rw) {
    ...
  }
  mode_definition(rw) {
    ...
  }
  ...
}
```

The following is an example message:

```
Warning: Line 206, The mode_definition(rw) group is defined
        multiple times. (LBDB-443)
```

What Next

Change the group name, or delete the duplicated group.

LBDB-444

(error) The mode definition '%s' has no values defined.

Description

A mode_definition group must have at least one mode value defined.

The following example shows an instance where this message occurs:

```
cell(CGNP) {
  area : 1;
  mode_definition(read) {
  }
```

Feedback

```
  ...
}
```

The following is an example message:

```
Error: Line 206, The mode definition 'read' has no values defined.
 (LBDB-444)
```

What Next

Define the mode values.

LBDB-445

(warning) The mode_value(%s) group is defined\n \tmultiple times.

Description

This message indicates that you specified the same mode_value group multiple times. Only the last one is retained.

The following example shows an instance where this message occurs:

```
cell(CGNP) {
  area : 1;

  mode_definition(rw) {
    mode_value(read) {
      when : R;
      sdf_cond : "R == 1";
    }
    mode_value(read) {
      when : !R;
      sdf_cond : "R == 0";
    }
  }
}
```

The following is an example message:

```
Warning: Line 206, The mode_value(read) group is defined
        multiple times. (LBDB-445)
```

What Next

Change the group name, or delete the duplicated group.

LBDB-446

(error) The sdf_cond attribute is not specified for the\n \tmode condition.

Feedback

Description

This message indicates that you specified the when condition for the mode value, but did not specify the sdf_cond attribute.

The following example shows an instance where this message occurs:

```
cell(CGNP) {
  area : 1;
  mode_difinition(rw) {
    mode_value(read) {
      when : R;
    }
  }
  ...
}
```

The following is an example message:

```
Error: Line 206, The sdf_cond attribute is not specified for the
        mode condition. (LBDB-446)
```

What Next

Add the missing sdf_cond attribute.

LBDB-447

(information) The %s is defined multiple times for %s. All of them are kept.

Description

This message indicates that you specified multiple attribute or group information. All of the attributes or group information are kept in db.

What Next

Please make sure that it is your real intention to have multiple attribute or group information.

EXMAPLES

The following example shows an instance where this message occurs:

```
cell(CGNP) {
  area : 1;

  pin (y) {
    timing() {
      mode(rw, read);
      mode(rw, write);
    }
```

Feedback

```
  }
}
```

Examples

```
Information: Line 206, The mode is defined multiple times for timing. All
 of them are kept (LBDB-447)
```

LBDB-448

(error) The Boolean condition overlaps with the condition\n \tspecified at line %d.

Description

The two Boolean conditions must be mutually exclusive.

The following example shows an instance where this message occurs:

```
cell(CGNP) {
  area : 1;
  mode_definition(rw) {
    mode_value(read) {
      when : R;
      sdf_cond : "R == 1";
    }
    mode_value(write) {
      when : R;
      sdf_cond : "R == 1";
    }
  }
  ...
}
```

The following is an example message:

```
Error: Line 206, The Boolean condition overlaps with the condition
        specified at line 202. (LBDB-448)
```

What Next

Check the conditions and make them mutually exclusive.

LBDB-449

(error) The mode instance mode(%s, %s) is invalid.

Description

The mohe instance delaration must be referring to a mode_definition and one of its mode_value

Feedback

The following example shows an instance where this message occurs:

```
cell(CGNP) {
  area : 1;
  mode_definition(rw) {
    mode_value(read) {
      ...
    }
    mode_value(werite) {
      ...
    }
  }
  pin (y) {
    timing () {
      mode(rw, latching);
      ...
    }
  }
  ...
}
```

The following is an example message:

```
Error: Line 206, The mode instance mode(rw, latching) is invalid.
 (LBDB-449)
```

What Next

Check for consistency between mode group and mode value definitions, and mode instance declarations.

LBDB-450

(error) Mismatched quotes in the sdf_cond string.

Description

In the sdf_cond string, a double quoting is mismatched.

The following example shows an instance where this message occurs:

```
cell(CGNP) {
  area : 1;
  mode_definition(rw) {
    mode_value(read) {
      when : R;
      sdf_cond : "R == 1 && C ==
    }
  }
  ...
}
```

Feedback

The following is an example message:

```
Error: Line 206, Mismatched quotes in the sdf_cond string. (LBDB-450)
```

What Next

Add the missing quote or delete the extra quote.

LBDB-451

(error) Undefined variable '%s'.

Description

The variable in the sdf_cond string must be a port or bus name.

The following example shows an instance where this message occurs:

```
cell(CGNP) {
  area : 1;
  mode_definition(rw) {
    mode_value(read) {
      when : R;
      sdf_cond : "read == 1";
    }
  }
  pin (R) {
    ...
  }
  ...
}
```

The following is an example message:

```
Error: Line 206, Undefined variable 'read'. (LBDB-451)
```

What Next

Eliminate undefined varibable.

LBDB-452

(error) Fewer than two ports are specified in the\n \tshort list.

Description

A short complex attribute must have more than one parameter.

The following example shows an instance where this message occurs:

```
cell (c) {
  ...
```

Feedback

```
  short(A);
  pin (A) {...}
  pin (Y) {...}
}
```

The following is an example message:

```
Error: Line 206, Fewer than two ports are specified in the
        short list. (LBDB-452)
```

What Next

Add the missing port names.

LBDB-453

(error) The parameter '%s' in the short list is not a\n \tport or bus name.

Description

The short complex attribute must take port or bus name as parameters.

The following example shows an instance where this message occurs:

```
cell(CGNP) {
  area : 1;
  short(R, T);

  pin(R) {...}
  ...
}
```

The following is an example message:

```
Error: Line 206, The parameter 'T' in the short list is not a
        port or bus name. (LBDB-453)
```

What Next

Eliminate undefined varibable.

LBDB-454

(error) Unequal bus widths in the short list. \tspecified timing arcs.

Description

All members of a short list must be of the same width. That is, they must all be simple ports, or all be buses of the same width.

Feedback

The following example shows an instance where this message occurs:

```
cell(CGNP) {
  area : 1;
  short(A, B);
  bus(A) {
    bus_type : bus4;
  }
  bus(B) {
    bus_tyep : bus8;
  }
  ...
}
```

The following is an example message:

```
Error: Line 206, Unequal bus widths in the short list. (LBDB-454)
```

What Next

Use the same width members.

LBDB-455

(error) Multiple drive arcs are defined on port %s.

Description

A port can have at most one drive arc defined.

The following example shows an instance where this message occurs:

```
pin(Y) {
  timing () {
    drive_arc : true;
    ...
  }
  timing () {
    drive_arc : true;
    ...
  }
  ...
}
```

The following is an example message:

```
Error: Line 206, Multiple drive arcs are defined on port Y. (LBDB-455)
```

What Next

Eliminate the extra ones.

Feedback

LBDB-456

(error) The drive arc is not combinational.

Description

Drive arc must be combinational.

The following example shows an instance where this message occurs:

```
pin(Z) {
    direction : output;
    timing() {
        timing_type : nochange_high_low;
        drive_arc : true;
        ...
    }
    ...
}
```

The following is an example message:

```
Error: Line 206, The drive arc is not combinational. (LBDB-456)
```

What Next

Change the drive arc to combinational or delete it.

LBDB-457

(error) Related pin is found on the drive arc.

Description

Drive arc cannot have related pins.

The following example shows an instance where this message occurs:

```
pin(Z) {
    direction : output;
    timing() {
        timing_type : nochange_high_low;
        drive_arc : true;
        related_pin : A;
        ...
    }
    ...
}
```

The following is an example message:

```
Error: Line 206, Related pin is found on the drive arc. (LBDB-457)
```

Feedback

What Next

Remove the related_pin attribute or unlabel the timing arc.

LBDB-458

(error) Cell rise or fall table is missing on the\n \tdrive arc.

Description

Drive arc requires cell rise and fall tables.

The following example shows an instance where this message occurs:

```
pin(Z) {
    direction : output;
    timing() {
        timing_type : nochange_high_low;
        drive_arc : true;
        cell_rise(table1) {
          ...
        }
    }
    ...
}
```

The following is an example message:

```
Error: Line 206, Cell rise or fall table is missing on the
        drive arc. (LBDB-458)
```

What Next

Add the missing tables.

LBDB-459

(error) The drive arc has tables that are not 1-D function\n \tof total_output_capacitance.

Description

Drive arc requires delay tables to be 1-D function of total output capacitance.

The following example shows an instance where this message occurs:

```
pin(Z) {
    direction : output;
    timing() {
        timing_type : nochange_high_low;
        drive_arc : true;
        cell_rise(table2D) {
```

```
            values("0.1, 0.2", "0.5, 0.8");
          }
      }
      ...
}
```

The following is an example message:

```
Error: Line 206, The drive rc has tables that are not 1-D function
        of total_output_capacitance. (LBDB-459)
```

What Next

Add the missing tables.

LBDB-460

(error) Multiple tlatch groups are defined on\n \tpin '%s'.

Description

This message indicates that you specified multiple tlatch groups on a pin.

The following example shows an instance where this message occurs:

```
pin(D) {

  tlatch(EN) {
    ...
  }
  tlatch(E) {
    ...
  }
  ...
}
```

The following is an example message:

```
Error: Line 206, Muliple tlatch groups are defined on
        pin 'D'.  (LBDB-460)
```

What Next

Delete the duplicated group.

LBDB-461

(error) The edge type is not specified for the tlatch.

Feedback

Description

A tlatch group must have the edge_type attribute specified.

The following example shows an instance where this message occurs:

```
pin(D) {

  tlatch(EN) {
    tdisable : TRUE;
  }
  ...
}
```

The following is an example message:

```
Error: Line 206, The edge tyep is not specified for the tlatch.
 (LBDB-461)
```

What Next

Add the missing attribute.

LBDB-462

(error) Pin '%s' referred to in tlatch does not exist.

Description

The tlatch group name must be the name of an existing enable pin.

The following example shows an instance where this message occurs:

```
cell (c) {
  pin(D) {
    tlatch(EN) {
      edge_type : rising;
    }
  }
  ...
  /* No such pin as EN */
}
```

The following is an example message:

```
Error: Line 206, Pin 'EN' referred to in tlatch does not exist.
 (LBDB-462)
```

What Next

Add the missing attribute.

Feedback

LBDB-463

(warning) The related pin '%s' for the non-sequential\n \tsetup/hold timing check is labeled a clock.

Description

If the related pin for the non-sequential constraint arc is labeled a clock, then timing analysis will not propagate a clock signal through the cell.

The following example shows an instance where this message occurs:

```
cell (c) {
  pin(D) {
    timing() {
      timing_type : non_seq_setup_falling;
      related_pin : OSC;
      ...
    }
  }
  pin(OSC) {
    clock : true;
    ...
  }
}
```

The following is an example message:

```
Warning: Line 206, The related pin 'OSC' for the non-sequential
        setup/hold timing check is labeled a clock. (LBDB-463)
```

What Next

Delete the "clock : true;" declaration in the pin group.

LBDB-464

(error) The '%s' cell is a non-pad cell with x_function,\n \twhich is not supported by Library Compiler.

Description

Library Compiler only supports x_function on pad cells. Library Compiler issues this error message if a non-pad cell defines x_function on one or more ports.

The following example shows an instance where this message occurs:

```
cell (lbdb464) {
    area    :   0.0;
    pin (D, CLK)    {
      direction   :   input;
```

Feedback

```
      capacitance :   1.0;
      fanout_load :   1.0;
    }
    pin(Q){
      direction   :   output;
      function : "IQ";
      x_function : CLK';
      timing () {
        timing_type : rising_edge;
        intrinsic_rise   : 1.0;
        rise_resistance  : 0.1;
        intrinsic_fall   : 1.0;
        fall_resistance  : 0.1;
        related_pin      : "CLK";
      }
    }
    ff (IQ, IQN) {
      next_state : D;
      clocked_on : CLK;
    }
  }
```

The following is an example message:

```
Error: Line 6, The 'lbdb464' cell is a non-pad cell with x_function,
 which is not supported by Library Compiler.(LBDB-464)
```

What Next

Remove the x_function attribute defined for any output pin of the cell.

LBDB-465

(error) The '%s' attribute is missing\n \tfrom the electromigration group.

Description

The *related_pin* or *related_bus_pins* attribute is required in an electromigration group with a two-dimensional lookup table.

The following example shows an instance where this message occurs:

```
electromigration() {
        em_max_toggle_rate(em_2d) {
                values ("1, 2, 3, 4", "5, 6, 7, 8", \
                        "9, 10, 11, 12", "13, 14, 15, 16");
        }
    }
```

To fix the problem, add the following line into the electromigration group:

```
related_pin : "A";
```

The following is an example message:

```
Error: Line 126, The 'related_pin or related_bus_pins' attribute is
 missing
        from the electromigration group. (LBDB-465)
```

What Next

Change the library source file by specifying the *related_pin* or the *related_bus_pins* attribute in the electromigration group as needed.

LBDB-466

(error) The '%s' attribute cannot be\n \tspecified in this electromigration group.

Description

This message indicates that you specified an attribute outside its context. An electromigration group with one-dimensional lookup tables cannot specify *related_pin* or *related_bus_pins* attributes.

The following example shows an instance where this message occurs:

```
electromigration() {
        em_max_toggle_rate(em_1d_temp) {
                values ("1, 2, 3, 4");
        }
        related_pin : "A";
    }
```

In this case, the *related_pin* attribute is not allowed in the one-dimensional lookup table. To fix the problem, remove the *related_pin* attribute from the electromigration group.

The following is an example message:

```
Error: Line 69, The 'related_pin or related_bus_pins' attribute cannot be
        specified in this electromigration group. (LBDB-466)
```

What Next

Change the technology library source file to delete the specified attribute or move the attribute to its correct context.

LBDB-467

(error) The '%s' lookup table in the input-associated\n \telectromigration group cannot use '%s' as its template.

Feedback

Description

The em_max_toggle_rate lookup table in an input-associated electromigration group must use a one-dimensional template with *input_transition_time* as its variable.

The following example shows an instance where this message occurs:

```
em_lut_template(ok_temp) {
    variable_1 : input_transition_time;
    index_1("0, 1, 2, 3");
  }
  em_lut_template(err_temp) {
    variable_1 : total_output_net_capacitance;
    index_1("0, 1, 2, 3");
  }

        em_max_toggle_rate(err_temp) {
                values ("1, 2, 3, 4");
        }
```

To fix the problem, change the template value of the *em_max_toggle_rate* attribute from *err_temp* to *ok_temp*.

The following is an example message:

```
Error: Line 126, The 'em_max_toggle_rate' lookup table in the
 input-associated
       electromigration group cannot use 'err_temp' as its template.
 (LBDB-467)
```

What Next

For more information about lookup tables, see the *Library Compiler User Guide*. Change the library source file by referencing a different template in the lookup table description.

LBDB-468

(error) The one-dimensional '%s' lookup table in the\n \tinout-associated electromigration group cannot use '%s' as its template.

Description

The one-dimensional em_max_toggle_rate lookup table in an inout-associated electromigration group must use a template with *input_transition_time* or *total_output_net_capacitance* as its variable.

The following example shows an instance where this message occurs:

```
em_lut_template(ok_template) {
    variable_1 : input_transition_time;
    index_1("0, 1, 2, 3");
```

Feedback

```
  }
  em_lut_template(ok2_template) {
    variable_1 : total_output_net_capacitance;
    index_1("0, 1, 2, 3");
  }
  em_lut_template(err_template) {
    variable_1 : output_net_length;
    index_1("0, 1, 2, 3");
  }

        em_max_toggle_rate(err_template) {
                values ("1, 2, 3, 4");
        }
```

To fix the problem, change the template value of the *em_max_toggle_rate* attribute from err_template to ok_template or ok2_template.

The following is an example message:

```
Error: Line 126, The 1-dimensional 'em_max_toggle_rate' lookup table in
 the
        inout-associated electromigration group cannot use
        'err_template' as its template. (LBDB-468)
```

What Next

For more information about lookup tables, see the *Library Compiler User Guide*. Change the library source file by referencing a different template in the lookup table description.

LBDB-469

(error) The one-dimensional '%s' lookup table in the\n \t%s-associated electromigration group cannot use '%s' as its template.

Description

The one-dimensional em_max_toggle_rate lookup table in an output-associated electromigration group must use a template with *total_output_net_capacitance* as its variable.

The following example shows an instance where this message occurs:

```
em_lut_template(err_template) {
    variable_1 : input_transition_time;
    index_1("0, 1, 2, 3");
  }
  em_lut_template(ok_template) {
    variable_1 : total_output_net_capacitance;
    index_1("0, 1, 2, 3");
  }
```

Feedback

```
        em_max_toggle_rate(err_template) {
                values ("1, 2, 3, 4");
        }
```

To fix the problem, change the template value of the *em_max_toggle_rate* attribute from *err_template* to *ok_template*.

The following is an example message:

```
Error: Line 126, The 1-dimensional 'em_max_toggle_rate' lookup table in
 the
        output-associated electromigration group cannot use
 'err_template' as its template. (LBDB-469)
```

What Next

For more information about lookup tables, see the *Library Compiler User Guide*. Change the library source file by referencing a different template in the lookup table description.

LBDB-470

(error) The two-dimensional '%s' lookup table in the\n \t%s-associated electromigration group cannot use '%s' as its template.

Description

The two-dimensional em_max_toggle_rate lookup table in an output-associated electromigration group must use a template with *input_transition_time* and *total_output_net_capacitance* as its variables.

The following example shows an instance where this message occurs:

```
em_lut_template(ok_template) {
    variable_1 : input_transition_time;
    index_1("0, 1, 2, 3");
    variable_2 : total_output_net_capacitance;
    index_2("0, 1, 2, 3");
  }
  em_lut_template(err_template) {
    variable_1 : total_output_net_capacitance;
    index_1("0, 1, 2, 3");
    variable_2 : constrained_pin_transition;
    index_2("0, 1, 2, 3");
  }

        em_max_toggle_rate(err_template) {
                values ("1, 2, 3, 4", "5, 6, 7, 8", \
                        "9, 10, 11, 12", "13, 14, 15, 16");
        }
```

To fix the problem, change the template value of the *em_max_toggle_rate* attribute from err_template to ok_template.

The following is an example message:

```
Error: Line 126, The 2-dimensional 'em_max_toggle_rate' lookup table in
 the
        output-associated electromigration group cannot use
 'err_template' as its template. (LBDB-470)
```

What Next

Refer to the *Library Compiler User Guide* for more information about lookup tables. Change the library source file by referencing a different template in the lookup table description.

LBDB-471

(warning) The current_type cannot be the same as the one on line\n \t%d which is under the same electromigration() group. Using the last\n \tem_max_toggle_rate group encountered.

Description

Library Compiler considers em_max_toggle_rate groups with same current_type value attribute as duplicate group. If both em_max_toggle_rate groups don't specify the current_type attribue, they are also considered duplicate. Library Compiler ignores all duplicate em_max_toggle_rate groups except the last one encountered during the compilation. The compiled database contains the last one only.

The following example shows an instance where this message occurs:

```
pin(Q){
       ...
       electromigration() {
         em_max_toggle_rate(em_2d) {
                 current_type : average ;
                 values ("1, 2, 3, 4", "5, 6, 7, 8", \
                         "9, 10, 11, 12", "13, 14, 15, 16");
         }
         em_max_toggle_rate(em_2d) {
                 current_type : average ;
                 values ("21, 22, 23, 24", "25, 26, 27, 28", \
                         "29, 30, 31, 32", "33, 34, 35, 36");
         }
          related_pin : "A";
       }
  }
```

To fix the problem, remove one of the em_max_toggle_rate tables.

Feedback

```
pin(Q){
      ...
      electromigration() {
        em_max_toggle_rate(em_2d) {
                current_type : average ;
                values ("1, 2, 3, 4", "5, 6, 7, 8", \
                        "9, 10, 11, 12", "13, 14, 15, 16");
        }
        related_pin : "A";
      }
  }
```

The following is an example message:

```
Error: Line 11, The current_type cannot be the same as the one on line
      6 which is under the same electromigration() group.  Using the last
      em_max_toggle_rate group encountered. (LBDB-471)
```

What Next

Change the library source file by removing any extra em_max_toggle_rate tables within the electromigration group.

LBDB-472

(warning) The timing type of the timing arc from '%s' to\n \t'%s' is changed from '%s' to\n \t'%s'.

Description

The functional relationships between the pin and the related pin(s) dictate that this timing arc is non-rising or non-falling. This is due to the input sharing between function, three_state, and x_function.

The following example shows an instance where this message occurs:

```
pin(io){
      direction : output;
      function : "!ap & !an";
      three_state : "ap & !an";
      x_function : "!ap & an";

      timing() {
        related_pin : "ap an";
        timing_type : three_state_disable;
        ...
      }
      ...
  }
```

To fix, change functions or change timing_types.

Feedback

```
pin(io){
      ...
      timing() {
        related_pin : "ap an";
        timing_type : three_state_disable_rise;
        ...
      }
      ...
  }
```

The following is an example message:

```
Warning: Line 9, The timing type of the timing arc from 'ap' to
        'io' is changed from 'three_state_disable' to
        'three_state_disable_rise'. (LBDB-472)
```

What Next

Change the library source file so that expected timing types are entered. In case of an error, change the functional description.

LBDB-473

(error) The timing label '%s' is already used for \n \tanother timing arc in the same cell.

Description

You receive this error message when the given timing label is invalid because it was already used by another timing arc in the cell. Duplicate timing labels are not allowed within a cell.

What Next

Edit the timing label list so that there is not a label in the list that is used in another timing group in the cell.

LBDB-474

(error) The timing group has incorrect number of labels.

Description

You receive this error message when the timing group at the specified line has either too many or too few specified labels.

What Next

Edit the timing label list in your library so that the timing group has the right number of labels specified.

Feedback

LBDB-475

(error) The port '%s' is missing the attribute '%s'.

Description

You receive this error message when the *rise_capacitance* attribute or the *fall_capacitance* attribute for a port is missing and the other attribute is specified. Both or neither of the attributes must be specified.

What Next

Specify the missing attribute or remove the specified attribute.

LBDB-476

(warning) The port '%s' does not have the attribute '%s' specified. The value %f will be assigned to the attribute.

Description

You receive this error message when the *rise_capacitance* and *fall_capacitance* attributes are specified for a port, and the *capacitance* attribute is not. The maximum value between *rise_capacitance* and *fall_capacitance* will be assigned to the attrribute.

What Next

If you accept the value assigned to the attribute referenced in the error message, no action is required on your part. If not, assign a value to the attribute.

LBDB-477

(error) The table %s has invalid intermediate_values \n \tentry.

Description

This message indicates that a intermediate_values table contain invalid values. The values have to be between zero and the corresponding values from the values table attribute.

What Next

Edit the intermediate_values table so that it no longer contains invalid values.

LBDB-478

(error) The intermediate_values cannot be used with \n \tcurrent setting of output delay threshold voltages.

Feedback

Description

This message indicates that the output delay threshold voltages are not valid for the intermediate_values table. The intermediate_values table values are used to specify the values from first slew point to the output delay point. The assumption is that the output delay point lies between the two slew points. This error message is issued when Library Compiler detects that the output delay point does not lie between the two slew points and intermediate_values table was used.

What Next

Stop using the intermediate_values table or edit the library-level attributes for threshold voltages (for delay and slew).

LBDB-479

(error) when '%s' is specified '%s' has to be \n \t given as well.

Description

This message indicates that a rise net delay table was given without a fall net delay table (or vice versa). Both tables are expected by the wire delay estimator.

What Next

Edit the library source file to add the missing table or delete the incomplete table for the file to compile.

LBDB-480

(error) Missing a timing arc of timing_type 'three_state_disable' between the '%s' and '%s' pins in the '%s' cell.

Description

To describe the transition from 0->Z or 1->Z, use the timing arc with a timing_type of *three_state_disable* for the pin with a *three_state* attribute.

The following example shows an instance where this message occurs:

```
cell(BTS4)  {
        area : 3.0;
    pin(Z)  {
      direction : output;
      function : "A";
      three_state : "E";
      timing()  {
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
```

```
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "A";
      }
      timing()  {
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "E";
      }
    }
    pin(A)  {
      direction : input;
        capacitance : 1.0;
    }
    pin(E)  {
      direction : input;
        capacitance : 1.0;
    }
  }
```

The following is an example message:

```
Error: Line 110, Missing a timing arc of timing_type
 'three_state_disable'
        between 'E' and 'Z' pins in the 'lbfb35' cell. (LBDB-480)
```

What Next

Add the missing timing group between the two pins. To change the message to a warning, set the environment variable *timing_check_all_errors* to 0.

LBDB-481

(warning) Port %s has multiple default timing arcs.\n \tOnly one arc is used as the default arc.

Description

You receive this message because a port has multiple default timing arcs in the case of State Dependent Timing. This is probably due to two conditions: First, a timing arc with no WHEN statement has been given as a default arc. Second, one timing arc with a condition has been specified as a default timing arc by having its *default_timing* attribute set for the arc.

What Next

Examine the library source file, and remove all but one default timing arc.

Feedback

LBDB-482

(error) Port %s has multiple timing \n \tarcs with default_timing attribute set.

Description

You receive this message because a port has multiple timing arcs with the *default_timing* attribute set. A port with State Dependent Timing should have only one timing arc. A library with this error does not compile.

What Next

Examine the library source file, and reset all but one timing arc of the *default_timing* attribute for the port.

LBDB-483

(error) Cannot find include file '%s',%s.

Description

You receive this message because one of the following: The *include()* attribute has been used to include a file but the file could not be located in the search path.

The file exists but it also includes another library file.

What Next

Add the missing include file or do not use "nested" include file.

LBDB-484

(error) No variables statement is specified in the '%s' poly_template.

Description

You receive this message because you did not define a variables statement in the specified poly_template group. Library Compiler expects you to define one variables statement there.

The following example shows an instance where this message occurs: The following example shows a poly_template named *p1* that is missing a variables statement:

```
poly_template(p1) {
  variable_1_range("1,2");
  variable_2_range("3,4");
}
```

Feedback

To correct the problem in the example above, insert the following statement in the *p1* poly_template group:

```
variables("temperature, total_output_net_capacitance");
```

The following is an example message:

```
Error: Line 191, No variables statement is specified in the 'p1'
 poly_template. (LBDB-484)
```

What Next

Define a variables statement for the specified poly_template.

LBDB-485

(error) Incompatible variable '%s' is used in the '%s' \n \tpoly_template.

Description

You receive this message because you defined an invalid variable in the variables statement in the poly_template group.

The following example shows an instance where this message occurs: In the following example, the *whatever* variable value is not valid in the *p1* poly_template.

```
poly_template(p1) {
  variables("whatever, total_output_net_capacitance");
  variable_1_range("1,2");
  variable_2_range("3,4");
}
```

To correct the problem in the example above, insert the following statement in the *p1* poly_template group:

```
variables("temperature, total_output_net_capacitance");
```

The following is an example message: Error: Line 191, Incompatible variable 'whatever' is used in the 'p1' poly_template. (LBDB-485)

What Next

Define a variable name for the specified poly_template.

LBDB-486

(warning) Variable range outside variable \n \tdimension is defined in '%s' poly_template.

Feedback

Description

You receive this message because you have defined a variable range outside the dimension of the poly_template.

The following example shows an instance where this message occurs: The following example shows a *variable_2_range* variable value that cannot be used in the *p1* poly_template.

```
poly_template(p1) {
  variables("total_output_net_capacitance");
  variable_1_range("1,2");
  variable_2_range("3,4");
}
```

Correct it by removing the *variable_2_range* statement.

The following is an example message: Warning: Line 191, Variable range outside variable dimension is defined in 'p1' poly_template. (LBDB-486)

What Next

Remove the statement for the variable range that is not in use.

LBDB-487

(error) No range information defined for variable_%d in\n\ \t'%s' poly_template.

Description

You receive this message because you have not defined the range for one of the variables used in the poly_template.

The following example shows an instance where this message occurs: The following example shows a *p1* poly_template that is missing the *variable_1_range* statement.

```
poly_template(p1) {
  variables("temperature, total_output_net_capacitance");
  variable_2_range("3,4");
}
```

Correct it by adding the following statement in the poly_template group:

```
variable_1_range("1,2");
```

The following is an example message: Error: Line 191, No range information defined for variable_1 in 'p1' poly_template. (LBDB-487)

What Next

Add the *variable_n_range* statement for the specified variable.

Feedback

LBDB-488

(error) No variables statement specified in '%s' \n \tdomain of '%s' poly_template.

Description

You receive this message because you have not defined a variables statement in this domain of the poly_template group.

The following example shows an instance where this message occurs: The following example shows a domain named *d1* in a poly_template named *p1* that is missing the variables statement:

```
poly_template(p1) {
  ......
  domain (d1) {
    variable_1_range("1,2");
    variable_2_range("3,4");
  }
}
```

Correct it by adding the following statement in the poly_template group:

```
variables("temperature, total_output_net_capacitance");
```

The following is an example message:

```
Error: Line 191, No variables statement specified in 'd1' domain of 'p1'
 poly_template. (LBDB-488)
```

What Next

Define a variables statement for this domain in the poly_template.

LBDB-489

(error) Incompatible variable '%s' used '%s' domain \n \tof '%s' poly_template.

Description

You receive this message because you defined an invalid variable in the variables statement of this domain in the poly_template.

The following example shows an instance where this message occurs: The following example shows an invalid variable named *whatever* in the *p1* poly_template.

```
poly_template(p1) {
  ......
  domain(d1) {
    variables("whatever, total_output_net_capacitance");
    variable_1_range("1,2");
```

Feedback

```
    variable_2_range("3,4");
  }
}
```

Correct it by adding the following statement in the domain group:

```
variables("temperature, total_output_net_capacitance");
```

The following is an example message:

```
Error: Line 191, Incompatible variable 'whatever' used in 'd1' domain of
 'p1' poly_template. (LBDB-489)
```

What Next

Examine the name of the specified variable to determine the cause.

LBDB-490

(warning) Variable range outside variable \n \tdimension is defined in '%s' domain of '%s' poly_template.

Description

You receive this message because you have defined a variable range outside the dimension of the specified domain of the poly_template.

The following example shows an instance where this message occurs: The following example shows a *variable_2_range* statement that is useless in the *d1* domain of the *p1* poly_template.

```
poly_template(p1) {
  ......
  domain(d1) {
    variables("total_output_net_capacitance");
    variable_1_range("1,2");
    variable_2_range("3,4");
  }
}
```

Correct it by removing the *variable_2_range* statement.

The following is an example message: Warning: Line 191, Variable range outside variable dimension is defined in 'd1' domain of 'p1' poly_template. (LBDB-490)

What Next

Remove the variable range statement not in use.

Feedback

LBDB-491

(error) No range information defined for variable_%d in\n \t'%s' domain of '%s' poly_template.

Description

You receive this message because you have not defined a range for the specified variable used in this domain of the poly_template.

The following example shows an instance where this message occurs: The following example shows the *d1* domain of the *p1* poly_template with the *variable_1_range* statement missing.

```
poly_template(p1) {
  ......
  domain(d1) {
    variables("temperature, total_output_net_capacitance");
    variable_2_range("3,4");
  }
}
```

Correct it by adding the following statement:

```
variable_1_range("1,2");
```

The following is an example message: Error: Line 191, No range information defined for variable_1 in 'd1' domain of 'p1' poly_template. (LBDB-491)

What Next

Add a *variable_n_range* statement (substituting the specified variable number for *n*).

LBDB-492

(error) Power rail mapping information missing in\n \t'%s' poly_template.

Description

You receive this message because you have not defined the power rail mapping information for the *voltage2* variable in the poly_template.

The following example shows an instance where this message occurs: The following example shows the *p1* poly_template with the mapping statement missing.

```
poly_template(p1) {
  variables("temperature, voltage2, total_output_net_capacitance");
  ......
}
```

Feedback

Correct it by adding the following statement:

```
mapping("voltage2, VDD");
```

The following is an example message: Error: Line 191, Power rail mapping information missing in 'p1' poly_template. (LBDB-492)

What Next

Add the mapping statement in the poly_template.

LBDB-493

(error) Power rail mapping information missing in\n \t'%s' domain of '%s' poly_template.

Description

You receive this message because you have not defined the power rail mapping information for the voltage2 variable in the specified domain of the specified poly_template.

The following example shows an instance where this message occurs: The following example shows the *d1* domain of the *p1* poly_template with the mapping statement missing.

```
poly_template(p1) {
  ......
  domain(d1) {
    variables("temperature, voltage2, total_output_net_capacitance");
    ......
  }
}
```

Correct it by adding the following statement:

```
mapping("voltage2, VDD");
```

The following is an example message: Error: Line 191, Power rail mapping information missing in 'd1' domain of 'p1' poly_template. (LBDB-493)

What Next

Add the mapping statement in this domain of the poly_template.

LBDB-495

(error) Invalid number of dimensions in '%s' \n \t poly_template.

Feedback

Description

You receive this message because the number of variables you have defined in the poly_template is invalid.

The following example shows an instance where this message occurs: The following example shows a variables statement that defines the wrong number of variables in the *p1* poly_template.

```
poly_template(p1) {
  variables("");
  ......
}
```

Correct it by changing the variables statement in the poly_template group to the following:

```
variables("temperature, total_output_net_capacitance");
```

The following is an example message: Error: Line 191, Invalid number of dimensions in 'p1' poly_template. (LBDB-495)

What Next

Examine the variables statement to determine why the number of variables is invalid.

LBDB-496

(error) Invalid number of dimensions in '%s' \n \t domain of '%s' poly_template.

Description

You receive this message because the number of variables you have defined in the specified domain of the specified poly_template is invalid.

The following example shows an instance where this message occurs: The following example shows a variables statement that defines the wrong number of variables in the *d1* domain of the *p1* poly_template.

```
poly_template(p1) {
  ......
  domain (d1) {
    variables("");
    ......
  }
}
```

Correct it by changing the variables statement in this domain of the poly_template group to the following:

```
variables("temperature, total_output_net_capacitance");
```

Feedback

The following is an example message: Error: Line 191, Invalid number of dimensions in 'd1' domain of 'p1' poly_template. (LBDB-496)

What Next

Examine the variables statement to determine why the number of variables is invalid.

LBDB-497

(error) Incomplete range of variable in '%s' \n \t poly_template.

Description

You receive this message because the variable statement of the specified poly_template has an incomplete range.

The following example shows an instance where this message occurs: The following example shows the *p1* poly_template with an incomplete *variable_1_range* statement.

```
poly_template(p1) {
  variables("temperature, total_output_net_capacitance");
  variable_1_range("1");
  ......
}
```

Correct it by changing the *variable_1_range* statement in the poly_template group to the following:

```
variable_1_range("1,2");
```

The following is an example message: Error: Line 191, Incomplete range of variable in 'p1' poly_template. (LBDB-497)

What Next

Examine all *variable_n_range* statements (substituting each existing variable number for *n*) of the specified poly_template to determine those that have an incomplete range.

LBDB-498

(error) Incomplete range of variable in '%s' \n \t domain of '%s' poly_template.

Description

You receive this message because the variable statement in the specified domain of the specified poly_template has an incomplete range.

The following example shows an instance where this message occurs: The following example shows *d1* domain of the *p1* poly_template with an incomplete *variable_1_range* statement.

Feedback

```
poly_template(p1) {
  ......
  domain (d1) {
    variables("temperature, total_output_net_capacitance");
    variable_1_range("1");
    ......
  }
}
```

Correct it by changing the *variable_1_range* statement in the *d1* domain of the poly_template group to the following:

```
variable_1_range("1,2");
```

The following is an example message: Error: Line 191, Incomplete range of variable in 'd1' domain of 'p1' poly_template. (LBDB-498)

What Next

Examine all *variable_n_range* statements (substituting each existing variable number for *n*) in the specified domain of the specified poly_template to determine those that have an incomplete range.

LBDB-499

(error) No orders information defined for the polynomial.

Description

You receive this message because you have not defined the *orders* statement for the polynomial.

The following example shows an instance where this message occurs: The following example shows a poly timing group with a missing *orders* statement.

```
rise_constraint(constraint) {
    coefs("1.2095, 0.2281, 0.0225, -0.0001, 0.0678, -0.0002, 0.0000,
 0.0000");
  }
```

Correct it by adding the following statement before the *coefs* statement:

```
orders("1,1,1");
```

The following is an example message: Error: Line 191, No orders information defined for the polynomial. (LBDB-499)

What Next

Add the *orders* statement before the *coefs* statement.

Feedback

LBDB-500

(error) No orders information defined for '%s' \n \t domain of the polynomial.

Description

You receive this message because you have not defined the *orders* statement for this domain of the polynomial.

The following example shows an instance where this message occurs: The following example shows the *d1* domain of a poly timing group with a missing *orders* statement.

```
rise_constraint(constraint) {
    ......
    domain (d1) {
      coefs("1.2095, 0.2281, 0.0225, -0.0001, 0.0678, -0.0002, 0.0000,
 0.0000");
    }
  }
```

Correct it by adding the following statement before the *coefs* statement:

```
orders("1,1,1");
```

The following is an example message: Error: Line 191, No orders information defined for 'd1' domain of the polynomial. (LBDB-500)

What Next

Add the *orders* statement before the *coefs* statement.

LBDB-501

(error) No coefs information defined for the polynomial.

Description

You receive this message because you have not defined the *coefs* statement for the polynomial.

The following example shows an instance where this message occurs: The following example shows a poly timing group with a missing *coefs* statement.

```
rise_constraint(constraint) {
    orders("1,1,1");
  }
```

Correct it by adding the following statement after the *orders* statement:

```
coefs("1.2095, 0.2281, 0.0225, -0.0001, 0.0678, -0.0002, 0.0000,
 0.0000");
```

Feedback

The following is an example message: Error: Line 191, No coefs information defined for the polynomial. (LBDB-500)

What Next

Add the *coefs* statement after the *orders* statement.

LBDB-502

(error) No coefs information defined for '%s' \n \t domain of the polynomial.

Description

You receive this message because you have not defined the *coefs* statement for the specified domain of the polynomial.

The following example shows an instance where this message occurs: The following example shows the *d1* domain of a poly timing group with a missing *coefs* statement.

```
rise_constraint(constraint) {
    ......
    domain (d1) {
      orders("1,1,1");
    }
  }
```

Correct it by adding the following after the *orders* statement:

```
coefs("1.2095, 0.2281, 0.0225, -0.0001, 0.0678, -0.0002, 0.0000,
 0.0000");
```

The following is an example message: Error: Line 191, No coefs information defined for 'd1' domain of the polynomial. (LBDB-502)

What Next

Add the *coefs* statement for the specified domain after the *orders* statement.

LBDB-503

(Error) The low range setting is equal to or greater than the high range setting in %s.

Description

This warning message tells you that the values specified for the variable range setting statement are incorrect. Only temperature, voltages, and generic parameters can have the same low range and high range.

The following example shows an instance where this message occurs: The following example shows the p1 poly_template with an incomplete variable_1_range statement.

Feedback

```
poly_template(p1) {
  variables("temperature, total_output_net_capacitance");
  variable_1_range("100,1");
  ......
}
```

Correct it by changing the variable_1_range statement in the poly_template group to the following:

```
variable_1_range("1,100");
```

The following is an example message: Error: Line 191, The low range setting is equal to or greater than the high range setting in variable_1_range. (LBDB-503)

LBDB-504

(warning) Range setting in domain at variable_%d_range conflicts with template setting. Use the template setting instead.

Description

This warning tells you that the variable range setting statement has a range that conflicts with the range set previously in the template.

The following example shows an instance where this message occurs: The following example shows the p1 poly_template with an incorrect variable_1_range statement in the domain.

```
poly_template(p1) {
  variables("temperature, total_output_net_capacitance");
  variable_1_range("1,50");
  domain (d1) {
    variable_1_range("2,100");
  }
  ......
}
```

Correct it by changing the variable_1_range statement in the domain to the following:

```
variable_1_range("2,40");
```

The value 40 can be any number less than or equal to 50.

The following is an example message: Warning: Line 191, Range setting conflicts with template setting. (LBDB-504)

What Next

Examine all variable_*n*_range statements. Substitute each existing variable number for *n* in the specified poly_template to determine the statements that conflict with each other.

Feedback

LBDB-505

(error) Variable %s is not a voltage. Can only map voltages to a power rail.

Description

This error message tells you that the first variable in mapping is not a voltage. Only voltages can be mapped to a power rail.

The following example shows an instance where this message occurs: The following example shows the p1 poly template with an incorrect mapping statement.

```
poly_template(p1) {
  variables("temperature, voltage,total_output_net_capacitance");
  variable_1_range("20,150");
  variable_2_range("1.2,3.2");
  variable_3_range("10,30");
  mapping(temperature,VDD1);
  ......
}
```

Fix the mapping statement by changing the variable_1_range statement in the domain to the following:

```
mapping(voltage,VDD1);
```

The following is an example message: Error: Line 191, Variable temperature is not a voltage (LBDB-505).

What Next

Check the variables in the mapping and replace the first variable with a voltage.

LBDB-506

(error) Variable %s is not defined in the %s.

Description

This error message tells you that the first variable in mapping is not defined in the template.

The following example shows an instance where this message occurs: The following example shows the p1 poly_template with an incorrect mapping statement.

```
poly_template(p1) {
  variables("temperature, voltage,total_output_net_capacitance");
  variable_1_range("20,150");
  variable_2_range("1.2,3.2");
  variable_3_range("10,30");
  mapping(voltage1,VDD1);
```

```
  ......
}
```

Correct it by changing the variable_1_range statement in the domain to the following:

```
mapping(voltage,VDD1);
```

The following is an example message: Error: Line 191, Variable voltage1 is not defined in the template (LBDB-506).

What Next

Define the variable in the template, or change the variable_1_range statement in the domain.

LBDB-507

(error) Attempting to map to %s, which is defined in power_supply group. However, power_supply group is missing.

Description

This error message tells you that you have not defined a power_supply group before using its information.

The following example shows an instance where this message occurs: The following example shows the p1 poly_template with the mapping statement missing.

```
poly_template(p1) {
  variables("temperature, voltage2, total_output_net_capacitance");
  mapping("voltage2, VDD");
  ......
}
```

Correct it by adding the following statement before the template:

```
power_supply() {
    default_power_rail : VDD ;
  }
```

The following is an example message: Error: Line 191, Power_supply group missing but trying to map to %s, which is supposed to be defined in a power_supply group. (LBDB-507)

What Next

Add a power_supply group before the templates.

Feedback

LBDB-508

(error) The '%s' port has hyperbolic low groups. Only input pin or bidirectional pin can have hyperbolic low groups.

Description

Library Compiler issues this error message if one hyperbolic low group is defined within an output pin.

The following example shows an instance where this message occurs:

```
pin(Q){
      direction : output;
      ...
      hyperbolic_noise_low() {
        ...
      }
  }
```

To correct the problem, remove one of the hyperbolic low groups.

```
pin(Q){
      direction : output;
      ...
  }
```

The following is an example message:

```
Error: Line 6, The 'Q' port has hyperbolic groups.
        Only input pin or bidirectional pin can have hyperbolic low
 groups. (LBDB-508)
```

What Next

Change the library source file by removing the hyperbolic low groups within the output pin group.

LBDB-509

(error) The '%s' port has hyperbolic high groups.\n \tOnly input pin or bi-directional pin can have hyperbolic high groups.

Description

Library Compiler issues this error message if one hyperbolic high group is defined within a output pin.

Feedback

The following example shows an instance where this message occurs:

```
pin(Q){
      direction : output;
      ...
      hyperbolic_noise_high() {
      }
  }
```

To fix the problem, remove one of the hyperbolic high groups.

```
pin(Q){
      direction : output;
      ...
  }
```

The following is an example message:

```
Error: Line 6, The 'Q' port has hyperbolic groups.
        Only input pin or bi-directional pin can have hyperbolic high
 groups. (LBDB-509)
```

What Next

Change the library source file by removing the hyperbolic high groups within the output pin group.

LBDB-510

(error) The '%s' port has hyperbolic above_high groups.\n \tOnly input pin or bi-directional pin can have hyperbolic above_high groups.

Description

Library Compiler issues this error message if one hyperbolic above_high group is defined within a output pin.

The following example shows an instance where this message occurs:

```
pin(Q){
      direction : output;
      ...
      hyperbolic_noise_above_high() {
      }
  }
```

To fix the problem, remove one of the hyperbolic above_high groups.

```
pin(Q){
      direction : output;
      ...
  }
```

The following is an example message:

```
Error: Line 6, The 'Q' port has hyperbolic groups.
        Only input pin or bi-directional pin can have hyperbolic
 above_high groups. (LBDB-510)
```

What Next

Change the library source file by removing the hyperbolic above_high groups within the output pin group.

LBDB-511

(error) The '%s' port has hyperbolic below_low groups.\n \tOnly input pin or bi-directional pin can have hyperbolic below_low groups.

Description

Library Compiler issues this error message if one hyperbolic below_low group is defined within a output pin.

The following example shows an instance where this message occurs:

```
pin(Q){
      direction : output;
      ...
      hyperbolic_noise_below_low() {
      }
  }
```

To fix the problem, remove one of the hyperbolic below_low groups.

```
pin(Q){
      direction : output;
      ...
  }
```

The following is an example message:

```
Error: Line 6, The 'Q' port has hyperbolic groups.
        Only input pin or bi-directional pin can have hyperbolic
 below_low groups. (LBDB-511)
```

What Next

Change the library source file by removing the hyperbolic below_low groups within the output pin group.

Feedback

LBDB-512

(error) The '%s' port has noise hyperbolic groups.\n \tOnly one input/bi-directional port can have noise hyperbolic groups.

Description

Library Compiler issues this error message if more than one noise hyperbolic is defined within a timing.

The following example shows an instance where this message occurs:

```
pin(Q){
      direction : output;
      ...
      noise_hyperbolic_low() {
        ...
      }
  }
```

To fix the problem, remove one of the noise hyperbolic groups.

```
pin(Q){
      direction : output;
      ...
  }
```

The following is an example message:

```
Error: Line 6, The 'Q' port has noise hyperbolic groups.
        Only input/bi-directional ports can have noise hyperbolic groups.
 (LBDB-512)
```

What Next

Change the library source file by removing any extra noise hyperbolic groups within the pin group.

LBDB-513

(error) The '%s' port has repeated noise hyperbolic groups. Only one such group is allowed.

Description

Library Compiler issues this error message if more than one of the same noise hyperbolic group is defined within a timing.

Feedback

The following example shows an instance where this message occurs:

```
pin(Q){
      ...
      noise hyperbolic_low() {
        ...
      }
      noise hyperbolic_low() {
        ...
      }
  }
```

To correct the problem, remove extra noise hyperbolic groups.

```
pin(Q){
      ...
      noise hyperbolic_low() {
        ...
      }
  }
```

The following is an example message:

```
Error: Line 6, The 'Q' port has repeated noise hyperbolic groups.
        Only one such group is allowed. (LBDB-513)
```

What Next

Change the library source file by removing any extra noise hyperbolic groups within the timing group.

LBDB-514

(error) The constraint timing arc has noise immunity groups.\n \tOnly non-constraint timing arc can specify such info.

Description

Library Compiler issues this error message if noise immunity info is defined within a constraint timing arc.

The following example shows an instance where this message occurs:

```
pin(Q){
      direction : output;
      ...
      timing() {
         timing_type: setup_rising;
         ...
         noise_immunity_low() {
           ...
         }
```

```
      }
  }
```

To fix the problem, remove the noise immunity tables/polys.

```
pin(Q){
      direction : output;
      ...
      timing() {
         timing_type: setup_rising;
         ...
      }
  }
```

The following is an example message:

```
Error: Line 6, The timing arc has noise immunity groups.
        Only non-constraint timing arc can specify such info. (LBDB-514)
```

What Next

Remove the noise immunity tables/polys.

LBDB-515

(error) The '%s' port has repeated noise immunity groups inside timing group. Only one such group is allowed.

Description

Library Compiler issues this error message if more than one noise immunity is defined within a timing group.

The following example shows an instance where this message occurs:

```
pin(Q){
      ...
      timing() {
         ...
         noise_immunity_low() {
           ...
         }
         noise_immunity_low() {
           ...
         }
      }
  }
```

To correct the problem, remove extra noise immunity groups.

```
pin(Q){
      ...
```

Feedback

```
      timing() {
      ...
        noise_immunity_low() {
        ...
        }
      }
  }
```

The following is an example message:

```
Error: Line 6, The 'Q' port has repeated noise immunity groups inside
 timing group.
        Only one such group is allowed. (LBDB-515)
```

What Next

Change the library source file by removing any extra noise immunity tables or polys within the timing group.

LBDB-516

(error) The '%s' group uses\n \ttemplate '%s' which does not contain 'iv_output_voltage' as its variable.

Description

The iv characteristics group must use a 1-d iv characteristics template with *iv_output_voltage* as its variable.

The following example shows an instance where this message occurs:

```
iv_lut_template(ok_temp){
        variable_1 : iv_output_voltage;
        index_1("0.5,1.0,1.5,2.0,2.5");
    }
    iv_lut_template(err_temp){
        variable_1 : input_transition_time;
        index_1("0.5,1.0,1.5,2.0,2.5");
    }
    ...
         steady_state_current_high(err_temp) {
                values("1.385,2.554,3.722,4.891,6.059");;
        }
```

To fix the problem, change the template value of the *steady_state_current_high* attribute from *err_temp* to *ok_temp*.

The following is an example message:

```
Error: Line 126, The 'steady_state_current_high' group in the timing
       group cannot use 'err_temp' as its template. (LBDB-516)
```

Feedback

What Next

Change the library source file by including 'iv_output_voltage' in the template.

LBDB-517

(error) The '%s' lookup table in the\n \ttiming group cannot use '%s' as its template.

Description

The noise characteristics group must use a 2-d noise characteristics template with *input_noise_width, total_output_net_capacitance* as its variables.

The following example shows an instance where this message occurs:

```
noise_lut_template(ok_temp){
        variable_1 : input_noise_width;
        variable_2 : total_output_net_capacitance;
        index_2("1.0,2.0,4.0,6.0,10.0");
        index_2("0.5,1.0,1.5,2.0,2.5");
    }
    noise_lut_template(err_temp){
        variable_1 : input_net_transition;
        variable_2 : total_output_net_capacitance;
        index_2("1.0,2.0,4.0,6.0,10.0");
        index_2("0.5,1.0,1.5,2.0,2.5");
    }
    ...
         noise_immunity_high(err_temp) {
                values("0.733,1.073,1.412,1.752,2.092",\
                           "0.873,1.214,1.554,1.894,2.234",\
                           "1.095,1.442,1.787,2.132,2.477",\
                           "1.298,1.648,1.996,2.343,2.691",\
                           "1.703,2.060,2.414,2.766,3.119");
        }
```

To fix the problem, change the template value of the *noise_immunity_high* attribute from *err_temp* to *ok_temp*.

The following is an example message:

```
Error: Line 126, The 'noise_immunity_high' lookup table in the timing
       group cannot use 'err_temp' as its template. (LBDB-517)
```

What Next

Change the library source file by including 'input_noise_width' and 'total_output_net_capacitance' in the template.

Feedback

LBDB-519

(error) The timing arc has steady_state_resistance_low/high/above_high/below_low attribute specified.\n \tOnly combo, enable, disable, rising_edge, falling_edge, clear and preset timing arc can specify such attributes.

Description

Library Compiler issues this error message if any steady_state_resistance_low/high/above_high/below_low attribute is defined within a timing arc which is not combo, disable or enable.

The following example shows an instance where this message occurs:

```
pin(Q){
       ...
       timing() {
         timing_type : setup_rising;
         ...
         steady_state_resistance_high() {
            ...
         }
       }
  }
```

To fix the problem, remove the steady_state_resistance attributes.

```
pin(Q){
       ...
       timing() {
         timing_type : setup_rising;
         ...
       }
  }
```

The following is an example message:

```
Error: Line 6, The timing arc has
 steady_state_resistance_low/high/above_high/below_low attribute
 specified.
        Only combo, enable, disable, rising_edge, falling_edge, clear and
 preset timing arc can specify such attributes. (LBDB-519)
```

What Next

Change the library source file by removing such attributes inside the timing() group.

LBDB-520

(error) The timing arc has steady_state_current_high/low specified.\n \tOnly combo, rising_edge, falling_edge, preset and clear timing arcs can specify such info.

Feedback

Description

Library Compiler issues this error message if any steady_state_current_high/low group is defined within a timing group which is not combo, disable or enable.

The following example shows an instance where this message occurs:

```
pin(Q){
      ...
      timing() {
        timing_type : setup_rising;
        ...
        steady_state_current_high(iv1x5) {
           ...
        }
      }
  }
```

To fix the problem, remove the steady_state_current_high group.

```
pin(Q){
      ...
      timing() {
        timing_type : setup_rising;
        ...
      }
  }
```

The following is an example message:

```
Error: Line 6, The timing arc has steady_state_current_high/low
 specified.
       Only combo, rising_edge, falling_edge, preset and clear timing
 arcs can specify such info. (LBDB-520)
```

What Next

Change the library source file by removing such groups inside the timing() group.

LBDB-521

(error) The timing arc has steady_state_current_tristate specified.\n \tOnly enable or disable timing arc can specify such info.

Description

Library Compiler issues this error message if any steady_state_current_tristate group is defined within a timing group which is not disable or enable.

Feedback

The following example shows an instance where this message occurs:

```
pin(Q){
      ...
      timing() {
        timing_type : setup_rising;
        ...
        steady_state_current_tristate(iv1x5) {
           ...
        }
      }
  }
```

To fix the problem, remove the steady_state_current_tristate group.

```
pin(Q){
      ...
      timing() {
        timing_type : setup_rising;
        ...
      }
  }
```

The following is an example message:

```
Error: Line 6, The timing arc has steady_state_current_tristate
 specified.
        Only enable or disable timing arc can specify such info.
 (LBDB-521)
```

What Next

Change the library source file by removing such groups inside the timing() group.

LBDB-522

(error) The '%s' group in the\n \ttiming arc cannot use '%s' as its template.

Description

The noise characteristics group must use a 3-d noise characteristics template with *input_noise_width, input_noise_height, total_output_net_capacitance* as its variables.

The following example shows an instance where this message occurs:

```
...
    propagation_lut_template(ok_temp){
        variable_1 : input_noise_width;
        variable_2 : input_noise_height;
        variable_3 : total_output_net_capacitance;
        index_1("1.0,2.0,4.0,6.0,10.0");
        index_2("0.5,1.0,1.5,2.0,2.5");
```

Feedback

```
        index_3("0.5,1.0,1.5,2.0,2.5");
    }
    noise_lut_template(err_temp){
        variable_1 : input_net_transition;
        variable_2 : input_noise_height;
        variable_3 : total_output_net_capacitance;
        index_1("1.0,2.0,4.0,6.0,10.0");
        index_2("0.5,1.0,1.5,2.0,2.5");
        index_3("0.5,1.0,1.5,2.0,2.5");
    }
    ...
         propagation_noise_width_high(err_temp) {
                values("0.733,1.073,1.412,1.752,2.092",\
                           "0.873,1.214,1.554,1.894,2.234",\
                           "1.095,1.442,1.787,2.132,2.477",\
                           "1.298,1.648,1.996,2.343,2.691",\
                           ...
                           "1.703,2.060,2.414,2.766,3.119");
        }
```

To fix the problem, change the template value of the *propagation_noise_width_high* attribute from *err_temp* to *ok_temp*.

The following is an example message:

```
Error: Line 126, The 'propagation_noise_width_high' group in the timing
       arc cannot use 'err_temp' as its template. (LBDB-522)
```

What Next

Change the library source file by including 'input_noise_width', 'input_noise_height' and 'total_output_net_capacitance' in the template.

LBDB-523

(error) The related '%s' group is not specified for\n \tthe %s' group in the timing arc.

Description

The noise propagation width and height group must coexist for the same region(low, high, below_low, above_high).

The following example shows an instance where this message occurs:

```
...
        timing() {
                propagation_noise_width_high(ok_temp) {
                values("0.733,1.073,1.412,1.752,2.092",\
                           "0.873,1.214,1.554,1.894,2.234",\
                           "1.095,1.442,1.787,2.132,2.477",\
                           "1.298,1.648,1.996,2.343,2.691",\
                           ...
```

Feedback

```
                    "1.703,2.060,2.414,2.766,3.119");
                }
                propagation_noise_width_low(ok_temp) {
                values("0.733,1.073,1.412,1.752,2.092",\
                    "0.873,1.214,1.554,1.894,2.234",\
                    "1.095,1.442,1.787,2.132,2.477",\
                    "1.298,1.648,1.996,2.343,2.691",\
                    ...
                    "1.703,2.060,2.414,2.766,3.119");
                propagation_noise_height_low(ok_temp) {
                values("0.733,1.073,1.412,1.752,2.092",\
                    "0.873,1.214,1.554,1.894,2.234",\
                    "1.095,1.442,1.787,2.132,2.477",\
                    "1.298,1.648,1.996,2.343,2.691",\
                    ...
                    "1.703,2.060,2.414,2.766,3.119");
        }
        ...
```

To fix the problem, add the *propagation_noise_width_high* group in the timing group.

The following is an example message:

```
Error: Line 126, The related 'propagation_noise_height_high' group is not
 specified
        for the 'propagation_noise_width_high' group in the timing arc.
 (LBDB-523)
```

What Next

Add the missiong propagation group in the timing group.

LBDB-524

(error) Invalid variable '%s' is used in the '%s' \n \tpoly_template refered by %s group.

Description

You receive this message because you defined an invalid variable in the variables statement in the poly_template group refered by leakage_power or pin_capacitance group. The valid variables can only be temperature voltage, and power_rails.

The following example shows an instance where this message occurs: In the following example, the *whatever* variable value is not valid in the *p1* poly_template.

```
poly_template(p1) {
  variables("temperature, total_output_net_capacitance");
  variable_1_range("1,2");
  variable_2_range("3,4");
}
```

Feedback

To correct the problem in the example above, insert the following statement in the *p1* poly_template group:

```
variables("temperature, voltage");
```

The following is an example message: Error: Line 191, Invalid variable 'total_output_net_capacitance' is used in the 'p1' poly_template refered by leakage_power group.(LBDB-524)

What Next

Define a variable name for the specified poly_template.

LBDB-525

(error) Only polynomial format is supported for '%s' group.

Description

You receive this message because you defined an non-polynomial group, such as pin_capacitance() group, leakagage_power() group.

What Next

Please redefine these groups using polynomials.

LBDB-526

(warning) The always on cell has no always on pin related to backup power or ground.

Description

If the cell is an always_on buffer/invertor cell, then backup power/ground is the preferred related pg pin.

This message is showed up when the cell has backup power/ground, but there is no singal pin related to backup pg pins.

The following example shows an instance where this message occurs:

```
cell(test) {
   always_on : TRUE;
   pg_pin(PWR) {
   voltage_name : VDD;
   pg_type : primary_power;
   }
   pg_pin(GND) {
   voltage_name : VSS;
   pg_type : primary_ground;
   }
```

Feedback

```
    pg_pin(GND1) {
    voltage_name : VSS1;
    pg_type : backup_ground;
    }
    pg_pin(VDDI) {
    voltage_name : VDDH;
    pg_type : backup_power;
    }
    ...
    pin(A) {
         direction : input;
         related_power_pin : PWR;
         related_ground_pin : GND;
       ...
    }
    pin(Z) {
         direction : output;
         function : A;
         related_power_pin : VDD;
         related_ground_pin : GND;
      ...
    }
    ...
}
```

Both input pin A and output pin Z should connect to backup PG.

The following is an example message:

```
Warning: Line 335, Cell "test", The always on cell has no always on pin
 related to backup power or ground. (LBDB-526)
```

What Next

Check the library source file, and make the necessary correction.

LBDB-527

(warning) is_clock_isolation_cell attribute is not supported. It's marked as dont_use, dont_touch.

Description

Currently if an isolation cell is modeled using the is_clock_isolation_cell attribute, it can not be auto inferred by Galaxy design tools (e.g. Power Compiler). Thus the cell is being marked as dont_touch and dont_use during read_lib.

The following is an example message:

```
Warning: Line 1023, Cell 'A', is_clock_isolation_cell attribute is not
 supported. (LBDB-527)
```

Feedback

What Next

Warning only. No action is required.

LBDB-530

(error) The pin '%s' used in\n \t%s '%s' cannot specify the '%s' %s.

Description

This error message occurs when the pin with "is_isolated" attribute is used in the expression of isolation_enable_condition.

The following example shows an instance where this message occurs: The following is an example of incorrect input that causes this error message:

```
cell (lbdb530) {
    ...
    pin (EN) {
      direction   :   input;
      capacitance :   1.0;
      fanout_load :   1.0;
      is_isolated :   true;
    }
    pin(Q0){
        direction   :   output;
        function : "I1";
        is_isolated :   true;
        isolation_enable_condition : "EN";

    }
    ...
  }
```

In this case, pin EN used in the attribute isolation_enable_condition of pin Q0 has been specified with is_isolated attribute. To fix the error, remove is_isolated attribute from pin EN.

The following is an example message:

```
Error: Line 179, Cell 'lbdb530', pin 'Q0', The pin 'EN' used in
        attribute 'isolation_enable_condition' cannot specify the
 'is_isolated' attribute. (LBDB-530)
```

What Next

Check the library source file and remove is_isolated attribute from the pin, or don't use the pin in the expression of isolation_enable_condition.

Feedback

LBDB-541

(error) The pin '%s' in the short list is not an 'inout' pin.

Description

The port in "short" attribute must be direction "inout".

The following example shows an instance where this message occurs:

```
cell (c) {
  ...
  short(A, Y);
  pin (A) {
    direction : input ;
    ...
  }
  pin (Y) {
    direction : input ;
    ...
  }
}
```

The following is an example message:

```
Error: Line 145, Cell 'c', The pin 'A' in the short list is not an
 'inout' pin. (LBDB-541)
```

What Next

Correct the port direction.

LBDB-542

(error) The pin '%s' in the short list is missing pin capacitance attribute.

Description

The port in "short" attribute must be specified with "capacitance" (or "rise_capacitance/ fall_capacitance") attribute.

The following example shows an instance where this message occurs:

```
cell (c) {
  ...
  short(A, Y);
  pin (A) {
    ...
  }
  pin (Y) {
    capacitance : 0.01 ;
    ...
```

```
  }
}
```

The following is an example message:

```
Error: Line 145, Cell 'c', The pin 'A' in the short list is missing pin
 capacitance attribute. (LBDB-542)
```

What Next

Add the pin capacitance attribute on the port.

LBDB-543

(error) Found an inconsistant pin capacitance for the shorted pin.

Description

The ports in same “short” attribute must be specified with identical "capacitance" (or “rise_capacitance/fall_capacitance”) attribute.

The following example shows an instance where this message occurs:

```
cell (c) {
  ...
  short(A, Y);
  pin (A) {
    capacitance : 0.01 ;
    ...
  }
  pin (Y) {
    capacitance : 0.02 ;
    ...
  }
}
```

The following is an example message:

```
Error: Line 145, Cell 'c', Pin 'Y', Found an inconsistant pin capacitance
 for the shorted pin. (LBDB-543)
```

What Next

Correct the pin capacitance attribute on the port.

LBDB-544

(error) The "retention_equivalent_cell" attribute can not be specified in a retention cell.

Feedback

Description

This message indicates that both attribute "retention_cell" and "retention_equivalent_cell" are specified on the cell. The "retention_equivalent_cell" is for a non-retention cell to point to its retention equivalent cell. So it can only be specified on a non retention cell.

The following example shows an instance where this message occurs:

```
cell (ret_cell) {

    retention_cell : test;
    retention_equivalent_cell : my_ret_cell;

    ...

  }
```

The following is an example message:

```
Error: Line 149, Cell 'ret_cell', The "retention_equivalent_cell"
 attribute can not be specified in a retention cell. (LBDB-544)
```

What Next

Check the library source file, remove the retention_equivalent_cell attribute.

LBDB-545

(error) The "retention_equivalent_pin" attribute can not be specified in cell without "retention_equivalent_cell" attribute.

Description

This message indicates that the pin has attribute "retention_equivalent_pin", but no cell level attribute "retention_equivalent_cell" specified. "retention_equivalent_pin" can only be used together with "retention_equivalent_cell" to describe the pin name.

The following example shows an instance where this message occurs:

```
cell (cell) {

    /* retention_equivalent_cell : my_ret_cell; */

    pin(D) {
      retention_equivalent_pin : DD;
      ...
    }

    ...

  }
```

Feedback

The following is an example message:

```
Error: Line 149, Cell 'ret_cell', Pin 'D', The "retention_equivalent_pin"
 attribute can not be specified in cell without
 "retention_equivalent_cell" attribute. (LBDB-545)
```

What Next

Check the library source file, add the retention_equivalent_cell attribute.

LBDB-546

(warning) The "retention_equivalent_cell" can not be specified in a non-black-box cell.

Description

This message indicated that cell is not a black-box cell, but is specified with "retention_equivalent_cell" attribute. The "retention_equivalent_cell" is desired for complex cell, so the cell should be black-box.

What Next

Check the library source file, remove the retention_equivalent_cell attribute.

LBDB-547

(warning) The cell referenced by "retention_equivalent_cell" attribute must be a retention cell.

Description

This message indicates that the cell referenced by "retention_equivalent_cell" is not a retention cell, it is missing the "retention_cell" attribute, or the attribute is pointing to a wrong cell.

The following example shows an instance where this message occurs:

```
cell (cell) {

    retention_equivalent_cell : my_ret_cell;

    ...

  }

  cell (my_ret_cell) {

    /* retention_cell : test; */

    ...
```

Feedback

```
}
```

The following is an example message:

```
Warning: Line 149, Cell 'my_ret_cell', The cell referenced by
 "retention_equivalent_cell" attribute must be a retention cell.
 (LBDB-547)
```

What Next

Check the library source file, add the retention_cell attribute, or correct the retention_equivalent_cell attribute.

LBDB-548

(warning) The cell referenced by "retention_equivalent_cell" attribute can't have dont_use attribute.

Description

This message indicates that the cell referenced by "retention_equivalent_cell" is a dont_use cell. This is wrong for optimization tools.

The following example shows an instance where this message occurs:

```
cell (cell) {

    retention_equivalent_cell : my_ret_cell;

    ...

  }

  cell (my_ret_cell) {

    dont_use: true;

    ...

  }
```

The following is an example message:

```
Error: Line 149, Cell 'my_ret_cell', The cell referenced by
 "retention_equivalent_cell" attribute can't have dont_use attribute.
 (LBDB-548)
```

What Next

Check the library source file, remove the dont_use attribute, or correct the retention_equivalent_cell attribute.

Feedback

LBDB-549

(warning) The cell referenced by "retention_equivalent_cell" attribute has inconsistent bias pg_pin setting with non-retention cell.

Description

If non-retention cell has bias pg_pin, its retention equivalent cell should also have bias pg_pin; If non-retention cell has no bias pg_pin, its retention equivalent cell should also have no bias pg_pin; This message indicates that the non-retention cell and its retention equivalent cell have different bias pg_pin setting.

The following example shows an instance where this message occurs:

```
cell (cell) {

    retention_equivalent_cell : my_ret_cell;

    /*
    pg_pin(VBP) {
      pg_type: pwell;
    }
    */
    ...

  }

  cell (my_ret_cell) {

    pg_pin(VBP) {
      pg_type: pwell;
    }

    ...

  }
```

The following is an example message:

```
Error: Line 149, Cell 'my_ret_cell', The cell referenced by
 "retention_equivalent_cell" attribute has inconsistent bias pg_pin
 setting with non-retention cell. (LBDB-549)
```

What Next

Check the library source file, correct the bias pg_pin setting.

LBDB-550

(warning) %s should be consistent with %s.

Feedback

Description

This message occurs when 2 or more related LVF table values should be consistent with each other.

```
The rules are issuing Warning when:
  Rule 1: mean_shift * skewness  < 0 (obsolete)
  Rule 2: skewness * (sigma_late - simga_early) < 0
  Rule 3: (std_dev - sigma_early) * (std_dev - sigma_late) > 0
```

For example, the corresponding values of skewness * (sigma_late - simga_early) should be negative.

The following example shows the inconsistent ocv_sigma_cell_fall early/late value and ocv_skewness_cell_fall table(ocv_std_dev_cell_fall value):

```
lu_table_template("del_1_8_7") {
    variable_1 : "input_net_transition" ;
    index_1("1, 2, 3, 4, 5, 6, 7, 8");
    variable_2 : "total_output_net_capacitance" ;
    index_2("1, 2, 3, 4, 5, 6, 7");
  }
 ...
 timing() {
   ...
    ocv_skewness_cell_fall(del_1_8_7) {
          index_1("0.004626, 0.009397, 0.01909, 0.03877, 0.07875, 0.16,
 0.3249, 0.66");
          index_2("0.000253, 0.0007021, 0.001949, 0.005408, 0.01501,
 0.04166, 0.1156");
          values("0.0003315, 0.0004154, 0.0006503, 0.001309, 0.003135,
 0.008191, 0.02237",\
                 "0.0003667, 0.0004518, 0.000687, 0.001345, 0.003174,
 0.008257, 0.02242",\
                 "0.0005104, 0.0005502, 0.0007653, 0.001423, 0.003261,
 0.00832, 0.0224",\
                 "0.0009744, 0.0009964, 0.001041, 0.001585, 0.003421,
 0.008503, 0.02259",\
                 "0.001875, 0.001913, 0.001975, 0.002119, 0.00375,
 0.008838, 0.02296",\
                 "0.003633, 0.003697, 0.003811, 0.004024, 0.004596,
 0.009506, 0.02362",\
                 "0.007095, 0.007179, 0.007403, 0.007758, 0.008299,
 0.01093, 0.02499",\
                 "0.01384, 0.0141, 0.01444, 0.01506, 0.01599, 0.01718,
 0.0278");
       }
   ...
 }

Warning: Line 1912, Cell 'STN_INV_1', pin 'X', related_pin 'A',
 when '', Rule 2, ocv_std_dev_cell_fall value [0.02237], the
 ocv_skewness_cell_fall value [0.02237] should be consistent with
```

Feedback

```
ocv_sigma_cell_fall early/late value [0.02411/-0.001501] (place: 6).
(LBDB-550)
```

What Next

Check the charaterization data which form the distribution and fix the values. These checks could be skipped if thresholds defined by global variable: - lc_lvf_skewness_threshold# if abs(skewness)<lc_lvf_skewness_threshold, then any skewness related checks will be skipped - lc_lvf_sigma_threshold#if abs(sigma_early-sigma_late)<lc_lvf_sigma_threshold, then any sigma related checks will be skipped - lc_lvf_normalized_skewness_threshold# if abs(skewness/std_dev)^3)<lc_lvf_normalized_skewness_threshold, then any skewness related checks will be skipped

See more on UIL-550 man page.

LBDB-551

(warning) The cell referenced by "retention_equivalent_cell" attribute can not be a non-black-box cell.

Description

This message indicated that retention equivalent cell is not a black-box cell. The cell referenced by "retention_equivalent_cell" is desired for a complex retention cell, so the cell should be black-box.

What Next

Check the library source file, correct the retention_equivalent_cell attribute.

LBDB-552

(warning) Can't find pin '%s' in the retention_equivalent_cell '%s'.

Description

For the non-retention cell with retention_equvialent_cell attribute, if any pin has no retention_equvialent_pin attribute, then the pin with same name should be exist in the referenced retention equivalent cell

For the retention equivalent pin referenced by retention_equvialent_pin attribute, the specified pin name should be existed in the retention equivalent cell

The following example shows an instance where this message occurs:

```
cell (cell) {

    retention_equivalent_cell : my_ret_cell;
```

Feedback

```
    pin(D) {
      ...
    }
    pin(E) {
      retention_equivalent_pin : EE;
      ...
    }

    ...

  }

  cell (my_ret_cell) {

    /*
    pin(D) {
      ...
    }
    pin(EE) {
      ...
    }
    */

    ...

  }
```

The following is an example message:

```
Warning: Line 139, Cell 'my_ret_cell', Pin 'D', Can't find pin 'D' in the
 retention_equivalent_cell 'my_ret_cell' (LBDB-552)
Warning: Line 149, Cell 'my_ret_cell', Pin 'E', Can't find pin 'EE'in the
 retention_equivalent_cell 'my_ret_cell' (LBDB-552)
```

What Next

Check the library source file, correct the retention_equivalent_pin attribute.

LBDB-553

(warning) The '%s' %s should not coexist with the '%s' %s.

Description

The first specified attribute/group should not coexist with the second specified attribute/group on the same group. For example, the *char_when_rise* attribute should not be specified with *char_when* attribute on the same timing group.

Feedback

The following example shows an instance where this message occurs:

```
cell(lbdb553) {
      Pin (Y) {
         timing () {
          related_pin : "IN";
            when : "A";
            char_when : "A*B";
            char_when_rise : "A*B";
            ...
         }
         ...
      }
      ...
   }
```

The following is an example message:

```
Warning: Line 2181, Cell 'lbdb553', pin 'Y', The 'char_when_rise'
 attribute should not coexist with the 'char_when' attribute. (LBDB-553)
```

What Next

Check the library source file, and remove the redundant one.

LBDB-555

(Error) The %s attribute is not defined for the library when %s is defined.

Description

This is for when a default attribute is required to be defined for the library but is not defined when certain attribute or group is defined.

The following is an example message:

```
Error: Line 10, The distance_unit attribute is not defined for the
 library when
default_ocv_derate_distance_group or ocv_derate_distance_group is
 defined. (LBDB-555)
```

What Next

Check the library source file, define the default attribute for the library.

LBDB-556

(Error) The '%s' ocv_derate group referenced by %s contains non-distance-based tables.

Feedback

Description

This is for when a default_ocv_derate_distance_group/ocv_distance_group attribute referenced an ocv_derate group, at least one ocv_derate_factor in that ocv_derate group used ocv_table_template that has "variable_1 : path_depth;" defined.

The following is an example message:

```
Error: Line 110, The 'ocv' ocv_derate group referenced by
 ocv_derate_group contains non-distance-based tables. (LBDB-556)
```

What Next

Check the library source file, use ocv_derate group that contain only distance-based tables.

LBDB-557

(error) The '%s' is missing in '%s' group.

Description

Required content is missing for the group.

The following example shows an instance where this message occurs:

```
cell ( test_cell )    {
      ocv_derate(ocv) {
        /* require ocv_derate_factors defined here */
      }
      ... ...
    }
```

The following is an example message:

```
Error: Line 144, The 'ocv_derate_factors' is missing in 'ocv_derate'
 group. (LBDB-557)
```

What Next

Check the library source file to see if you missed the required content for the specified group.

LBDB-558

(error) The '%s' %s group referenced by %s attribute is not found.

Feedback

Description

This message indicates that the attribute cross-referenced by its value an undefined group with specific name.

The following example shows an instance where this message occurs:

```
library(lbdb158) {
cell(IV) {
  ocv_derate_group : a_ocv_derate_not_defined;
  area : 1;
  pin(A) {
    direction : input;
    capacitance : 1;
  }
  pin(Z) {
    direction : output;
    function : "A'";
    timing() {
      intrinsic_rise : 0.1;
      intrinsic_fall : 0.1;
      rise_resistance : 0.1;
      fall_resistance : 0.1;
      slope_rise : 0.0;
      slope_fall : 0.0;
      related_pin : "A";
    }
  }
}
}
```

The following is an example message:

```
Error: Line 35, The 'a_ocv_derate_not_defined' ocv_derate group
 referenced by ocv_derate_group attribute
is not found. (LBDB-558)
```

What Next

Add the group if it is missing, or fix the attribute value if it has a typo.

LBDB-559

(warning) The '%s' table used different indices from the '%s' table.

Description

This message occurs when a look-up table used different indices from its master table. Using same indices between the tables is prefered.

Feedback

The following example shows the ocv_sigma_cell_rise table used different indices from cell_rise table:

```
lu_table_template(del_0_2_2) {
  variable_1 : input_net_transition;
  index_1("7.500000,325.000000");
  variable_2 : total_output_net_capacitance;
  index_2("1.100,10.000");
 }
 lu_table_template(del_1_2_2) {
  variable_1 : input_net_transition;
  index_1("17.500000,25.000000");
  variable_2 : total_output_net_capacitance;
  index_2("3.518,12.418");
 }
 ...
 timing() {
   ...
   ocv_sigma_cell_rise(del_1_2_2) {
     values( " 95.492787, 104.196860",\
             " 221.983170, 258.953160");
   }
   cell_rise(del_0_2_2) {
     values( " 95.492787, 104.196860",\
             " 221.983170, 258.953160");
   }
   ...
 }

Warning: Line 191, The 'ocv_sigma_cell_rise' table used different indices
 from the 'cell_rise' table. (LBDB-559)
```

What Next

Charaterize the library using same indices for the look-up tables.

LBDB-560

(error) The pin '%s' specified in the '%s' attribute is not a(n) %s pin.

Description

This error message occurs when a pin specified by this attribute has direction not of required type.

The following example shows an instance where this message occurs: The following example shows the attribute which needs a internal pin.

```
mode_value ( A2I ) {
    mode_value_internal_pin : A1 ;
    when : "EN" ;
```

Feedback

```
    sdf_cond : "EN=1" ;
}
```

The following is an example message:

```
Error: Line 191, The pin 'A1' specified in the 'mode_value_internal_pin'
 attribute is not a(n) internal pin. (LBDB-560)
```

What Next

Specify a correct pin for this attribute.

LBDB-561

(error) The event instance event(%s, %s) is invalid.

Description

The event instance delaration must be referring to a mode_definition and one of its event_defintion.

The following example shows an incorrect event instance:

```
cell(CGNP) {
  area : 1;
  mode_definition(rw) {
    mode_value(read) {
      ...
    }
    mode_value(write) {
      ...
    }
    event_definition (I2A) {
        start_mode : "read" ;
        end_mode : "write" ;
    }

  }
    dynamic_current () {
      event(rw, latching);
      ...
    }
  ...
}
```

The following is an example message:

```
Error: Line 206, The event instance event(rw, latching) is invalid.
 (LBDB-561)
```

Feedback

What Next

Check for consistency between mode group and event definitions, and event instance declarations.

LBDB-562

(error) '%s' only allows single pin Boolean-expression.

Description

This error message occurs when Boolean expression contains multiple pins defined for the specified attribute.

The following example shows an incorrect Boolean expression.

```
cell(CGNP) {
  area : 1;
  mode_definition(rw) {
    mode_value(read) {
      ...
    }
    mode_value(write) {
      ...
    }
    event_trigger () {
        trigger_transition : "clock + EN";
    }
  }
  ...
}
```

The following is an example message:

```
Error Line 272, "trigger_transition" only allows single pin
 Boolean-expression. (LBDB-562)
```

What Next

Check the Boolean expression.

LBDB-563

(error) The '%s' must be defined within a mode_defintion group with mutually_exclusive_mode_values is true.

Description

This error message occurs when specified attribute defined within a mode_defintion group which has no attribute mutually_exclusive_mode_values or its value is false.

Feedback

The following example shows an instance where this message occurs: The following example shows an incorrect mode_defintion group.

```
cell(CGNP) {
  area : 1;
  mode_definition(rw) {
    default_mode : "read" ;
    mode_value(read) {
      ...
    }
    mode_value(write) {
      ...
    }
  }
  ...
}
```

The following is an example message:

```
Error: Line 540, The 'default_mode' must be defined within a
 mode_defintion
group with mutually_exclusive_mode_values is true. (LBDB-563)
```

What Next

Add mutually_exclusive_mode_values : true or remove the attribute in the mode_defintion group.

LBDB-564

(information) The event instance is defined multiple times for the same group.

Description

This message indicates that you specified multiple event instances for a power group. All the event instances will be retained.

The following example shows an instance where this message occurs:

```
cell(CGNP) {
  area : 1;

  dynamic_current () {
      event(rw, A2I);
      event(rw, I2S);
  }
}
```

The following is an example message:

```
Information: Line 206, The event instance is defined multiple times
        for the same group. (LBDB-564)
```

Feedback

What Next

Please make sure that it is your real intention to have multiple events that apply to the power group.

LBDB-566

(warning) the macro cell has the switch_cell_type: coarse_grain. It is marked as dont_touch and dont_use.

Description

If macro cell has switch_cell_type, it should be fine_grain. This message means that this macro cell has the switch_cell_type: coarse_grain, it is marked as dont_touch and dont_use, it can not be auto inferred by galaxy design tools (e.g. ICC1/ICC2 router).

The following example shows an instance where this message occurs:

```
cell(A) {
    is_macro_cell : true;
    switch_cell_type : coarse_grain;
  }
```

The following is an example message:

```
Warning: Line 1023, Cell 'A', the macro cell has the switch_cell_type:
 coarse_grain. It is marked as dont_touch and dont_use. (LBDB-566)
```

What Next

Correct the "switch_cell_type" to fine_grain for the macro cell.

LBDB-567

(error) The swing of the slew/transition is more than 100% which is not possible.

Description

This error message occurs when (slew_upper_threshold_pct_rise - slew_lower_threshold_pct_rise) / slew_derate_from_library > 100 or (slew_upper_threshold_pct_fall - slew_lower_threshold_pct_fall) / slew_derate_from_library > 100. If a slew after considering the slew_derate factor is more than 100%, such a waveform slew for any characterization waveform points to waveform going beyond the rail to rail swing which is not possible.

The following example shows an instance where this message occurs:

```
library( MyLib ) {
  slew_derate_from_library : 0.5;
  slew_lower_threshold_pct_rise : 20.0;
```

Feedback

```
  slew_upper_threshold_pct_rise : 80.0;
  ...
}
```

From the above information the slew/transition has a swing of more than 100% which is not possible.

The following is an example message:

```
Error: Line 140, The swing of the slew/transition is more than 100% which
 is not possible. (LBDB-567)
```

What Next

correct the slew thresholds or slew derate such that its swing is less than rail-to-rail.

LBDB-567w

(warning) The swing of the slew/transition is more than 100% which is not possible.

Description

This warning message occurs when (slew_upper_threshold_pct_rise - slew_lower_threshold_pct_rise) / slew_derate_from_library > 100 or (slew_upper_threshold_pct_fall - slew_lower_threshold_pct_fall) / slew_derate_from_library > 100. If a slew after considering the slew_derate factor is more than 100%, such a waveform slew for any characterization waveform points to waveform going beyond the rail to rail swing which is not possible.

The following example shows an instance where this message occurs:

```
library( MyLib ) {
  slew_derate_from_library : 0.5;
  slew_lower_threshold_pct_rise : 20.0;
  slew_upper_threshold_pct_rise : 80.0;
  ...
}
```

From the above information the slew/transition has a swing of more than 100% which is not possible.

The following is an example message:

```
Warning: Line 140, The swing of the slew/transition is more than 100%
 which is not possible. (LBDB-567w)
```

What Next

correct the slew thresholds or slew derate such that its swing is less than rail-to-rail.

Feedback

LBDB-568

(warning) Cell '%s' has %d async signal pins, user must specify one async signal pin for level shifter cell or isolation cell with more than 3 pins. It's marked as dont_use, dont_touch.

Description

This warning message occurs when the level shifter or isolation cell has more than 3 pins, but the number of async signal pin is not 1. The cell will be marked as dont_use, dont_touch except one condition for level shift with more than 3 pins. The condition is: isDifferentLS is true, and including 3 input pins, 1 output pin, 1 level shifter enable pin.

The following is an example message:

```
Warning: Line 191, Cell 'LS', Cell 'LS' has 0 async signal pins, user
 must
specify one async signal pin for level shifter cell or isolation cell
 with
more than 3 pins. It's marked as dont_use, dont_touch.
```

What Next

This is only a warning message. No action is required.

You could correct the modeling in the previous example to specify the cell with exact 1 async signal pin.

LBDB-569

(warning) The std cell has the switch_cell_type: fine_grain. It is marked as dont_touch and dont_use.

Description

If std cell has switch_cell_type, it should be coarse_grain. This message means that this std cell has the switch_cell_type: fine_grain, it is marked as dont_touch and dont_use, it can not be auto inferred by galaxy design tools (e.g. ICC1/ICC2 router).

The following example shows an instance where this message occurs:

```
cell(A) {
    switch_cell_type : fine_grain;
  }
```

The following is an example message:

```
Warning: Line 1023, Cell 'A', The std cell has the switch_cell_type:
 fine_grain. It is marked as dont_touch and dont_use. (LBDB-569)
```

Feedback

What Next

Correct the "switch_cell_type" to coarse_grain for the std cell.

LBDB-580

(error) This retention cell is not a valid sequential device in normal mode.

Description

```
When retention pin disable values are appied, the sequential elements do
 not function.
This may be due to user was intended to model a zero-pin retention cell
 but put a wrong
retention_pin attribute on the clock signal.
```

The following example shows an instance where this message occurs:

```
library(test) {
 ...
  cell (zpr) {
    ...
    pin(clk) {
      direction : input ;
      related_ground_pin : vss ;
      related_power_pin : vcc_in ;
      retention_pin(save_restore, 1); /* wrong attribute, should be
 removed */
      ...
    }

    latch(IQ1,IQN1) {
      enable : "!clk" ;
      data_in : "d" ;
      power_down_function : "!vcc+vss" ;
    }
    latch(IQ2,IQN2) {
      enable : "clk" ;
      data_in : "IQ1" ;
      power_down_function : "!vcc_in+vss" ;
    }

    retention_condition() {
      required_condition : "!clk";
      power_down_function : "!vcc+vss" ;
    }

    ...
  }
}
```

The following is an example message:

```
Error: Line 3, Cell 'zpr', This retention cell is not a valid sequential
 device in normal mode.
```

What Next

```
Remove the "retention_pin" attribute in this cell.
```

LBDB-581

(warning) The '%s' pg_pin '%s' is using '%s' logic in power_down_function.

Description

```
The pg_pin specified as power pg_type should have negative logic in
 power_down_function;
The pg_pin specified as ground pg_type should have positive logic in
 power_down_function.

This message indicate that the pg_pin logic in the power_down_function is
 wrong.
```

The following example shows an instance where this message occurs:

```
library(test) {
 ...
  cell (a) {
    ...
    pg_pin(vdd) {
      pg_type : primary_power;
      ...
    }
    pg_pin(vss) {
      pg_type : primary_ground;
      ...
    }

    pin(out) {
      power_down_function : "vdd+vss" ;
      ...
    }

    ...
  }
}
```

The following is an example message:

```
Error: Line 300, Cell 'a', pin 'out', The 'power' pg_pin 'vdd' is using
 'positive' logic in power_down_function.
```

Feedback

What Next

Correct the pg_pin logic in power_down_function.

LBDB-582

(error) The 'true' is_pass_gate attribute is conflicting with \n \tthe 'true' is_inverting attribute for the '%s' group.

Description

This message indicates you specified 'true' is_pass_gate attribute and 'true' is_inverting attribute simltaneously for the same CCB (i.e., the same ccsn_first_stage, ccsn_last_stage, input_ccb or output_ccb group), which causes conflict.

The following example shows an instance where this message occurs.

```
library (test) {
   ...
   cell(inv) {
     ...
     pin(A) {
       direction : input;
       input_ccb(iccb) {
         is_inverting : true;
         is_pass_gate : true;
         ...
       }
       ...
    }
    ...
 }
```

The following is an example message:

```
Error: Line 74, Cell 'inv', pin 'A', The 'true' is_pass_gate attribute is
 conflicting with
the 'true' is_inverting attribute for the 'input_ccb' group. (LBDB-582)
```

What Next

Change the library file by either remove the is_pass_gate attribute from the CCB or specify 'false' is_inverting attribute for the CCB.

LBDB-586

(error) This timing group is missing NLDM '%s' data to work with 'propagating_ccb' attribute at line %u.

Feedback

Description

In the referenced ccs noise data modeling (hereinafter "ccb modeling"), there is a synergy between NLDM delay data and input_ccb/output_ccb data referenced by the attribute propagating_ccb. However, a required data (cell_rise, cell_fall, rise_transition, fall_transition) is not found, as indicated by the message.

Examples

Error: Line 1564, Cell 'INV_X8M_A9TL', pin 'Y', This timing group is missing NLDM 'cell_rise' data to work with 'propagating_ccb' attribute at line 2815. (LBDB-586)

What Next

Add missing data.

LBDB-587

(warning) attribute '%s'. Input slew (vector/index_1) not matching between '%s' at line %u of 'input_ccb' stage (line %u) and '%s' at line %u of 'output_ccb' stage (line %u). Mismatch %s.

Description

In a two-stage propagation_ccb usage, both referenced ccb stages must have the same set of input slew values (vector/index_1 of respective output_voltage_rise/fall groups), matching in size and values.

Warning: Line 5085, Cell 'AND2_X2M_A9TL', pin 'Y', attribute 'propagating_ccb'.
Input slew (vector/index_1) not matching between 'output_voltage_rise' at line 3118 of 'input_ccb' stage (line 3017) and 'output_voltage_fall' at line 6424 of 'output_ccb' stage (line 6382). Mismatch in size. (LBDB-587)

What Next

Correct characterization procedure.

LBDB-588

(error) attribute '%s'. The referenced '%s' stage at line %u has more than one load value in its 'vector/index_2' of '%s' at line %u.

Description

The issue is related to a two-stcge input_ccb/output_ccb configuration. The input_ccb stage has more than one index_2 value ("total_output_net_capacitance") among the vectors of its output_voltage_rise/fall group. However, this stage drives a fixed internal oad

Feedback

(i.e. the output ccb stage), no internal load variation is currently supported. Hence there can only be one index_2 value.

This problem may be caused by the use of the same input_ccb in a single-stage propagating_ccb of another timing group.

Examples

Error: Line 7492, Cell 'custom_cell_xwy', pin 'nx2', attribute 'propagating_ccb'. The referenced 'input_ccb' stage at line 488 has more than one load value in its 'vector/index_2' of 'output_voltage_rise' at line 561. (LBDB-588)

What Next

Correct the characterization procedure.

LBDB-589

(warning) The voltage value of middle 3 points should be consistent with that of delay/slew measure points in %s group.

Description

In referenced CCB noise modeling, the voltage value of middle three points (stored in attribute "values") in each vector group of output_voltage_rise group should be slew_lower_threshold_pct_rise, output_threshold_pct_rise, slew_upper_threshold_pct_rise of Vdd, and for output_voltage_fall group, slew_upper_threshold_pct_fall, output_threshold_pct_fall, slew_lower_threshold_pct_fall of Vdd.

The following example shows an instance where this message occurs:

```
library("test_library") {
  ...
  output_threshold_pct_fall : 50 ;
  output_threshold_pct_rise : 50 ;
  slew_lower_threshold_pct_fall : 30 ;
  slew_lower_threshold_pct_rise : 30 ;
  slew_upper_threshold_pct_fall : 70 ;
  slew_upper_threshold_pct_rise : 70 ;
  voltage_map(VDD, 0.765);
  ...

  cell(BUFX0P5BV0LI35P) {
    ...
    pin(A) {
      ...
      related_power_pin : VDD ;

      input_ccb(INVX1BV0LI35P__nco_0_FR_RF:a:z) {
```

Feedback

```
        ...
        output_voltage_fall() {

          vector(ccsn_wf1x1x5) {
            index_1("0.001000");
            index_2("0.000500");
            index_3("0.00430831, 0.00566391, 0.00721167, 0.00889193,
 0.0114251");
            values("0.688500, 0.535500, 0.482500, 0.229500, 0.076500");
          }
          ...
        }
        ...
      }
      ...
    }
    ...
  }
  ...
}
```

The following is an example message:

```
Warning: Line 1193, Cell 'BUFX0P5BV0LI35P', pin 'A', The voltage value of
 middle
 3 points should be consistent with that of delay/slew measure points in
output_voltage_fall group. (LBDB-589)
```

What Next

Fix the mistake. In the example above, the middle value should be: 0.382500.

LBDB-590

(warning) There is only %d index value(s) in '%s' for this %s table.

Description

To be able to calculate value that not on grid, there's minimal index values requirement on specific tables.

For pg_current in dynamic_current, the indices except time (the last index) in all vectors will be grouped and checked. If it has only one index, which usually is input_net_transition, at least three index values are needed. If it has multiple indices, then for each index, at least two index values are needed.

The following example has only one input_net_transition value of 5.1 in the pg_current table, and two total_output_net_capacitance values of 0.1 and 0.3.

```
pg_current(V2) {
        vector(test_2) {
```

Feedback

```
          reference_time : 93.2;
          index_1("5.1");
          index_2("0.1");
          index_3("8.2 8.3 9.0");
          values("3.78 92.4 100.1");
         }
        vector(test_2) {
          reference_time : 93.2;
          index_1("5.1");
          index_2("0.3");
          index_3("8.2 9.4 9.8");
          values("1.78 12.4 110.1");
         }
```

```
The following is an example message:
Warning: Line 518, Cell 'OR2', There is only 1 index value(s) in
 'input_net_transition' for this pg_current table. (LBDB-590)
```

What Next

Add more index values.

LBDB-591

(warning) The pg_current values are irregular, peak point is at beginning or end.

Description

This message is issued since the current waveform("values(...)") in the pg_current vector is abnormal, it has the peak value at beginning or end. Note: peak is the largest absolute value. This constraint will only be applied while output is switching, and if the peak value is under 1uA, which is closing to leakage current, the constraint is not needed.

The following example has the peak value at end.

```
vector(test_1) {
     reference_time : 23.7;
     index_1("0.8");
     index_2("0.7");
     index_3("10.4");
     index_4("8.2 8.5 9.1 9.4 9.8");
     values("0.7 34.6 3.78 92.4 100.1");
    }
```

The following is an example message:

```
Warning: Line 520, Cell 'OR2', The pg_current values are irregular, peak
 point is at beginning or end. (LBDB-591)
```

What Next

Check the characterization data.

Feedback

LBDB-592

(warning) Too few value points in this vector, at least '%d' values needed.

Description

This message is issued since the current waveform("values(...)") in the pg_current vector has too few points. At least three points are needed. The only exception is that all current values are under the threshold (1uA), which is closing to leakage current, then the requirement is not needed.

The following example has the peak value at end.

```
vector(test_1) {
     reference_time : 23.7;
     index_1("0.8");
     index_2("0.7");
     index_3("10.4");
     index_4("8.2 8.5");
     values("0.7 34.6");
    }
```

The following is an example message:

```
Warning: Line 520, Cell 'OR2', Too few value points in this vector, at
 least '3' values needed. (LBDB-592)
```

What Next

Check the characterization data.

LBDB-593

(error) value list of '%s' attribute not full range, or not monotonically %s.

Description

The value list of this attribute is either not full range or monotonic. The values are required to:

start at 0.0, and increase monotonically to 100.0, or

start at 100.0, and decrease monotonically to 0.0

The following example has two issues: the 3rd value is less than the 2nd, and the last one is not 100.0;

```
receiver_trip_threshold_pct_rise(0.0, 40.0, 30.0, 60.0, 75.0,
 85.0, 99.0);
```

Feedback

The following is an example message:

```
Error: Line 74, value list of 'receiver_trip_threshold_pct_rise'
 attribute not full range, or not monotonically increasing.
```

What Next

Fix the problem.

LBDB-594

(error) Unnamed CCB stage.

Description

All input_ccb & output_ccb groups must be given names. Named ccsn stages are placed only at pin group level. They are referenced, if needed, in acitve_input_ccb, active_output_ccb, & propagating_ccb attributes at timing group level.

The following "input_ccb" example does not have a name.

```
library (test) {
   ...
   cell(inv) {
      ...
     pin(A) {
       direction : input;
       input_ccb() {
         ...
       }
       ...
    }
    ...
 }
```

The following is an example message:

```
Error: Line 74, Cell 'inv', pin 'A', Unnamed CCB stage. (LBDB-594)
```

What Next

Add name to the input_ccb or output_ccb group.

LBDB-595

(error) CCB stage name '%s' already used by the %s group at line %u.

Feedback

Description

The name shown in the message is already used by another input_ccb or output_ccb group in the same pin group. Please replace it with a unique name, and update affected active_input_ccb, active_output_ccb, and propagating_ccb attributes.

The following example shows an instance where this message occurs. The CCB stage name *b* is used twice under pin b:

```
pin(b) {
     direction : inout;
     input_ccb(b) {
       ...
     }
     output_ccb(b) {
       ...
     }
     ...
   }
```

The following is an example message:

```
Error: Line 1813, Cell 'dup_names', pin 'I', CCB stage name 'b' already
used by the input_ccb group at line 1476. (LBDB-595)
```

What Next

Modify to make sure names are unique. For example:

```
pin(b) {
     direction : inout;
     input_ccb(b_in) {
       ...
     }
     output_ccb(b_out) {
       ...
     }
     ...
   }
```

LBDB-596

(error) The value of min_capacitance is greater than that of max_capacitance.

Description

This information occurs when the value of min_capacitance is greater than that of max_capacitance.

Feedback

The following example shows an instance where this message occurs:

```
pin (Z) {
  direction : "output";
  function : "A";
  output_signal_level : "VDD";
  max_capacitance : 0.057841;
  min_capacitance : 0.557841;
 }
```

The following is an example message:

```
Error: Line 258, Cell 'BUFX1', pin 'Z', The value of min_capacitance is
 greater than that of max_capacitance. (LBDB-596)
```

What Next

Make sure the value of min_capacitance is not greater than that of max_capacitance.

LBDB-597

(error) CCB group '%s' has been utilized by attribute '%s' at line %u.

Description

For a given timing group, a particular CCB stage group may only be referenced once among attributes propagating_ccb, active_input_ccb, and active_output_ccb. It is an error to be referenced more than once.

The following example shows an instance where this message occurs. The input_ccb group *ccb_a* is referenced twice in the same timing group.

```
library(test) {
    cell test(inv) {
      pin(a) {
        direction : in;
          input_ccb(ccb_a) {
          ...
          }
        ...
      }
      pin(out) {
        direction : out;
        output_ccb(ccb_out) {
          ...
          }
        timing () {
          related_pin : in;
          active_input_ccb("ccb_a");
          propagating_ccb("ccb_a", "ccb_out");
        }
      }
```

Feedback

```
    }
  }
```

The following is an example message:

```
Error: Line 3209, Cell 'inv', pin 'ZN', CCB group 'ccb_a' has been
 utilized by attribute 'propagating_ccb' at line 3210. (LBDB-597)
```

What Next

Remove the incorrect usage.

LBDB-598

(error) CCB group '%s' referenced by attribute '%s' not found in pin '%s' at line %u.

Description

A CCB stage referenced in attributes propagating_ccb, active_input_ccb, and active_output_ccb must be located at the input pin (related_pin) or the output pin, depending on the context.

The following example shows an instance where this message occurs:

```
library(test) {
    cell test(and2) {
      pin(a) {
        direction : in;
        input_ccb(ccb_a) {
        ...
        }
      ...
      }
      pin(b) {
        direction : in;
        input_ccb(ccb_b) {
        ...
        }
      ...
      }
      pin(o1) {
        direction : out;
        output_ccb(ccb_o1) {
          ...
          }
        ...
      }
      pin(o2) {
        direction : out;
        output_ccb(ccb_o2) {
          ...
          }
```

Feedback

```
        timing () {
          related_pin : a;
          propagating_ccb("ccb_a", "ccb_o1");
        }
      }
    }
  }
```

The following is an example message:

```
Error: Line 759, Cell 'and2', pin 'o2', CCB group 'ccb_o1' referenced by
 attribute 'propagating_ccb' not found in pin 'o2' at line 70. (LBDB-598)
```

What Next

Fix the mistake. In the example above, attribute propagating_ccb should be specified as:

```
propagation("ccb_a", "ccb_o2");
```

LBDB-599

(error) In attribute '%s', ccb '%s' referenced is of the wrong type.

Description

The ccb referenced is not of the correct type for one of the following reasons:

1. The 1st parameter of propagating_ccb, or all parameters in active_input_ccb must reference a input_ccb of the related pin, not a output_ccb.
2. The 2nd parameter of propagating_ccb, if present, must reference a output_ccb in the current (output/inout) pin, not a input_ccb.
3. Finally, note that only one ccb can drive the output. If the attribute mentioned is 'active_output_ccb', remove the offending output_ccb because:

1. Another output_ccb has already been given in the same attribute. In fact, the only one valid possibility of more than 1 output_ccb's being referenced is the two output_ccb's in which one has the stage_type:pull_up and the other has the stage_type:pull_down.
2. The 'propagating_ccb' attribute is present.

The following example shows an instance where this message occurs:

```
library(test) {
    cell test(complex) {
      pin(a) {
        direction : inout;
        input_ccb(ccb_a_in) {
        ...
        }
        output_ccb(ccb_a_out) {
```

```
        ...
        }
      ...
      }
      pin(out) {
        direction : out;
        output_ccb(ccb_o2) {
          ...
          }
        timing () {
          related_pin : a;
          active_input_ccb("ccb_a_out");
        }
      }
    }
  }
```

The following is an example message:

```
Error: Line 3175, Cell 'complex', pin 'out', In attribute
 'active_input_ccb', CCS noise stage 'ccb_a_out' referenced is of the
 wrong type. (LBDB-599)
```

What Next

Fix the mistake.

LBDB-600

(error) The '%s' direction cannot be specified on a\n \tpin.

Description

This message indicates that you specified an incompatible direction value on a pin. Library Compiler fails if the direction value includes the following combinations:

```
* tristate
```

The following example shows an instance where this message occurs:

```
cell(lbdb600) {
    area : 2;
    pin(A) {
      direction : tristate;
      capacitance : 1.0;
    }
    ...
  }
```

Feedback

The following is an example message:

```
Error: Line 84, The 'tristate' direction cannot be specified on a
       pin. (LBDB-600)
```

What Next

Refer to the "Library Compiler User Guide" for direction information. Remove the incompatible values of the direction attribute.

LBDB-601

(error) related_pin is illegal in the timing group. \ Timing arc info is missing.

Description

This message indicates that you specified an illegal related_pin in a timing group.

The following example shows an instance where this message occurs:

```
timing() {
                /* noise immunity */
                noise_immunity_high(noise5x5){
                    index_2("0.362,0.725,1.087,1.449,1.812");
                    values("0.733,1.073,1.412,1.752,2.092",\
                           "0.873,1.214,1.554,1.894,2.234",\
                           "1.095,1.442,1.787,2.132,2.477",\
                           "1.298,1.648,1.996,2.343,2.691",\
                           "1.703,2.060,2.414,2.766,3.119");
                }
                related_pin: "a";
            }
```

The following is an example message:

```
Error: Line 120, related_pin is illegal in the timing group. \
 Timing arc info is missing.  (LBDB-601)
```

What Next

Refer to the "Library Compiler User Guide" for related_pin information.

LBDB-602

(warning) The units of time, capacitance, voltage and current are not consistent.

Description

This message indicates that you specified an inconsistent units in the library.

Feedback

The following example shows an instance where this message occurs:

```
library (mi333) {
    ...
   time_unit                    : "1ns";
   voltage_unit                 : "1mV";
   current_unit                 : "1mA";
   pulling_resistance_unit      : "1kohm";
   capacitive_load_unit  (1, pf);
    ...
```

The following is an example message:

```
Warning: Line 120, The units of time, capacitance, voltage and current
 are not consistent. (LBDB-602)
```

What Next

Refer to the "Library Compiler User Guide" for unit information. Modify the realted unit values to make them consistent.

LBDB-603

(error) The '%s' attribute cannot be supplied a \n \tnonpositive value (%d).

Description

This message indicates that the specified attribute cannot have a nonpositive value.

The following example shows an instance where this message occurs:

```
orders ( 0, 2, 3 );
```

The following is an example message:

```
Error: Line 18, The 'orders' attribute cannot be supplied a
       nonpositive value (0) (LBDB-603)
```

What Next

Change the value of the attribute to positive in the technology library file.

LBDB-604

(error) '%s' attribute should be less than '%s' attribute.

Description

This message indicates that the specified attributes are not consistent.

Feedback

The following example shows an instance where this message occurs:

```
slew_lower_threshold_pct_rise: 80.0
   slew_upper_threshold_pct_rise: 20.0
```

The following is an example message:

```
Error: Attribute 'slew_lower_threshold_pct_rise' should be less
       than 'slew_upper_threshold_pct_rise'. (LBDB-604)
```

What Next

Change the value of the attributes to be consistent in the technology library file.

LBDB-605

(warning) The attribute '%s' is not specified.

Description

This message indicates that an attribute is missing.

The following example shows an instance where this message occurs:

```
slew_lower_threshold_pct_rise: 20.0
```

The following is an example message:

```
Warning: Line 18, The attribute 'slew_lower_threshold_pct_rise' is not
 specified. (LBDB-605)
```

What Next

Either add the missing attribute to the technology library or ignore the message.

LBDB-606

(error) The invalid '%s' value is encountered\n \ton the '%s' attribute.

Description

This message indicates that you specified an invalid attribute's value

The following example shows an instance where this message occurs:

```
fall_propagation ( table4x6 ) {
   index_1 ("2.00e+02 2.50e+02 3.50e+02 4.00e+02 ") ;
   index_2 ("4.48e-02 8.96e-02 1.34e-01 1.79e-01 2.24e-01 2.69e-01 ");
   values ("Look.here 9.56e+01 1.15e+02 1.34e+02 1.52e+02 1.71e+02 ", \
           "9.38e+01 1.20e+02 1.45e+02 1.67e+02 1.89e+02 2.10e+02 ", \
           "1.01e+02 1.32e+02 1.58e+02 1.83e+02 2.07e+02 2.29e+02 ", \
```

Feedback

```
            "1.04e+02 1.43e-93 1.43e-93 1.43e-93 2.75e+226 9.30e+254 " ) ;
}
```

The following is an example message:

```
Error: Line 85, The invalid 'Look.here' value is encountered
        on the 'values' attribute. (LBDB-606)
```

What Next

Check the library source file, and correct the problem.

LBDB-607

(warning) The pin '%s' does not have a internal_power group.

Description

For a signal pin, it should have one internal_power table.

The following example shows an instance where this message occurs:

```
cell ( cell1 ) {
    pg_pin (VDD) {
      pg_type : "primary_power";
      related_bias_pin : "VDDB";
      voltage_name : "VDD";
    }
    pg_pin (VDDB) {
      pg_type : "nwell";
      physical_connection : "device_layer";
      voltage_name : "VDDB";
    }
    pg_pin (VSS) {
      pg_type : "primary_ground";
      related_bias_pin : "VSSB";
      voltage_name : "VSS";
    }
    pg_pin (VSSB) {
      pg_type : "pwell";
      physical_connection : "device_layer";
      voltage_name : "VSSB";
    }
     pin(A) {
        ...
     }
     pin(B) {
        ...
     }
     pin ( CP ) {
        direction : input ;
        related_bias_pin : "VDDB VSSB";
```

Feedback

```
        related_ground_pin : "VSS";
        related_power_pin : "VDD";

         ...
      }
      ...
```

To fix the problem, add internal_power group under pin CP.

```
internal_power () {
        related_pg_pin : "VDD";
        when : "(!A&B)";
        power ("power_1") {
          index_1("0.002, 0.0263908, 0.0995546, 0.2215, 0.392218,
 0.611718, 0.88");
          values("0.0002916, 0.0005488, 0.0015848, 0.0024696, 0.0029070,
 0.0031031, 0.0032115");
        }

}
```

The following is an example message:

```
Warning: Line 126, The pin 'CP' does not have a internal_power group.
 (LBDB-607)
```

What Next

Add the internal_power table.

LBDB-608

(Warning) Library cell '%s' has a valid function-id,\n \tbut it has also been annotated with the user_function_class\n \tattribute. Resolving this conflict by ignoring the\n \tuser_function_class attribute for this library cell.

Description

The specified cell has been annotated with the *user_function_classr* attribute even though it has a valid function-id. Library Compiler can generate a function-id for most cells in a technology library. However, there may be a few complex sequential or combinational cells that Library Compiler cannot successfully generate a function-id for. In addition, some black-box cells in the library do not have any function information. The *user_function_class* attribute is intended for such cells that otherwise would not have a function-id. The *user_function_class* attribute is not intended for library cells that already have a valid function-id.

Feedback

What Next

This warning message indicates that the *user_function_class* attribute for this library cell will be ignored. No further action is required. To turn off this warning message in the future, make sure that a *user_function_class attribute* is not set on this library cell.

LBDB-609

(Warning) Library cells '%s' and '%s' have\n \tdifferent pin information, but they have been assigned the\n \tsame user_function_class. Resolving this conflict by ignoring\n \tthe user_function_class attribute on the latter library cell.

Description

Two library cells that are assigned the same *user_function_class* attribute should have the exact same pin information. That is, they must have the same number of pins and the same pin names. This requirement is necessary so that Design Compiler can establish pin-to-pin correspondence between two cells in the same *user_function_class* when it replaces a reference to one library cell by a reference to the other library cell.

This warning message indicates that an inconsistency was found between the pin information of two library cells in the same *user_function_class*. To resolve this conflict, the *user_function_class* attribute for the second library cell will be ignored.

What Next

This warning message indicates that the *user_function_class* attribute for the second library cell will be ignored. No further action is required. To turn off this warning message in the future, make sure that all library cells in a given *user_function_class* attribute have the same pin information.

LBDB-610

(warning) The units of %s are not consistent.

Description

This message indicates that you specified an inconsistent units in the library.

The following example shows an instance where this message occurs:

```
library (mi333) {
    ...
   time_unit                    : "1ns";
   voltage_unit                 : "1V";
   current_unit                 : "1mA";
   resistance_unit              : "1kohm";
   capacitive_load_unit  (1, pf);
    ...
```

Feedback

The following is an example message:

```
Warning: Line 120, The units of time, capacitance, resistance are not
 consistent. (LBDB-610)
```

What Next

Refer to the "Library Compiler User Guide" for unit information. Modify the realted unit values to make them consistent.

LBDB-611

(warning) The '%s' %s group is not used by any %s pin in the library.

Description

This message indicates that the library pins does not use the defined input/output voltage groups.

The following example shows an instance where this message occurs:

```
input_voltage(CMOS) {
    vil : 1.5;
    vih : 3.5;
    vimin : -0.3;
    vimax : VDD + 0.3;
  }

  input_voltage(CMOS) {
    vil : 2.5;
    vih : 4.5;
    vimin : -0.3;
    vimax : VDD + 0.3;
  }
```

The following is an example message:

```
Error: Line 31, The 'CMOS' input_voltage  group is not used by any input
 pin in the library. (LBDB-611)
```

What Next

For input_voltage group, add "input_voltage" attrribute to input library pins. For output_voltage group, add "output_voltage" attrribute to output library pins.

LBDB-612

(information) The '%s' attribute value is\n \t %s (%3.1f).

Feedback

Description

This message indicates that you specified an attribute value that maybe out of the accepted range. The value is either less than the minimum value or greater than the maximum value. Unlike LBDB-163, it does not reset the value.

The following example shows an instance where this message occurs:

```
height_coefficient : -0.01;
```

In this case, the height_coefficient's value -0.01 is less than the minimum accepted value 0.0. However, it is not reset.

The following is an example message:

```
Warning: Line 109, The 'height_coefficient' attribute value is
         less than 0.0. (LBDB-612)
```

LBDB-612w

(warning) The '%s' attribute value (%g) is\n \t %s (%g).

Description

This message indicates that you specified an attribute value that maybe out of the accepted range. The value is either less than the minimum value or greater than the maximum value. Unlike LBDB-163, it does not reset the value.

The following example shows an instance where this message occurs:

```
voltage_map(VDDL, 1.00) ;
  ...
  cell (A) {
    ...
    pin(I)  {
      ...
      input_voltage_range (0.4, 3.3);
      related_power_pin : VDDL;
      max_input_delta_overdrive_high : 0.05;
      max_input_delta_underdrive_high : 0.8;
    }
  }
```

In this case, the max_input_delta_underdrive_high's value (0.8) is greater than the input_voltage_range allowed (0.6, which is the difference of voltage value between related_power_pin and the lower bound of input_voltage_range). However, it is not reset.

The following is an example message:

```
Warning: Line 79, The 'max_input_delta_underdrive_high' attribute value
 (0.8) is
         greater than the input_voltage_range allowed (0.6). (LBDB-612w)
```

Feedback

What Next

Change the attribute value to satisfy the value range.

LBDB-613

(error) The '%s' group requires the '%s' %s.\n \tEither the attribute(or group) is missing or the attribute(or group) has an invalid value.

Description

This message indicates a group is missing, or you specified a group without one of its required attributes(or groups, or vectors). Library Compiler rejects the attribute(group) definition if the attribute(group) is missing, or exists but has an invalid value.

The following example shows an instance where this message occurs:

```
memory() {
        type : random;
        address_width : 10;
        word_width : 8;
      }
```

In this case, the 'type' has an invalid value. To fix the problem, assign 'rom' or 'ram' to the type.

The following is an example message:

```
Error: Line 27, The 'memory' group requires the 'type' attribute.
 Either the attribute(or group) is missing or the attribute(or group)has
 an invalid value. (LBDB-613)
```

Here is another example shows where this message occurs:

```
ccsn_last_stage() {
          output_voltage_fall () {
          }
          propagated_noise_low () {
          }
          propagated_noise_high () {
          }
 }
```

In this case, 'output_voltage_rise' group is missing. In addition, 'vector' data tables are also missing for output_voltage_fall, propagated_noise_low, propagated_noise_high. These need to be added to fix the problem.

The following is an example message.

```
Error: Line 54, The 'ccsn_last_stage' group requires the
 'output_voltage_rise' group.
```

```
 Either the attribute(or group) is missing or the attribute(or group)has
 an invalid value. (LBDB-613)
Error: Line 54, The 'ccsn_last_stage' group requires the
 'output_voltage_fall' group.
 Either the attribute(or group) is missing or the attribute(or group)has
 an invalid value. (LBDB-613)
Error: Line 54, The 'ccsn_last_stage' group requires the
 'propagated_noise_low' group.
 Either the attribute(or group) is missing or the attribute(or group)has
 an invalid value. (LBDB-613)
Error: Line 54, The 'ccsn_last_stage' group requires the
 'propagated_noise_high' group.
 Either the attribute(or group) is missing or the attribute(or group)has
 an invalid value. (LBDB-613)
```

What Next

Change the library file by adding the missing attribute(or group, or vector) to the group.

LBDB-614

(error) The '%s' has a count of %d, which does not match\n \tthe number of "%s" specified.

Description

The specification of the variables implied the number of indices of a template (or template domain).

The following example shows an instance where this message occurs:

```
lu_table_template(basic_template) {
        variable_1 : input_net_transition;
        index_1 ("0.1, 1.2, 2.3, 3.4");
        index_2 ("0.1, 1.2, 2.3, 3.4");
  }
```

The following is an example message:

```
Error: Line 160, The 'index_*' have a count of 2, which does not match
        the number of 'varible_*' specified. (LBDB-614)
```

What Next

Check the library source file, and make the number of variables and indices to\n \tthe same.

LBDB-615

(warning) Connect pin '%s' to the default_power_supply '%s'\n \tdefined in the power_supply() group in library.

Feedback

Description

Either the input_signal_level or the output_signal_level attribute is missing in a pin within a multiple power supply cell. By default, LC connect this pin to the default_power_supply defined in the power_supply() group in library.

The following example shows an instance where this message occurs:

```
power_supply() {
        default_power_rail : VDD0;
        power_rail(VDD1, 5.0);
        power_rail(VDD2, 3.3);
    }

cell(lbdb428) {
  area : 2;
  pad_cell : true;
  rail_connection(PV1, VDD1);
  rail_connection(PV2, VDD2);
  pin(A) {
    direction : input;          /* missing input_signal_level attribute,
 will use default VDD0 */
    capacitance : 1;
  }
  pin(Z) {
    direction : output;
    function : "A";
    output_signal_level : VDD2;
    timing() {
      intrinsic_rise : 0.48;
      intrinsic_fall : 0.77;
      rise_resistance : 0.1443;
      fall_resistance : 0.0523;
      slope_rise : 0.0;
      slope_fall : 0.0;
      related_pin : "A";
    }
  }
}
}
```

The following is an example message:

```
Warning: Line 96, Connect pin 'A' to the default_power_supply 'VDD0'
       defined in the power_supply() group in library. (LBDB-615)
```

What Next

Check the library source file to see if you missed the input_signal_level or the output_signal_level attributes.

Feedback

LBDB-616

(error) Found the timing arc '%s' has lookup table or poly template \n \twhich is more than %s dimensional in a '%s' timing group in the library

Description

The related_pin and constraint_pin are the same in the specified timing group; therefore, there cannot be a two-dimension or more lookup table/poly template based on related_pin_transition and constraint_pin_transition because they are the same pin and one pin cannot have two different values at the same time.

Note that the min_pulse_width timing group can be one- or two-dimensional, because the arc can be indexed by the output load.

The following example shows an instance where this message occurs:

```
lu_table_template  (table_2)   {
   variable_1  :  constrained_pin_transition  ;
   variable_2  :  related_pin_transition  ;
   index_1 ("0.00, 0.25, 0.50") ;
   index_2 ("0.00, 0.50, 2.00") ;
}

 ...

    timing() {
      related_pin : CP ;
      timing_type : min_pulse_width ;
      rise_constraint(table_2) {
          index_1 ("0.00, 1.00, 2.50") ;
          index_2 ("0.00, 1.00, 2.50") ;
          values (
                  "4.0, 5.0, 6.0"
                  "4.2, 5.2, 6.2"
                  "4.4, 5.4, 6.4"
          );
      }
      fall_constraint(table_2) {
          index_1 ("0.00, 1.00, 2.50") ;
          index_2 ("0.00, 1.00, 2.50") ;
          values (
                  "4.0, 5.0, 6.0" \
                  "4.2, 5.2, 6.2" \
                  "4.4, 5.4, 6.4" \
          );
      }
```

Feedback

The following is an example message:

```
Error: Line 160, Found the timing arc 'rise_constraint' has lookup table
 or poly template which is more than one dimensional in a min_pulse_width
 timing group in the library (LBDB-616)
```

What Next

Modify the timing arc based on a one-dimensional lookup table or poly template.

LBDB-617

(warning) The related pin in a '%s' timing group is specified as '%s', not \n \t the pin '%s' itself. It is reset to pin '%s'.

Description

In the timing group reported, since the related_pin and constraint_pin are the same, the related_pin attribute is optional and has be to set to the pin itself.

The following example shows an instance where this message occurs:

```
pin(CP) {
   ...
    timing() {
      related_pin : D ;
      timing_type : min_pulse_width ;
      rise_constraint(table_2) {
          index_1 ("0.00, 1.00, 2.50") ;
          index_2 ("0.00, 1.00, 2.50") ;
          values (\
                  "4.0, 5.0, 6.0"\
                  "4.2, 5.2, 6.2"\
                  "4.4, 5.4, 6.4"\
          );
      }
      fall_constraint(table_2) {
          index_1 ("0.00, 1.00, 2.50") ;
          index_2 ("0.00, 1.00, 2.50") ;
          values (\
                  "4.0, 5.0, 6.0"\
                  "4.2, 5.2, 6.2"\
                  "4.4, 5.4, 6.4"\
          );
      }
  }

need to delete related_pin attribute or set it as
related_pin : CP ;
```

Feedback

The following is an example message:

```
Warning: Line 160, The related pin in a min_pulse_width timing group
 is specified as 'D', not the pin 'CP' itself. It is reset to pin 'CP'.
 (LBDB-617)
```

What Next

Either delete the related_pin attribute or set the attribute to the pin's name.

LBDB-618

(error) The min/max_clock_tree_path timing arc contains illegal rise/fall_propagation group.

Description

In a min/max_clock_tree_path timing arc, only cell_rise group or cell_fall group or both are allowed

The following example shows an instance where this message occurs:

```
pin(CP) {
   ...
    timing() {
      related_pin : CLK ;
      timing_type : min_clock_tree_path ;
      rise_propagation(table_2) {
          index_1 ("0.00, 1.00, 2.50") ;
          values (\
                  "4.0, 5.0, 6.0"\
          );
      }
      fall_propagation(table_2) {
          index_1 ("0.00, 1.00, 2.50") ;
          index_2 ("0.00, 1.00, 2.50") ;
          values (\
                  "4.0, 5.0, 6.0"\
          );
      }
  }

need to delete both rise_propagation and fall_propagation lookup table
 and replace with
cell_rise and cell_fall lookup tables
```

The following is an example message:

```
Warning: Line 160, the min/max_clock_tree_path timing arc containts
 illegal rise/fall_progagation group (LBDB-618)
```

Feedback

What Next

Delete the illegal rise/fall_propagation group

LBDB-619

(error) The '%s' attribute cannot be specified on the %s %s.

Description

This error message occurs when you specify an invalid attribute for an object. As shown in the following example, the *output_signal_level_high* attribute is invalid for a pin object, causing the error message:

```
cell(lbdb600) {
    area : 2;
    pin(A) {
      direction : input;
      capacitance : 1.0;
      output_signal_level_high : 1.2;
      ...
    }
    ...
  }

Error: Line 84, The 'output_signal_level_high' attribute cannot be
 specified on the
       pin 'A'. (LBDB-619)
```

What Next

Remove the attribute from the pin and rerun the command.

LBDB-619w

(warning) The '%s' attribute cannot be specified on the %s %s.

Description

This warning message occurs when you specify an invalid attribute for an object. As shown in the following example, the *output_signal_level_high* attribute is invalid for a pin object, causing the warning message:

```
cell(lbdb600) {
    area : 2;
    pin(A) {
      direction : input;
      capacitance : 1.0;
      output_signal_level_high : 1.2;
      ...
```

```
    }
    ...
  }
```

```
Warning: Line 84, The 'output_signal_level_high' attribute cannot be
 specified on the
       pin 'A'. (LBDB-619w)
```

What Next

Remove the attribute from the pin and rerun the command.

LBDB-620

(warning) The lookup table domain '%s' is defined multiple times\n \twithin '%s'. Using the last one encountered.

Description

This message indicates that the same lookup table domain has been defined for multiple times within one timing/power arc. In the case of a domain conflict, Library Compiler ignores all except the last domain encountered during the compilation. The compiled database contains the last domain only.

The following example shows an instance where this message occurs:

```
cell_rise(li7X7){
     domain(D1) { ... }
     domain(D1) { ... }
     domain(D2) { ... }
   }
```

The following is an example message:

```
Warning: Line 987, The lookup table domain 'D1' is defined multiple times
         within 'cell_rise'. Using the last one encountered. (LBDB-620)
```

What Next

Make sure that only define one lookup table for each domain for each timing/power arc.

LBDB-621

(error) Invalid calc_mode '%s' is detected. This name must be\n \tunique among domains within one lu_table_template.

Description

This message indicates a duplicate calc_mode defined among domains within one lu_table_template.

Feedback

The following example shows an instance where this message occurs:

```
lu_table_template(li7X7){
    domain(D1) {
      calc_mode : "CM1";
      . . .
    }
    domain(D2) {
      calc_mode : "CM1";
      . . .
    }
  }
```

The following is an example message:

```
Error: Line 56, Invalid calc_mode 'CM1' is detected. This name must be
        unique among domains within one lu_table_template. (LBDB-621)
```

What Next

Change the name of the pin, bus, bundle, rail_connection in the technology library.

LBDB-622

(error) The '%s' attribute is missing for the %s %s.

Description

This error message occurs because either the *max_input_noise_width* or the *min_input_noise_width* attribute is missing when both attributes are required.

This message also occurs when *input_signal_level* and *output_signal_level* are not defined in the input/output pin of a level shifter or isolation cell.

What Next

Check the library source file, and add the missing attribute.

LBDB-623

(error) The '%s' attribute is larger than the %s '%s' %sfor the %s %s.

Description

This error message occurs when the *min_input_noise_width* attributed value is larger than the *max_input_noise_width* attribute value. Library Compiler requires that the *min_input_noise_width* value be no larger than the *max_input_noise_width* value.

The following example shows *min_input_noise_width* set at a higher value than *max_input_noise_width* and the resulting error message.

Feedback

```
pin(S) {
  min_input_noise_width : 2.0;
  max_input_noise_width : 1.0;
  ...
  }

Error: Line 18, The 'min_input_noise_width' attribute is larger than
the 'min_input_noise_width' attribute for the pin '%s'.  (LBDB-623)
```

This error message also occurs when any of the following are true:

- The value of **output_signal_level_high** is greater than **output_signal_level_low**.
- The value of **output_signal_level_high** is greater than **output_signal_level**.
- The value of **input_signal_level_high** is greater than **input_signal_level_low**.
- The value of **input_signal_level_high** is greater than **input_signal_level**.

What Next

Change all related values to conform to the requirement and rerun the command.

LBDB-624

(error) The output/inout pin '%s' has illegal 'tied-off' timing arcs.

Description

If a output pin is not tied to "high"(the function attribute is set to "1") or "low"(the function attribute is set to "0"), its time arcs should not set the 'tied-off' attribute to true.

The following example shows an instance where this message occurs:

```
pin(S) {
   function : "A B";
   ...
    timing() {
      tied_off : true;
      steady_state_current_high(table_1) {
          index_1 ("0.00, 1.00, 2.50") ;
          values (\
                  "4.0, 5.0, 6.0"\
                  ...
          );
      }
      ...
  }
```

Feedback

```
need to delete the 'tied-off' attribute.
```

The following is an example message:

```
Warning: Line 160,  The output pin 'S' has illegal 'tied-off' timing
 arcs. (LBDB-624)
```

What Next

Delete the 'tied-off' attribute.

LBDB-625

(error) The output/inout pin '%s' has a 'tied-off' timing arc containing illegal '%s' %s.

Description

If a output pin is tied to "high"(the function attribute is set to "1"), only steady_state_current_high group is allowed in its timing arc whose 'tied_off' attribute is set to true.

The following example shows an instance where this message occurs:

```
pin(S) {
   function : "1";
   ...
    timing() {
      tied_off : true;
      steady_state_current_high(table_1) {
          index_1 ("0.00, 1.00, 2.50") ;
          values (\
                  "4.0, 5.0, 6.0"\
                  ...
          );
      }
      ...
  }

need to delete the 'steady_state_current_high' table.
```

The following is an example message:

```
Warning: Line 160,  The output pin 'S' has a 'tied-off' timing arc
 containing illegal 'steady_state_current_high' group.  (LBDB-625)
```

What Next

Delete the illegal noise_immunity/noise_propagation groups.

Feedback

LBDB-626

(error) The 'tied-off' timing arc contains illegal noise_immunity/noise_propagation group.

Description

In a timing arc whose tied_off attribute is set to true, for noise information, only steady_state_current_low group or steady_state_current_high group is allowed

The following example shows an instance where this message occurs:

```
pin(CP) {
   ...
    timing() {
      tied_off : true;
      noise_immunity_high(table_1) {
          index_1 ("0.00, 1.00, 2.50") ;
          index_2 ("0.00, 1.00, 2.50") ;
          values (\
                  "4.0, 5.0, 6.0"\
                  ...
          );
      }
      ...
  }

need to delete the 'noise_immunity_high' table.
```

The following is an example message:

```
Warning: Line 160, the 'tied-off' timing arc containts illegal
 noise_immunity/noise_propagation group (LBDB-626)
```

What Next

Delete the illegal noise_immunity/noise_propagation groups.

LBDB-627

(error) The '%s' group of the '%s' timing arc\n \tis not referencing the compatible template.

Description

In the specified min_pulse_width timing arc, the only valid templates are as follows:

1. "constrained_pin_transition" (one-dimensional)
2. "related_pin_transition" (one-dimensional)
3. "constrained_pin_transition" + "related_out_total_output_net_capacitance"
4. "related_pin_transition" + "related_out_total_output_net_capacitance"

Feedback

The following example shows an instance where this message occurs:

```
lu_table_template  (table_1)   {
   variable_1  :  related_pin_transition  ;
   index_1 ("0.10, 0.25, 0.50") ;
}
lu_table_template  (table_2)   {
   variable_1  :  related_out_total_output_net_capacitance;
   index_1 ("0.10, 0.25, 0.50") ;
}

 ...

    timing() {
      related_pin : CP ;
      timing_type : min_pulse_width ;
      rise_constraint(table_2) {
          index_1 ("0.50, 1.00, 2.50") ;
          values (\
                  "4.0, 5.0, 6.0"\
          );
      }
      fall_constraint(table_1) {
          index_1 ("0.50, 1.00, 2.50") ;
          values (\
                  "4.0, 5.0, 6.0"\
          );
      }
```

change the template table_2 to

```
lu_table_template  (table_2)   {
   variable_1  :  constrained_pin_transition  ;
   index_1 ("0.10, 0.25, 0.50") ;
}
```

The following is an example message:

```
Error: Line 160, The 'rise_constraint' group of the 'min_pulse_width'
 timing arc\n
\tis not referencing the compatible template.  (LBDB-627)
```

What Next

Change the variable in the template accordingly.

LBDB-628

(error) The value of timing_sense attribute is invalid for \n \tthe timing arc whose timing_sense should be '%s' instead.

Feedback

Description

The timing arc with feed_through_type attribute must have 'positive_unate' timing_sense.

The following example shows an instance where this message occurs:

```
...
        pin(Z) {
          direction : inout;
          timing() {
            feed_through_type : short;
            timing_sense : negative_unate;
            ...
          }
        }
        ...
```

In this case, the timing sense should be "positive_unate".

The following is an example message:

```
Error: Line 256, The value of timing_sense attribute is invalid for the
        timing arc whose timing_sense should be 'positive_unate' instead.
 (LBDB-628)
```

What Next

Check the timing arc and make the correction accordingly.

LBDB-629

(error) The parent '%s' of the user-defined attribute is not defined.

Description

For define(name, parent, type), parent must be the name of a user-defined group or a predefined library group.

The following example shows an instance where this message occurs:

```
library(test) {
        define(a, test, string);
        ...
    }
```

Since "test" is not defined, we can define a new user-defined group call "test" by adding the following statement: define_group(test, library);

The following is an example message:

```
Error: Line 256, The parent 'test' of the user-defined attribute is not
 defined. (LBDB-629)
```

Feedback

What Next

Either change the parent name or define a new user-defined group with the parent name.

LBDB-630

(error) The 'user_parameters' group is not specified.

Description

This message indicates that the 'user_parameters' group is not specified. Library Compiler errors out because some generic parameters(parameter1..5) are used in either poly_template or power_poly_template, and the 'user_parameters' must be defined to contain the definition of those generic parameters.

The following example shows an instance where this message occurs:

```
user_parameters() {
      parameter1 : 0.80;
    }
```

The following is an example message:

```
Error: Line 52, The 'user_parameters' group is not specified. (LBDB-630)
```

What Next

Add the missing attribute to the 'user_parameters' group. the message.

LBDB-631

(error) The '%s' attribute in the 'user_parameters' group is not specified.

Description

This message indicates that an attribute is missing, and Library Compiler errors out because this attribute is used in either poly_template or power_poly_template.

The following example shows an instance where this message occurs:

```
user_parameters() {
      parameter1 : 0.80;
    }
```

The following is an example message:

```
Error: Line 52, The 'parameter2' attribute in  the 'user_parameters'
 group is not specified. (LBDB-631)
```

Feedback

What Next

Add the missing attribute to the 'user_parameters' group. the message.

LBDB-632

(error) The power rail name '%s' is invalid.

Description

This message indicates that you specified an invalid name for the current power rail. The name should not conflict with the generic parameters(parameter1..paramter5).

The following example shows an instance where this message occurs:

```
power_supply() {
          default_power_rail : VDD0;
          power_rail(parameter1, 4.95);
 }
```

The following is an example message:

```
Error: Line 104, The power rail name 'parameter1' layer name is invalid.
 (LBDB-632)
```

What Next

User a different name that is not conflicting with parameter1..paramter5.

LBDB-633

(error) The %s value, '%s', has not been\n \tdefined in the %s.

Description

This message indicates that the referred value is undefined in the library.

The following example shows an instance where this message occurs:

```
part(a) {
    valid_speed_grades ("A","B","C");
    valid_step_levels ("step0","step1","step3");
    default_step_level : "step0";
    speed_grade("D") {
        step_level("step0");
    }
  }
```

In this case, the "D" valid_speed_grade is not defined.

Feedback

The following is an example message:

```
Error: Line 57, The valid_speed_grade value, 'D',
       has not been defined in the part. (LBDB-74)
```

What Next

Add the referred value in the library.

LBDB-634

(error) The "variables" definition is conflicting with the main template.

Description

This message indicates that you specified an invalid 'variables' for the current poly template domain. It's required that a poly template define the same 'variables' as that of its main poly template.

The following example shows an instance where this message occurs:

```
poy_template(T3) {
       variables (input_net_transition, voltage, temperature);
       . . .
    domain(D1) {
       variables (input_net_transition, voltage);
       . . .
    }
 }
```

The following is an example message:

```
Error: Line 124, The "variables" definition is conflicting with its main
 template. (LBDB-634)
```

What Next

User the same 'variables' definition as that of its main poly template.

LBDB-635

(error) The 'tied-off' timing arc contains illegal related_pin attribute.

Description

In a timing arc whose tied_off attribute is set to true, related_pin attribute is not allowed.

The following example shows an instance where this message occurs:

```
pin(CP) {
   ...
```

Feedback

```
    timing() {
      tied_off : true;
      ...
      related_pin : A;
      }
      ...
  }
```

```
need to delete the 'related_pin' attribute.
```

The following is an example message:

```
Warning: Line 160, the 'tied-off' timing arc containts illegal
 related_pin attribute. (LBDB-635)
```

What Next

Delete the related_pin attribute.

LBDB-636

(error) The '%s' attribute value is invalid for the timing arc.

Description

This message indicates for a timing arc that the attribute value is invalid. For example, clock_gate_check attribute can only be defined to "true" for the setup/hold/nochange timing arcs.

What Next

Remove the attribute from the timing arc.

LBDB-637

(error) The %s-associated '%s' lookup table\n \tcannot use '%s' as its template.

Description

This message can be used as generic error message template. For frequency-base max_cap, it means that: 1. the max_cap lookup table in an input-associated max_cap group must use a one-dimensional template with *frequency* as its variable. 2. the max_cap lookup table in an ouput-associated max_cap group must use a one-dimensional template with *frequency* as its variable, or a two-dimensional template with *frequency* and *total_output_net_capacitance* as its variables with *frequency* being the first variable.

The following example shows an instance where this message occurs:

```
maxcap_lut_template(ok_temp) {
    variable_1 : frequency;
```

Feedback

```
    index_1("0, 1, 2, 3");
  }
  maxcap_lut_template(err_temp) {
    variable_1 : input_transition_time;
    index_1("0, 1, 2, 3");
  }

        max_cap(err_temp) {
                values ("1, 2, 3, 4");
        }
```

To fix the problem, change the template value of the *max_cap* attribute from *err_temp* to *ok_temp*.

The following is an example message:

```
Error: Line 126, The input-associated 'max_cap' lookup table
       cannot use 'err_temp' as its template. (LBDB-637)
```

What Next

For more information about lookup tables, see the *Library Compiler User Guide*. Change the library source file by referencing a different template in the lookup table description.

LBDB-638

(error) It is invalid to specify the '%s' %s \n \ton an %s pin.

Description

This message indicates that you specified a invalid group on a pin.

The following example shows an instance where this message occurs:

```
pin (p) {
    direction : input;
    ...
    max_cap (test) {
      ...
    }
    ...
  }
```

The following is an example message:

```
Error: Line 67, It is invalid to specify the 'max_cap' group
        on an input pin. (LBDB-638)
```

What Next

Check the library source file, and correct the problem.

Feedback

LBDB-639

(warning) The '%s' %s in this timing arc are ignored.

Description

This message indicates that you specified a redundant attribute or group for the sequential half-nate timing arcs.

In the following example, both the cell_fall group and the fall_transition group are redundant for the sequential half-unate timing arc.

```
timing() {
  timing_type : rising_edge;
  timing_sense : positive_unate;
  cell_rise( f_ocap ){
    index_1 ( "0.0000, 1.0000, 512.0000, 7999.9995, 15999.9990,
 31999.9980, 63999.9961");
    values ( "25.0000, 35.0000, 5145.0000, 80024.9922, 160024.9844,
 320024.9688, 640024.9375");
  }
  rise_transition( f_ocap ){
    index_1 ( "0.0000, 1.0000, 512.0000, 7999.9995, 15999.9990,
 31999.9980, 63999.9961");
    values ( "15.0000, 25.0000, 5135.0000, 80014.9922, 160014.9844,
 320014.9688, 640014.9375");
  }
  cell_fall( f_ocap ){
    index_1 ( "0.0000, 1.0000, 512.0000, 7999.9995, 15999.9990,
 31999.9980, 63999.9961");
    values ( "25.0000, 35.0000, 5145.0000, 80024.9922, 160024.9844,
 320024.9688, 640024.9375");
  }
  fall_transition( f_ocap ){
    index_1 ( "0.0000, 1.0000, 512.0000, 7999.9995, 15999.9990,
 31999.9980, 63999.9961");
    values ( "15.0000, 25.0000, 5135.0000, 80014.9922, 160014.9844,
 320014.9688, 640014.9375");
  }
}

Warning: Line 639, The cell_fall group in this
   timing arc are ignored. (LBDB-390)
Warning: Line 639, The fall_transition group in this
   timing arc are ignored. (LBDB-390)
```

What Next

Remove the redundant groups from the timing arc and rerun the command.

Feedback

LBDB-640

(error) The '%s' attribute %s \n \tin this %s group.

Description

This message indicates you need to specify or remove an attribute from the group according to the template it references as follows: 1. 1-dimentional template does not allow the 'related_pin' attribute. 2. 2-dimentional template requires the 'related_pin' attribute.

The following example shows an instance where this message occurs:

```
max_cap(maxcap_1d_template) {
                values ("1, 2, 3, 4");
                related_pin : "A";
        }
```

In this case, the 'related_pin' attribute is not allowed in 1-dimensional lookup table. To fix the problem, remove the related_pin attribute from the max_cap group.

The following is an example message:

```
Error: Line 69, The 'related_pin' attribute cannot be specified
        in this max_cap group. (LBDB-640)
```

What Next

Change the technology library source file to add or delete the specified attribute.

LBDB-641

(error) The '%s' %s has some %s groups \n \tmissing the %s attribute.

Description

This message indicates there is one or more leakage_power(internal) groups without the power_level attribute. When at least one leakage_power(internal_power) is specified with the power_level attribute in a cell(pin), all the leakage_power(internal_power) in the cell must also have the power_level attribute defined.

It can also be used to notify a user that teh related_pg_pin attribute is missing in the leakage_power/internal_power groups.

The following example shows an instance where this message occurs:

```
cell(AN2) {
      leakage_power () {
        power_level : VDD1;
        value : 1.0;
      }
```

```
      leakage_power () {
        /* power_level : VDD2; */
        value : 2.0;
      }
      ...
  }
```

In this case, the power_level attribute is missing for the 2nd leakage_power. To fix the problem, add the attribute to the leakage_power group:

```
cell(AN2) {
      leakage_power () {
        power_level : VDD1;
        value : 1.0;
      }
      leakage_power () {
        power_level : VDD2;
        value : 2.0;
      }
      ...
  }
```

The following is an example message:

```
Error: Line 12, The 'AN2' cell has some leakage_power groups
        missing the power_level attribute. (LBDB-641)
```

What Next

Add the missing attribute for the leakage_power group.

LBDB-642

(warning) The group '%s' is defined multiple times\n \tin group '%s'. Using the last one encountered.

Description

Some groups require that no more than one same group be defined in their scope.

Some groups require when statement, and only one of them can be defined without when statement in their scope.

The following example shows an instance where this message occurs:

```
pin_capacitance ()  {
     rise_capacitance_range() { ... }
     rise_capacitance_range() { ... }
   }
```

Feedback

The following is the example message:

```
Warning: Line 987, The group 'rise_capacitance_range' is defined multiple
 times
        in group 'pin_capacitance'. Using the last one encountered.
 (LBDB-642)
```

The following example shows another instance where this message occurs:

```
cell(test) {
   ...
   leakage_current ()  {
     when : A;
     pg_current(VDD) {
       value : 5.3;
     }
   }
   leakage_current ()  {
     when : A1;
     pg_current(VDD) {
       value : 15.3;
     }
   }
   ...
   leakage_current ()  {
     pg_current(VDD) {
       value : 0.3;
     }
   }
   leakage_current ()  {
     pg_current(VDD) {
       value : 8.3;
     }
   }
   ...
Only one of leakage_current groups with no 'when' statement can be
defined under a cell.  If there are more than one group with no
'when' statement defined, then they are duplicated groups.
```

The following is the example message:

```
Warning: Line 138, The group 'leakage_current' is defined multiple times
        in group 'cell'. Using the last one encountered. (LBDB-642)
```

What Next

Remove the extra objects.

LBDB-643

(error) '%s' is used more than once inside cell '%s'.

Feedback

Description

This error message occurs when unique *power_gating_pin* attribute value is specified more than once within a cell.

The following example shows power_pin_1 specified twice within a cell and the resulting error message:

```
cell (BUF) {
    pin(A) {
      power_gating_pin (power_pin_1, "0") ;
      direction : input;
    }
    pin(B) {
      power_gating_pin (power_pin_1, "0") ;
      direction : output;
    }
  }

Error: Line 56, 'power_pin_1' is used more than once inside cell 'BUF'.
(LBDB-643)
```

What Next

Make sure that each unique *power_gating_pin* value is specified only once.

LBDB-644

(warning) The cell_leakage_power attribute of the '%s' cell is redundant\n \tand not used in the leakage_power modeling.

Description

This message indicates one of the following two cases are true: 1. there is power_level specific leakage_power groups in the cell 2. the cell has no power_level specific leakage_power groups, and it has default leakage_power group(leakage_power group without 'when' statement).

The following example shows an instance where this message occurs:

```
cell(AN2) {
      cell_leakage_power : 0.5;
      leakage_power () {
        power_level : VDD1;
        when : "A";
        value : 1.0;
      }
      ...
  }
```

Feedback

In this case, the cell has power_level specific leakage_power groups, thus the cell_leakage_power attribute is redundant. To fix the problem, remove the attribute from the cell group.

The following example shows another instance where this message occurs:

```
cell(AN2) {
      cell_leakage_power : 0.5;
      leakage_power () {
        when : "A";
        power(LKP_T) {
           orders ("1, 1");
           coefs  ("1, 1, 1, 1");
           domain (D1) {
                 orders ("1, 1");
                 coefs  ("1, 1, 1, 1");
           }
        }
      }
      ...
  }
```

In this case, a cell_leakage_power attribute is redundant. To fix the problem, remove the attribute from the cell group:

Warning: Line 12, The cell_leakage_power attribute of the 'AN2' cell is redundant and not used in the leakage_power modeling. (LBDB-644)

What Next

Remove the 'cell_leakage_power' from the cell.

LBDB-645

(error) Cannot find the '%s' %s in the %s.

Description

This error message occurs when a power_rail name attached to a *related_power_rail* or *rail_value* attribute does not exist in the power_supply.

This error message also occurs when the *default_power_rail* attribute is not defined in the power_supply group.

The following code does not contain VDD4 in the power_supply, which results in the error message.

```
library(libg5) {
    ...
    power_supply(pw) {
      default_power_rail : VDD;
```

```
        power_rail (VDD1, 2.0);
        power_rail (VDD2, 2.5);
        power_rail (VDD3, 3.0);
        power_rail (VSS1, 3.0);
        power_rail (VSS2, 3.0);

        mapping(VSS1) {
                related_power_rail : "VDD1 VDD2";
        }
        mapping(VSS2) {
                related_power_rail : "  VDD4 VDD3       ";
        }
      }

 }

Error: Line 403, Cannot find the 'VDD4' power_rail in the power_supply.
(LBDB-645)
```

What Next

Check your library for an incorrect power_rail name, correct the name, and run the command again.

LBDB-646

(error) No %s information is defined before the %s '%s'.

Description

This error message occurs when you have not defined the power_supply statement for the power_level.

This message also occurs when the power_supply group is missing for a cell rail_connections because some pins of the cell do not define the *input_signal_level* (for an input pin) or the *output_signal_level* (for an output pin).

The following example shows a library with a missing power_supply statement before the cell containing the power_level attribute and the resulting error message.

```
library(lib) {
  ...
  cell (A)
    ...
    leakage_power() {
        power_level : "VDD";
        ...
    }
    ...
 }
```

Feedback

```
Error: Line 191, No power_supply information is defined before the
power_level 'VDD'. (LBDB-646)
```

What Next

Add the power_supply statement before the cell statement that contains the power_level, as shown in the following example:

```
power_supply() {
        default_power_rail : VDD;
        power_rail (VDD, 2.0);
        ...
  }
```

LBDB-647

(warning) Found the obsolete and unsupported '%s' %s in the '%s' cell; use '%s' instead.

Description

The *rail_connection* attribute is not supported after 2004.12 Beta version. Instead, the information should now be described in the power_pin group.

The following is an example of the error message:

```
Warning: Line 159, Found the obsolete and unsupported 'rail_connection'
attribute in the 'sample' cell; use 'power_pin' group instead. (LBDB-647)
```

What Next

If you have access to the technology library source file, change the *rail_connection* attribute to power_pin group. Otherwise, contact the vendor and inform them of the problem.

LBDB-648

(error) The power_pin definitions of cell '%s' do not follow the mapping rules specified in the power_supply group.

Description

This error message occurs when the definitions of the power_pins do not follow the mapping rules in the power_supply group. The following is an example of this error message:

```
Warning: Line 159, The power_pin definitions of cell '%s' do not follow
the mapping rules in the power_supply group. (LBDB-648)
```

Feedback

What Next

Either change the mapping rules in the power_supply group or redefine the power_pins and run the command again.

LBDB-649

(error) The '%s' domain's power rail mapping information conflicts with its main template.

Description

This error message occurs when the power rail mapping information is incorrectly defined in the domain of the poly_template. The information in poly_template domain must be exactly the same as the poly_template.

The following example shows the *d1* domain of the *p1* poly_template with the incorrect mapping statement and the resulting error message:

```
poly_template(p1) {
  ...
  mapping(voltage1, VDD1);
  mapping(voltage, VDD0);
  ...
  domain(d1) {
    ...
    mapping(voltage1, VDD2);
    mapping(voltage, VDD0);
    ...
  }
}

Error: Line 191, The 'd1' domain's power rail mapping information
conflicts with its main template. (LBDB-649)
```

What Next

Modify the mapping statements in this domain of the poly_template to match those of the poly_template.

The following example shows the correct *d1* domain mapping statements:

```
mapping(voltage1, VDD1);
    mapping(voltage, VDD0);
```

LBDB-650

(error) The '%s' cell is not a valid %s.

Feedback

Description

This error message occurs when the level shifter, isolation cell or clock isolation cell is incorrectly modeled. A level shifter or an isolation cell must satisfy one of the following sets of conditions:

- It has 3 pins, including 1 input pin, 1 level_shifter_enable_pin/ isolation_cell_enable_pin, 1 output pin.
- It has 2 pins, including 1 input pin and 1 output pin.

A clock isolation cell must satisfy:

- It has 3 pins, including 1 clock_isolation_cell_clock_pin, 1 isolation_cell_enable_pin, 1 output pin.

  The following example shows the level shifter with the incorrect modeling and the resulting error message:

```
cell(LS) {
 is_level_shifter : true;
 ...
 pin(a) {
        ...
 }
 pin(b) {
        ...
 }
 pin(c) {
        ...
 }
 pin(d) {
        ...
 }
}
Error: Line 191, The 'LS' cell is not a valid level shifter.
 (LBDB-650)
```

What Next

Correct the modeling information of the level shifter or isolation cell to satisfy the requirements.

You could correct the modeling in the previous example by removing one of the pins specified in the cell.

LBDB-651

(error) The %s%s '%s' contains the \n \tconflicting '%s'/'%s' values.

Feedback

Description

This error message occurs when the *input_signal_level* and *output_signal_level* values are modeled incorrectly for the level shifter or isolation cell.

For a level shifter, *input_signal_level* in input pin can't be the same as *output_signal_level* in output pin. Meaning that the rail names can't be the same in a level shifter.

For an isolation cell, the value of *input_signal_level* in input pin can't be different from the value of *output_signal_level* in output pin. Meaning that the rail values can't be difference in an isolation cell.

The following example shows the level-shifter with the incorrect modeling and the resulting error message:

```
cell(LS) {
 is_level_shifter : true;
 ...
 pin(in) {
        ...
        input_signal_level : VDD2
 }
 pin(out) {
        ...
        output_signal_level : VDD2
 }
}

Error: Line 191, The pins of level shifter 'LS' contain the
conflicting 'input_signal_level'/'output_signal_level' values. (LBDB-651)
```

The following example shows the isolation cell with the incorrect modeling and the resulting error message:

```
library(libdb651) {
  ...
  /* operation conditions */
  operating_conditions(5v_1v) {
    ...
    power_rail (VDDH, 5);    /* high power */
    power_rail (VDDL, 1);    /* low power */
    ...
  }
  ...
  default_operating_conditions : 5v_1v;

  ...
cell(ISO) {
 is_isolation_cell : true;
 ...
 pin(in) {
        ...
```

```
        input_signal_level : VDDH
 }
 pin(out) {
        ...
        output_signal_level : VDDL
 }
}

Error: Line 191, The pins of isolation cell 'ISO' contain the
conflicting 'input_signal_level'/'output_signal_level' values. (LBDB-651)
```

What Next

For the first example, modify the modeling information of the level shifter to meet the requirements.

To correct the modeling of the example above, make the *input_signal_level* string "VDD1" of the input pin different from the *output_signal_level* string "VDD2" of the output pin as follows:

```
cell(LS) {
 is_level_shifter : true;
 ...
 pin(in) {
        ...
        input_signal_level : VDD1
 }
 pin(out) {
        ...
        output_signal_level : VDD2
 }
}

For the second example, modify the modeling information of the isolation
 cell
to meet the requirements.

To correct the modeling of the example above, make the
input_signal_level value "5" of the input pin
same as the output_signal_level value "1" of the
output pin.  You can assiged both to the same pin like
"VDDH", so that both will refer to same value "5" in
operating_conditions as follows.

library(libdb651) {
  ...
  /* operation conditions */
  operating_conditions(5v_1v) {
    ...
    power_rail (VDDH, 5);    /* high power */
    power_rail (VDDL, 1);    /* low power */
```

Feedback

```
    ...
  }
  ...
  default_operating_conditions : 5v_1v;

  ...
cell(ISO) {
 is_isolation_cell : true;
 ...
 pin(in) {
        ...
        input_signal_level : VDDH
 }
 pin(out) {
        ...
        output_signal_level : VDDH
 }
}
```

LBDB-652

(error) The %s '%s' has incompatible '%s' and '%s'.

Description

This error message occurs when the user specified attributes are incompatible. For example, specifying both *pulse_clock* and *generated_clock* inside a cell.

```
Error: Line 159, The cell 'A' has incompatible 'pulse_clock'
and 'generated_clock'.  (LBDB-652)
```

What Next

Either remove the *pulse_clock*attribute or the *generated_clock* group for the cell.

LBDB-653

(error) The index of '%s' can define only one value.

Description

This error message occurs because the specified index cannot contain more than one value. This restriction applies to the dimension input_net_transition, and total_output_net_capacitance in the vector group.

The following example shows an index with more than one value and the resulting error message.

```
output_current_template(CCS_T) {
    variable_1 : input_net_transition;
```

Feedback

```
    variable_2 : total_output_net_capacitance;
    variable_3 : time;
  }
  vector(CCS_T) {
        reference_time : 0.5;
        index_1 ("0.12");
        index_2 ("0.1, 1.2");
        index_3 ("0.01, 0.02, 0.03");
        values (" ... ");
  }

Error: Line 46, The index of 'total_output_net_capacitance' can
only define one value. (LBDB-653)
```

To correct the error, change index_2 to ("0.1");

What Next

Check the library source file and remove the extra values in the index definition.

LBDB-654

(error) The values of '%s' and '%s' are not consistent in %s '%s'.

Description

This error message occurs when the values of the *reference_time* and *input_net_transition* attributes are inconsistent inside the output_current_rise or output_current_fall group. Inside each output_current_rise or output_current_fall group, only the same pair of *reference_time* and *inout_net_transition* values is allowed.

Note: In 2007.03 release, the message is enhanced to also report inconsistent input_voltage_range and output_voltage_range values in a level shifter. Assuming that a level shifter defines the following information: level_shifter_type : <lst_val>; input_voltage_range(<<ivrl_val>, <ivrh_val>); output_voltage_range(<ovrl_val>, <ovrh_val>); then it must satisfy the following requirements: - if <lst_val> = HL, then <ivrh_val> > <ovrl_val>. - if <lst_val> = LH, then <ivrl_val> < <ovrh_val>. Otherwise, LC will issue LBDB-654 error.

The following is an example of inconsistent *reference_time* and *input_net_transition* values and the resulting error message:

```
output_current_template(CCT) {
  variable_1 : input_net_transition;
  variable_2 : total_output_net_capacitance;
  variable_3 : time;
 }
 . . .
 output_current_rise() {
   vector(CCT) {
```

Feedback

```
      reference_time : 0.11; <=== reference_time = 0.11 with
 input_net_transition = 0.1
      index_1 ("0.1");
      index_2 ("1");
      index_3 ("1, 2, 3");
      values ("1, 2, 3");
   }
    vector(CCT) {
      reference_time : 0.12; <=== reference_time = 0.12 with
 input_net_transition = 0.1
      index_1 ("0.1");
      index_2 ("2");
      index_3 ("1, 2, 3");
      values ("1, 2, 3");
   }
 }

Error: Line 98, The values of 'reference_time' are not consistent in
group 'output_current_rise'. (LBDB-654)
```

What Next

Check the library source file, and correct the values of the *reference_time* attribute.

LBDB-655

(error) The vectors are not dense in group '%s'.

Description

This error message occurs because Library Compiler requires a "complete grid" of vector groups inside each output_current_rise or output_current_fall group. The vector groups must form a dense MxN grid, with M unique input_net_transition values, and N unique total_output_net_capacitance values. The vector groups should have exact MxN number and any duplicate input_net_transition and total_output_net_capacitance pair will cause this error.

A similar dense grid requirement is also imposed on the output_voltage_rise and output_voltage_fall groups of input_ccb and output_ccb. (This requirement does not apply to those of ccsn_first_stage and ccsn_last_stage).

The following example shows an output_current_rise group without a dense vector and resulting error message.

```
output_current_template(CCT) {
  variable_1 : input_net_transition;
  variable_2 : total_output_net_capacitance;
  variable_3 : time;
 }
 . . .
 output_current_rise() {
```

Feedback

```
   vector(CCT) {
      reference_time : 0.11;
      index_1 ("0.1");
      index_2 ("1");
      index_3 ("1, 2, 3");
      values ("1, 2, 3");
   }
    vector(CCT) {
      reference_time : 0.11;
      index_1 ("0.2");
      index_2 ("2");
      index_3 ("1, 2, 3");
      values ("1, 2, 3");
   }
   /* need vectors for (0.1, 2) and (0.2, 1) */
 }

Error: Line 198, The vectors are not dense in group
 'output_current_rise'.
(LBDB-655)
```

What Next

Check the library source file and add a vector for each input_net_transition and total_output_net_capacitance pair.

LBDB-656

(error) The lu_table_template '%s' referred by '%s' in line %d is invalid.

Description

This error message occurs because the variable of the referred lu_table_template can only include the *input_net_transition* variable for the pin based receiver model. For the timing arc based receiver model, the variable of the referred lu_table_template can include *input_net_transiton* and *total_output_net_capacitance*.

The following example shows an invalid lu_table_template reference and the resulting error message:

```
lu_table_template(T1) {
  variable_1 : input_net_transition;
  variable_2 : total_output_net_capacitance;
  . . .
 }
 . . .
 pin(A) {

 receiver_capacitance() {
   receiver_capacitance1_rise(T1) {
      index_1 ("0.1, 0.1");
```

Feedback

```
      index_2 ("1, 2");
      values ("1, 2", "2.5, 3");
   }
   . . .
 }
```

```
Error: Line 298, The lu_table_template 'T1' referred by
 'receiver_capacitance1_rise' in line 1239 is invalid. (LBDB-656)
```

What Next

Check the library source file, and correct the variable(s) of the corresponding lu_table_template.

LBDB-657

(error) Conflicting receiver model found in pin '%s' (pin-based) and in timing arc '%s-%s' (arc-based).

Description

This error message occurs because when an input (or inout) pin A defines a receiver_capacitance() group, then no timing arc whose from pin is A, can define receiver_capacitance1_rise/receiver_capacitance1_fall/ receiver_capacitance2_rise/ receiver_capacitance2_fall.

The following is an example of an incorrect definition and the resulting error message:

```
pin(A) {
   direction : input;
   receiver_capacitance() { . . .}
   . . .
 }
 pin(Y) {
   direction : output;
   timing() {
     receiver_capacitance1_rise(T1) { . . .}
     receiver_capacitance1_fall(T1) { . . .}
     receiver_capacitance2_rise(T1) { . . .}
     receiver_capacitance2_fall(T1) { . . .}
     . . .
   }
   . . .
 }
```

Error: Line 398, Conflicting receiver model found in pin 'A' (pin-based) and in timing arc 'A-Y' (arc-based). (LBDB-657)

Feedback

What Next

Check the library source file and remove the duplicated receiver model. Usually it is best practice to use the timing arc based receiver model.

LBDB-658

(error) Both variable and range of poly_template '%s' should be defined before domain '%s' is defined.

Description

You receive this message a domain can't be defined because either the variable or range statement of the main poly_template is missing.

The following example shows an instance where this message occurs: The following example shows the *p1* poly_template is missing both variable and range information.

```
poly_template(p1) {
 poly_template(PT)  {
  domain(D1)  {
    variables("temperature, total_output_net_capacitance");
    variable_1_range(0, 40);
    variable_2_range(1, 2);
  }
  ......
}
```

Correct it by add *variables, variable_1_range and variable_2_range statement in the poly_template group.*

The following is an example message: Error: Line 191, Both variable and range of poly_template 'PT' should be defined before domain 'D1' is defined. (LBDB-658)

What Next

Make sure that *variables* and all *variable_n_range* statements exist before defining domains.

LBDB-659

(error) The %s %s cannot coexist\n \twith the '%s' %s on the '%s' pin.

Description

The first specified attribute/group in the pin cannot coexist with the second specified attribute/group on the same pin. For example, the *is_three_state* attribute cannot be specified on a pin with *three_state* attribute.

Feedback

The following example shows an instance where this message occurs:

```
cell(lbdb239) {
    area : 2;
    pin(A) {
      direction : input;
      capacitance : 1.0;
    }
    ...

    pin(Z) {
      direction : output;
      function : "A";
      three_state : "B"

      is_three_state : false; /* error */
      ...
    }
  }
```

The following is an example message:

```
Error: Line 84, The  "false" 'is_three_state' attribute cannot coexist
        with the 'three_state' attribute on the 'Z' pin. (LBDB-659)
```

What Next

Check the specification of the cell, and make the appropriate change to the *driver_type* attribute or other attributes in the faulty pin group.

LBDB-660

(error) It is invalid to specify the '%s' %s on the '%s' %s%s.

Description

This message indicates that you have specified an invalid attribute or group for a cell.

The following example shows an instance where this message occurs:

```
cell (p) {
    clocked_cell : rising_edge;
    pin(clk) {
      clock : true;
    }

    pin(out) {
      function : "clk";
    }
  }
```

To correct the error, add at least 1 combinational timing arc between the *clk* and *out* pins.

Feedback

The following is an example message:

```
Error: Line 67, It is invalid to specify the 'clocked_cell' attribute on
 the 'p' cell. (LBDB-660)
```

What Next

Check the library source file, and ensure that the following conditions are met:

- The *is_isolated attribute* is specified only on the macro-cell pins.
- When the *clocked_cell* attribute is specified, the corresponding cell has
  - only 1 clock-pin, with the *clock* attribute set to *true*.
  - at least 1 timing arc between the clock pin and an output pin.

LBDB-661

(error) The 'generic' integrated clock gating cell should not define the 'statetable' group without 'ff/latch' group.

Description

This message indicates that you specified the 'generic' integrated gating clock cell with 'statetable' definition without 'ff/latch' group definition. You should define 'statetable' group with 'ff' or 'latch' group.

The following example shows an instance where this message occurs:

```
cell(CGNP) {
  area : 1;
  clock_gating_integrated_cell : "generic";

  statetable(" CP EN ", "IQ ") {
     table : " L  L  : - : L ,\
               L  H  : - : H ,\
               H  -  : - : N ";
  }
  ...
}

The modified cell description should be :

cell(CGNP) {
  area : 1;
  clock_gating_integrated_cell : "generic";

  statetable(" CP EN ", "IQ ") {
     table : " L  L  : - : L ,\
               L  H  : - : H ,\
               H  -  : - : N ";
```

Feedback

```
  }
  latch("IQ","IQN") {
    enable : "CP'";
    data_in : "EN";
  }
  ...
}
```

The following is an example message:

```
Error: Line 206, The 'generic' integrated clock gating cell should not
 define the 'statetable' group without 'ff/latch' group.(LBDB-661)
```

What Next

Change the library source file, add 'ff' group or 'latch' group definition.

LBDB-662

(warning) The %s is not defined. operating_conditions "nom_pvt" is created \n \tand set as the default_operating_conditions.

Description

This warning message occurs when the *default_operating_conditions* is undefined and there is eith no operating_conditions groups defined or multiple operating_conditions defined.

What Next

If you do not want Library Compiler to create the default operating_conditions for you, please check your library to define the relative operating_condition group and set it as the default_operating_conditions with the library-level attribute "default_operating_conditions".

LBDB-663

(warning) The %s is not defined. operating_conditions '%s' is set\n \tas the default_operating_conditions.

Description

This warning message occurs when the *default_operating_conditions* is undefined and there is extactly 1 operating_conditions group defined in the library.

What Next

If you do not want Library Compiler to automatically set the default operating_conditions for you, please check your library to define the relative operating_condition group

Feedback

and set it as the default_operating_conditions with the library-level attribute "default_operating_conditions".

LBDB-664

(error) The '%s' attribute of the '%s' has a value '%g',\n \twhich should be %s for the %s.

Description

The value specified is equal to a threshold value 0.0 for the attribute.

The following example shows an instance where this message occurs:

```
output_current_rise() {
        vector(current_template_8x7) {
           reference_time : 0.0140609;
           index_1("0");
           index_2("0.019368");
           index_3("0.1462, 0.175, 0.19, 0.205, 0.235, 0.25, 0.265,
 0.275, 0.29, 0.305, 0.32, 0.35, 0.406591");
           values("0.0, 0.2, 0.3, 0.4, 0.5, 0.6, 0.7, 0.8, 0.9, 1.0, 1.1,
 1.2, 1.3");
        }
      }
```

The following is an example message:

```
Error: Line 1897, Cell 'A', pin 'X', The 'values' attribute of the
 'vector' has a value '0',
       which should be non-zero for the output_current_rise vector.
 (LBDB-664)
```

What Next

Check the library source file and correct the problem.

LBDB-665

(error) The %s value of the '%s' attribute of the '%s' is the peak value.

Description

The frist value specified in the specified attribute is a peak value, i.e., the maximun value for the values attribute of the vector of an output_current_rise group, or the minimum value for the values attribute of the vector of an output_current_fall group.

The following example shows an instance where this message occurs:

```
output_current_rise(current_template_8x7) {
        vector(current_template_8x7) {
           reference_time : 0.0140609;
```

Feedback

```
          index_1("0");
          index_2("0.019368");
          index_3("0.1462, 0.175, 0.19, 0.205, 0.235, 0.25, 0.265,
 0.275, 0.29, 0.305, 0.32, 0.35, 0.406591");
          values("1.8, 0.2, 0.3, 0.4, 0.5, 0.6, 0.7, 0.8, 0.9, 1.0, 1.1,
 1.2, 1.3");
       }
     }
```

The following is an example message:

```
Error: Line 35, The first value of the 'values' attribute of the 'vector'
 is the peak value. (LBDB-665)
```

What Next

Check the library source file and correct the problem.

LBDB-666

(warning) The '%s' has the same %s %g as the '%s' at line %d, \n \tbut the %s does not increase(from %g to %g) \n \twith increasing %s (from %g to %g).

Description

For a timing arc, within each output_current_rise/fall group. for a given total_output_net_capacitance(load), teh reference_times should increase with the increasing input_transition_time(slew). This check is only useful for the signoff timing analysis with the 2004.12 and the relative sevice pack releases of PrimeTime.

The following example shows an instance where this message occurs:

```
output_current_rise(current_template) {
               ...
              vector(current_template) {
                 reference_time : 0.0140609;
                 index_1("0.1"); /* load */
                 index_2("0.019368"); /* slew */
                 index_3("0.1462, 0.175, 0.19, 0.205, 0.235, 0.25,
 0.265, 0.275, 0.29, 0.305, 0.32, 0.35, 0.406591");
                 /* LBDB-664 */
                 values("0.1, 0.2, 0.3, 0.4, 0.5, 0.6, 0.7, 0.8, 0.9,
 1.0, 1.1, 1.2, 1.3");
              }
              vector(current_template) {
                 reference_time : 0.0319875;
                 index_1("0.1"); /* load */
                 index_2("0.049573"); /* slew */
                 index_3("0.160795, 0.185, 0.2, 0.23, 0.24, 0.255, 0.27,
 0.285, 0.295, 0.31, 0.325, 0.34, 0.355, 0.37, 0.4
175");
```

Feedback

```
                values("0.1, 0.2, 0.3, 0.4, 0.5, 0.6, 0.7, 0.8, 0.9,
 1.0, 1.1, 1.2, 1.3");
              }
               ...
        }
```

The following is an example message:

```
Warning : Line 357, The 'vector' has the same
 total_output_net_capacitance 0.000000 as the 'vector' at line 364,
        but the reference_time does not increase(from 0.031987 to
 0.026168)
        with increasing input_net_transition (from 0.049573 to 0.094881).
 (LBDB-666)
```

What Next

Check the library source file and correct the problem.

LBDB-667

(warning) This '%s' group has a value (%g) in 'vector/index_1' that does not match any values of 'index_1' in '%s' at line %u. Parent '%s' is at line %u.

Description

In the referenced ccs noise data modeling, output_voltage_rise and output_voltage_fall are characterized in ways to be closer to timing characterization. Their "input slew" (vector/index_1) and "output load" (vector/index_2) values form a 2D grid, similar to various timing lookup tables.

To best match timing behavior, "input slew" values of all CCB's should match points given in index_1 of respective driver waveform. See also LBDB-979 for additional checks on CCB's involved in propagating noise.

The following example shows an instance where this message occurs:

```
library(test) {
  ...
  normalized_driver_waveform(ndw1) {
    driver_waveform_name : "driver_waveform_default_fall" ;
    index_1("0.003209, 0.0133113, 0.033516, 0.0726625, 0.152218");
    ...
  }
  ...

    }
}
```

Examples

Warning: Line 28818, Cell 'ICG', pin 'SE', This 'output_voltage_fall' group has a value (0.00863453) in 'vector/index_1' that does not match any values of 'index_1' in 'normalized_driver_waveform' at line 261. Parent 'input_ccb' is at line 28776. (LBDB-667)

What Next

Correct the characterization procedure.

LBDB-668

(warning) related_pin '(%s)', when '(%s)', slew/load '(%g/%g)', The final signal voltage of the %s is %g, which does not reach within the 5 percent of the rail voltage %g.

Description

For each output_current_rise/fall vector, the final signal voltage must be within the 5% of the final rail voltage. This can be described with the following formulas:

If output_signal_level_low and output_signal_level_high are specified, volt_low = output_signal_level_low; volt_high = output_signal_level_high; Else volt_low = VSS; volt_high = VDD;

1. For the output_current_rise vector, Vfinal = volt_low + (0.5/Cout)*(I2+I1)*(T2-T1)+... +(0.5/Cout)*(In+In-1)*(Tn-Tn-1) and fabs(Vfinal - volt_high) must NOT be greater than 0.02 (volt_high - volt_low) 2. For the output_current_fall vector, Vfinal = volt_high + (0.5/Cout)*(I2+I1)*(T2-T1)+...+(0.5/Cout)*(In+In-1)*(Tn-Tn-1) and fabs(Vfinal - volt_low) must NOT be greater than 0.02 (volt_high - volt_low)

The following is an example message:

```
Error : Line 373, cell 'TEST', pin 'Q', related_pin '(CP)', when '(!D)',
 slew/load '(0.0088/0.0012)', The final signal voltage of the vector is
 1.200000, which does not reach within the 5 percent of the rail voltage
 1.000000. (LBDB-668)
```

Feedback

What Next

Check the library source file and correct the problem.

LBDB-669

(error) The final signal voltage of the %s is %g and it does not reach beyond the 2nd \n \tslew threshold voltage, which is %g for the %s.

Description

For each output_current_rise/fall vector, the final signal voltage must reach the 2nd slew threshold(i.e., the maximum of the slew thresholds for the output_current_rise vectors, and the minimum of the slew thresholds for the output_current_fall vectors) This can be described with the following formulas:

If output_signal_level_low and output_signal_level_high are specified, volt_low = output_signal_level_low; volt_high = output_signal_level_high; Else volt_low = VSS; volt_high = VDD;

1. For the output_current_rise vector, Vfinal = volt_low + (0.5/Cout)*(I2+I1)*(T2-T1)+... +(0.5/Cout)*(In+In-1)*(Tn-Tn-1) Verr = volt_low + MAX(slew_lower_threshold_pct_rise, slew_upper_threshold_pct_rise, output_threshold_pct_rise) * (volt_high-volt_low) * 0.01

Vfinal must NOT be less than Verr. 2. For the output_current_fall vector, Vfinal = volt_high + (0.5/Cout)*(I2+I1)*(T2-T1)+...+(0.5/Cout)*(In+In-1)*(Tn-Tn-1) Verr = volt_low + MIN(slew_lower_threshold_pct_fall, slew_upper_threshold_pct_fall, output_threshold_pct_fall) * (volt_high-volt_low) * 0.01

Vfinal must NOT be greater than Verr.

The following is an example message:

```
Error : Line 373, The final signal voltage of the vector is 0.800000 and
 it does not reach beyond the 2nd
        slew threshold voltage, which is 1.000000 for the
 output_current_fall vector. (LBDB-669)
```

What Next

Check the library source file and correct the problem.

LBDB-670

(information) The '%s' has '%s' %s, \n \twhich has less than %d significant digits.

Feedback

Description

The values in the current/receiver_capacitance tables should have at least 4 significant digits. The value of intrinsic_resistance and intrinsic_capacitance should have at least 2 significant digits if there is no off channel resistance (i.e. greater than 1Mohm) in the library.

The following example shows an instance where this message occurs:

```
output_current_rise(current_template) {
        ...
        vector(current_template) {
           reference_time : 0.0961844;
           index_1("0");
           index_2("0.170393");
           index_3("0.254379, 0.295, 0.31, 0.325, 0.34, 0.355, 0.385,
 0.4, 0.415, 0.43, 0.445, 0.475, 0.543056");
           values("0.1234, 0.2345, 0.3456, 0.4567, 0.5678, 0.6789,
 0.7890, 0.7891, 0.0001, 0.7892, 0.7893, 0.7894, 0.7895");
        }
        ...
    }
```

The following is an example message:

```
Information : Line 373, The 'vector' has 'values' 0.4,
        which has less than 4 significant digits. (LBDB-670)
```

What Next

Check the library source file and correct the problem.

LBDB-671

(warning) The '%s' has %s adjacent '%s' (%.8g, %.8g).

Description

The adjacent 'values' in the vectors fo the outpur_current_rise/fall tables are identical.

The following example shows an instance where this message occurs:

```
output_current_rise(current_template) {
        ...
        vector(current_template) {
           reference_time : 0.0961844;
           index_1("0");
           index_2("0.170393");
           index_3("0.254379, 0.295, 0.31, 0.325, 0.34, 0.355, 0.385,
 0.4, 0.415, 0.43, 0.445, 0.475, 0.543056");
           values("0.1234, 0.2345, 0.2345, 0.4567, 0.5678, 0.6789,
 0.7890, 0.7891, 0.0001, 0.7892, 0.7893, 0.7894, 0.7895");
```

```
        }
        ...
    }
```

The following is an example message:

```
Error : Line 373, The 'vector' has identical adjacent 'values' (0.2345,
 0.2345). (LBDB-671)
```

What Next

Check the library source file and correct the problem.

LBDB-672

(information) There are more than 1 operating_conditions defined in the library.

Description

The message is to notify users that there are more than 1 operating_conditions defined in the library. For each library, only 1 operating_condtions group is necessary since it defined the pvt used for characterizing the library, and this operating_condtion is also the "default_operating_conditions" of the library.

LBDB-673

(warning) The timing arc does not have full receiver modeling information.

Description

This message indicates that the timing arc does not have all the following receiver modeling information: receiver_capacitance1_rise, receiver_capacitance1_fall, receiver_capacitance2_rise, receiver_capacitance2_fall

Although it is usually valid to specify only half of the receiver modeling information for the half-nate timing arcs. However, in some corner cases, we may need the full receiver modeling information.

In the following example,the receiver_capacitance1_fall group and the receiver_capacitance2_fall group are not specified for the half-unate timing arc.

```
timing() {
  timing_type : rising_edge;
  timing_sense : positive_unate;
  ...
  receiver_capacitance1_rise(basic_template_8x7) {
              index_1 ("0, 0.00081298, 0.0188997, 0.0460298, 0.0912466,
 0.18168, 0.452981, 0.905149");
              index_2 ("0.019368, 0.049573, 0.0948806, 0.170393,
 0.321418, 0.774494, 1.52962");
```

```
                values ("0.00165664, 0.00165664, 0.00165936, 0.00166126,

  }
  ...
}
```

```
Warning: Line 673, The timing arc does not have full receiver modeling
 information. (LBDB-390)
```

What Next

If possoble, add the missing receiver modeling information in the library.

Feedback

LBDB-674

(information) The 1st pair of (%s, %s) index of timing arc\n \t'%s' is (%g, %g) which is larger than recommended (%g, %g).

Description

This information occurs when the 1st index values of the timing arc are larger than the recommended values.

The following example shows an instance where this message occurs:

```
cell_rise(template) {
      index_1("1.0 ,2.0,4.0,6.0,10.0"); /* total_output_net_capacitance
 */
      index_2("0.362,0.725,1.087,1.449,1.812"); /* input_transition_time
 */
      ...
  }
```

The following is an example message:

```
Information: Line 20068, The 1st pair of
 (total_output_net_capacitance,input_transition_time) index of timing arc
       'cell_rise' is (1.0, 0.362) which is larger than recommended (0,
 0).  (LBDB-674)
```

What Next

Make sure the 1st index values are not larger than the recommended.

LBDB-675

(information) The 1st %s index of timing arc\n \t'%s' is %g, which is larger than recommended %g.

Description

This information occurs when the 1st index value of the timing arc is larger than the recommended value.

The following example shows an instance where this message occurs:

```
cell_rise(template) {
      index_1("1.0 ,2.0,4.0,6.0,10.0"); /* total_output_net_capacitance
 */
      ...
  }
```

The following is an example message:

```
Information: Line 20068, The 1st total_output_net_capacitance index of
 timing arc
        'cell_rise' is 1.0, which is larger than recommended 0.
 (LBDB-675)
```

What Next

Make sure the 1st index value is not larger than the recommended.

LBDB-676

(information) The significant digits of values in timing arc '%s' is %d,\n \twhich is less than recommended %d.

Description

This information occurs when the significant digits of values in the specified table is less than the recommended number.

The following example shows an instance where this message occurs:

```
cell_rise(template) {
      ...
      values("0.459,0.651,0.843,1.034,1.225",\
      ...);
  }
```

The following is an example message:

```
Information: Line 454, The significant digits of values in timing arc
 'cell_rise' is 4,
        which is less than recommended 5. (LBDB-676)
```

What Next

Make sure the significant digits is not less than the recommended.

LBDB-677

(warning) The table size of timing arc '%s' is %dx%d,\n \twhich is less than recommended %dx%d.

Description

This information occurs when the table size is less than the recommended number.

Feedback

The following example shows an instance where this message occurs:

```
cell_rise(template) {
      index_1("1.0 ,2.0,4.0,6.0,10.0"); /* total_output_net_capacitance
 */
      index_2("0.362,0.725,1.087,1.449,1.812"); /* input_transition_time
 */
      ...
  }
```

The following is an example message:

```
Warning: Line 446, The table size of timing arc 'cell_rise' is 5x5,
        which is less than recommended 7x7. (LBDB-677)
```

What Next

Make sure the table size is not less than the recommended.

LBDB-678

(warning) The table size of timing arc '%s' is %d,\n \twhich is less than recommended %d.

Description

This information occurs when the table size is less than the recommended number.

The following example shows an instance where this message occurs:

```
cell_rise(template) {
      index_1("1.0 ,2.0,4.0,6.0,10.0"); /* total_output_net_capacitance
 */
      ...
  }
```

The following is an example message:

```
Warning: Line 446, The table size of timing arc 'cell_rise' is 5,
        which is less than recommended 7. (LBDB-678)
```

What Next

Make sure the table size is not less than the recommended.

LBDB-679

(error) Can not find the %s of the %spin%s.

Feedback

Description

This information occurs when pin's max_capacitance/min_capacitance or the related_pin's max_transition information can not be found.

The following example shows an instance where this message occurs:

```
cell ( INV ) {
    area : 1 ;
    pin ( A ) {
      direction : input ;
      capacitance : 1 ;
      fanout_load : 1 ;
      ...
    }
    pin ( Z ) {
      related_pin :  A ;
      direction : output ;
      capacitance : 1 ;
      fanout_load : 1 ;
      ...
    }
  }
```

The following is an example message:

```
Error: Line 446, Can not find the max_transition of the input pin 'A'.
 (LBDB-679)
Error: Line 446, Can not find the min_capacitance of the  pin 'Z'.
 (LBDB-679)
Error: Line 446, Can not find the max_capacitance of the  pin 'Z'.
 (LBDB-679)
```

What Next

Make sure the max_transition/max_capacitance/min_capacitance information are defined in the source .lib file.

LBDB-680

(warning) The max value of %s index of group '%s' is %g,\n \twhich is less than max %s of pin '%s', %g.

Description

This information occurs when the max value of the specified index is less than the max constraint for the pin.

Feedback

In 10nm library, the index of input_net_transition of CCS receiver model will be checked using these ways in order of priority:

1) If driver waveform is defined, choose driver waveform matching the max_transition of related input pin, masure the transition time used in characterization of C1/C2 respectively from driver waveform, then use the restored transition time as constraint.

2) If driver waveform is NOT defined, use 80% of the max_transition value of related input pin as constraint.

The following example shows an instance where this message occurs:

```
pin(y) {
     direction   : input;
     min_capacitance : 0.361;
     max_capacitance : 1.813;
     max_transition : 0.5;
     cell_rise(template) {
       index_2("0.362,0.725,1.087,1.449,1.812"); /* total_out_net_cap  */
       ...
     }
     ...
   }
```

The following is an example message:

```
Warning: Line 762, The max value of total_out_net_cap index of timing arc
 'cell_rise' is 1.812,
        which is less than max total_out_net_cap of pin 'y', 1.813.
 (LBDB-680)

Warning: Line 1117, Cell 'dfnrb4', The max value of 1st index of group
 'receiver_capacitance1_fall' is 1755.58,
        which is less than max transition restored from driver_waveform
 of pin 'CP', 2369.48. (LBDB-680)

Warning: Line 78450, Cell 'r0hd_eln20_cbgclnbt06p00', The max value of
 1st index of group 'receiver_capacitance1_rise' is 0.4035,
        which is less than max transition with a 20.0 percent tolerance
 of pin 'root_clk_off', 1.2. (LBDB-680)
```

What Next

Make sure the max index value is not less than the constraint.

LBDB-681

(warning) The min value of %s index of timing arc '%s' is %g,\n \twhich is bigger than min %s of pin '%s', %g.

Feedback

Description

This information occurs when the min value of the specified index is larger than the min constraint for the pin.

The following example shows an instance where this message occurs:

```
pin(y) {
     direction   : input;
     min_capacitance : 0.361;
     max_capacitance : 1.813;
     max_transition : 0.5;
     cell_rise(template) {
       index_2("0.362,0.725,1.087,1.449,1.812"); /* total_out_net_cap  */
       ...
     }
     ...
   }
```

The following is an example message:

```
Warning: Line 762, The min value of total_out_net_cap index of timing arc
 'cell_rise' is 0.362,
        which is larger than min total_out_net_cap of pin 'y', 0.361.
 (LBDB-681)
```

What Next

Make sure the min index value is not larger than the constraint.

LBDB-682

(warning) The values in timing arc '%s' are nonmonotonic %g, %g,\n \twhen %s = %g.

Description

This information appears when the delay values in the specified table do not increase monotonically with the increasing capacitance.

The following example shows an instance where this message occurs:

```
cell_rise(template) {
      index_1("1.0 ,2.0,4.0,6.0,10.0"); /* input_transition_time */
      index_2("0.362,0.725,1.087,1.449,1.812"); /*
 total_output_net_capacitance */
      values ("1.405, 1.116...")
  }
```

Feedback

The following is an example message:

```
Warning: Line 762, The values in timing arc 'cell_rise' are non monotonic
 1.405, 1.116,
        when input_net_transition = 1.    (LBDB-682)
```

What Next

Make sure that the delay values increase monotonically with the increasing capacitance.

LBDB-683

(warning) The table is a load independent table.

Description

This information occurs when the template of one table do not have the total_output_net_capacitance index where it is needed.

The following example shows an instance where this message occurs:

```
lu_table_template(transition1x5){
    variable_1 : input_net_transition;
    index_1("0.5,1.0,1.5,2.0,2.5");
 }
 ...
 cell (AND) {
   pin(y) {
      ...
      cell_rise(transition1x5) {
        index_1("0.362,0.725,1.087,1.449,1.812"); /* input_net_transition
 */
        ...
      }
      ...
   }
   ...
 }
```

The following is an example message:

```
Warning: Line 762, The table is a load independent table. (LBDB-683)
```

What Next

Make sure the table use the correct template which is with total_output_net_capacitance index.

LBDB-684

(warning) The table is a scalar table.

Feedback

Description

This information occurs when the template of one table do not have any index where it is needed.

The following example shows an instance where this message occurs:

```
lu_table_template(scalar_template){
 }
 ...
 cell (AND) {
   pin(y) {
     ...
     cell_rise(scalar_template) {
        values ("...");
     }
     ...
   }
   ...
 }
```

The following is an example message:

```
Warning: Line 762, The table is a scalar table. (LBDB-684)
```

What Next

Make sure the table use the correct template which is with index.

LBDB-685

(warning) The voltage range of %s is %g->%g,\n \twhich is less than recommended %g->%g.

Description

This information occurs when the range of voltage index for IV curves is less than the recommended.

The following example shows an instance where this message occurs:

```
...
   iv_lut_template ("LUT_TEMPLATE_13570_t") {
        variable_1 : "iv_output_voltage";
        index_1("-1.500000, -0.611850, -0.019800, 0.009900, 0.246750,
 0.868350, 1.016400, 1.578900, 2.526300, 3.000000");
   }
     ...
    timing () {
      steady_state_current_low ("LUT_TEMPLATE_13570_t") {
                    values("-1.500000, -0.611850, -0.019800, 0.009900,
 0.246750, 0.868350, 1.016400, 1.578900, 2.526300, 3.000000");
```

Feedback

```
      }
    }
```

The following is an example message:

```
Warning: Line 780, The voltage range of steady_state_current_low is
 -1.5->3,
        which is less than recommended -5->10. (LBDB-685)
```

What Next

Make sure the voltage range is not less than the recommended.

LBDB-686

(warning) There is potential extrapolation problem\n \t%s[%g, %g, %g]=%g (> %g).

Description

This information occurs when the noise value extrapolated with the boundary values is larger than the recommended zero value.

The following example shows an instance where this message occurs:

```
propagated_noise_width_below_low(my_noise_propagation){
      index_1("0.00250, 0.00500, 0.01000, 0.01500, 0.02500, 0.03750,
 0.05000"); /*total_output_net_capacitance*/
      index_2("0.400,1.000,1.500,2.000"); /*input_noise_width*/
      index_3("0.36000,0.54000,0.72000,0.90000");
      values("0.025, 0.024, 0.010, 0.013",\
             "1.071, 0.342, 0.121, 0.222",\
             "0.489, 0.565, 0.789, 0.750",\
             "0.282, 0.021, 0.279, 0.118",\
             "0.034, 0.042, 0.009, 0.015",\
             "1.068, 0.346, 0.121,...);
  }
```

The following is an example message:

```
Warning: Line 215, There is potential extrapolation problem
        Width[0.05, 1, 0]=0.376 (> 0.1). (LBDB-686)
```

What Next

Make sure the boundary values in the table correct.

LBDB-687

(warning) There is potential extrapolation problem\n \t%s[%g, %g]=%g (> %g).

Feedback

Description

This information occurs when the noise value extrapolated with the boundary values is larger than the recommended zero value.

The following example shows an instance where this message occurs:

```
propagated_noise_width_below_low(my_noise_propagation){
      index_1("0.400,1.000,1.500,2.000"); /*input_noise_width*/
      index_2("0.36000,0.54000,0.72000,0.90000");
      values("0.025, 0.024, 0.010, 0.013",\
             "1.071, 0.342, 0.121, 0.222",\
             "0.489, 0.565, 0.789, 0.750",\
             "0.282, 0.021, 0.279, 0.118");
  }
```

The following is an example message:

```
Warning: Line 215, There is potential extrapolation problem
        Width[1, 0]=2.529 (> 0.1). (LBDB-687)
```

What Next

Make sure the boundary values in the table correct.

LBDB-688

(warning) The curve is curling upwards at the end.\n \twhen total_output_net_capacitance=%g.

Description

This information occurs when the immunity curve curls upwards at the end of the curve.

The following example shows an instance where this message occurs:

```
noise_immunity_high (my_noise_reject) {
    values ("1.3, 0.8, 0.7, 0.6, 0.55", \
            "1.5, 0.9, 0.8, 0.65, 0.6", \
            "1.5, 0.9, 0.8, 0.65, 0.6", \
            "1.5, 0.9, 0.8, 0.65, 0.6", \
            "-1.5, 1.9, 0.8, 0.65, 0.6") ;
  }
```

The following is an example message:

```
Warning: Line 178, The curve is curling upwards at the end.
        when total_output_net_capacitance=0.1. (LBDB-688)
```

Feedback

What Next

Make sure each last 2 values with the same total_output_net_capacitance index are almost identical.

LBDB-689

(warning) The curve is not leveling off at the end.\n \twhen total_output_net_capacitance= %g.

Description

This information occurs when the immunity curve is not leveling off at the end.

The following example shows an instance where this message occurs:

```
noise_immunity_high (my_noise_reject) {
    values ("1.3, 0.8, 0.7, 0.6, 0.55", \
            "1.5, 0.9, 0.8, 0.65, 0.6", \
            "1.5, 0.9, 0.8, 0.65, 0.6", \
            "1.5, 0.9, 0.8, 0.65, 0.6", \
            "-1.5, 1.9, 0.8, 0.65, 0.6") ;
  }
```

The following is an example message:

```
Warning: Line 178, The curve is not leveling off at the end.
        when total_output_net_capacitance=0. (LBDB-689)
```

What Next

Make sure each last 2 values with the same total_output_net_capacitance index are almost identical.

LBDB-690

(error) The current polarity is reversed.

Description

This information occurs when the current polarity is reversed.

The following example shows an instance where this message occurs:

```
steady_state_current_low(my_current_low) {
    values("0.1, 0.05, 0, -0.1, -0.25, -1, -1.8");
  }
```

The following is an example message:

```
Error: Line 198, The current polarity is reversed. (LBDB-690)
```

Feedback

What Next

Make sure the skew of the current at middle point is correct.

LBDB-691

(error) There is negative or zero values in the table.

Description

This information occurs when the value in the table is negative or zero where it should be positive.

The following example shows an instance where this message occurs:

```
propagated_noise_height_below_low(my_noise_propagation){
  ...
          values ("-1.4 ..");
```

The following is an example message:

```
Error: Line 198, There is negative values in the table. (LBDB-691)
```

What Next

Make sure the values in the table are positive.

LBDB-692

(warning) The max height of the noise table %s is %g,\n \twhich is less than recommended %g.

Description

This information occurs when the max height of the noise table is less than the recommended.

The following example shows an instance where this message occurs:

```
propagated_noise_height_below_low(my_noise_propagation){
                index_1("0.00250, 0.00500, 0.01000, 0.01500, 0.02500,
 0.03750, 0.05000");
                index_2("0.400,1.000,1.500,2.000");

 index_3("0.36000,0.54000,0.72000,0.90000"); /*input_noise_height*/
```

The following is an example message:

```
Warning: Line 248, The max height of the noise table
 propagated_noise_height_below_low is 0.9,
        which is less than recommended 5. (LBDB-692)
```

Feedback

What Next

Make sure the max height is not less than the recommended.

LBDB-693

(warning) The max width of the noise table %s is %g,\n \twhich is less than recommended %g.

Description

This information occurs when the max width of the noise table is less than the recommended.

The following example shows an instance where this message occurs:

```
propagated_noise_height_below_low(my_noise_propagation){
                index_1("0.00250, 0.00500, 0.01000, 0.01500, 0.02500,
 0.03750, 0.05000");
                index_2("0.400,1.000,1.500,2.000"); /*input_noise_width*/
                index_3("0.36000,0.54000,0.72000,0.90000");
```

The following is an example message:

```
Warning: Line 281, The max width of the noise table
 propagated_noise_width_low is 2,
        which is less than recommended 4. (LBDB-693)
```

What Next

Make sure the max width is not less than the recommended.

LBDB-694

(warning) The width range of %s is %g->%g,\n \twhich is less than recommended %g->%g.

Description

This information occurs when the width index does not have enough range.

The following example shows an instance where this message occurs:

```
noise_immunity_above_high (my_noise_reject_outside_rail) {
    index_1("0, 0.1, 2"); /*input_noise_width*/
    values ("1, 0.8, 0.5", \
            "1, 0.8, 0.5", \
            "1, 0.8, 0.5");
  }
```

Feedback

The following is an example message:

```
Warning: Line 192, The width range of noise_immunity_above_high is 0->2,
        which is less than recommended 2->4. (LBDB-694)
```

What Next

Make sure the width index have the enough range.

LBDB-695

(error) The pin '%s' misses DC noise margin.

Description

This information occurs when one pin does not DC noise margin information.

The following example shows an instance where this message occurs:

```
pin(a) {
            direction   : input;
            capacitance : 1.000;
        }
```

The following is an example message:

```
Error: Line 794, The pin 'a' misses DC noise margin. (LBDB-695)
```

What Next

Make sure there is DC noise margin information defined in one pin if no other noise information.

LBDB-696

(warning) The timing arc misses noise %s information.

Description

This information occurs when the timing arc does not have specified noise information.

The following is an example message:

```
Warning: Line 137, The timing arc misses noise
 propagated_noise_width_high information. (LBDB-696)
```

What Next

Make sure there is complete noise information defined in the timing arc.

Feedback

LBDB-697

(warning) The timing arc %s->%s misses noise %s_%s information.

Description

This information occurs when the timing arc does not have specified noise information.

The following is an example message:

```
Warning: Line 137, The timing arc DA[0]->QB[0] misses noise
 propagated_noise_width_above_high information. (LBDB-697)
```

What Next

Make sure there is complete noise information defined in the timing arc.

LBDB-698

(warning) The values in noise table '%s' are non monotonous\n \t%g, %g, when %s = %g, %s = %g.

Description

This information occurs when the delay values in specified table do not decrease monotonously with increasing capacitance.

The following example shows an instance where this message occurs:

```
propagated_noise_width_below_low(my_noise_propagation){
                index_1("0.00250, 0.00500, 0.01000, 0.01500, 0.02500,
 0.03750, 0.05000");
                index_2("0.400,1.000,1.500,2.000");
                index_3("0.36000,0.54000,0.72000,0.90000");
                values("0.000, 0.024, 0.010, 0.013",\
                       "1.071, 0.342, 0.121, 0.222",\
                       "0.489, 0.565, 0.789, 0.750",\
                       "0.282, 0.021, 0.279, 0.118",\
                       "1.000, 0.042, 0.009, 0.015",\
                       "1.068, 0.346, 0.121, 0.248",\
                       "0.497, 0.584, 0.786, 0.777",\
                       "0.271, 0.029, 0.281, 0.120",\
                       "0.055, 0.074, 0.008, 0.017",\
                       "1.076, 0.356, 0.121, 0.306",\
                       "0.481, 0.612, 0.783, 0.778",\
                       "0.257, 0.045, 0.288, 0.103",\
                       "0.072, 0.102, 0.006, 0.018",\
                       "1.098, 0.367, 0.121, 0.359",\
                       "0.506, 0.646, 0.779, 0.770",\
                       "0.248, 0.057, 0.295, 0.105",\
                       "0.102, 0.161, 0.002, 0.018",\
```

```
                        "1.162, 0.392, 0.118, 0.437",\
                        "0.571, 0.707, 0.775, 0.763",\
                        "0.238, 0.076, 0.311, 0.107",\
                        "0.142, 0.202, 0.002, 0.059",\
                        "0.389, 0.426, 0.102, 0.541",\
                        "0.673, 0.775, 0.772, 0.768",\
                        "0.235, 0.094, 0.329, 0.109",\
                        "0.180, 0.246, 0.005, 0.071",\
                        "0.434, 0.463, 0.090, 0.644",\
                        "0.705, 0.835, 0.758, 0.783",\
                        "0.235, 0.108, 0.345, 0.111");
            }
```

The following is an example message:

```
Warning: Line 248, The values in noise table
 'propagated_noise_height_below_low' are non monotonous
        0.025, 1.000, when input_noise_width = 0.4, input_noise_height =
 0.36. (LBDB-698)
```

What Next

Make sure the delay values decrease monotonously with increasing capacitance.

LBDB-699

(error) The 'generic' integrated clock gating cell '%s' should only have at most 1 inout/output pin with \n \tattribute 'clock_gate_out_pin' set to true.

Description

This message indicates that you specified the 'generic' integrated gating clock cell can only have 1 inout/output pin with 'clock_gate_out_pin : true'.

The following example shows an instance where this message occurs:

```
cell(CGNP) {
  area : 1;
  clock_gating_integrated_cell : "generic";
  ...
  pin(O1) {
                direction : output;
                clock_gate_out_pin : true;
                ...
  }
  pin(O2) {
                direction : output;
                clock_gate_out_pin : true;
                ...
  }
  ...
}
```

Feedback

```
The modified cell description can be :

cell(CGNP) {
  area : 1;
  clock_gating_integrated_cell : "generic";
  ...
  pin(O1) {
                direction : output;
                clock_gate_out_pin : true;
                ...
  }
  ...
}
```

The following is an example message:

```
Error: Line 206, The 'generic' integrated clock gating cell 'CGNP' should
 only have at most 1 inout/output pin with \n
        attribute 'clock_gate_out_pin' set to true. (LBDB-699)
```

What Next

Change the library source file.

LBDB-700

(error) The pin '%s' of the 'generic' integrated clock gating cell '%s' can not define\n \t attribute 'state_function'. It should use attribute 'function" instead.

Description

This message indicates that you specified attribute 'state_function' in the 'generic' integrated gating clock cell. It should be changed as 'function'.

The following example shows an instance where this message occurs:

```
cell(CGNP) {
  area : 1;
  clock_gating_integrated_cell : "generic";
  ...
  pin(O1) {
                direction : output;
                state_function : "!(IQ + SE) * CP_IN"
                ...
  }
  ...
}

The modified cell description can be :

cell(CGNP) {
```

Feedback

```
  area : 1;
  clock_gating_integrated_cell : "generic";
  ...
  pin(O1) {
                direction : output;
                function : "!(IQ + SE) * CP_IN"
                ...
  }
  ...
}
```

The following is an example message:

```
Error: Line 206, The pin 'O1' of the 'generic' integrated clock gating
 cell 'CGNP' can not define attribute 'state_function'. It should use
 attribute 'function" instead. (LBDB-700)
```

What Next

Change the library source file by replacing "state_function" to "function".

LBDB-701

(error) The %scell '%s' can not define pin functions of both '%s' and '%s'.

Description

Assume the integrated clock gating cell is modeled as :

... clock_gating_integrated_cell : "generic"; latch("IQ", "IQN") { data_in : "EN1 * EN2" ; enable : "CLK"' ; } ...

This message indicates that you specified pin functions for either one of the following 2 cases, which is invalid: 1. the same pin function with both IQ and IQN. for example, pin(Y1) { function : "IQ * (A + IQN)"; ... }

1. the different pin functions involved with IQ and IQN. for example, pin(Y1) { function : "IQ * A"; ... } pin(Y2) { function : "IQN * A"; ... }

The following is an example message:

```
Error: Line 206, The integrated clock gating cell '%s' can not define pin
 functions of both '%s' and '%s'. (LBDB-701)
```

What Next

Change the library source file by replacing "IQN" to "IQ"'.

Feedback

LBDB-702

(error) The cell should not define the 'statetable' group. \n \tIt should use 'ff' group or 'latch' group instead.

Description

This message indicates that you specified statetable and the pin function of "...IQ..." or "...IQN..."(excluding "IQ" and IQN", where IQ and IQN are the outptut of sequential element. You should define 'ff/latch' group instead.

The following example shows an instance where this message occurs:

```
cell(A) {
  area : 1;
  ...
  statetable(" CP EN ", "IQ ") {
     table : " L  L  : - : L ,\
               L  H  : - : H ,\
               H  -  : - : N ";
  }

  pin(Y) {
        function : "IQ * CP";
        ...
  }
  ...
}

The modified cell description should be :

cell(A) {
  area : 1;

  latch("IQ","IQN") {
    enable : "CP'";
    data_in : "EN";
  }
  ...
  pin(Y) {
        function : "IQ * CP";
        ...
  }
}
```

The following is an example message:

```
Error: Line 206, The cell should not define the 'statetable' group.
        It should use 'ff' group or 'latch' group instead. (LBDB-702)
```

Feedback

What Next

Change the library source file, and replace the statetable group with the ff/latch group of the specified cell.

LBDB-703

(error) An invalid %s '%s' is found in the '%s' group.

Description

The message is to notify users that either the attribute/group should not be defined in the relative parent group, or the value of the attribute/group need to be corrected.

What Next

Remove the attribute/group or correct the value of the attribute/group and rerun the command.

LBDB-704

(warning) The standard cells '%s' and '%s' does not have the same pg_pin configuration.

Description

The message is to notify users that all the standard cells(cells having 1 primary_power pg_pin and 1 primary_ground pg_pin) should have exactly the same pg_pin configuration: - all the primrary_power pg_pins of these cells have the same "voltage_name" - all the primrary_ground pg_pins of these cells have the same "voltage_name"

What Next

Correct the "voltage_name" attribute values of the pg_pins of the standard cells and rerun the command.

LBDB-705

(warning) The '%s' %s group has been defined multiple times in\n \tthe '%s' %s group. Using the last definition encountered.

Description

The library contains more than one definition of a group. The Library Compiler issues this error message, ignores the previous definitions, and takes into consideration the last definition encountered.

Feedback

The following example shows an instance where this message occurs:

```
cell(sample) {
        ...
        pg_pin(A) {
          ...
        }
        pg_pin(A) {
          ...
        }
        ...
    }
```

The following is an example message:

```
Warning: Line 50, The 'A' pg_pin group has been defined multiple times in
        the 'sample' cell group. Using the last definition encountered.
 (LBDB-705)
```

What Next

Change the group name if it is wrong, or delete the second definition.

LBDB-706

(error) %s analysis failed during CCS or CCB Noise compilation

Description

This error message reports that the ccsn_first_stage, ccsn_last_stage, input_ccb, or output_ccb at the line indicated cannot be compiled successfully. The analysis of an output_voltage_rise/fall data set fails.

If there is an LBDB-953 warning also associated with this stage, please consult the man page on LBDB-953 on how to debug the dc_current table.

If there is an LBDB-15 (or LBDB-954w, LBDB-955 specifically for N10) warning also associated with this stage, please consult the corresponding man page on how to correct the miller capacitance values.

If the cell is a level shifter, or has multiple pg_pins (primary_power, backup_power, or internal_power) of different voltages, LDBD-706 is likely to occur on those low-to-high level-shifting ccs noise stages. Please look for LBDB-939 warning to get more details.

Otherwise, make sure all capacitance values (miller_cap_rise/fall, and total_output_net_capacitance) are reasonable. Look for an LBDB-955 warning on miller_cap_rise/fall. Check to make sure index_2 (total_output_net_capacitance) values of all vector groups within the output_voltage_rise/fall group are smaller than the largest output load of delay and slew lookup tables.

Finally, examine index_1 (input_net_transition) values of all vector groups within the output_voltage_rise/fall group. They should not be smaller than the second smallest index_1 (input_net_transition) values of delay and slew lookup tables.

What Next

Correct the CCS or CCB Noise data accordingly.

LBDB-706w

(warning) %s analysis failed during CCS or CCB Noise compilation

Description

This warning message reports that the ccsn_first_stage, ccsn_last_stage, input_ccb, or output_ccb at the line indicated cannot be compiled successfully. The analysis of an output_voltage_rise/fall data set fails.

If there is an LBDB-953 warning also associated with this stage, please consult the man page on LBDB-953 on how to debug the dc_current table.

If there is an LBDB-15 (or LBDB-954w, LBDB-955 specifically for N10) warning also associated with this stage, please consult the corresponding man page on how to correct the miller capacitance values.

If the cell is a level shifter, or has multiple pg_pins (primary_power, backup_power, or internal_power) of different voltages, LDBD-706w is likely to occur on those low-to-high level-shifting ccs noise stages. Please look for LBDB-939 warning to get more details.

Otherwise, make sure all capacitance values (miller_cap_rise/fall, and total_output_net_capacitance) are reasonable. Look for an LBDB-955 warning on miller_cap_rise/fall. Check to make sure index_2 (total_output_net_capacitance) values of all vector groups within the output_voltage_rise/fall group are smaller than the largest output load of delay and slew lookup tables.

Finally, examine index_1 (input_net_transition) values of all vector groups within the output_voltage_rise/fall group. They should not be smaller than the second smallest index_1 (input_net_transition) values of delay and slew lookup tables.

What Next

Correct the CCS or CCB Noise data accordingly.

LBDB-707

(information) Compiling CCS Noise data --- %%d...

Feedback

Description

This message is for information purposes only and it is to show the process of compiling CCS noise data.

The following is an example message:

```
Information: Compiling CCS Noise data --- 10%... (LBDB-707)
Information: Compiling CCS Noise data --- 20%... (LBDB-707)
 ...
Information: Compiling CCS Noise data --- 100%... (LBDB-707)
```

LBDB-708

(error) The timing arc has '%s' timing_sense, which is not consistent with \n \tthe "is_inverting" attribute value(s) of its %s group(s).

Description

```
In the following descriptions, "input ccb" stands for input_ccb in new
 noise
model or ccsn_first_stage in old noise model, and "output ccb" stands for
output_ccb in new noise model or ccsn_last_stage in old noise model.

This message is to indicate that the "is_inverting" attribute value of
 the
"input ccb"/"output ccb" group(s) defined in the timing arc is not
 consistent
with the timing_sense of the arc.

The correct configuration should be:
1. If the timing sense is "positive_unate", then it can only contain
 either 1
"input ccb" with "FALSE" "is_inverting" attribute,
or 1 "input ccb" with "TRUE" "is_inverting" attribute and 1 "output ccb"
 with
"TRUE" "is_inverting" attribute,
or 1 "input ccb" with "FALSE" "is_inverting" attribute and 1 "output ccb"
 with
"FALSE" "is_inverting" attribute.
2. If the timing sense is "negative_unate", then it can only contain
 either 1
"input ccb" with "TRUE" "is_inverting" attribute,
or 1 "input ccb" with "TRUE" "is_inverting" attribute and 1 "output ccb"
 with
"FALSE" "is_inverting" attribute,
or 1 "input ccb" with "FALSE" "is_inverting" attribute and 1 "output ccb"
 with
"TRUE" "is_inverting" attribute.
```

Feedback

The following is an example message:

```
Error: Line 50, The timing arc has 'negative_unate' timing_sense, which
 is not
consistent with the "is_inverting" attribute values of its
 input_ccb/output_ccb
group(s). (LBDB-708)
```

LBDB-709

(error) '%s' cannot be used in the timing arc.

Description

This particular timing arc cannot have the aforementioned group or attribute because it is not a delay arc, or its timing sense is not positive or negative unate. (Non-unate timing sense typically occurs in sequential arcs.)

The following is an example message:

Error: Line 2077, Cell 'LL_SSYNCCFD1QSX010', pin 'Q', 'ccsn_first_stage' cannot be used in the timing arc.

What Next

correct the timing type or sense. Or remove the group or attribute.

LBDB-710

(error) The table size of '%s' is %dx%d,\n \twhich is less than the required %dx%d.

Description

This information occurs when the table size is less than the required number.

The following example shows an instance where this message occurs:

```
dc_current(template) {
      index_1("1.0") ; /* input_voltage */
      index_2("0.362"); /* output_voltage */
      ...
  }
```

The following is an example message:

```
Warning: Line 446, The table size of 'dc_current' is 5x5,
        which is less than the required 6x6. (LBDB-710)
```

What Next

Make sure the table size is not less than the recommended.

Feedback

LBDB-711

(error) a %s pin cannot specify the '%s' %s.

Description

This error message occurs when there is a mismatch between the direction of a pin and the CCS Noise data. Library Compiler fails if the following rules are not satisfied:

```
1. An input pin can only specify at least 1 ccsn_first_stage group.

2. An inout pin can specify both ccsn_first_stage group and
 ccsn_last_stage group.

3. An output pin can only specify ccsn_last_stage group.
```

The following example shows an instance where this message occurs: The following is an example of incorrect input that causes this error message:

```
cell(lbdb711) {
    ...
    pin(Y ) {
      direction : output;
      ...
      ccsn_first_stage() {
        ...
      }
    }
  }
```

In this case, the Y pin has the ccsn_first_stage group specified. To fix the error, change ccsn_first_stage to ccsn_last_stage.

What Next

Check the library source file and fix either the invalid CCS Noise data, or the direction of the pin.

LBDB-712

(warning) an %s pin should either specify at least one non-static\n \t'%s' in the pin group or specify noise data for all of its timing arcs.

Description

This warning message occurs because: 1. an inout or input pin should have: 1.1 at least one non-static ccsn_first_stage group in the pin group or define non-static ccs noise first stage data for all of its timing groups for CCSN modeling. 1.2 at least one non-static input_ccb group in the pin group for referenced CCSN modeling. 2. an inout or output pin should have: 2.1 at least one non-static ccsn_last_stage group in the pin group or define

Feedback

non-static ccs noise last stage data for all of its timing groups for CCSN modeling. 2.2 at least one non-static output_ccb group in the pin group for referenced CCSN modeling.

A static CCS noise model captures the behaviors of a static CCB (channel connected block). A static CCB refers to a CCB that does not have any input terminal or the voltage level at the input terminal does not affect the output current of the CCB. For example, a static CCS noise model can be characterized for a CMOS NAND gate when both inputs are tied to ground. Such static CCS noise models can be used in noise analysis with case analysis, but they cannot be used for propagating crosstalk delay or noise waveforms through the cell under study. See the *Make CCS Noise User Guide* for detailed information.

The following example shows an instance where this message occurs: In the following example, the Y pin does not have the ccsn_last_stage group specified, so the tool issues this warning message. To fix the problem, add the ccsn_last_stage group into the pin group.

```
cell(good) {
    ...
    pin(Y ) {
      direction : output;
      ...
      ccsn_last_stage() {
        ...
      }
      }
    }
  }
  cell(lbdb712) {
    ...
    pin(Y ) {
      /* no ccs noise information inside the pin group */
      direction : output;
      ...
      /* not all timing arcs inside the pin group has ccs noise data */
    }
  }
```

What Next

This is only a warning message. No action is required.

Feedback

However, you can do any of the following:

- Check the library source file and fix either the invalid CCS Noise data, or the direction of the pin.
- Safely ignore this warning if the following three categories of cells are identified in a library:
  - inverters: A cell always has 1 input pin and 1 output pin with the function as "!input" or "input'"
  - NAND: A cell always has 2 input or more and 1 output pin with the function as "!(input1 * input2 * ... input(n))" or "(input1 * input2 * ... input(n))'"
  - NOR: A cell always has 2 input or more and 1 output pin with the function as "!(input1 + input2 + ... input(n))" or "(input1 + input2 + ... input(n))'"

LBDB-713

(error) The '%s' group with %s '%s' attribute cannot specify following CCS or CCB Noise data: %s.

Description

This message indicates that if a ccsn_first_stage, ccsn_last_stage, input_ccb, or output_ccb group has 'is_needed' attribute set to FALSE, then it is not valid to specify the following noise data:

stage_type, is_inverting, miller_cap_rise, miller_cap_fall, dc_current, output_voltage_rise, output_voltage_fall, propagated_noise_low, propagated_noise_high.

The following example shows an instance where this message occurs:

```
cell(bad) {
    ...
    pin(Y ) {
      direction : output;
        ...
        ccsn_last_stage() {
                is_needed : FALSE;
                stage_type : both
                ...
        }
      }
    }
  }
```

Feedback

The following is an example message:

```
Error: Line 71, The 'ccsn_last_stage' group with FALSE 'is_needed'
 attribute
cannot specify following CCS or CCB Noise data: 'stage_type'. (LBDB-713)
```

What Next

Check the library source file, and remove the redundant CCS/CCB Noise data.

LBDB-714

(error) The '%s' group cannot specify the '%s' attribute with value '%s'.

Description

This message can be used to indicate that the output pin of a tie-off cell(pin function= "1" | "0", or driver_type = "pull_up" | "pull_down") specify incorrect value for the stage_type attribute of the ccsn_first_stage/ccsn_last_stage groups defined on the pin, which must satisfy the following rules: 1. If the driver pin with driver_type = pull_up or function = "1", then its ccsn_first_stage/ccsn_last_stage group must have the stage_type attribute with value "PULL_UP". 2. If the driver pin with driver_type = pull_down or function = "0", then its ccsn_first_stage/ccsn_last_stage group must have the stage_type attribute with value "PULL_DOWN".

The following example shows an instance where this message occurs:

```
cell(bad) {
    ...
    pin(Y ) {
        direction : output;
        function : 1;
        driver_type : "pull_up";
        ...
        ccsn_last_stage() {
                is_needed : FALSE;
                stage_type : "pull_down";
                ...
        }
      }
    }
  }
```

In this case, the 'Y' pin specify 'pull_down' stage_type attribute in its 'ccsn_last_stage' group. To fix the problem, change the 'pull_down' to 'pull_up'.

The following is an example message:

```
Error: Line 71, The 'ccsn_last_stage' group cannot specify the
 'stage_type' attribute with value 'PULL_DOWN'. (LBDB-714)
```

Feedback

What Next

Check the library source file, and correct the incorrect 'stage_type' value.

LBDB-716

(error) The %s %g of '%s' attribute is %s %s = %g.

Description

This message indicates that the first/last/some value of the specific attribute is greater than the upper bound value, or lower than the lower bound value.

What Next

Check your library and correct the value.

LBDB-717

(error) The value %g of '%s' attribute is %s %g.

Description

This message indicates that the value of the specific attribute is greater than the upper bound value, or less than the lower bound value.

What Next

Check your library and correct the value.

LBDB-718

(warning) The %s %g of '%s' attribute is %s %s = %g.

Description

This message indicates that the first/last/some value of the specific attribute is greater than the upper bound value, or lower than the lower bound value. Note that this is just a warning, not an error.

What Next

Check your library and correct the value.

LBDB-719

(error) The cell must have at least 1 'primary_ground' pg_pin and at least 1 'primary_power' pg_pin. It's being marked as dont_use, dont_touch.

Feedback

Description

This error message occurs when a primary_ground pg_pin or a primary_power pg_pin is missing. Cell in the following list could occurs this message, if it doesn't have at least 1 primary_ground pg_pin and at least 1 primary_power pg_pin. (1) The cell is a macro cell. (2) The cell has function info. (except for tie-off cell) (3) The cell has timing/noise/power info.

What Next

Add the missing primary_ground pg_pin or primary_power pg_pin and run the command again.

LBDB-720

(error) The '%s' %s cannot be specified in the library\n \tbased on pg_pin.

Description

This message indicates that you specified the syntax(power_supply, rail_connection, input/output_signal_level, power_level, etc.) which is incompatible with the syntax based on pg_pin such as voltage_map, pg_pin, related_power/ground_pin, related_pg_pin).

The following example shows an instance where this message occurs:

```
cell(lbdb720) {
    area : 2;
    pin(A) {
      direction : input;
      capacitance : 1.0;

      input_signal_level : VDD;

      related_power_pin : VDD;
      related_ground_pin : VSS;

    }
    ...
  }
```

The following is an example message:

```
Error: Line 84, The 'input_signal_level' attribute cannot be specified in
 the library
        based on pg_pin. (LBDB-720)
```

Feedback

What Next

Refer to the "Library Compiler User Guide" for related information and emove the incompatible values,

---

LBDB-720w

(warning) The '%s' %s cannot be specified in the library\n \tbased on pg_pin.

Description

This message indicates that you specified the syntax(power_supply, rail_connection, input/output_signal_level, power_level, etc.) which is incompatible with the syntax based on pg_pin such as voltage_map, pg_pin, related_power/ground_pin, related_pg_pin).

The following example shows an instance where this message occurs:

```
cell(lbdb720) {
    area : 2;
    pin(A) {
      direction : input;
      capacitance : 1.0;

      input_signal_level : VDD;

      related_power_pin : VDD;
      related_ground_pin : VSS;

    }
    ...
  }
```

The following is an example message:

```
Warning: Line 84, The 'input_signal_level' attribute cannot be specified
 in the library
        based on pg_pin. (LBDB-720w)
```

What Next

Refer to the "Library Compiler User Guide" for related information and emove the incompatible values,

---

LBDB-721

(warning) The value %f of 'nom_voltage' is not the same as the value\n \t%f of 'voltage' of the default operating_conditions '%s'.

Feedback

Description

This message indicates that the nom_voltage valye is not equal to the value of "voltage" attribute of the default operating_conditions group of the library.

The following example shows an instance where this message occurs:

```
nom_voltage     : 1.09;

  operating_conditions(sample) {
    process     : 1;
    temperature : 85;
    voltage     : 1.08;
    tree_type   : balanced_tree
  }
```

The following is an example message:

```
Warning: Line 52, The value 1.09 of 'nom_voltage' is not the same as the
 value
        1.08 of 'voltage' of the default operating_conditions '%s'.
 (LBDB-721)
```

What Next

Correct the nominal_voltage value to make it the same as the value of the voltage attribute of the default operating_conditions group.

LBDB-722

(error) The voltage value %f of the 1st voltage_map '%s' is not the same as\n \tthe value of 'voltage' of the default operating_conditions '%s'.

Description

This message indicates the 1st specified voltage_map attribute specifiy the different voltage value from that of the 'voltage' of the default operating_consitions group if there are only two voltage_map specified in library. They should be equal.

The following example shows an instance where this message occurs:

```
voltage_map(VDD, 1.2);
      voltage_map(VSS, 0);
      operating_conditions(sample) {
        process     : 1;
        temperature : 85;
        voltage     : 1.08;
        tree_type   : balanced_tree
      }
      default_operating_conditions : sample;
```

Feedback

In this case, there are two voltage_map specified, and the voltage value of the 1st voltage_map 'VDD1' voltage_map is 1.2, while the voltage value of default operating_conditions 'sample' is 1.08. To Fix the problem, update the voltage_map 'VDD' as follows:

```
voltage_map(VDD, 1.08);
      voltage_map(VSS, 0);
      operating_conditions(sample) {
        process     : 1;
        temperature : 85;
        voltage     : 1.08;
        tree_type   : balanced_tree
      }
      default_operating_conditions : sample;
```

The following is an example message:

```
Error: Line 23, The voltage value 1.2 of the 1st voltage_map 'VDD' is not
 the same as\n
\tthe value of 'voltage' of the default operating_conditions 'sample'.
 (LBDB-722)
```

What Next

Correct the voltage value of the 1st voltage_map.

LBDB-723

(error) The last variable '%s' is '%s',\n \twhich is wrong. The value must be "time".

Description

This message indicates that the value of the last variable can only be "time" in pg_current_template. pg_current_template can have one variable up to 4 variables, and input_net_transition, time, and total_output_net_capacitance are 3 avaiable values can be assigned. No matter what size of template is, the last variable must be "time".

The following example shows an instance where this message occurs:

```
pg_current_template(basic_template) {
    variable_1 : input_net_transition;
    variable_2 : time;
    variable_3 : total_output_net_capacitance;
    variable_4 : total_output_net_capacitance;
  }
```

To fix the problem, exchange the values between variable_2 and variable_4.

Feedback

The following is an example message:

```
Error: Line 388, The last variable variable_4 is
 total_output_net_capacitance,
        which is wrong.  The value must be "time". (LBDB-723)
```

What Next

If the last variable is not "time", change the variable, which is assigned to "time", to the last.

LBDB-724

(error) There is no voltage_map defined for ground voltage value 0.

Description

This message indicates the library does not define the voltage_map for the ground voltage value 0. In the libraries based on the new power modeling syntax (voltage_map, pg_pin, ..., etc.), this condition myst be satisfied.

The following example shows an instance where this message occurs:

```
voltage_map(VDD, 1.08);
      voltage_map(VDD1, 1.1);

      operating_conditions(sample) {
        process     : 1;
        temperature : 85;
        voltage     : 1.08;
        tree_type   : balanced_tree
      }
      default_operating_conditions : sample;
```

In this case, there is no voltage_map defined for ground voltage value 0. To fix the problem, add the following voltage_map attribute at the library level:

```
voltage_map(VDD, 1.08);
      voltage_map(VDD1, 1.1);
      voltage_map(VSS, 0);

      operating_conditions(sample) {
        process     : 1;
        temperature : 85;
        voltage     : 1.08;
        tree_type   : balanced_tree
      }
      default_operating_conditions : sample;
```

Feedback

The following is an example message:

```
Error: Line 23, There is no voltage_map defined for ground voltage value
 0. (LBDB-724)
```

What Next

Add the voltage_map for the ground voltage value 0.

LBDB-725

(warning) Connect pin '%s' to the default %s pg_pin '%s'.

Description

Either the related_power_pin or the related_ground_pin attribute is missing in a pin. By default, LC connect this pin to the default related_power_pin/related_ground_pin.

The following example shows an instance where this message occurs:

```
voltage_map(VDD0, 1.8);
   voltage_map(VDD1, 1.9);
   voltage_map(VDD2, 23);
   voltage_map(VSS, 0);

cell(lbdb428) {
  area : 2;
  pad_cell : true;
  pg_pin(PV1) {
    voltage_name : VDD1;
    pg_type : primary_power;
  }
  pg_pin(PV2) {
    voltage_name : VDD2;
    pg_type : primary_power;
  }
  pg_pin(VSS) {
    voltage_name : VSS;
    pg_type : primary_ground;
  }
  pin(A) {
    direction : input;
    capacitance : 1;
    /* missing related_power_pin attribute, will use default PV1 */
    related_ground_pin : VSS;
  }
  pin(Z) {
    direction : output;
    function : "A";
    related_power_pin : PV1;
    related_ground_pin : VSS;
    timing() {
```

Feedback

```
      intrinsic_rise : 0.48;
      intrinsic_fall : 0.77;
      rise_resistance : 0.1443;
      fall_resistance : 0.0523;
      slope_rise : 0.0;
      slope_fall : 0.0;
      related_pin : "A";
    }
  }
}
```

The following is an example message:

```
Warning: Line 96, Connect pin 'A' to the default power pg_pin 'PV1'.
 (LBDB-725)
```

What Next

Check the library source file to see if you missed the related_power_pin or the related_ground_pin attributes.

LBDB-726

(error) All the pins in the '%s' cell with more than 2 %s pg_pins\n \tmust have '%s' attribute.

Description

The related_power_pin (or the related_ground_pin) attribute is missing in a pin within a cell with more than 2 power pg_pins (or ground pg_pins) respectively.

The following example shows an instance where this message occurs:

```
voltage_map(VDD0, 1.8);
   voltage_map(VDD1, 1.9);
   voltage_map(VDD2, 23);
   voltage_map(VSS, 0);

cell(lbdb428) {
  area : 2;
  pad_cell : true;
  pg_pin(PV1) {
    voltage_name : VDD1;
    pg_type : primary_power;
  }
  pg_pin(PV2) {
    voltage_name : VDD2;
    pg_type : primary_power;
  }
  pg_pin(VSS) {
    voltage_name : VSS;
    pg_type : primary_ground;
  }
```

Feedback

```
  pin(A) {
    direction : input;
    capacitance : 1;
    /* missing related_power_pin attribute, will use default PV1 */
    related_ground_pin : VSS;
  }
  pin(Z) {
    direction : output;
    function : "A";
    related_power_pin : PV1;
    related_ground_pin : VSS;
    timing() {
      intrinsic_rise : 0.48;
      intrinsic_fall : 0.77;
      rise_resistance : 0.1443;
      fall_resistance : 0.0523;
      slope_rise : 0.0;
      slope_fall : 0.0;
      related_pin : "A";
    }
  }
}
```

To fix the problem, add the attribute to the 'A' pin group,

```
related_power_pin : VDD1;
```

The following is an example message:

```
Error: Line 96, All the pins in the 'lbdb726' cell with more than 2 power
 pg_pins
        must have 'related_power_pin' attribute. (LBDB-726)
```

What Next

Check the library source file to see if you missed the related_power_pin or the related_ground_pin attributes.

LBDB-727

(error) The %s%s '%s' contains the conflicting %s \n \t'%s' for pin '%s' and %s '%s' for pin '%s'.

Description

This error message occurs when the *input_signal_level*, *output_signal_level*, or *related_power_pin* values is modeled incorrectly for the level shifter or isolation cell. See detail checking as described below.

Liberty supports two kinds of PG syntax: old and new.

Feedback

Rule for a level shifter in the old syntax:

The rail name of *input_signal_level* in input pin cannot be the same as rail name of *output_signal_level* in output pin.

Rule for a level shifter in the new syntax:

If *input_signal_level* and *related_power_pin* both present in input pin, then Library Compiler will choose the value of *input_signal_level* for comparison. Either *input_signal_level* or *related_power_pin* in input pin cannot refer to the same voltage name as what *related_power_pin* refers to in output pin.

Rule for an isolation cell in the old syntax:

The rail value of *input_signal_level* in input pin shall be the same as the rail value of *output_signal_level* in output pin.

Rule for an isolation cell in the new syntax:

The value of either *input_signal_level* or *related_power_pin* in input pin shall refer to the same voltage value as what *related_power_pin* refers to in output pin.

The following example shows a level shifter with incorrect modeling and the resulting error message in the new PG syntax:

```
library (test) {
 ...
 voltage_map( VSS, 0.0);
 voltage_map( VDDH, 0.9);
 voltage_map( VDDL, 0.7);
 ...
 cell(LS) {
 ...
 pg_pin(GND) {
 voltage_name : VSS;
 pg_type : primary_ground;
 }
 pg_pin(VDD2) {
 voltage_name : VDDH;
 pg_type : primary_power;
 }
 pg_pin(VDD1) {
 voltage_name : VDDL;
 pg_type : primary_power;
 }

 is_level_shifter : true;
 ...
 pin(in) {
        ...
        input_signal_level : VDDL;
        related_power_pin : VDD1;  /* discard */
```

```
        related_ground_pin : GND;
 }
 pin(out) {
        ...
        related_power_pin: VDD1;
        related_ground_pin : GND;
 }
}
```

In this case, input_signal_level "VDDL", which is the same voltage name as what related_power_pin "VDD1" is referring to.

```
Error: Line 191, The level shifter 'LS' contain the conflicting
 input_signal_level
        'VDDL' for pin 'in' and related_power_pin 'VDD1' for pin 'out'.
 (LBDB-727)
```

The following example shows the isolation cell with the incorrect modeling and the resulting error message in new pg syntax:

```
library (libdb727) {
 ...
 voltage_map( VDD, 0.7);
 voltage_map(VDDH, 0.80); /* high power */
 voltage_map(VDDL, 0.4); /* low power */
 voltage_map(VSS, 0.0);   /* primary ground */
 ...
 cell(ISO) {
 ...
 pg_pin(VDD1) {
 voltage_name : VDDH;
 pg_type : primary_power;
 }
 pg_pin(VDD2) {
 voltage_name : VDDL;
 pg_type : primary_power;
 }

 is_isolation_cell : true;
 ...
 pin(in) {
        ...
        related_power_pin : VDD1;
        related_ground_pin : GND;
 }
 pin(out) {
        ...
        related_power_pin: VDD2;
        related_ground_pin : GND;
 }
}
```

Feedback

In this case, related_power_pin 'VDD1' is referred to voltage value 0.8 and related_power_pin 'VDD2' is referred to voltage value 0.4. So, the valtage value 0.8 in input pin is different from valtage value 0.4 in output pin, which is wrong.

```
Error: Line 191, The isolation cell 'ISO' contain the conflicting
 related_power_pin
        'VDD1' for pin 'in' and related_power_pin 'VDD2' for pin 'out'.
 (LBDB-727)
```

The following example shows the level shifter with the incorrect modeling and the resulting error message in the old PG syntax:

```
cell(LS) {
 is_level_shifter : true;
 ...
 pin(in) {
        ...
        input_signal_level : VDD2

 }
 pin(out) {
        ...
        output_signal_level : VDD2

 }
}

Error: Line 191, The level shifter 'LS' contain the conflicting
 input_signal_level 'VDD2' for pin 'in' and output_signal_level 'VDD2'
 for pin 'out'. (LBDB-727)
```

The following example shows the isolation cell with the incorrect modeling and the resulting error message in old pg syntax:

```
library(libdb727) {
  ...
  /* operation conditions */
  operating_conditions(5v_1v) {
    ...
    power_rail (VDDH, 5);    /* high power */
    power_rail (VDDL, 1);    /* low power */
    ...
  }
  ...
  default_operating_conditions : 5v_1v;

  ...
cell(ISO) {
 is_isolation_cell : true;
 ...
 pin(in) {
        ...
```

```
        input_signal_level : VDDH
 }
 pin(out) {
        ...
        output_signal_level : VDDL
 }
}

Error: Line 191, The isolation cell 'ISO' contain the conflicting
 input_signal_level 'VDDH' for pin 'in' and output_signal_level 'VDDL'
 for pin 'out'. (LBDB-727)
```

What Next

For the first example, modify the modeling information of the level shifter to meet the requirements.

To correct the modeling of the example above, make the *input_signal_level* value of the input pin different from the *related_power_pin* value of the output pin as follows:

```
cell(LS) {
 is_level_shifter : true;
 ...
 pin(in) {
        ...
        input_signal_level : VDDL;
        related_power_pin: VDD1;
        related_ground_pin : GND;
 }
 pin(out) {
        ...
        related_power_pin: VDD2;
        related_ground_pin : GND;
 }
}

For the second example, modify the modeling information of the isolation
 cell to meet
the requirements.

To correct the modeling of the example above, make the
related_power_pin value of the input pin
same as the related_power_pin
value of the output pin as follows:

library (libdb727) {
 ...
 voltage_map( VDD, 0.7);
 voltage_map(VDDH, 0.80); /* high power */
 voltage_map(VDDL, 0.4); /* low power */
 voltage_map(VSS, 0.0);   /* primary ground */
 ...
```

Feedback

```
 cell(ISO) {
 ...
 pg_pin(VDD1) {
 voltage_name : VDDH;
 pg_type : primary_power;
 }
 pg_pin(VDD2) {
 voltage_name : VDDL;
 pg_type : primary_power;
 }

 is_isolation_cell : true;
 ...
 pin(in) {
        ...
        related_power_pin : VDD1;
        related_ground_pin : GND;
 }
 pin(out) {
        ...
        related_power_pin: VDD1;
        related_ground_pin : GND;
 }
}
```

For the third example, modify the modeling information of the level shifter to meet the requirements.

To correct the modeling of the example above, make the *input_signal_level* string of the input pin different from the *output_signal_level* string "VDD2" of the output pin as follows:

```
cell(LS) {
 is_level_shifter : true;
 ...
 pin(in) {
        ...
        input_signal_level : VDD1
 }
 pin(out) {
        ...
        output_signal_level : VDD2
 }
}
```

```
For the fourth example, modify the modeling information of the isolation
 cell
to meet the requirements.

input_signal_level 'VDDH' is referred to voltage value
'5' and output_signal_level 'VDDL' is referred to
voltage value '1'.  The voltage value is '5' in input
pin and the voltage value is '1' in output pin, which
```

Feedback

```
is wrong.

To correct it, you can assiged both to the same voltage
like "VDDH", so that both will refer to same value "5"
in operating_conditions as follows.

library(libdb727) {
  ...
  /* operation conditions */
  operating_conditions(5v_1v) {
    ...
    power_rail (VDDH, 5);    /* high power */
    power_rail (VDDL, 1);    /* low power */
    ...
  }
  ...
  default_operating_conditions : 5v_1v;

  ...
cell(ISO) {
 is_isolation_cell : true;
 ...
 pin(in) {
        ...
        input_signal_level : VDDH
 }
 pin(out) {
        ...
        output_signal_level : VDDH

 }
}
```

LBDB-728

(error) You can not specify the same pin '%s' twice\n \tin '%s'.

Description

This message indicates that you specified the same pin more than one in either *related_inputs* or *related_outputs*. Each pin can be only specifed once.

The following example shows an instance where this message occurs:

```
cell(lbdb728) {
  area : 2;
  pin(A) {
    direction : input;
    capacitance : 1;
  }
  pin(B) {
```

Feedback

```
    direction : input;
    capacitance : 1;
  }

  pin(Z) {
    direction : output;
    function : "A B";
    timing() {
     ...
    }
  }
  dynamic_current() {
    when : "A";
    related_inputs : "B B";
    related_outputs : "Z Z"
    typical_capacitances(0.3 0.4);
    switching_group() {
     ...
    }
  }
  ...
}
```

In this case, both related_outputs and related_inputs, have specified the same pin name twice. To fix the problems, change the name from 'Z Z' to 'Z' in the related_outputs, change the name from 'B B' to 'B' in the related_inputs.

The following is an example message:

```
Error: Line 272, You can not specify the same pin 'Z' twice
        in 'related_outputs'. (LBDB-728)
Error: Line 572, You can not specify the same pin 'B' twice
        in 'related_inputs'. (LBDB-728)
```

What Next

Check the library source file, and make the necessary correction.

LBDB-729

(warning) You can't specify the same pin '%s' in different\n \trelated_output attributes which are under the same intrinsic_parasitic group.

Description

If there are more than one *intrinsic_resistance* group under a *intrinsic_parasitic* group, then no *related_output* can have the same pin. However, the rule does not apply to closed channel, where the value specified in *intrinsic_resistance* group is greater than 1M Ohm.

Feedback

The following example shows an instance where this message occurs:

```
library(my) {
  /* unit attributes */
  time_unit : "1ns";
  capacitive_load_unit (1.0,pf);
  ...
 cell(lbdb729) {
  area : 2;
  pin(A) {
    direction : input;
    capacitance : 1;
  }
  pin(B) {
    direction : input;
    capacitance : 1;
  }
  pin(Z) {
    direction : output;
    ...
  }
  pin(ZN) {
    direction : output;
    ...
  }
  intrinsic_parasitic() {
    /* default state */
    intrinsic_resistance(<pg_name>) {
       related_output : "ZN";
       value : 9.0;
    }
    intrinsic_resistance(<pg_name>) {
       related_output : "ZN";
       value : 920.0;
    }
    intrinsic_resistance(<pg_name>) {
       related_output : "ZN";
       value : 1001.0;
    }
    intrinsic_capacitance(<pg_name>) {
       value : 8.2;
    }
  }
  ...
 }
}
```

Based on timing and capacitance unit, we know the resistance unit is kilo. In this case, all intrinsic_resistance groups under a intrinsic_parasitic have same related_output 'ZN'. To fix the problem, change the name 'ZN' to 'Z' in either the group which has value '9.0' or the group which has value '920.0' because both are opened channel. No need to change the

name in the group which has value '1001.0' because it is greater than 1M ohm, which is closed channel.

The following is an example message:

```
Warning Line 272, You can't specify the same pin 'ZN' in different
        related_output attributes which are under the same
 intrinsic_parasitic group. (LBDB-729)
```

What Next

Check the library source file, and make the necessary correction.

LBDB-730

(error) The pin '%s' specified in the '%s' is neither\n \tan %s pin nor an inout pin.

Description

This message indicates that direction of the pin you specified in a *related_inputs*, *related_outputs*, *related_output*, *index_output* or *gate_leakage* is wrong.

The following example shows an instance where this message occurs:

```
cell(lbdb730) {
  area : 2;
  pin(A) {
    direction : input;
    capacitance : 1;
  }
  pin(B) {
    direction : input;
    capacitance : 1;
  }
  pin(Z) {
    direction : output;
    function : "A B";
    timing() {
      intrinsic_rise : 1.0;
      intrinsic_fall : 1.0;
      rise_resistance : 0.1;
      fall_resistance : 0.1;
      slope_rise : 0.0;
      slope_fall : 0.0;
      related_pin : "A B";
    }
  }
  leakage_current() {
     when : "A & !B & Z";
     pg_current(V1) {
      ...
     }
```

Feedback

```
      ...
      gate_leakage(Z) {  /* must be input or inout pin */
        input_high_value : 2.1;
        input_low_value : -1.7;
      }
    }
    dynamic_current() {
      when : "A";
      related_inputs : "Z";
      related_outputs : "B"
      typical_capacitances(0.3);
      switching_group() {
        input_switching_condition(fall);
        output_switching_condition(rise);
        pg_current(<pg_name>) {
          vector(<lu_template_name>) {
            reference_time : 93.2;
            index_output : "A";
            index_1("5.1");
            index_2("0.3");
            index_3("8.2 9.4 9.8");
            values("1.78 12.4 110.1");
          }
        }
      ...
      }
    }
    intrinsic_parasitic() {
      /* default state */
      intrinsic_resistance(<pg_name>) {
         related_output : "B";
         value : 9.0;
      }
      intrinsic_capacitance(<pg_name>) {
         value : 8.2;
      }

    }
    ...
}
```

In this case, all related_output, related_outputs, related_inputs, index_output and gate_leakage have a wrong pin name. To fix the problems, change the name from 'Z' to either 'A' or 'B' in the related_inputs, change the name from 'B' to 'Z' in the related_outputs, change the name from 'A' to 'Z' in the index_output, change the name from 'B' to 'Z' in the related_output and change the name from 'Z' to either 'A' or 'B' in the gate_leakage.

The following is an example message:

```
Error: Line 272, The pin 'Z' specified in the 'related_inputs' is neither
        an input pin nor an inout pin. (LBDB-730)
```

Feedback

```
Error: Line 471, The pin 'B' specified in the 'related_outputs' is
 neither
        an output pin nor an inout pin. (LBDB-730)
Error: Line 526, The pin 'A' specified in the 'index_output' is neither
        an output pin nor an inout pin. (LBDB-730)
Error: Line 890, The pin 'B' specified in the 'related_output' is neither
        an output pin nor an inout pin. (LBDB-730)
Error: Line 749, The pin 'Z' specified in the 'gate_leakage' is neither
        an input pin nor an inout pin. (LBDB-730)
```

What Next

Check the library source file, and make the necessary correction.

LBDB-731

(error) The pin '%s' specified in the '%s' can not\n \tbe found in '%s'.

Description

Whatever the pin you specified in *index_output* must be matched to one of pins that you specified in *related_outputs*.

This message indicates that the pin you specified in a *index_output* is wrong because it can not be found in *related_outputs* which is defined under the same dynamic_current group as where *index_output* is defined.

The following example shows an instance where this message occurs:

```
cell(lbdb731) {
  area : 2;
  pin(A) {
    direction : input;
    capacitance : 1;
  }
  pin(B) {
    direction : input;
    capacitance : 1;
  }
  pin(Z) {
    direction : output;
    ...
  }
  pin(ZN) {
    direction : output;
    ...
  }
  dynamic_current() {
    when : "A";
    related_inputs : "B";
    related_outputs : "Z"
    typical_capacitances(0.3);
```

Feedback

```
    switching_group() {
      input_switching_condition(fall);
      output_switching_condition(rise);
      pg_current(<pg_name>) {
        vector(<lu_template_name>) {
          reference_time : 93.2;
          index_output : "ZN";
          index_1("5.1");
          index_2("0.3");
          index_3("8.2 9.4 9.8");
          values("1.78 12.4 110.1");
        }
      }
     ...
    }
  }
  ...
}
```

In this case, index_output have a wrong pin 'ZN' because it does not match the pin 'Z', which is specified in related_outputs. To fix the problem, change the name from 'ZN' to 'Z' in index_output.

The following is an example message:

```
Error: Line 272, The pin 'ZN' specified in the 'index_output' can not
        be found in 'related_outputs'. (LBDB-731)
```

What Next

Check the library source file, and make the necessary correction.

LBDB-732

(error) You cannot specify more than one output pin or one bit\n \tof a bus or bundle output pin in the '%s'.

Description

Only single output pin is allowed to be specified in a *index_output* and a *related_output*.

This message indicates that you specified multiple pins either in a *index_output* or in a *related_output*.

The following example shows an instance where this message occurs:

```
cell(lbdb732) {
  area : 2;
  pin(A) {
    direction : input;
    capacitance : 1;
  }
```

Feedback

```
    pin(B) {
      direction : input;
      capacitance : 1;
    }
    pin(Z) {
      direction : output;
      ...
    }
    pin(ZN) {
      direction : output;
      ...
    }

    dynamic_current() {
      when : "A";
      related_inputs : "B";
      related_outputs : "Z ZN"
      typical_capacitances(0.3 0.4);
      switching_group() {
        input_switching_condition(fall);
        output_switching_condition(rise fall);
        pg_current(<pg_name>) {
          vector(<lu_template_name>) {
            reference_time : 93.2;
            index_output : "Z ZN";
            index_1("5.1");
            index_2("0.3");
            index_3("8.2 9.4 9.8");
            values("1.78 12.4 110.1");
          }
        }
       ...
      }
    }
    ...
    intrinsic_parasitic() {
      /* default state */
      intrinsic_resistance(<pg_name>) {
         related_output : "Z ZN";
         value : 9.0;
      }
      intrinsic_capacitance(<pg_name>) {
         value : 8.2;
      }

    }

}
```

In this case, index_output and related_output have specified "Z ZN" which is wrong. To fix the problem, remove either 'Z' or 'ZN' from "Z ZN".

Feedback

The following is an example message:

```
Error: Line 272, You cannot specify more than one output pin or one bit
        of a bus or bundle output pin in the 'index_output'. (LBDB-732)
Error: Line 262, You cannot specify more than one output pin or one bit
        of a bus or bundle output pin in the 'related_output'. (LBDB-732)
```

What Next

Check the library source file, and make the necessary correction.

LBDB-733

(error) An unbuffered %s pin '%s' should specify at least 1 'ccsn_first_stage' group.

Description

This message indicates that the following rule is not satisfied: If is_unbuffered is set to true on an inout/output pin, there should be at least 1 ccsn_first_stage group in the pin group.

The following example shows an instance where this message occurs:

```
cell(LAQM1RA) {
    ...
    pin (Q) {
      is_unbuffered : true;
      direction : "output";
      function : "IQ";
      ...
    }
  }
```

In this case, is_unbuffered of output pin 'Q' is true but the pin 'Q' has no 'ccsn_first_stage' group specified. To fix the problem, add the 'ccsn_first_stage' group into the pin 'Q'.

The following is an example message:

```
Error: Line 1620, Cell 'LAQM1RA', pin 'Q', An unbuffered output pin 'Q'
 should specify at least 1 'ccsn_first_stage' group. (LBDB-733)
```

What Next

Check the library source file, and add ccsn_first_stage or change the value of is_unbuffered.

LBDB-734

(warning) an %s pin should specify at least 1 non-static '%s' groups.

Feedback

Description

This warning message occurs when an input or inout pin does not have non-static ccsn_first_stage (or input_ccb for referenced CCSN modeling) group in the pin group and there are no related timing arcs referring this pin as the related_pin.

A static CCS noise model captures the behaviors of a static CCB (channel connected block). A static CCB refers to a CCB that does not have any input terminal or the voltage level at the input terminal does not affect the output current of the CCB. For example, a static CCS noise model can be characterized for a CMOS NAND gate when both inputs are tied to ground. Such static CCS noise models can be used in noise analysis with case analysis, but they cannot be used for propagating crosstalk delay or noise waveforms through the cell under study. See the *Make CCS Noise User Guide* for detailed information.

The following example shows an instance where this message occurs: The following is an example of incorrect input that causes this warning message:

```
cell(sample) {
    ...
    pin (A) {
        direction : input;
    }

    pin(Y ) {
      direction : output;
      ...
      ccsn_last_stage() {
        ...
      }

    }
  }
```

In this example, the A pin does not have the ccsn_first_stage group specified, and there are no associated timing arcs specifying ccs_first_stage groups. To fix the problem, add the non-static ccsn_first_stage group into pin A.

What Next

Check the library source file and fix either the invalid CCS Noise data, or the direction of the pin.

LBDB-735

(error) '%s' can't be specified in '%s' if power cell type is macro.

Feedback

Description

Currently in Liberty syntax, we support two power cell types for CCS power model. One is 'stdcell' and another is 'macro'. For a 'macro' cell type, there is one restriction. You can not specify *related_outputs* in *dynamic_current* group and *output_switching_condition* in *switching_group* group if cell type in CCS power is 'macro'.

This message indicates that you either specified *related_outputs* or *output_switching_condition* when cell type is 'macro'.

The following example shows an instance where this message occurs:

```
cell(lbdb735) {
  area : 2;
  pin(A) {
    direction : input;
    capacitance : 1;
  }
    ...
  power_cell_type : macro;
  dynamic_current() {
    ...
    related_outputs : "Z ZN";                /* remove this */
    typical_capacitances(0.3 0.4);
    switching_group() {
      input_switching_condition(fall);
      output_switching_condition(rise fall); /* remove this */
      pg_current(<pg_name>) {
        vector(<lu_template_name>) {
        ...
        }
        ...
      }
     ...
    }
  }
  ...
}
```

In the case above, related_outputs and output_switching_condition are sepcified when cell type is 'macro', which is wrong. To fix the problem, we shall remove both attributes.

The following is an example message:

```
Error: Line 272, 'related_outputs' can't be specified in
 'dynamic_current' if power cell type is macro. (LBDB-735)
Error: Line 292, 'output_switching_condition' can't be specified in
 'switching_group' if power cell type is macro. (LBDB-735)
```

Feedback

What Next

Check the library source file, and make the necessary correction. You can remove *output_switching_condition* or *related_outputs* attribute to avoid the error if you specify any of them.

LBDB-736

(error) Size of '%s' must be the same as size of related_outputs.

Description

Size of *output_switching_condition* specified in *switching_group* and size of *related_outputs* specified in *dynamic_current*, they must be identical, which is the same for *typical_capacitances*. Meaning that size of *typical_capacitances* specified in *dynamic_current* must be the same size as what *related_outputs* has.

This message indicates that either size is different between *related_outputs* and *typical_capacitances* or size is different between *related_outputs* and *output_switching_condition*.

The following example shows an instance where this message occurs:

```
cell(lbdb736) {
  area : 2;
  pin(A) {
    direction : input;
    capacitance : 1;
  }
  pin(B) {
    direction : input;
    capacitance : 1;
  }
  pin(Z) {
    direction : output;
    ...
  }
  pin(ZN) {
    direction : output;
    ...
  }

  dynamic_current() {
    when : "A";
    related_inputs : "B";
    related_outputs : "Z";
    typical_capacitances(0.3 0.4);
    switching_group() {
      input_switching_condition(fall);
      output_switching_condition(rise fall);
      pg_current(<pg_name>) {
```

```
          vector(<lu_template_name>) {
            ...
        }
       ...
     }
   }
   ...
   }
}
```

In this case, size of related_outputs is 1 ("Z"), but size of typical_capacitances is 2 (0.3 and 0.4) and size of output_switching_condition is 2 (rise and fall) as well. To fix the problem, you can increase size of related_outputs to 2. You can change "Z" to "Z ZN".

The following is an example message:

```
Error: Line 272, Size of 'typical_capacitances' must be the same as size
 of related_outputs. (LBDB-736)
Error: Line 282, Size of 'output_switching_condition' must be the same as
 size of related_outputs. (LBDB-736)
```

What Next

Check the library source file, and make the necessary correction. Size of *output_switching_condition*, *related_outputs* and *typical_capacitances* must be identical.

LBDB-737

(error) '%s' is required in '%s' if index_output is specified\n \tin one of pg_current groups.

Description

For expanded ccs power, if *index_output* is specified in one of *vector* groups, then all of the *vector* groups under the same *pg_current* group must define an *index_output*.

For compact ccs power, if *index_output* is specified in one of *compact_ccs_power* groups, then all of the *compact_ccs_power* groups under the same *pg_current* group must define an *index_output*.

In the case like this, *typical_capacitances* attribute is required in *dynamic_current* group.

This message indicates that there no *typical_capacitances* attribute can be found in *dynamic_current* when *index_output* is defined.

The following example shows an instance where this message occurs:

```
cell(lbdb737) {
  area : 2;
  pin(A) {
    direction : input;
    capacitance : 1;
```

Feedback

```
  }
  pin(B) {
    direction : input;
    capacitance : 1;
  }
  pin(Z) {
    direction : output;
    ...
  }
  pin(ZN) {
    direction : output;
    ...
  }

  dynamic_current() {
    when : "A";
    related_inputs : "B";
    related_outputs : "Z ZN"
    switching_group() {
      ...
      pg_current(<pg_name>) {
        vector(<lu_template_name>) {
          reference_time : 93.2;
          index_output : "Z";
          index_1("5.1");
          index_2("0.3");
          index_3("8.2 9.4 9.8");
          values("1.78 12.4 110.1");
        }
        ...
      }
     ...
    }
  }
  ...
}
```

In this case, index_output is specified, but no typical_capacitances attribute is specified. To fix the problem, add the line like this typical_capacitances(0.1); in the dynamic_current group.

The following is an example message:

```
Error: Line 272, 'typical_capacitances' is required in 'dynamic_current'
 if index_output is specified
       in one of pg_current groups. (LBDB-737)
```

What Next

Check the library source file, and make the necessary correction. Add *typical_capacitances* attribute to avoid the error.

Feedback

LBDB-738

(error) In '%s' group, size of '%s' must be larger than one\n \tif index_output is defined in one of pg_current groups.

Description

For expanded ccs power, if *index_output* is specified in one of *vector* groups, then all of the *vector* groups under the same *pg_current* group must define an *index_output* attribute.

For compact ccs power, if *index_output* is specified in one of *compact_ccs_power* groups, then all of the *compact_ccs_power* groups under the same *pg_current* group must define an *index_output* attribute.

In the case like this, the size of *related_outputs* must be larger than 1.

This message indicates that the size of *related_outputs* is less than 2, when *index_output* is defined.

The following example shows an instance where this message occurs:

```
cell(lbdb738) {
  area : 2;
  pin(A) {
    direction : input;
    capacitance : 1;
  }
  pin(B) {
    direction : input;
    capacitance : 1;
  }
  pin(Z) {
    direction : output;
    ...
  }
  pin(ZN) {
    direction : output;
    ...
  }

  dynamic_current() {
    related_outputs : "Z"
    ...
    switching_group() {
      ...
      pg_current(<pg_name>) {
        vector(<lu_template_name>) {
          reference_time : 93.2;
          index_output : "Z";
          index_1("5.1");
          index_2("0.3");
          index_3("8.2 9.4 9.8");
```

Feedback

```
          values("1.78 12.4 110.1");
        }
        ...
      }
    ...
```

In this case, size of related_outputs is 1 ("Z"), when index_output is defined, which is wrong. To fix problem, we shall increase size of related_outputs. We can change "Z" to "Z ZN".

The following is an example message:

```
Error: Line 272, In 'dynamic_current' group, size of 'related_outputs'
 must be larger than one
       if index_output is defined in one of pg_current groups. (LBDB-738)
```

What Next

Check the library source file, and make the necessary correction. Increase the size of *related_outputs* up to at least 2 to avoid the error.

LBDB-739

(error) '%s' attribute is required for this '%s' group.

Description

For expanded ccs power, all *vector* groups under the same *pg_current* group must specify the same template. If there is no any *index_output* attribute specified in these *vector* groups and template used for these *vector* groups contains only one total_output_net_capacitance, then *related_outputs* attribute is required in *dynamic_current*.

For expanded ccs power, all *compact_ccs_power* groups under the same *pg_current* group must specify the same template. If there is no any *index_output* attribute specified in these *compact_ccs_power* groups and template used for these *compact_ccs_power* groups contains only one total_output_net_capacitance, then *related_outputs* attribute is required in *dynamic_current*.

This message indicates that you must specify *related_outputs* attribute in *dynamic_current* because the above rule is applied.

The following example shows an instance where this message occurs:

```
pg_current_template(test_2) {
    variable_1 : input_net_transition;
    variable_2 : total_output_net_capacitance;
    variable_3 : time;
    index_1("0.6 0.9");
    index_2("0.6 0.9");
```

Feedback

```
    index_3("0.3 4.7");
  }
  ...
  cell(lbdb739) {
    area : 2;
    pin(A) {
      direction : input;
      capacitance : 1;
    }
    pin(B) {
      direction : input;
      capacitance : 1;
    }
    pin(Z) {
      direction : output;
      ...
    }
    pin(ZN) {
      direction : output;
      ...
    }

    dynamic_current() {
      when : "A";
      related_inputs : "B";
      ...
      switching_group() {
        input_switching_condition(fall);
        output_switching_condition(rise fall);
        pg_current(<pg_name>) {
          vector(test_2) {
            reference_time : 93.2;
            index_1("5.1");
            index_2("0.3");
            index_3("8.2 9.4 9.8");
            values("1.78 12.4 110.1");
          }
          ...
        }
       ...
      }
    }
    ...
  }
```

In this case, there is no index_output specified in any vector under a pg_current group. Also, the template (test_2) that vector referred to contains only one total_output_net_capacitance (variable_2). In the case like this a related_outputs attribute is required to be defined in dynamic_current group. To fix the problem, we need to add a related_outputs attribute within a dynamic_current group.

Feedback

The following is an example message:

```
Error: Line 272, 'related_outputs' attribute is required for this
 'dynamic_current' group. (LBDB-739)
```

What Next

Check the library source file, and make the necessary correction.

LBDB-740

(error) Size of '%s' in this '%s' group must be two.

Description

For expanded ccs power, all *vector* groups under the same *pg_current* group refer to the same *pg_current_template*.

For compact ccs power, a *compact_ccs_power* group refers to a *compact_lut_template*.

In the pg_current_template or compact_lut_template, if there are two total_output_net_capacitance, then size of *related_outputs* in *dynamic_current* must be two.

This message indicates that the size of *related_outputs* is not two.

The following example shows an instance where this message occurs:

```
pg_current_template(test_1) {
    variable_1 : input_net_transition;
    variable_2 : total_output_net_capacitance;
    variable_3 : total_output_net_capacitance;
    variable_4 : time;
    index_1("0.6 0.9");
    index_2("0.6 0.9");
    index_3("0.3 4.7");
    index_4("4.5 6.7 7.2");
 }
 ...
 cell(lbdb740) {
   area : 2;
   pin(A) {
     direction : input;
     capacitance : 1;
   }
   pin(B) {
     direction : input;
     capacitance : 1;
   }
   pin(Z) {
     direction : output;
     ...
```

Feedback

```
}
pin(ZN) {
  direction : output;
  ...
}

dynamic_current() {
  when : "A";
  related_inputs : "B";
  related_outputs : "Z"
  switching_group() {
    ...
    pg_current(<pg_name>) {
      vector(test_1) {
        reference_time : 93.2;
        index_1("5.1");
        index_2("0.3");
        index_3("0.3");
        index_4("8.2 9.4 9.8");
        values("1.78 12.4 110.1");
      }
      ...
    }
   ...
```

In this case, template 'test_1' contains two total_output_net_capacitance values, but size of related_outputs is 1 ("Z"), which is wrong. To fix the problem, you might want to increase size of related_outputs to two. You can change "Z" to "Z ZN".

The following is an example message:

```
Error: Line 262, Size of 'related_outputs' in this 'dynamic_current'
 group must be two. (LBDB-740)
```

What Next

Check the library source file, and make the necessary correction.

LBDB-741

(error) Two switching_group groups in line %d and %d are\n \toverlapping.

Description

If either min_input_switching_count or max_input_switching_count specified in switching groups, and the switching count number they covered are overlapping, then these *switching_group* groups are considered overlapped.

If there is no min_input_switching_count or max_input_switching_count, then two *switching_group* groups are considered overlapped if both *input_switching_condition* and *output_switching_condition* are overlapped.

Feedback

If one of followings are true, then *output_switching_condition* is considered to be overlapping condition : + *output_switching_condition* is undefined on both *switching_group* groups. + *output_switching_condition* is defined on both *switching_group* groups and values of them are indentical.

If one of followings are true, then *input_switching_condition* is considered to be overlapping condition : + *input_switching_condition* is undefined on both *switching_group* groups. + *input_switching_condition* is defined on both *switching_group* groups and values of them are indentical. + values of them are difference, but one *input_switching_condition* is undefined, and another has value either "rise" or "fall".

This message indicates that two *switching_group* groups are overlapped because *input_switching_condition* and *output_switching_condition* both are in overlapping condition.

The following example shows an instance where this message occurs:

```
cell(lbdb741) {
  area : 2;
  pin(A) {
    direction : input;
    capacitance : 1;
  }
  pin(B) {
    direction : input;
    capacitance : 1;
  }
  pin(Z) {
    direction : output;
    ...
  }
  pin(ZN) {
    direction : output;
    ...
  }
  power_cell_type : stdcell;
  dynamic_current() {
    when : "A";
    related_inputs : "B";
    related_outputs : "Z ZN"
    typical_capacitances(0.3 0.4);
    switching_group() {
      input_switching_condition(fall);
      output_switching_condition(rise fall);
     ...
    }
    switching_group() {
      output_switching_condition(rise fall);
     ...
    }
```

Feedback

```
  }
  ...
```

In this case, both switching_group have same output_switching_condition, and one input_switching_condition has value "fall" and another is undefined. input_switching_condition is overlapping and which is same as output_switching_condition, so two switching_group groups are overlapped. To fix the problem, you might want to change the value to "fall fall" in one of output_switching_condition groups.

```
type(bus6) {
  base_type : array ;
  data_type : bit ;
  bit_width : 6 ;
  bit_from : 5 ;
  bit_to : 0 ;
  downto : true ;
}

cell(lbdb741) {
  bus(sel) {
    bus_type : bus6 ;
    direction : input ;
    capacitance : 2 ;
    related_power_pin : V1;
    related_ground_pin : G1;
  }

  bundle(C) {
    members(Cx, Cy, Cz);
    direction : input;
    capacitance : 2 ;
    related_power_pin : V1;
    related_ground_pin : G1;

  }
  area : 2;
  pg_pin(V1) {
     voltage_name : VDD1;
     pg_type : primary_power;
  }
  pg_pin(V2) {
     voltage_name : VDD2;
     pg_type : backup_power;
  }
  pg_pin(G1) {
     voltage_name : GND1;
     pg_type : primary_ground;
  }
  pg_pin(G2) {
     voltage_name : GND2;
     pg_type : backup_ground;
```

Feedback

```
  }
  power_cell_type : macro;
  dynamic_current() {
    related_inputs : "C sel";
    switching_group() {
      min_input_switching_count : 1;
      max_input_switching_count : 6;
      ...
    }
    switching_group() {
      min_input_switching_count : 5;
      max_input_switching_count : 9;
      ...
    }
    ...
  }
}

In this case, the min_input_switching_count and max_input_switching_count
 are
specified in "macro" cell type.  If that is the case, we need to check if
 the number
they covered are overlapping.  We don't worry about
 input_switching_condition or
output_switching_condition here because these attributes can't be
 sepcified
if either min_input_switching_count or max_input_switching_count is
 sepcified.

'C' is 6 bits bus and 'sel' is 3 bits bundle.  The total bits are 9.
For the first switching_group, the switching count is from 1 to 6, and
 for the
second switching_group, the switching count is from 5 to 9.  The number 5
 and 6
are covered in both groups, which means the two groups are overlapping.
 To fix the
problem, please change number 5 to 7 in the second switching_group or
 change number
6 to 4 in the first switching_group.
```

SH EXAMPLE MESSAGE

```
Error: Line 100, Two switching_group groups in line 170 and 189 are
       overlapping. (LBDB-741)
```

What Next

Check the library source file, and make the necessary correction.

Feedback

LBDB-742

(error) Only one total_output_net_capacitance is allowed for the\n \ttemplate specified in this %s.

Description

For expanded ccs power, if *index_output* is specified in one of *vector* groups, then all of the *vector* groups under the same *pg_current* group must define an *index_output* attribute.

For compact ccs power, if *index_output* is specified in one of *compact_ccs_power* groups, then all of the *compact_ccs_power* groups under the same *pg_current* group must define an *index_output* attribute.

In the case like this, the template , which these *vector*/*compact_ccs_power* groups referred to, must contains only one total_output_net_capacitance.

This message indicates that the template contains either more than one or less than one total_output_net_capacitance.

The following example shows an instance where this message occurs:

```
pg_current_template(test_1) {
    variable_1 : input_net_transition;
    variable_2 : total_output_net_capacitance;
    variable_3 : total_output_net_capacitance;
    variable_4 : time;
    index_1("0.6 0.9");
    index_2("0.6 0.9");
    index_3("0.3 4.7");
    index_4("4.5 6.7 7.2");
 }

 pg_current_template(test_2) {
    variable_1 : input_net_transition;
    variable_2 : total_output_net_capacitance;
    variable_3 : time;
    index_1("0.6 0.9");
    index_2("0.6 0.9");
    index_3("0.3 4.7");
 }
 ...

   area : 2;
   pin(A) {
     direction : input;
     capacitance : 1;
   }
   pin(B) {
     direction : input;
     capacitance : 1;
   }
```

Feedback

```
pin(Z) {
  direction : output;
  ...
}
pin(ZN) {
  direction : output;
  ...
}

dynamic_current() {
  when : "A";
  related_inputs : "B";
  related_outputs : "Z ZN";
  typical_capacitances(0.3 0.4);
  switching_group() {
    input_switching_condition(fall);
    output_switching_condition(rise fall);
    pg_current(<pg_name>) {
      vector(test_1) {
        reference_time : 93.2;
        index_output : "Z";
        index_1("5.1");
        index_2("0.3");
        index_3("0.3");
        index_4("8.2 9.4 9.8");
        values("1.78 12.4 110.1");
      }
    }
   ...
```

In this case, index_output is specified in vector, and the vector is referred to template 'test_1', which contains two total_output_net_capacitance values. That is wrong. To fix the problem, we can change referred template to 'test_2'.

The following is an example message:

```
Error: Line 272, Only one total_output_net_capacitance is allowed for the
       template specified in this vector. (LBDB-742)
```

What Next

Check the library source file, and make the necessary correction.

LBDB-743

(error) All %s under a pg_current group must specify\n \tsame template.

Description

All *vector* or *compact_ccs_power* groups under the same *pg_current* group must specify the same template.

Feedback

This message indicates that you specified different templates in /fBvector or *compact_ccs_power* groups, which are all under same *pg_current*.

The following example shows an instance where this message occurs:

```
pg_current_template(test_1) {
    variable_1 : input_net_transition;
    variable_2 : total_output_net_capacitance;
    variable_3 : total_output_net_capacitance;
    variable_4 : time;
    index_1("0.6 0.9");
    index_2("0.6 0.9");
    index_3("0.3 4.7");
    index_4("4.5 6.7 7.2");
 }

 pg_current_template(test_2) {
    variable_1 : input_net_transition;
    variable_2 : total_output_net_capacitance;
    variable_3 : time;
    index_1("0.6 0.9");
    index_2("0.6 0.9");
    index_3("0.3 4.7");
 }
 ...
 cell(lbdb743) {
   area : 2;
   ...
   dynamic_current() {
      ...
     switching_group() {
       ...
       pg_current(<pg_name>) {
         vector(test_2) {
           reference_time : 93.2;
           index_1("5.1");
           index_2("0.3");
           index_3("8.2 9.4 9.8");
           values("1.78 12.4 110.1");
         }
         vector(test_1) {
           reference_time : 93.2;
           index_1("5.1");
           index_2("0.3");
           index_3("0.3");
           index_4("8.2 9.4 9.8");
           values("1.78 12.4 110.1");
         }
         ...
       }
      ...
```

In this case, two vectors refer to different templates, one is 'test_1', and another is 'test_2'. This is wrong. To fix the problem, change 'test_1' to 'test_2' in second vector.

The following is an example message:

```
Error: Line 272, All vectors under a pg_current group must specify
       same template. (LBDB-743)
```

What Next

Check the library source file, and make the necessary correction.

LBDB-744

(error) index_output is required for all %s in this\n \tpg_current group.

Description

For expanded ccs power, if *index_output* is specified in one of *vector* groups, then all of the *vector* groups under the same *pg_current* group must define an *index_output* attribute.

For compact ccs power, if *index_output* is specified in one of *compact_ccs_power* groups, then all of the *compact_ccs_power* groups under the same *pg_current* group must define an *index_output* attribute.

This message indicates that *index_output* attribute is not defined in all *vector*/*compact_ccs_power* groups under a *pg_current*.

Also to see, LBDB-737, LBDB-738, and LBDB-742.

The following example shows an instance where this message occurs:

```
cell(lbdb744) {
  area : 2;
  pin(A) {
    direction : input;
    capacitance : 1;
  }
  pin(B) {
    direction : input;
    capacitance : 1;
  }
  pin(Z) {
    direction : output;
    ...
  }
  pin(ZN) {
    direction : output;
    ...
  }

  dynamic_current() {
```

```
    when : "A";
    related_inputs : "B";
    related_outputs : "Z ZN"
    typical_capacitances(0.3 0.4);
    switching_group() {
      input_switching_condition(fall);
      output_switching_condition(rise fall);
      pg_current(VDD) {
        vector(<lu_template_name>) {
          reference_time : 93.2;
          index_output : "ZN";
          index_1("5.1");
          index_2("0.3");
          index_3("8.2 9.4 9.8");
          values("1.78 12.4 110.1");
        }
         vector(<lu_template_name>) {
          reference_time : 93.2;
          index_output : "Z";
          index_1("5.1");
          index_2("0.3");
          index_3("8.2 9.4 9.8");
          values("1.78 12.4 110.1");
        }
        vector(<lu_template_name>) {
          reference_time : 93.2;
          index_1("5.1");
          index_2("0.3");
          index_3("8.2 9.4 9.8");
          values("1.78 12.4 110.1");
        }
      }
     ...
    }
  }
  ...
```

In this case, index_output is not specified in third vector, which is wrong. All vectors under pg_current(VDD) must specify index_output, because index_output has beed defined in one of vectors. To fix the problem, add index_output attribute to the third vector.

The following is an example message:

```
Error: Line 272, index_output is required for all vectors in this
       pg_current group. (LBDB-744)
```

What Next

Check the library source file, and make the necessary correction.

Feedback

LBDB-745

(error) Under this dynamic_current, pin '%s' is specified in\n \t'%s' and '%s'.

Description

/fBwhen, *related_outputs*, and *related_inputs* can't specify the same pin if they are under the same *dynamic_current* group.

This message indicates that you specified the same pin for two of following attributes : /fBwhen, *related_outputs*, and *related_inputs*

The following example shows an instance where this message occurs:

```
cell(lbdb745) {
  area : 2;
  pin(A) {
    direction : input;
    capacitance : 1;
  }
  pin(B) {
    direction : input;
    capacitance : 1;
  }
  pin(Z) {
    direction : output;
    ...
  }
  pin(ZN) {
    direction : output;
    ...
  }
  pin(ZN1) {
    direction : output;
    ...
  }
  dynamic_current() {
    when : "B + ZN'";
    related_inputs : "B";
    related_outputs : "Z ZN"
    typical_capacitances(0.3 0.4);
    switching_group() {
  ...
}
```

In this case, pin B is specified in both when and related_inputs, which is wrong. Same for pin ZN, which is specified in both when and related_outputs. To fix the problem, change "B" to "A" in related_inputs, and change "Z ZN" to "Z ZN1" in related_outputs.

Feedback

The following are example messages:

```
Error: Line 272, Under this dynamic_current, pin 'B' is specified in
 'related_inputs' and 'when'. (LBDB-745)

Error: Line 272, Under this dynamic_current, pin 'ZN' is specified in
 'related_outputs' and 'when'. (LBDB-745)
```

What Next

Check the library source file, and make the necessary correction.

LBDB-746

(error) The %s of cell '%s'\n \tshould be specified before the %s '%s' is defined.

Description

You receive this message because the switch_cell_type is not defined before specifying the attributes related to switch cells.

The following example shows an instance where this message occurs: The following example shows the *switch_cell_type* is missing.

```
cell(sample) {
 pin(Y)  {
        switch_function : "sp";
        ...
 }
  ......
}
```

Correct it by add *fBswitch_cell_type attribute in the cell group.*

The following is an example message: Error: Line 191, The switch_cell_type attribute of cell 'sample' should be specified before the switch_function 'sp' is defined. (LBDB-746)

What Next

Make sure that *switch_cell_type* attribute exists before defining other attributes related switch cells.

LBDB-747

(warning) %s on input pin and %s on output pin\n \thave same power rail value but different rail name.

Description

This message will only be applied for an isolation cell.

Feedback

In Liberty, we support two kinds (old and new) of pg syntax. If *input_signal_level* and *related_power_pin* both presented in new syntax, then *input_signal_level* will be chosen, and *related_power_pin* will be discarded.

If you are in new pg syntax, the message indicates that voltage name of either *input_signal_level* or *related_power_pin* in input pin is different from voltage name of *related_power_pin* in ouput pin, but both are referring to the same voltage value.

If you are in old pg syntax, the message indicates that rail name of *input_signal_level* in input pin is different from rail name of utput_signal_level *in ouput pin, but both rail names are referring to the same voltage value.*

The following example shows an instance where this message occurs:

```
/* This is an example of old pg syntax. */
library(libdb747) {
 ...
   power_supply() {
        default_power_rail : VDD;
        power_rail (VDDH, 3); /* high power */
        power_rail (VDDL, 3); /* low power */
        power_rail (VSS, 0.0);   /* primary ground */
  }
  ...
  /* operation conditions */
  nom_process   : 1;
  nom_temperature       : 25;
  nom_voltage   : 1.0;
  operating_conditions(3v_3v) {
    process     : 1;
    temperature : 25;
    voltage     : 1.0;
    tree_type   : balanced_tree
    power_rail (VDDH, 3);    /* high power */
    power_rail (VDDL, 3);    /* low power */
    power_rail (VSS, 0.0);   /* primary ground */
  }
  default_operating_conditions : 3v_3v;

 ...
cell (LVLHLEHX2M) {
  ...
  rail_connection (VDD, VDDL);
  area : 2.600000;
  is_isolation_cell : true;
  pin(A) {
    direction : input;
    input_signal_level : VDDH;
    capacitance : 0.1859;
    internal_power() {
    ...
  }
```

Feedback

```
 pin(Y) {
   direction : output;
   output_signal_level : VDDL;
   capacitance : 0.0;
   function : "(A & EN)";
   internal_power() {
     power_level : VDDL;
  ...
```

In this case, input_signal_level in input pin "A" is specified "VDDH" as power rail, which is different from "VDDL" specified in output_signal_level in output pin "Y". However, both "VDDH" and "VDDL" are referring to same voltage value "3" as defined in operating_conditions group.

The following is the example message:

```
Warning: Line 100, input_signal_level on input pin and
 output_signal_level on output pin
        have same power rail value but different rail name. (LBDB-747)
```

The following example shows another instance where this message occurs:

```
/* This is an example of new pg syntax */
library (libdb747) {
 ...
 voltage_map( VDD, 0.7);
 voltage_map(VDDH, 0.8); /* high power */
 voltage_map(VDDL, 0.8); /* low power */
 voltage_map(VSS, 0.0);   /* primary ground */
 ...
 cell(ISO) {
 ...
 pg_pin(VDD1) {
 voltage_name : VDDH;
 pg_type : primary_power;
 }
 pg_pin(VDD2) {
 voltage_name : VDDL;
 pg_type : primary_power;
 }

 is_isolation_cell : true;
 ...
 pin(in) {
        ...
        input_signal_level : VDDH;
        related_power_pin : VDD1;  /* discard */
        related_ground_pin : GND;
 }
 pin(out) {
        ...
        related_power_pin: VDD2;
        related_ground_pin : GND;
```

Feedback

```
 }
}

In this case, input_signal_level 'VDDH' is referred to voltage value 0.8
 and
related_power_pin 'VDD2' is referred to voltage value 0.8, too.  The
 voltage
value 0.8 in input pin is same as valtage value in output pin, but their
voltage names are different, one is VDDH, and the other is VDDL.

The following is the example message:
Warning: Line 100, input_signal_level on input pin and related_power_pin
 on output pin
        have same power rail value but different rail name. (LBDB-747)
```

What Next

Check the library source file, and make the necessary correctiorn if it is needed.

LBDB-748

(error) There are less than 4 vectors specified in group '%s'.

Description

This error message occurs because Library Compiler requires at least 4 vectors inside each output_current_rise or output_current_fall group.

The following example shows an output_current_rise group without a dense vector and resulting error message.

```
output_current_template(CCT) {
  variable_1 : input_net_transition;
  variable_2 : total_output_net_capacitance;
  variable_3 : time;
 }
 . . .
 output_current_rise() {
   vector(CCT) {
      reference_time : 0.11;
      index_1 ("0.1");
      index_2 ("1");
      index_3 ("1, 2, 3");
      values ("1, 2, 3");
   }
   /* need at least additional 3 vectors to compile */
 }

Error: Line 198, There are less than 4 vectors specified in group
 'output_current_rise'.  (LBDB-748)
```

Feedback

What Next

Check the library source file and add additional vectors.

LBDB-749

(error) The size of %s should be at least %d.

Description

The specification of the size of the index is less than the minim index size.

The following example shows an instance where this message occurs:

```
lu_table_template(basic_template) {
        variable_1 : input_net_transition;
        index_1 ("1");
  }

          receiver_capacitance1_rise(basic_template) {
                index_1 ("500");
                values ("1.3401");
          }
```

The following is an example message:

```
Error: Line 160, The size of index_1 should be at least 2. (LBDB-749)
```

What Next

Check the library source file, and correct the problem by inceasing the size of the specified index.

LBDB-750

(warning) Overwrite '%s' by default '%s' value %f defined\n \tin 'operating_conditions'.

Description

There are two pg pin syntaxes in liberty: one is old syntax such as power_rail or rail_connection, another is new syntax such as voltage_map or pg_pin.

If new pg_pin syntax has been defined in .lib file , all PVT (process, voltage and temperature) defined in default_operating_conditions will be copied over to nom PVT.

For .lib/.db file without pg pin syntaxes, all PVT (process, voltage and temperature) defined in default_operating_conditions will be copied over to nom PVT.

The warning message indicates that whatever default nom PVT values you defined have been overwritten by values of default_operating_conditions.

Feedback

The following example shows an instance where this message occurs:

```
library(libdb750) {
 ...
  nom_process : 1.3
  nom_temperature : 20.0;
  nom_voltage : 4.0;

  operating_conditions ( TYPICAL ) {
    process : 1.0 ;
    temperature : 22.0 ;
    voltage : 3.0 ;
    tree_type : balanced_tree ;
  }
  default_operating_conditions :  TYPICAL;
   ...
  voltage_map(VDD1, 4.0); /* new pg pin syntax */
  voltage_map(VDD2, 4.5);
   ...
  cell (and2) {
   ...
  pg_pin(V1) { /* new pg pin syntax */
     voltage_name : VDD1;
     pg_type : primary_power;
  }
  pg_pin(V2) {
     voltage_name : VDD2;
     pg_type : backup_power;
  }
  ...
```

In this case, nom_process will be overwritten by "process" value 1.0, which is defined in default operating_conditions group. nom_temperature will be overwritten by "temperature" value 22.0, which is defined in default operating_conditions group. nom_voltage will be overwritten by "voltage" value 3.0, which is defined in default operating_conditions group.

The following is an example message:

```
Warning: Line 100, Overwrite 'nom_process' by default 'process' value 1.0
 defined
        in 'operating_conditions'. (LBDB-750)
Warning: Line 100, Overwrite 'nom_temperature' by default 'temperature'
 value 22.0 defined
        in 'operating_conditions'. (LBDB-750)
Warning: Line 100, Overwrite 'nom_voltage' by default 'voltage' value 3.0
 defined
        in 'operating_conditions'. (LBDB-750)
```

LBDB-751

(error) The %s group with name '%s', has not been defined in the %s.

Feedback

Description

This message indicates that the referred group name is undefined in the library.

The following is an example message:

```
Error: Line 57, The base_curves group with name 'AND2",
       has not been defined in the library.(LBDB-751)
```

What Next

Add the referred group in the library. Or remove the reference

---

LBDB-752

(error) The '%s' attribute is missing in compressed_lut_template '%s'.

Description

This message indicates that the attribute is not defined in the compressed_lut_template group.

The following is an example message:

```
Error: Line 58, The 'base_curves_group' attribute is missing in
 compressed_lut_template 'LTT3'.(LBDB-752)
```

What Next

Add the attribute in compressed_lut_template.

LBDB-753

(error) The '%s' base curve parameter is missing in compressed_lut_template '%s' index_3.

Description

For ccs timing base curves, these six elementary curve parameters are must needed: init_current, peak_current, peak_voltage, peak_time, left_id, right_id. Additional parameters are also allowed, the index_3 value list can contains more than six parameters.

The following example shows an instance where this message occurs:

```
compressed_lut_template(LTT3) {
        variable_1 : input_net_transition;
        variable_2 : total_output_net_capacitance;
        variable_3 : curve_parameters;
        index_1 ("0.1, 0.2");
        index_2 ("1.0, 1.2");
```

Feedback

```
        index_3 ("init_current, peak_current, peak_voltage, left_id,
 right_id");
    }
```

The following is an example message:

```
Error: Line 60, The 'peak_time' base curve parameter is missing in
 compressed_lut_template 'LTT3' index_3.(LBDB-753)
```

What Next

Add the missing elementary curve parameter in compressed_lut_template index_3.

LBDB-754

(error) Redudant curve_x defined in base_curves '%s'.

Description

In a base_curves group, only one curve_x definition is allowed, otherwise it brings confusing to users.

The following example shows an instance where this message occurs:

```
base_curves(AND2_BC) {
        base_curve_type : ccs_timing_half_curve;
        curve_x ("0.1, 0.5, 0.9");
        curve_x ("0.2, 0.5, 0.8");
        curve_y (1, "0.8, 0.5, 0.2");
        curve_y (2, "0.85, 0.5, 0.15");
        ...
    }
```

The following is an example message:

```
Error: Line 62, Redudant curve_x defined in base_curves
 'AND2_BC'.(LBDB-754)
```

What Next

Remove redudant curve_x definition in base curves group, left one curve_x is enough.

LBDB-755

(error) Illegal base curve data is specified in '%s'.

Feedback

Description

The syntax of base_curves group:

```
base_curves("name") {
    base_curve_type : ccs_half_curve;
    curve_x ("float..., float");
    curve_y (curve_id, "float..., float";
    ...
}
```

Following are rules for base curve data: For curve data specified in curve_x: 1. At least 3 points are specified; 2. The value should between 0 and 1; 3. The values should be monotonic increasing;

For curve_data specified in curve_y: 1. number of points should be same as that in curve_x; 2. curve_y should be defined after curve_x; 3. valid boundary is [-inf, 1] for both compact CCS timing and compact CCS power.

The following example shows an instance where this message occurs:

```
base_curves(AND2_BC) {
        base_curve_type : ccs_timing_half_curve;
        curve_x ("0.1, 0.5, 1.1");
        curve_y (1, "0.8, 0.5, 0.2, 0.1");
        curve_y (2, "0.85, 0.5, 0.15");
        ...
    }
```

The following is an example message:

```
Error: Line 63, Illegal base curve data is specified in
 'curve_x'.(LBDB-755)
Error: Line 64, Illegal base curve data is specified in
 'curve_y'.(LBDB-755)
```

What Next

Check base curve data according these rules, fix error.

LBDB-756

(error) No curve_x definition found before curve_y in the base_curves '%s'.

Description

In a base_curves group, Only and Must have one curve_x defined before curve_y.

The following example shows an instance where this message occurs:

```
base_curves(AND2_BC) {
        base_curve_type : ccs_timing_half_curve;
```

Feedback

```
        curve_y (1, "0.8, 0.5, 0.2");
        curve_y (2, "0.85, 0.5, 0.15");
        ...
    }
```

The following is an example message:

```
Error: Line 65, No curve_x definition found before curve_y in the
 base_curves 'AND2_BC'.(LBDB-756)
```

What Next

Add the curve_x definition before the curve_y, otherwise, the base curve data is incomplete.

LBDB-757

(error) No curve_y definition found in the base_curves '%s'.

Description

In a base_curves group, base curves are demonstrated by curve_x and curve_y together. curve_y can't be absent.

The following example shows an instance where this message occurs:

```
base_curves(AND2_BC) {
        base_curve_type : ccs_timing_half_curve;
        curve_x ("0.1, 0.5, 0.9");
    }
```

The following is an example message:

```
Error: Line 63, No curve_y definition found in the base_curves
 'AND2_BC'.(LBDB-757)
```

What Next

Add the curve_y definition after the curve_x, in the base curves group.

LBDB-758

(error) Duplicate or negative curve_id '%d' is specified.

Description

In a base_curves group, the curve_id in curve_y should satisfy following rules: 1. curve_id should be an interger that greater than 0; 2. curve_id should be unique in the base_curves group;

Feedback

The following example shows an instance where this message occurs:

```
base_curves(AND2_BC) {
        base_curve_type : ccs_timing_half_curve;
        curve_x ("0.1, 0.5, 1.1");
        curve_y (-1, "0.8, 0.5, 0.2, 0.1");
        curve_y (2, "0.85, 0.5, 0.15");
        curve_y (4, "0.8, 0.5, 0.2, 0.1");
        curve_y (4, "0.85, 0.5, 0.15");
        ...
    }
```

The following is an example message:

```
Error: Line 63, Duplicate or negative curve_id '-1' is
 specified.(LBDB-758)
Error: Line 60, Duplicate or negative curve_id '4' is
 specified.(LBDB-758)
```

What Next

Check rules above, correct the curve_id data in curve_y.

LBDB-759

(error) Bad init_current value '%g' is specified in '%s'.

Description

Init_current is one of six parameters to model compressed ccs timing base curve. In compressed_ccs_rise group, the init_current values should >= 0; And in compressed_ccs_fall group, the init_current values should <= 0;

The following example shows an instance where this message occurs:

```
library(name) {
  ...
  base_curves (ctbct1){
    base_curve_type : ccs_timing_half_curve;
    curve_x("0.2, 0.5, 0.8");
    curve_y(1, "0.8, 0.5, 0.2");
    curve_y(2, "0.75, 0.5, 0.35");
    curve_y(3, "0.85, 0.5, 0.15");
    curve_y(4, "0.85, 0.5, 0.15");
  }
  compressed_lut_template(LTT3) {
    variable_1 : input_net_transition;
    variable_2 : total_output_net_capacitance;
    variable_3 : curve_parameters;
    index_1 ("0.1, 0.2");
    index_2 ("1.0, 2.0");
```

Feedback

```
    index_3 ("init_current, peak_current, peak_voltage, peak_time,
 left_id, right_id");
    base_curves_group: "ctbct1";
  }

  cell(cell_name) {
    pin(pin_name) {
        timing() {
            compressed_ccs_rise("LTT3") {
              values("0, 0.5, 0.6, 0.8, 1, 3", \
                     "-0.15, 0.55, 0.65, 0.85, 2, 4", \
                     "0.2, 0.6, 0.7, 0.9, 3, 2", \
                     "0.25, 0.65, 0.75, 0.95, 4, 1");
            } /* end of compressed_ccs_rise */
        }
    }
  }
  ...
}
```

The following is an example message:

```
Error: Line 1163, Bad init_current value '-0.15' is specified in
 'compressed_ccs_rise'.(LBDB-759)
```

What Next

According the rule above, correct the init_current value.

LBDB-760

(error) Bad peak_current value '%g' is specified in '%s'.

Description

peak_current is one of six parameters to model compressed ccs timing base curve. In compressed_ccs_rise group, the peak_current values should > 0; And in compressed_ccs_fall group, the peak_current values should < 0;

The following example shows an instance where this message occurs:

```
library(name) {
  ...
  base_curves (ctbct1){
    base_curve_type : ccs_timing_half_curve;
    curve_x("0.2, 0.5, 0.8");
    curve_y(1, "0.8, 0.5, 0.2");
    curve_y(2, "0.75, 0.5, 0.35");
    curve_y(3, "0.85, 0.5, 0.15");
    curve_y(4, "0.85, 0.5, 0.15");
  }
  compressed_lut_template(LTT3) {
```

Feedback

```
    variable_1 : input_net_transition;
    variable_2 : total_output_net_capacitance;
    variable_3 : curve_parameters;
    index_1 ("0.1, 0.2");
    index_2 ("1.0, 2.0");
    index_3 ("init_current, peak_current, peak_voltage, peak_time,
 left_id, right_id");
    base_curves_group: "ctbct1";
  }

  cell(cell_name) {
    pin(pin_name) {
        timing() {
            compressed_ccs_rise("LTT3") {
              values("0.1, 0, 0.6, 0.8, 1, 3", \
                     "0.15, -0.55, 0.65, 0.85, 2, 4", \
                     "0.2, 0.6, 0.7, 0.9, 3, 2", \
                     "0.25, 0.65, 0.75, 0.95, 4, 1");
            } /* end of compressed_ccs_rise */
        }
    }
  }
  ...
}
```

The following are example messages:

```
Error: Line 1163, Bad peak_current value '0' is specified in
 'compressed_ccs_rise'.(LBDB-760)
Error: Line 1163, Bad peak_current value '-0.55' is specified in
 'compressed_ccs_rise'.(LBDB-760)
```

What Next

According the rule above, correct the peak_current value.

LBDB-761

(error) Non-integer base curve id '%s' is specified in '%s'.

Description

Curve_id should be integers because it is defined with integer data type.

For compact ccs timing, curve_id is the data corresponding to left_id or right_id in compressed_ccs_rise/compressed_ccs_fall group.

For compact ccs power, curve_id is the data corresponding to bc_id* in compact_ccs_power group.

Feedback

The following example shows an instance where this message occurs:

```
library(name) {
  ...
  base_curves (ctbct1){
    base_curve_type : ccs_timing_half_curve;
    curve_x("0.2, 0.5, 0.8");
    curve_y(1, "0.8, 0.5, 0.2");
    curve_y(2, "0.75, 0.5, 0.35");
    curve_y(3, "0.85, 0.5, 0.15");
    curve_y(4, "0.85, 0.5, 0.15");
  }
  compressed_lut_template(LTT3) {
    variable_1 : input_net_transition;
    variable_2 : total_output_net_capacitance;
    variable_3 : curve_parameters;
    index_1 ("0.1, 0.2");
    index_2 ("1.0, 2.0");
    index_3 ("init_current, peak_current, peak_voltage, peak_time,
 left_id, right_id");
    base_curves_group: "ctbct1";
  }

  cell(cell_name) {
    pin(pin_name) {
        timing() {
            compressed_ccs_rise("LTT3") {
              values("0.1, 0, 0.6, 0.8, 1, 3", \
                     "0.15, -0.55, 0.65, 0.85, 2, 4", \
                     "0.2, 0.6, 0.7, 0.9, 3, 2", \
                     "0.25, 0.65, 0.75, 0.95, 4, 1");
            } /* end of compressed_ccs_rise */
        }
    }
  }
  ...
}
```

The following is an example message:

```
Error: Line 1163, Non-integer curve_id(lef_id/right_id) '3.5' is
 specified in 'compressed_ccs_rise'.(LBDB-761)
Error: Line 1163, Non-integer curve_id(lef_id/right_id) '2.0' is
 specified in 'compressed_ccs_rise'.(LBDB-761)
```

What Next

According the rule above, correct the left_id/right_id value in compressed_ccs_rise/ compressed_ccs_fall group, or the bc_id* value in compact_ccs_power group.

Feedback

LBDB-762

(error) Undefined base curve id '%d' is referenced in '%s'.

Description

Curve_id must be predefined in previous base_curve group.

For compact ccs timing, curve_id is the data corresponding to left_id or right_id in compressed_ccs_rise/compressed_ccs_fall group.

For compact ccs power, curve_id is the data corresponding to bc_id* in compact_ccs_power group.

The following example shows an instance where this message occurs:

```
library(name) {
  ...
  base_curves (ctbct1){
    base_curve_type : ccs_timing_half_curve;
    curve_x("0.2, 0.5, 0.8");
    curve_y(1, "0.8, 0.5, 0.2");
    curve_y(2, "0.75, 0.5, 0.35");
    curve_y(3, "0.85, 0.5, 0.15");
    curve_y(4, "0.85, 0.5, 0.15");
  }
  compressed_lut_template(LTT3) {
    variable_1 : input_net_transition;
    variable_2 : total_output_net_capacitance;
    variable_3 : curve_parameters;
    index_1 ("0.1, 0.2");
    index_2 ("1.0, 2.0");
    index_3 ("init_current, peak_current, peak_voltage, peak_time,
 left_id, right_id");
    base_curves_group: "ctbct1";
  }

  cell(cell_name) {
    pin(pin_name) {
        timing() {
            compressed_ccs_rise("LTT3") {
              values("0.1, 0, 0.6, 0.8, 1, 31", \
                     "0.15, -0.55, 0.65, 0.85, 7, 4", \
                     "0.2, 0.6, 0.7, 0.9, 3, 2", \
                     "0.25, 0.65, 0.75, 0.95, 4, 1");
            } /* end of compressed_ccs_rise */
        }
    }
  }
  ...
}
```

Feedback

The following is an example message:

```
Error: Line 1163, Undefined curve_id(lef_id/right_id) '31' is referenced
 in 'compressed_ccs_rise'.(LBDB-762)
Error: Line 1163, Undefined curve_id(lef_id/right_id) '7' is referenced
 in 'compressed_ccs_rise'.(LBDB-762)
```

What Next

According the rule above, correct the left_id/right_id value in compressed_ccs_rise/ compressed_ccs_fall group, or the bc_id* value in compact_ccs_power group.

LBDB-763

(error) Incompatible %s data specified in %s.

Description

For ccs timing and power data, there are two models that can be used. One is expanded model, the other is compact model.

Expanded ccs timing model is specified by output_current_{rise|fall}. Compact ccs timing model is specified by compact_ccs_{rise|fall}. Expanded ccs power model is specified by vector under pg_current group. Compact ccs power model is specified by compact_ccs_power under pg_current group.

Currently, only one model is supported in one library. If both of them are used in the library, the error is issued.

Users can't specify expanded ccs timing/power model for some cells in the library, while compact ccs timing/power model for other cells.

The following example shows an instance where this message occurs:

```
library(name) {
  ...

  cell(cell_name1) {
    pin(pin_name) {
        timing() {
            output_current_rise() {
              vector("CT3") {
                ...
              }
              ...
            }
            output_current_fall() {
              vector("CT3") {
                ...
              }
              ...
```

Feedback

```
            }
        }
    }
  }
  cell(cell_name2) {
    pin(pin_name) {
        timing() {
            compact_ccs_rise("LTT3") {
              values("..."..., "...");
            }
            compact_ccs_fall("LTT3") {
              values("..."..., "...");
            }
        }
    }
  }
  ...
}
```

The following is an example message:

```
Error: Line 1, Un-Compatible CCS timing data specified in timing
 arc.(LBDB-763)
```

What Next

Keep only one ccs timing/power model in the library.

LBDB-764

(error) Redundant base_curves group '%s' with '%s' type defined in library.

Description

Since the compressed ccs data (for the time being, it only support compressed ccs timing) is consumed by PT, to ensure the performance of PT, guarantee the ccs accuracy and ease the implementation of PT support and implementation, we only support one base curve group with specific base curve type.

The following example shows an instance where this message occurs:

```
library(name) {
  ...

  base_curves(bct1) {
    base_curve_type : ccs_timing_half_curve;
    curve_x ("0.1, 0.5, 0.9");
    curve_y (1, "0.2, 0.5, 0.8");
    ...
  }
  base_curves(bct2) {
    base_curve_type : ccs_timing_half_curve;
```

Feedback

```
    curve_x ("0.1, 0.5, 0.9");
    curve_y (1, "0.33, 0.55, 0.88");
    ...
  }
  ...
}
```

The following is an example message:

```
Error: Line 165, Redundant base_curves group 'bct2' with
 'ccs_timing_half_curve' type defined in library.(LBDB-764)
```

What Next

Remove the base_curves group or combine same base curve type groups into one base_curves group if possible. Leave only one base_curves group with the base curve type.

LBDB-765

(error) Bad peak_voltage value '%g' is specified in '%s',\n \tLegal vale should be in range of [%g, %g].

Description

peak_voltage is one of six parameters to model compact ccs timing base curve. In [va_]compact_ccs_rise/fall group, the peak_voltage values should less than Vdd of this port.

Note that the ways to define VDD are different between pg pin library, power-rail library, non-pg pin library. details may need to refer to application notes for pg pin supporting.

The following example shows an instance where this message occurs:

```
library(name) {
  ...
  operating_conditions(typical) {
    process     : 1;
    temperature : 25;
    voltage     : 1.0;
    tree_type   : balanced_tree
  }
  default_operating_conditions : typical;

  base_curves (ctbct1){
    base_curve_type : ccs_timing_half_curve;
    curve_x("0.2, 0.5, 0.8");
    curve_y(1, "0.8, 0.5, 0.2");
    curve_y(2, "0.75, 0.5, 0.35");
    curve_y(3, "0.85, 0.5, 0.15");
    curve_y(4, "0.85, 0.5, 0.15");
```

Feedback

```
  }
  compressed_lut_template(LTT3) {
    variable_1 : input_net_transition;
    variable_2 : total_output_net_capacitance;
    variable_3 : curve_parameters;
    index_1 ("0.1, 0.2");
    index_2 ("1.0, 2.0");
    index_3 ("init_current, peak_current, peak_voltage, peak_time,
 left_id, right_id");
    base_curves_group: "ctbct1";
  }

  cell(cell_name) {
    pin(pin_name) {
        timing() {
            compact_ccs_rise("LTT3") {
              values("0.1, 0, 0.6, 0.8, 1, 3", \
                     "0.15, 1.55, 0.65, 0.85, 2, 4", \
                     "0.2, 0.6, 0.7, 0.9, 3, 2", \
                     "0.25, 0.65, 0.75, 0.95, 4, 1");
            } /* end of compressed_ccs_rise */
        }
    }
  }
  ...
}
```

The following is an example message:

```
Error: Line 1163, Bad peak_voltage value '1.55' is specified in
 'compact_ccs_rise',
        Legal value should be in range of [0, 1.0].(LBDB-765)
```

What Next

According the rule above, correct the peak_voltage value.

LBDB-766

(warning) The '%s' attribute of %s '%s' overwrites the value specified \tin the '%s' attrbiute.

Description

This message indicates that the latest value overwrites the previous value defined for the same attribute.

The following is an example message:

```
Error: Line 100, The 'retention_pin' attribute of pin 'A' overwrites the
 value specified
        in the 'map_to_logic' attrbiute. (LBDB-766)
```

Feedback

What Next

Make sure that it is what have been expected.

LBDB-767

(error) No mandatory attribute '%s' defined in sensitization group '%s'.

Description

sensitization group is to describe the complete state patterns (by vector attributes) for a specific list of pins (by pin_names attribute). vector and pin_names are mandatory attributes in the group.

The following example shows an instance where this message occurs:

```
library(name) {
  ...
  sensitization (my_sensitization){
    pin_names("A, B, Y");
  }

  ...
}
```

The following is an example message:

```
Error: Line 11, No mandatory attribute 'vector' defined in sensitization
 group 'my_sensitization'.(LBDB-767)
```

What Next

According to message, add pin_names or vector to make the sensitization group complete.

LBDB-768

(error) Duplicate pin name '%s' specified in '%s'.

Description

This error is issued when duplicate pin name specified in sensitization group pin_names, or cell/timing group pin_name_map attribute. Pin names in the attribute are used to generate stimuli from sensitization group for timing arc.

The following example shows an instance where this message occurs:

```
library(name) {
  ...
  sensitization (my_sensitization){
```

Feedback

```
    pin_names("A, B, B, Y");
    vector (0, "0 0 0 0");
    vector (1, "0 0 0 1");
    ...
  }

  ...
}
```

The following is an example message:

```
Error: Line 12, Duplicate pin name 'B' specified in
 'pin_names'.(LBDB-768)
```

What Next

Correct the duplicate pin name definition, if the number of pin is changed because of the fix, other sensitization related attributes may also need to be updated.

LBDB-769

(error) %s id (%d) specified sensitization vector.

Description

This error is issued when duplicate or negative vector id specified in vector attribute. The vector attribute is composed by: vector(vector_id, vector_string); The vector id should greater than or equal to zero, and unique in current sensitization group.

The following example shows an instance where this message occurs:

```
library(name) {
  ...
  sensitization (my_sensitization){
    pin_names("A, B, C, Y");
    vector (0, "0 0 0 0");
    vector (1, "0 0 0 1");
    vector (1, "0 0 1 1");
    vector (-1, "0 0 1 0");
    ...
  }

  ...
}
```

The following is an example message:

```
Error: Line 14, Duplicate id (1) specified in sensitization
 vector.(LBDB-769)
Error: Line 15, Negative id (-1) specified in sensitization
 vector.(LBDB-769)
```

Feedback

What Next

Correct the vector id in the vector attribute, according to the rule above.

LBDB-770

(error) No pin_names attribute defined before the vector.

Description

In sensitization group, pin_names attribute should be declared before all vectors. The error is issued when processing vector but find no pin_names attribute defined before in the sensitization group.

The following example shows an instance where this message occurs:

```
library(name) {
  ...
  sensitization (my_sensitization){
    vector (0, "0 0 0 0");
    pin_names("A, B, C, Y");
    vector (1, "0 0 0 1");
    vector (2, "0 0 1 0");
    vector (3, "0 0 1 1");
    ...
  }

  ...
}
```

The following is an example message:

```
Error: Line 13, No pin_names attribute defined before the
 vector.(LBDB-770)
```

What Next

Add pin_names attribute if it's missing, or reorder the pin_names attribute to the first declaration in the sensitization group.

LBDB-771

(error) Number of elements in the vector string (%d) is different from number of pin (%d).

Description

This error is issued when the number of elements in vector string is different the number of pins defined in pin_names attribute. The vector attribute is composed by: vector(vector_id, vector_string);

Feedback

The following example shows an instance where this message occurs:

```
library(name) {
  ...
  sensitization (my_sensitization){
    pin_names("A, B, C, Y");
    vector (0, "0 0 0 0");
    vector (1, "0 0 0 1");
    vector (2, "0 0 1 0");
    vector (3, "0 1 1");
    ...
  }

  ...
}
```

The following is an example message:

```
Error: Line 17, Number of elements in the vector string (3) is different
 from number of pins (4).(LBDB-771)
```

What Next

Correct the vector string in the vector attribute, make it's elements number equal to number of pin in pin_names.

LBDB-772

(error) Number of pins (%d) in the %s pin_name_map \tis different from that (%d) in sensitization master '%s'.

Description

This error is issued when run into following situations: 1. Number of pin in cell->pin_name_map is different from that in cell->sensitization_master->pin_names. 2. Number of pin in timing->pin_name_map is different from that in timing->sensitization_master->pin_names. 3. When there is timing->pin_name_map defined, but there is only cell->sensitization_master attribute, Number of pin in timing->pin_name_map is different from that in cell->sensitization_master->pin_names.

When there is pin_name_map defined in cell or timing, pins in the attribute is used to generate stimuli for characterization, instead of pin_names in sensitization master. but the number of pins should be the same, otherwise vectors in the sensitization_master can not be mapped to these pins properly.

The following example shows an instance where this message occurs:

```
library(name) {
  ...
  sensitization (my_sensitization){
    pin_names("A, B, C, Y");
```

Feedback

```
    vector (0, "0 0 0 0");
    vector (1, "0 0 0 1");
    vector (2, "0 0 1 0");
    vector (3, "0 0 1 1");
    ...
  }

  cell (my_cell) {
    sensitization_master : my_sensitization;
    pin_name_map("A, B, Z");
    pin (A) {
        ...
    }
    ...
  }
  ...
}
```

The following is an example message:

```
Error: Line 1170, Number of pins (3) in the cell pin_name_map
        is different from that (4) in sensitization master
 'my_sensitization'.(LBDB-772)
```

What Next

Correct the vector string in the vector attribute, make it's elements number equal to number of pin in pin_names.

LBDB-773

(error) Illegal pin name '%s' specified in %s level sensitization attribute.

Description

This error is issued when pin name specified in cell/timing level sensitizaiotn attribute is an illegal(undefined) pin in the cell: This screener rule checks following pin names: 1. pin names specified in cell->pin_name_map attribute. 2. when there is no cell->pin_name_map, pin_names in cell->sensitization_master. 3. pin names in timing->pin_name_map attribute. 4. when there is no timing->pin_name_map, pin_names in timing->sensitization_master.

The following example shows an instance where this message occurs:

```
library(name) {
  ...
  sensitization (my_sensitization){
    pin_names("A, B, C");
    vector (0, "0 0 0");
    vector (1, "0 0 1");
    vector (2, "0 1 0");
```

Feedback

```
    vector (3, "0 1 1");
    ...
  }

  cell (my_cell) {
    sensitization_master : my_sensitization;
    pin_name_map("A, B, Z");
    pin (A) {
        ...
    }
    pin (B) {
        ...
    }
    pin (Y) {
        ...
    }
  }
  ...
}
```

The following is an example message:

```
Error: Line 1170, Illegal pin name 'Z' specified in cell level
 sensitization attribute.(LBDB-773)
```

What Next

Check pin names in the sensitization attributes(pin_name_map, or pin_names in sensitization_master), make sure all pin names are real pin in the cell.

LBDB-774

(error) Incomplete sensitization info in the timing arc.

Description

This error is issued when there is wave_rise/wave_fall attribute defined in the timing group, but none of following attributes found: 1. pin_name_map attribute in current timing group. 2. sensitization_master attribute in current timing group. 3. pin_name_map attribute in current cell. 2. sensitization_master attribute in current cell.

Since there is no way to get the pin names for the wave_rise/wave_fall, the sensitization information for the timing is incomplete.

The following example shows an instance where this message occurs:

```
library(name) {
  ...
  sensitization (my_sensitization){
    pin_names("A, B, C");
    vector (0, "0 0 0");
```

```
    vector (1, "0 0 1");
    vector (2, "0 1 0");
    vector (3, "0 1 1");
    ...
  }

  cell (my_cell) {
    ...
    pin (A) {
        timing() {
            wave_rise (1, 3);
            wave_fall (2, 0);
            /* other timing arc data */
        }
    }
  }
  ...
}
```

The following is an example message:

```
Error: Line 1170, Incomplete sensitization info in the timing
 arc.(LBDB-774)
```

What Next

Define pin_name_map or sensitization_master attribute either in the timing arc or in the cell, make sure the sensitization information in this timing group is complete.

LBDB-775

(warning) No sensitization_master defined, sensitization vector is derived from vector id in the timing arc.

Description

This warning is issued when there is wave_rise/wave_fall attribute defined in the timing group, But no sensitization_master attribute defined either in the timing group or current cell.

This is a simplified usage model of sensitization, that sensitization vector used to get from sensitization group by vector id, but is derived from vector id and number of pin in pin_name_map by binary scale directly in such cases.

Example:

```
timing() {
    pin_name_map("A, B, C, Z");
    wave_rise (5, 8, 15);
}
```

Here '5' implies vector string of "0 1 0 1", '8' implies vector string of "1 0 0 0", and so on.

The following example shows an instance where this message occurs:

```
library(name) {
  ...

  cell (my_cell) {
    ...
    pin (A) {
        timing() {
            pin_name_map("A, B, Y");
            wave_rise (1, 3);
            wave_fall (2, 0);
            /* other timing arc data */
        }
    }
  }
  ...
}
```

The following is an example message:

```
Warning: Line 1170, No sensitization_master defined, sensitization vector
 is derived from vector id in the timing arc.(LBDB-775)
```

What Next

If this is what the users wanted, just ignore this warning. otherwise, specify valid sensitization_master attribute in the timing group or current cell.

LBDB-776

(error) Vector id (%d) in '%s' is undefined in sensitization group '%s'.

Description

When there is sensitization master defined for the timing arc, Vector id specified in wave_rise and wave_fall should be predefined in the sensitization group, otherwise, this error is issued.

The following example shows an instance where this message occurs:

```
library(name) {
  sensitization (my_sensitization){
    pin_names("A, B, C");
    vector (0, "1 0 0");
    vector (1, "0 0 1");
    vector (2, "1 1 0");
    vector (3, "0 1 1");
  }
  ...
```

Feedback

```
  cell (my_cell) {
    ...
    pin (A) {
        timing() {
            sensitization_master : my_sensitization;
            pin_name_map ("A, B, Y");
            wave_rise (1, 3);
            wave_fall (2, 4);
            /* other timing arc data */
        }
    }
  }
  ...
}
```

The following is an example message:

```
Error: Line 1181, Vector id (4) in 'wave_fall' is undefined in
 sensitization group 'my_sensitization'(LBDB-776)
```

What Next

Modify vector id in the wave_rise/wave_fall, make sure every vector id is predefined in sensitization master group.

LBDB-777

(error) Vector id (%d) for implied vector string in '%s' is out of range (0~%d).

Description

When there is no sensitization master defined either in the timing group or current cell, Vector string is implied by vector id and number of pin in pin_name_map. So the vector id should greater than or equal to zero, and less than 2^(number of pin in pin_name_map).

For example:

```
timing() {
    pin_name_map("A, B, C, Z");
    wave_rise (5, 8, 17);
}
```

Here number of pin in pin_name_map is 4, the vector id should < (2^4 = 16), so the vector id = 17 is out of range, and is not allowed.

The following example shows an instance where this message occurs:

```
library(name) {
  ...
  cell (my_cell) {
    ...
```

Feedback

```
    pin (A) {
        timing() {
            sensitization_master : my_sensitization;
            pin_name_map ("A, B, Y");
            wave_rise (1, 7);
            wave_fall (2, 8);
            /* other timing arc data */
        }
    }
  }
  ...
}
```

The following is an example message:

```
Error: Line 1181, Vector id (8) for implied vector string in 'wave_fall'
 is out of range (0~7)(LBDB-777)
```

What Next

Modify vector id in the wave_rise/wave_fall, make sure every vector id is in the legal range.

LBDB-778

(error) index (%d) specified in '%s' is out of range (1~%d).

Description

The wave_rise_sampling_index/wave_fall_sampling_index is to define from which transition, (instead of default last transition) to the transition of the output pin, the delay is measured.

If the number of elements in wave_rise/wave_fall is N, then The index value should between (1 ~ N-1).

The following example shows an instance where this message occurs:

```
library(name) {
  ...
  cell (my_cell) {
    ...
    pin (A) {
        timing() {
            sensitization_master : my_sensitization;
            pin_name_map ("A, B, Y");
            wave_rise (1, 4, 7);
            wave_fall (2, 5, 8);
            wave_rise_sampling_index : 3;
            /* other timing arc data */
        }
    }
```

Feedback

```
  }
  ...
}
```

The following is an example message:

```
Error: Line 1181, index (3) specified in 'wave_rise_sampling_index' is
 out of range (1~2)(LBDB-778)
```

What Next

Modify sampling index accordingly, make sure it's in the legal range.

LBDB-779

(error) Number of elements (%d) specified in '%s' is out of range (1~%d).

Description

The wave_rise_timing_interval/wave_fall_timing_interval attributes are for special cases that customers want to control the time interval between transitions. which is used to characterize some special-purpose cells and pessimistic timing characterization.

If the number of elements in wave_rise/wave_fall is N, then Number of elements in these two attributes should between (1 ~ N-1);

The following example shows an instance where this message occurs:

```
library(name) {
  ...
  cell (my_cell) {
    ...
    pin (A) {
        timing() {
            sensitization_master : my_sensitization;
            pin_name_map ("A, B, Y");
            wave_rise (1, 4, 7);
            wave_fall (2, 5, 8);
            wave_rise_timing_interval(0.0, 0.5, 1.0);
            /* other timing arc data */
        }
    }
  }
  ...
}
```

The following is an example message:

```
Error: Line 1181, Number of elements (3) specified in
 'wave_rise_sampling_index' is out of range (1~2)(LBDB-779)
```

Feedback

What Next

Modify the wave_rise_timing_interval/wave_fall_timing_interval attribute values, accordingly to the rule above.

LBDB-780

(error) The '%s' %s is not %s '%s' %s.

Description

This error message occurs when you specify an invalid 'std_cell_main_rail' pg_pin in a level shifter not satisfying one of the following constraints: - the pg_pin must be a 'primary_power' or 'primary_ground' pg_pin. - if the pg_pin is 'primary_power', the pg_pin must be specified as the "related_power_pin" of one of the signal pins of the level shifter. - if the pg_pin is 'primary_ground', the pg_pin must be specified as the "related_ground_pin" of one of the signal pins of the level shifter.

As shown in the following example, the 'VDD' pg_pin is invalid because it is not a 'primary power' pg_pin.

```
cell(ls) {
    is_level_shifter : true;

    pg_pin(VDD) {
        voltage_name : VDDL;
        pg_type : backup_power;

        std_cell_main_rail : true;
    }
    ...
  }

Error: Line 84, The 'VDD' pg_pin is not a 'primary_power' pg_pin.
 (LBDB-780)
```

What Next

Modify the cell accordingly to satisfy the constraints.

LBDB-781

(error) The timing arc with feed_through_type '%s'\n \t%s specify the CCS Timing Current waveform vectors.

Description

The timing arc with feed_through_type attribute must satisfy the following requirements: 1. if the feed_through_type attribute is "short", then the timing arc must not have CCS Timing

Feedback

current waveform vectors. 2. if the feed_through_type attribute is "wire" or "gate", then the timing arc must have CCS Timing current waveform vectors.

The following example shows an instance where this message occurs:

```
pin(Z) {
          direction : output;
          timing() {
            /* no ccs information defined in the timing arc */
            feed_through_type : wire;
            ...
          }
        }
```

The following is an example message: Error: Line 144, The timing arc with feed_through_type 'short' cannot specify the CCS Timing Current waveform vectors. (LBDB-781)

What Next

Check the timing arc and make the correction accordingly.

LBDB-782

(error) The pin '%s' should be an 'inout' pin because of the associated \n \ttiming arc with feed_through_type attribute.

Description

The timing arc with feed_through_type attribute can only be specified between inout pins.

The following example shows an instance where this message occurs:

```
pin (A) {
          direction : output;
          ...
        }
        pin(Z) {
          direction : output;
          timing() {
            feed_through_type : short;
            ...
            related_pin : "A";
          }
        }
```

The following is an example message: Error: Line 144, The pin 'A' should be an 'inout' pin because of the associated timing arc with feed_through_type attribute. (LBDB-782) Error: Line 148, The pin 'Z' should be an 'inout' pin because of the associated timing arc with feed_through_type attribute. (LBDB-782)

Feedback

What Next

Check the timing arc and make the correction accordingly.

LBDB-783

(error) In cell '%s', the %s timing arc from pin '%s' to '%s' with feed_through_type '%s'\n \tdoes not have the required timing arc from pin '%s' to '%s' of the same timing_type\n \t, timing_sense and feed_though_type.

Description

The timing arc with feed_through_type attribute 'short' or 'wire' must have the relative backward timing arc with the same timing_type and feed_through_type for the same cell.

The following example shows an instance where this message occurs:

```
cell(T) {
        ...
        pin(Z) {
          direction : output;
          /* no timing arc Z->A with timing_type = combinational and
 feed_through_type= wire exists in the cell T */
          timing() {
            timing_type : combinational;
            feed_through_type : wire;
            ...
            related_pin "A";
          }
        }
        ...
     }
```

The following is an example message: Error: Line 144, In cell 'T', the combinational timing arc from pin 'A' to 'Z' with feed_through_type '%s' does not have the required timing arc from pin 'Z' to 'A' of the same timing_type, timing_sense and feed_though_type. (LBDB-783)

What Next

Check the timing arcs and make the correction accordingly.

LBDB-784

(error) The %s value of the '%s' attribute is %g,\n \twhich is %s the required value %g.

Description

The minimum/maximum value of the attribute is less/greater than the required value.

Feedback

The following example shows an instance where this message occurs:

```
...
  current_unit : "1mA" ;
  ...
  dc_current (ccsn_dc_29x29) {
        index_1 ("...");
        index_2 ("...");
        /* current unit = 1mA, and the max value = 0.005 */
        values ("0.0005, ...., 0.00091);
  }
```

The following is an example message:

```
Error: Line 35, The maximum value of the 'values' attribute is 0.0005,
        which is less than required value 0.001. (LBDB-784)
```

What Next

Check the library source file and correct the problem.

LBDB-785

(warning) The '%s' attribute is not defined in the library. \n \tUsing %f as the default value.

Description

You receive this message because the relative attribute is not defined in the library, so LC will create the attribute with the predefined default value.

The following is an example message: Warning: Line 85, The 'nom_voltage' attribute is not defined in the library. Using 5 as the default value. (LBDB-785)

What Next

Examine the library source file, and add the correct value for the attribute.

LBDB-786

(error) The attribute valus is not a switch pin.

Description

The value of related_switch_pin must be referring to either a switch pin or an internal pin as defined below.

switch pin : switch_pin attribute is set to "true" within a pin. internal pin : related_pin attribute is referred to a switch pin.

The following example shows an instance where this message occurs:

```
dc_current (ccsn_dc_29x29) {
    related_switch_pin : D;
    ...
 }
 pin(CTL) { /* this is a switch pin as switch_pin is set to "true" */
    capacitance : 0.5;
    direction : input;
    switch_pin : true;
    ...
 }
 pin(int_1) { /* this is an internal pin, which refers to a switch pin by
                 related_pin attribute */
    direction : internal;
    timing () {
      related_pin : CTL;
      ...
    }
    ...
 }
 pin(D) {
    capacitance : 0.5;
    direction : input;
    ...
  }
```

In this case, related_switch_pin is pointing to pin "D", which is not either an internal pin or a switch pin. The way to correct it is to specify related_switch_pin to either pin "CTL" or pin "int_1".

The following is an example message:

```
Error Line 272, The attribute valus is not a switch pin. (LBDB-786)
```

What Next

Check the library source file, and make the necessary correction.

LBDB-787

(error) Cell(%s): The 'internal_node' in the '%s' port\n \tcan't be specified because no statetable is allowed in generic type\n \tof clock gating integrated cell.

Description

If attribute 'clock_gating_integrated_cell' is generic, then no statetable is allowed. 'internal_node' attribute must match one of the internal node names in statetable. Since there is no statetable is allowed, there is no 'internal_node' attribute can be specified in a port, either.

Feedback

The following example shows an instance where this message occurs:

```
cell(ldbd-787) {
    ...
  cell_leakage_power : 0.023529479 ;
  clock_gating_integrated_cell : "generic" ;
    ...

  pin(Q) {
    direction : internal;
    internal_node : "Q1";
    timing() {
      timing_type : rising_edge;
      intrinsic_rise : 1.34;
      intrinsic_fall : 1.54;
      rise_resistance : 0.0718;
      fall_resistance : 0.0347;
      related_pin : "CP";
    }
  }
}
```

In this case, Q1 in internal_node attribute shall not be specified because there is no statetable in the cell.

The following is an example message:

```
Error: Line 139, Cell(lbdb-787): The 'internal_node' in the 'Q' port
        can't be specified because no statetable is allowed in generic
 type
        of clock gating integrated cell. (LBDB-787)
```

What Next

Remove the internal_node attribute to fix the problem.

LBDB-788

(warning) No default '%s" group defined in '%s'.

Description

This warning is issued when there is some default group is missing in library, but no default can be assumed to it.

For example, if there is no default driver waveform specified, This warning will be reported.

The following is an example message:

```
Warning Line 10, No default 'normalized_driver_waveform" group defined in
 'library'.(LBDB-788)
```

Feedback

What Next

Check the library source file, add default group.

LBDB-789

(warning) The '%s' attribute in the '%s' table has\n \tless than %d '%s" points,that is point between %g to %g.

Description

The values of the corresponding attribute has no enough type of points.

For example, the normalized voltage points for driver waveform need at lease 1 start points(0~0.05) and end points(0.95~1.0) for accuracy.

The following example shows an instance where this message occurs:

```
normalized_driver_waveform (dw01) {
    index_1 ("1.0");    /* input net transition */
    index_2 ("0.1, 0.3, 0.5, 0.7, 0.9"); /* normalized voltage*/
    ...
 }
```

In this case, the index_2 of normalized_driver-waveform is normalized_voltage, It would be better to supply at leat one start points and end points for accuracy purpose.

The following is an example message:

```
Warning Line 27, The 'index_2' attribute in the
 'normalized_driver_waveform' table
       has less than 1 'start" points, that is between '0' to '0.05'.
 (LBDB-789)
Warning Line 27, The 'index_2' attribute in the
 'normalized_driver_waveform' table
       has less than 1 'end" points, that is between '0.95' to '1.0'.
 (LBDB-789)
```

What Next

Check the library source file, add some example points for the attribute.

LBDB-790

(error) '%s' only allows single %s pin name.

Description

Only one single pg pin name can be specified in intrinsic_resistance, intrinsic_capacitance and pg_current or only one single pin name can be specified in gate_leakage.

Feedback

The following example shows an instance where this message occurs:

```
pg_pin(V1) {
     voltage_name : VDD1;
     pg_type : primary_power;
  }
  pg_pin(V2) {
     voltage_name : VDD2;
     pg_type : backup_power;
  }
  pg_pin(G1) {
     voltage_name : GND1;
     pg_type : primary_ground;
  }
  pg_pin(G2) {
     voltage_name : GND2;
     pg_type : backup_ground;
  }

 pin(A1) {
  direction : input;
  ...
   }
 pin(A2) {
  direction : input;
  ...
   }
 pin(A3) {
  direction : input;
  ...
   }
 pin(ZN1) {
  direction : output;
  ...
 }
 pin(ZN) {
  direction : output;
  ...
 }
 ...
  dynamic_current() {
    when : "A1";
    related_inputs : "A2 A3";
    related_outputs : "ZN ZN1";
    typical_capacitances(0.3 0.4);
    switching_group() {
      input_switching_condition(fall);
      output_switching_condition(rise fall);
      pg_current(V2 G1) {
        vector(test_2) {
          reference_time : 193.2;
          index_output : "ZN1";
          index_1("15.1");
```

Feedback

```
          ...
        }
      ...
    }
   ...
 }

leakage_current() {
   pg_current(V1) {
     value : 4.5;
   }
   pg_current(G1 G2) {
     value : -4.5;
   }
  ...
   gate_leakage(A2 A3) {
     input_high_value : 1.0;
     input_low_value : -10.0;
   }
   gate_leakage() {
     input_high_value : 3.0;
     input_low_value : -40.0;
   }

}
intrinsic_parasitic() {
  when : "A1 & A2 & ZN";
  intrinsic_resistance(G1 G1) {
     related_output : "ZN";
     value : 9.0;
  }
  intrinsic_resistance(G1) {
     related_output : "ZN1";
     value : 62.2;
  }
  intrinsic_capacitance(G2 G2) {
     value : 31.47;
  }
}
```

In this case, the pg_current within switching_group has two pg pins, V2 and G1, which is wrong. The pg_current within leakage_current has two pg pins, G1 and G2, which is wrong. The intrinsic_resistance has two pg names, G1 and G1, which is wrong. The intrinsic_capacitance has two pg names, G2 and G2, which is wrong. The first gate_leakage has two pin names A3 and A2, which is wrong, and the second gate_leakage has no name there, which is wrong, too. You might want to change all of them to one PG or pin name to avoid the error.

Feedback

The following is an example message:

```
Error Line 272, 'pg_current' only allows single pg pin name. (LBDB-790)
Error Line 222, 'gate_leakage' only allows single pin name. (LBDB-790)
```

What Next

Check the library source file, and make the necessary correction.

LBDB-791

(error) pg_pin group is required for ccs power cell.

Description

If the cell is a ccs power cell, which contains dynamic_current, leakage_current or intrinsic_parasitic, then pg_pin group is required.

The following example shows an instance where this message occurs:

```
cell (AND3) {
  ...
  power_cell_type : stdcell;
  dynamic_current() {
    when : "A1";
    related_inputs : "A2 A3";
    related_outputs : "ZN ZN1";
    typical_capacitances(0.3 0.4);
    switching_group() {
    ...
    }
    ...
  } ...
}
```

In this case, cell, AND3, is a ccs power cell. The pg_pin must be specified within cell to fix the error as shown below :

```
cell (AND3) {
  pg_pin(V1) {
     voltage_name : VDD1;
     pg_type : primary_power;
  }
  pg_pin(V2) {
     voltage_name : VDD2;
     pg_type : backup_power;
  }
  pg_pin(G1) {
     voltage_name : GND1;
     pg_type : primary_ground;
  }
  pg_pin(G2) {
```

```
    voltage_name : GND2;
    pg_type : backup_ground;
  }

  power_cell_type : stdcell;
  dynamic_current() {  ...
```

The following is an example message:

```
Error Line 272, pg_pin group is required for ccs power cell. (LBDB-791)
```

What Next

Check the library source file, and make the necessary correction.

LBDB-792

(error) leakage current in simplified format must be >= 0.

Description

If there is no pg_current within leakage_current group, we defined that as simplified format. Please refer to users guide for details.

If leakage_current is in simplifed format, then the value of leakage current must be zero or positive floating number.

The same rule is applied to va_leakage_current.

The following example shows an instance where this message occurs:

```
cell (OR2) {
  pg_pin(V1) {
     voltage_name : VDD1;
     pg_type : primary_power;
  }
  pg_pin(G1) {
     voltage_name : GND1;
     pg_type : primary_ground;
  }
  leakage_current() {
     when : "A1 & !A2 & ZN";
     value : 3.1;
  }
  leakage_current() {
     when : "A1 & !A2 & !ZN";
     value : 0.0;
  }
  leakage_current() {
     /* default state */
     value : -8.1;
  }
```

Feedback

```
  ...
}
```

In this case, leakage current -8.1 is not allowed. The value must be >= 0 in simplified format.

The following is an example message:

```
Error Line 272, leakage current in simplified format must be >= 0.
 (LBDB-792)
```

What Next

Check the library source file, and make the necessary correction.

LBDB-793

(error) Name specified in '%s' is not a valid %s pin.

Description

You got this message because an invalid PG or signal pin is used.

The pin name specified in intrinsic_capacitance, intrinsic_resistance, or pg_current group must be referred to a valid PG pin defined in cell, and a pg name is required for these groups.

The pin name specified in gate_leakage group must be referred to a valid signal pin defined in cell, and a pin name is required for gate_leakage.

The following example shows an instance where this message occurs:

```
cell (AND3) {
  ...
  pg_pin(V1) {
     voltage_name : VDD1;
     pg_type : primary_power;
  }
  pg_pin(V2) {
     voltage_name : VDD2;
     pg_type : backup_power;
  }
  pg_pin(G1) {
     voltage_name : GND1;
     pg_type : primary_ground;
  }
  pg_pin(G2) {
     voltage_name : GND2;
     pg_type : backup_ground;
  }
 ...
 dynamic_current() {
```

Feedback

```
  when : "A1";
  related_inputs : "A2 A3";
  related_outputs : "ZN ZN1";
  typical_capacitances(0.3 0.4);
  switching_group() {

    input_switching_condition(fall);
    output_switching_condition(rise fall);

    pg_current(V5) {     /* error */
      vector(test_2) {
      ...
    }
    pg_current() {       /* error */
    ...
  ...
}
 ...
 leakage_current() {
   when : "A1 & !A2 | ZN";
   pg_current(V5) {      /* error */
     value : 4.5;
   }
   pg_current(V2) {
     value : 4.5;
   }
   pg_current(G2) {
     value : -3.5;
   }
   pg_current() {       /* error */
     value : 4.5;
   }
}
...
intrinsic_parasitic() {
  when : "A1 & A2 & ZN";
  intrinsic_resistance() {    /* error */
     related_output : "ZN";
     value : 9.0;
  }
  intrinsic_resistance(V5) {   /* error */
     related_output : "ZN1";
     value : 62.2;
  }
  intrinsic_capacitance(G2) {
     value : 31.47;
  }
  intrinsic_capacitance() {    /* error */
     value : 31.47;
  }
  intrinsic_capacitance(V5) {  /* error */
     value : 31.47;
  }
```

```
    ...
  }
}
```

Please check the lines marked as 'error'. For these lines, they are either refers to an empty pg name, or refers to a invalid pg pin name, V5. Both are wrong. To fix the problems, please change V5 to a valid pg pin like V1, and also give a valid pg name for the empty ones.

The following is an example message:

```
Error Line 272, Name specified in 'pg_current' is not a valid PG pin.
 (LBDB-793)
```

What Next

Check the library source file, and make the necessary correction.

LBDB-794

(warning) The value of pg_current should be '%s'.

Description

This is rule for leakage_current groups. If the PG pin is a power or internal ground pin, then the value of leakage current should be either zero or positive floating number. If the PG pin is a ground or internal power pin, then the value of leakage current should be either zero or negative floating number.

The following example shows an instance where this message occurs:

```
cell (AND3_1) {
  pg_pin(V1) {
     voltage_name : VDD1;
     pg_type : primary_power;
  }
  pg_pin(V2) {
     voltage_name : VDD2;
     pg_type : backup_power;
  }
  pg_pin(V3) {
     voltage_name : VDD3;
     pg_type : internal_ground;
  }
  pg_pin(G1) {
     voltage_name : GND1;
     pg_type : primary_ground;
  }
  pg_pin(G2) {
     voltage_name : GND2;
     pg_type : backup_ground;
```

Feedback

```
   }
   pg_pin(G3) {
      voltage_name : GND3;
      pg_type : internal_power;
   }
   leakage_current() {
      when : "A1 & !A2 & ZN";
      pg_current(V1) {
        value : -4.5;
      }
      pg_current(V2) {
        value : -4.5;
      }
      pg_current(G2) {
        value : 4.5;
      }
      pg_current(V3) {
        value : -4.5;
      }
      pg_current(G1) {
        value : 4.5;
      }
      pg_current(G3) {
        value : 4.5;
      }
   }
   ...
}
```

In this case, V1, V2 and V3 should be positive or zero, and G1, G2 and G3 should be negative or zero based on the pg_type.

The following is an example message:

```
Warning Line 272, The value of pg_current should be '>=0'. (LBDB-794)
```

What Next

Check the library source file, and make the necessary correction.

LBDB-795

(error) Only one PG pin can be omitted in %s group.

Description

All the PG pins except one shall be specified in leakage_current. This rule is also applied to va_leakage_current group.

Feedback

The following example shows an instance where this message occurs:

```
cell (AND3) {

  pg_pin(V1) {
     voltage_name : VDD1;
     pg_type : primary_power;
  }
  pg_pin(V2) {
     voltage_name : VDD2;
     pg_type : backup_power;
  }
  pg_pin(G1) {
     voltage_name : GND1;
     pg_type : primary_ground;
  }
  pg_pin(G2) {
     voltage_name : GND2;
     pg_type : backup_ground;
  }
  leakage_current() {
     when : "A1 & A2 & !ZN";
     pg_current(V1) {
       value : 4.5;
     }
     pg_current(V2) {
       value : 4.5;
     }
  }
  ...
}
```

There are 4 pg pins in the cell AND3, and based on rule only one pg pin can be omitted in leakage_current group. Meaning you have to specify at least three pg pins for this case. However, there are only two pg pins (V1 and V2) specified in leakage_current. To fix the problem, please specify at least one of ground pins for leakage_current as shown below.

```
leakage_current() {
     when : "!A1 & A2 & ZN";
     pg_current(V1) {
       value : 4.5;
     }
     pg_current(V2) {
       value : 4.5;
     }
     pg_current(G2) {
       value : -4.5;
     }
  }
```

Feedback

The following is an example message:

```
Error Line 272, Only one PG pin can be omitted in leakage_current group.
 (LBDB-795)
```

What Next

Check the library source file, and make the necessary correction.

LBDB-796

(warning) The leakage current of all PG pins and gate\n \tleakage current of all input/inout pins must be summed up to zero.

Description

This rule applies to leakage_current and va_leakage_current groups if leakage current of all PG pins are specified.

If no gate_leakage are specified, the leakage current of all PG pins should add up to zero. If gate_leakage of all input/inout pins are specified, the leakage current of all PG pins and gate leakage current of all input/inout pins should add up to zero.

Total leakage current must add up to zero. A small error of +/- 1e-10 A (0.1 nA) is allowed. Larger errors must still be within a tolerance of 1.0e-6 * (total of absolute values of leakage current). The tolerance is calculated as follows:

```
| total of leakage current |
       ------------------------------  <= 1.0e-06
        total of | leakage current |
```

The following example shows an instance where this message occurs: In the example below, the total of leakage current is -0.000028. Based on the rule above, it will be like | -0.000028 | / 27.000028 = 1.03 * 1.0e-6 The result is greater than 1.0e-6. To fix the problem, we can change the G3 current to -4.500020.

```
cell (AND3_1) {
  pg_pin(V1) {
     voltage_name : VDD1;
     pg_type : primary_power;
  }
  pg_pin(V2) {
     voltage_name : VDD2;
     pg_type : backup_power;
  }
  pg_pin(V3) {
     voltage_name : VDD3;
     pg_type : internal_ground;
  }
  pg_pin(G1) {
     voltage_name : GND1;
```

Feedback

```
      pg_type : primary_ground;
   }
   pg_pin(G2) {
      voltage_name : GND2;
      pg_type : backup_ground;
   }
   pg_pin(G3) {
      voltage_name : GND3;
      pg_type : internal_power;
   }
   leakage_current() {
      when : "A1 & A2 & ZN";
      pg_current(V1) {
        value : 4.5;
      }
      pg_current(V2) {
        value : 4.5;
      }
      pg_current(G2) {
        value : -4.5;
      }
      pg_current(V3) {
        value : 4.5;
      }
      pg_current(G1) {
        value : -4.5;
      }
      pg_current(G3) {
        value : -4.500028;
      }
 }
```

The following is an example message:

```
Warning: Line 246, The leakage current of all PG pins and gate leakage
         current of all input/inout pins must be summed up to zero.
 (LBDB-796)
```

What Next

Check the library source file and make the necessary correction.

LBDB-797

(warning) The leakage_current is in wrong format.

Description

Please also refer to LBDB-798.

The leakage_cuurent only allow either regular or simplified format. The regular format shall contain pg_current group, and the simplified format shall contain value attribute.

Feedback

The following example shows an instance where this message occurs:

```
leakage_current() {
     when : "A1 & !A2 & !ZN";
   }
```

In this case, leakage_current is neither in regular nor in simplified format. To avoid the warning, please change it to either of following formats:

```
simplified format :
   leakage_current() {
     when : "A1 & !A2 & !ZN";
     value : 0.0;
   }

  regular format :
   leakage_current() {
     when : "A1 & !A2 & !ZN";
     pg_current(V1) {
       value : 0.0;
     }
   }
```

The following is an example message:

```
Warning Line 272, The leakage_current is in wrong format. (LBDB-797)
```

What Next

Check the library source file, and make the necessary correction.

LBDB-798

(error) The leakage current groups have mix format.

Description

Please also refer to LBDB-797.

The leakage_cuurent only allow either regular or simplified format. The regular format shall contain pg_current group, and the simplified format shall contain value attribute. And, two formats can not be mixed.

The following example shows an instance where this message occurs:

```
cell (test) {
  ...
  leakage_current() {
     pg_current(V1) {
       value : 4.5;
     }
     pg_current(G1) {
```

```
        value : -4.5;
      }
      pg_current(G2) {
        value : -14.5;
      }
      pg_current(V2) {
        value : 14.5;
      }
  }
  leakage_current() {
     when : "!A1 & !A2 & ZN";
     value : 0.0;
  }
  ...
}
```

In this case, first leakage_current is in regular format and second leakage_current is in simplified format, which is wrong. Two formats can not be mixed under the same cell.

The following is an example message:

```
Error Line 272, The leakage current groups have mix format. (LBDB-798)
```

What Next

Check the library source file, and make the necessary correction.

LBDB-799

(error) The multiple PG pins can not be simplified format\n \tin %s.

Description

The simplified format in leakage_current means no pg_current group specified under this leakage_current. If a cell have more than one power or ground pin, then we can not use simplified format for leakage_current.

The rule is also applied to va_leakage_current.

The following example shows an instance where this message occurs:

```
cell (test) {
  pg_pin(V1) {
     voltage_name : VDD1;
     pg_type : primary_power;
  }
  pg_pin(G1) {
     voltage_name : GND1;
     pg_type : primary_ground;
  }
  pg_pin(V2) {
     voltage_name : VDD2;
```

Feedback

```
      pg_type : backup_ground;
  }
  leakage_current() {
      when : "A1 & !A2 | ZN";
      value : 3.1;
  }
 ...
}
```

In this case, the cell 'test' has more than one power pin, and leakage_current is in simplified format, which is wrong. To fix the problem, change the simplified format to regular format as shown below.

```
leakage_current() {
     when : "A1 & !A2 | ZN";
     pg_current(V1) {
       value : 1.1;
     }
     pg_current(G1) {
       value : -3.1;
     }
     pg_current(V2) {
       value : 2.0;
     }
  }
```

The following is an example message:

```
Error Line 272, The multiple PG pins can not be simplified format
        in leakage_current group. (LBDB-799)
```

What Next

Check the library source file, and make the necessary correction.

LBDB-800

(error) In group '%s', the number of differnt\n \t'%s' values in the vectors is %d, which should \n \tbe at least %d.

Description

This error message occurs because Library Compiler requires the vectors should contain at least 2 different slew values and 2 different load values.

The following example shows an output_current_rise group with vectors containing only 1 slew value, which is 1.

```
output_current_template(CCT) {
  variable_1 : input_net_transition;
  variable_2 : total_output_net_capacitance;
```

Feedback

```
 variable_3 : time;
}
. . .
output_current_rise() {
  vector(CCT) {
     reference_time : 0.11;
     index_1 ("0.1");
     index_2 ("1");
     index_3 ("1, 2, 3");
     values ("1, 2, 3");
  }
   vector(CCT) {
     reference_time : 0.11;
     index_1 ("0.2");
     index_2 ("1");
     index_3 ("1, 2, 3");
     values ("1, 2, 3");
  }
}
```

```
Error: Line 198, In group 'output_current_rise', the number of differnt
        'total_output_net_capacitance' values in the vectors is 1, which
 should
       be at least %d. (LBDB-800)
```

What Next

Check the library source file and add a vector for each input_net_transition and total_output_net_capacitance pair.

LBDB-801

(error) %s and %s attributes must be specified in pair.

Description

The max_input_switching_count and min_input_switching_count attributes must be defined in pair within a switching_group. Meaning that if max_input_switching_count is defined, then min_input_switching_count must be defined under the same switching_group and vice versa.

The following example shows an instance where this message occurs:

```
power_cell_type : macro;
  dynamic_current() {
    ...
    switching_group() {
      min_input_switching_count : 1;
      ...
    }
  ...}
```

In this case, min_input_switching_count is defined, but there is no max_input_switching_count, which is wrong. To fix the problem, you can either remove min_input_switching_count from the switching_group or specify max_input_switching_count within switching_group.

The following is an example message:

```
Error Line 272, min_input_switching_count and max_input_switching_count
 attributes must be specified in pair. (LBDB-801)
```

What Next

Check the library source file, and make the necessary correction.

LBDB-802

(error) %s can not be defined within a %s\n \tgroup where %s is defined.

Description

You can only specify either max_input_switching_count and min_input_switching_count or input_switching_condition within a switching_group group. Meaning max_input_switching_count/ min_input_switching_count and input_switching_condition shall not present under the same switching_group group.

ALSO SEE LBDB-801

The following example shows an instance where this message occurs:

```
switching_group() {
      min_input_switching_count : 1;
      max_input_switching_count : 9;
      input_switching_condition(rise);
      ...
   }
```

In this case, min_input_switching_count and max_input_switching_count are defined, and also input_switching_condition is defined under the same switching_group where min_input_switching_count and max_input_switching_count are defined. This is wrong. To fix the problem, please remove either input_switching_condition or min_input_switching_count and max_input_switching_count.

The following is an example message:

```
Error Line 272, input_switching_condition can not be defined within a
 switching_group
        group where min_input_switching_count or
 max_input_switching_count is defined. (LBDB-802)
```

Feedback

What Next

Check the library source file, and make the necessary correction.

LBDB-803

(error) %s and %s are required for all %s\n \tgroups within this %s group.

Description

If min_input_switching_count and max_input_switching_count are specified in one of switching_group groups within a dynamic_current group, then they must be defined in the rest of switching_group groups.

This message indicates that min_input_switching_count and max_input_switching_count are not defined in all switching_group groups within a dynamic_current.

The following example shows an instance where this message occurs:

```
cell(lbdb803) {
    ...
  dynamic_current() {
     ...
   switching_group() {
      pg_current(V1) {
        vector(test_3) {
          reference_time : 193.2;
          index_1("1.1");
          index_2("18.2 18.3 19.0");
          values("13.78 192.4 1100.1");
         }
        vector(test_3) {
          reference_time : 193.2;
          index_1("1.8");
          index_2("18.2 19.4 19.8");
          values("11.78 112.4 1110.1");
         }
        vector(test_3) {
          reference_time : 193.2;
          index_1("2.1");
          index_2("18.2 19.4 19.8");
          values("12.78 122.4 1120.1");
         }
         ...
       }
    }
   switching_group() {
      min_input_switching_count : 1;
      max_input_switching_count : 9;
      pg_current(V2) {
        vector(test_3) {
```

```
          ...
          }
        vector(test_3) {
          ...
          }
          ...
       }
     }
  }
  ...
```

In this case, min_input_switching_count and max_input_switching_count are defined in second switching_group, but not in first switching_group. This is wrong. min_input_switching_count and max_input_switching_count are required for all switching_group groups if they are defined in one of switching_group under the same dynamic_current. To fix the problem, please define min_input_switching_count and max_input_switching_count in first switching_group.

The following is an example message:

```
Errorr Line 272, min_input_switching_count and max_input_switching_count
 are required for all switching_group
        groups within this dynamic_current group. (LBDB-803)
```

What Next

Check the library source file, and make the necessary correction.

LBDB-804

(error) The switching count shall cover all bits in related_inputs.

Description

The max_input_switching_count and min_input_switching_count attributes defined in a dynamic_current shall cover all bits specified in related_inputs.

The following example shows an instance where this message occurs:

```
type(bus6) {
  base_type : array ;
  data_type : bit ;
  bit_width : 6 ;
  bit_from : 5 ;
  bit_to : 0 ;
  downto : true ;
}
cell (libdb804) {
  bus(sel) {
    bus_type : bus6 ;
    direction : input ;
```

```
    ...
  }
  bundle(C) {
    members(Cx, Cy, Cz);
    direction : input;
    ...
  }
 pin(A1) {
  direction : input;
 ...
   }
 pin(A2) {
  direction : input;
  ...
   }
 pin(A3) {
  direction : input;
   ...
   }
  ...
  power_cell_type : macro;
  dynamic_current() {
    when : "A1";
    related_inputs : "Cx A3 Cy sel[0:3] A2";
    switching_group() {
      min_input_switching_count : 1;
      max_input_switching_count : 3;
      ...
    }
    switching_group() {
      min_input_switching_count : 5;
      max_input_switching_count : 8;
      ...
    }
  }
  ...
```

In this case, total number of bits in related_inputs is 8, so the switching count we specified in min_input_switching_count and max_input_switching_count shall cover number from 1 up to 8. The first switching group covers number from 1 to 3 and second switching group covers number from 5 to 8. The number 4 is not covered by any switching count within the dynamic_current. This is wrong. To fix the problem, change the third switching_group as follows :

```
switching_group() {
      min_input_switching_count : 4;
      max_input_switching_count : 4;
      ...
    }
```

Feedback

The following is an example message:

```
Error Line 272, The switching count shall cover all bits in
 related_inputs. (LBDB-804)
```

What Next

Check the library source file, and make the necessary correction.

LBDB-805

(error) The value of %s is invalid.

Description

The message indicates that you are breaking one of following rules :

1> The value of min_input_switching_count must be greater than 0. 2> The value of max_input_switching_count must be greater than or equal to min_input_switching_count. 3> The value of max_input_switching_count must be less than or equal to total number of bits in related_inputs

The following example shows an instance where this message occurs:

```
type(bus6) {
  base_type : array ;
  data_type : bit ;
  bit_width : 6 ;
  bit_from : 5 ;
  bit_to : 0 ;
  downto : true ;
}
cell (libdb804) {
  bus(sel) {
    bus_type : bus6 ;
    direction : input ;
    ...
  }
  bundle(C) {
    members(Cx, Cy, Cz);
    direction : input;
    ...
  }
 pin(A1) {
  direction : input;
 ...
   }
 pin(A2) {
  direction : input;
  ...
   }
 pin(A3) {
```

```
direction : input;
 ...
 }
...
power_cell_type : macro;
dynamic_current() {
  when : "A1";
  related_inputs : "Cx A3 Cy sel[0:3] A2";
  switching_group() {
    min_input_switching_count : 0;
    max_input_switching_count : 9;
    ...
  }
  switching_group() {
    min_input_switching_count : 8;
    max_input_switching_count : 6;
    ...
  }
}
...
```

In this case, total number of bits in related_inputs is 8, so the switching count we specified in min_input_switching_count and max_input_switching_count shall cover only from 1 up to 8. 0 in min_input_switching_count is not a valid number, and 9 in max_input_switching_count is not a valid number, either. In the second switching_group, min_input_switching_count is greater than max_input_switching_count, which is wrong.

The following is an example message:

```
Error Line 272, The value of min_input_switching_count is invalid.
 (LBDB-805)
Error Line 272, The value of max_input_switching_count is invalid.
 (LBDB-805)
```

What Next

Check the library source file, and make the necessary correction.

LBDB-806

(error) table_lookup is required model in ccs.

Description

The table_lookup is required delay_model for following ccs syntax forms :

ccs timing (driver and receiver), compact ccs timing, ccs noise, and ccs power

The message indicates that either there is no delay_model in your library or the delay_model you defined is not "table_lookup".

Feedback

The following example shows an instance where this message occurs:

```
library(libdb806) {
  ...
  cell(test_1) {
    pin(Z) {
      direction : output;
      timing() {
        compact_ccs_rise(template) {
          ....
        }
        compact_ccs_fall(template) {
          ....
        }
      }
    }
    ...
  }
  ...
}
```

In this case, ccs compact is defined but there is no delay_model specified, which is wrong. This is the fix to avoid the error message.

```
library(libdb806) {
  delay_model : table_lookup;
  ...
  cell(test_1) {
    ...
}
```

The following is an example message:

```
Error Line 272, table_lookup is required model in ccs. (LBDB-806)
```

What Next

Check the library source file, and make the necessary correction.

LBDB-807

(error) The power_down_function is not allowed in test_cell.

Description

The power_down_function attribute can not be specified under test_cell group.

The following example shows an instance where this message occurs:

```
cell(libdb807) {
  ...
    test_cell() {
```

```
      pin(QN) {
        direction : output;
        power_down_function : "!VDD + VSS";
        function : "IQN";
        signal_type : test_scan_out_inverted;
      }
    }
  ...
}
```

In this case, power_down_function attribute is defined under a test_cell, which is wrong. You can avoid the message by comment out power_down_function attribute.

The following is an example message:

```
Error Line 272, The power_down_function is not allowed in test_cell.
 (LBDB-807)
```

What Next

Check the library source file, and make the necessary correction.

LBDB-808

(error) The %s can't be specified if %s is not defined.

Description

The nominal tables must be specified if variation-aware tables are there. Meaning the following variation-aware tables can be specified only if the corresponding nominal tables are defined.

va tables : va_compact_ccs_rise , va_compact_ccs_fall va_receiver_capacitance1_rise , va_receiver_capacitance2_rise va_receiver_capacitance1_fall , va_receiver_capacitance2_fall va_rise_constraint, va_fall_constraint and va_leakage_current

corresponding nominal tables : compact_ccs_rise , compact_ccs_fall receiver_capacitance1_rise , receiver_capacitance2_rise receiver_capacitance1_fall , receiver_capacitance2_fall rise_constraint, fall_constraint and leakage_current

For the leakage_current, we need to consider when statement. Meaning that va_leakage_current can be defined only if leakage_current with the same state condition as what va_leakage_current has and it is defined within the same cell as where va_leakage_current is deinfed.

The same rule is applied to gate_leakage. The gate_leakage in va_leakage_current can't be specified if gate_leakage with same pin name is not defined in leakage_current, and both va_leakage_current and leakage_current are under the same state condition.

Feedback

The following example shows an instance where this message occurs:

```
pin(QN) {
   ...
   pin_based_variation() {
      va_parameters(var1, var2);
      nominal_va_values(10.0, 20.0);
      va_receiver_capacitance1_rise ( pinTB2INVXC_rise_1 ) {
        va_values(10.0, 21.0);
        values ( \
          "1.100, 1.100, 1.100");
      }
      ...
    }
  }
```

In this case, there is no receiver_capacitance specified within QN pin, so it is wrong to define va_receiver_capacitance1_rise table.

The following is the example message:

```
Error: Line 341, The va receiver cap can't be specified if nominal
 receiver cap is not defined. (LBDB-808)
```

The following example shows another instance where this message occurs:

```
leakage_current() {
     when : "B1";
     ...
   }
   leakage_current() {
     when : "C1";
     ...
   }
   leakage_current() {
     when : "D1";
     ...
   }
   leakage_current() { /* default */
     ...
   }
   cell_based_variation() {
      va_parameters(var1, var2);
      nominal_va_values(10.0, 20.0);
      va_leakage_current() {
        when : "A1";
        va_values(10.0, 21.0);
        ...
      }
      ...
    }
  }
```

Feedback

In this case, there is no "when statement" A1 in leakage_current, but "when : A1" is defined in va_leakage_current, which is wrong.

The following is an example message:

```
Error: Line 246, The va_leakage_current can't be specified if
 leakage_current with the same state condition is not defined.
 (LBDB-808)
```

The following example shows another instance where this message occurs:

```
leakage_current() {
     when : "A2";
     pg_current(V1) {
       value : 4.5;
     }
     pg_current(G1) {
       value : -4.5;
     }
     gate_leakage(A2) {
       input_high_value : 7.1;
     }
   }
   cell_based_variation() {
      va_parameters(var1);
      nominal_va_values(10.0);
      va_leakage_current() {
        when : "A2";
        va_values(11.0);
        pg_current(V1) {
          value : 4.5;
        }
        pg_current(G1) {
          value : -4.5;
        }
        gate_leakage(A1) {
         input_high_value : 9.3;
         input_low_value : -8.7;
        }
      }
      ...
    }
  }
```

The gate_leakage "A1" is defined under va_leakage_current, but it is not defined under leakage_current, where va_leakage_current and leakage_current have same state condition (when : "A2"). This violate the rule.

The following is the example message:

```
Error: Line 161, The gate_leakage in va_leakage_current can't be
 specified if gate_leakage in leakage_current is not defined.  (LBDB-808)
```

Feedback

What Next

Check the library source file, and make the necessary correction.

LBDB-809

(error) The left_id and right_id must be either defined in\n \tpairs or non-defined.

Description

The left_id and right_id are optoinal attributes for variation-aware compact table. If they are defined, then they must be defined in pairs.

The following example shows an instance where this message occurs:

```
library(libdb809) {
 ...
 compact_lut_template(va_test){
  variable_1 : input_net_transition ;
  variable_2 : total_output_net_capacitance ;
  variable_3 : curve_parameters;
  index_1 ( "5.236700e-02, 6.042500e-02, 8.710600e-02" ) ;
  index_2 ( "1.000000e-03, 1.511000e-03" ) ;
  index_3 ("init_current, peak_current, peak_voltage, peak_time,
 left_id");
  base_curves_group : "tt";
 }
 ...
   timing () {
     ...
      timing_based_variation() {
        va_parameters(var1, var2);
        nominal_va_values(10.0, 20.0);
        va_compact_ccs_rise(va_test) {
         va_values(10.0, 21.0);
         values ( \
            "0.01, 3.45, 3.20, 1.3, 1", "1.01, 2.45, 4.20, 2.3, 1",
 "2.01, 3.35, 5.20, 3.3, 1","3.01, 4.45, 6.20, 4.3, 1","4.01, 5.45, 7.20,
 5.3, 1", "6.01, 7.45, 8.20, 6.3, 1");
       }
     }
   ...
}
```

In this case, va_compact_ccs_rise is referring to a template, va_test, which has only left_id without right_id. This is wrong. To avoid the error message, you shall either remove left_id from the template or define right_id in the template.

The following is an example message:

```
Error: Line 813, The left_id and right_id must be either defined in
        pairs or non-defined. (LBDB-809)
```

Feedback

What Next

Check the library source file, and make the necessary correction.

LBDB-810

(error) The %s can't be empty.

Description

There must be at least one variable specified in va_parameters attribute.

The following example shows an instance where this message occurs:

```
pin_based_variation() {
        va_parameters();
        ...
    }
```

In this case, there is no value inside va_parameters, which is wrong. You can specified a list of variables in va_parameters(), and the list can't be empty.

The following is an example message:

```
Error: Line 1029, The va_parameters can't be empty. (LBDB-810)
```

What Next

Check the library source file, and make the necessary correction.

LBDB-811

(error) The %s must be defined before %s is defined.

Description

The va_parameters can be defined within library(), timing_based_variation(), pin_based_variation() or cell_based_variation() group.

The va_parameters is referred by nominal_va_values and va_values, and must be defined before nominal_va_values and va_values are defined.

The following example shows an instance where this message occurs:

```
library(libdb811) {
  ...
    pin_based_variation() {
        nominal_va_values(10.0, 20.0);
        ...
        va_receiver_capacitance1_rise ( pinTB2INVXC_rise_1 ) {
         va_values(10.0, 21.0);
```

Feedback

```
          values ( \
             "1.100, 1.100, 1.100");
          }
      }
    ...
    va_parameters(var1, var2);
}
```

In this case, there is no va_parameters attribute defined inside either library() or pin_based_variation() before nominal_va_values and va_values. To fix the problem, please move va_parameters(var1, var2) to the line above pin_based_variation().

```
library(libdb811) {
  va_parameters(var1, var2);
  ...
    pin_based_variation() {
        nominal_va_values(10.0, 20.0);
        ...
        va_receiver_capacitance1_rise ( pinTB2INVXC_rise_1 ) {
         va_values(10.0, 21.0);
         values ( \
            "1.100, 1.100, 1.100");
        }
    }
  ...
}
```

Or, you can move the va_parameters(var1, var2) to the line above nominal_va_values(10.0, 20.0).

```
library(libdb811) {
  ...
    pin_based_variation() {
        va_parameters(var1, var2);
        nominal_va_values(10.0, 20.0);
        ...
        va_receiver_capacitance1_rise ( pinTB2INVXC_rise_1 ) {
         va_values(10.0, 21.0);
         values ( \
            "1.100, 1.100, 1.100");
        }
    }
  ...
}
```

The following is an example message:

```
Error: Line 626, The va_parameters must be defined before
 nominal_va_values is defined. (LBDB-811)
Error: Line 638, The va_parameters must be defined before va_values is
 defined. (LBDB-811)
```

Feedback

What Next

Check the library source file, and make the necessary correction.

LBDB-812

(error) The size of %s and %s must be identical.

Description

When the above-mentioned attributes are specified, they must be of the same size.

This rule applies to:

1. receiver_capacitance_fall_threshold_pct and receiver_capacitance_rise_threshold_pct.
2. va_parameters, nominal_va_values, and va_values.

The following example shows an instance where this message occurs:

```
library(libdb821) {
  ..
  receiver_capacitance_rise_threshold_pct("0 50 60 70 80 90 100 ");
  receiver_capacitance_fall_threshold_pct("100 50 40 30 20 10 ");
  ...
}
```

The two attribtues are of different sizes (7 versus 6).

Examples

The following is an example message:

```
Error: Line 18, The size of receiver_capacitance_fall_threshold_pct and
 receiver_capacitance_rise_threshold_pct must be identical. (LBDB-812)
```

What Next

Check the library source file, and make the necessary correction.

LBDB-813

(error) The values in %s must be unique.

Description

This error message occurs when the specified variables in va_parameters are not unique or when the variable name in ff/latch/ff_bank/latch_bank is not unique.

Feedback

The following example shows an instance where this message occurs: The following example is incorrect, because there are 2 var2 entries in va_parameters:

```
va_parameters(var1, var2, var2, var4); i
```

This causes the following error message:

```
Error: Line 363, The values in va_parameters must be unique.
(LBDB-813)
```

In this example, the second and the third ff have the same variable name of IQ1, which is incorrect. All variable names in an ff group within a cell must be unique.

```
cell (LBDB-813) {
   ...
   ff ("IQ","IQN") {
          ...      }
   ff ("IQ1","IQN1") {
          ...      }
   ff ("IQ1","IQN2") {
          ...      }
   ...
}
```

This results in the following error message:

```
Error: Line 363, The values in ff/latch/ff_bank/latch_bank must
be unique.  (LBDB-813)
```

What Next

Check the library source file, and make the necessary correction.

LBDB-814

(error) The values in %s must be the same as defined values.

Description

The following predefined parameters can be specified in *va_parameters*:

- The parameters defined in default_operating_conditions, such as process, temperature, and voltage
- The voltage names defined in voltage_map

If these predefined parameters are specified in *va_parameters*, then the values defined in *nominal_va_values* must match the values of the predefined parameters.

Feedback

If both *default_operating_conditions* and *voltage_map* are defined, and *voltage* is defined in *va_parameters*, then Library Compiler considers *voltage* as a user-defined parameter, an exception to the rule.

What Next

Check the library source file, and make sure the values are correct.

In the following example, the predefined parameter *voltage* is specified in *va_parameters*, and the corresponding value in *nominal_va_values* is defined as 15.1. This value is incorrect because it will be the same value of 9.0 as defined in *default_operating_conditions*, WCCOM. For the *process* predefined parameter, 35.0 in *nominal_va_values* is incorrect, because it is not the same value of 1.5 as defined in *default_operating_conditions*.

```
library(libdb814) {
    operating_conditions(WCCOM) {
        process : 1.5 ;
        temperature : 45 ;
        voltage : 9.0 ;
        tree_type : "worst_case_tree" ;
    }
    default_operating_conditions : WCCOM;
    ...
      timing_based_variation() {
        va_parameters(voltage, var2, process, temperature);
        nominal_va_values(15.1, 25.0, 35.0, 45.0);
        ...
      }
    ...
}
```

In the example below, both *default_operating_conditions* and *voltage_map* are defined. The *voltage* is user-defined parameter, (not a predefined parameter), which means you can specify any voltage value in *nominal_va_values*. However, VDD is a predefined parameter in *voltage_map*. If you specified it in *va_parameters*, then the corresponding value of 10.0 in *nominal_va_values* will be the same as the value of 9.0 defined in *voltage_map*. The values are not the same, so the error message is generated.

```
library(libdb814) {
    ...
    voltage_map( VDD, 9.0);
    voltage_map(VDDH, 4.91);
    voltage_map(VDDL, 4.80);
    voltage_map(VSS, 0.0);

    operating_conditions(WCCOM) {
        process : 1.5 ;
        temperature : 45 ;
        voltage : 9.0 ;
        tree_type : "worst_case_tree" ;
```

Feedback

```
    }
    default_operating_conditions : WCCOM;
    ...
      timing_based_variation() {
        va_parameters(voltage, var2, VDD, temperature);
        nominal_va_values(15.1, 25.0, 10.0, 45.0);
        ...
      }
    ...
}
```

LBDB-815

(error) The number of %s in %s must be exactly twice the number of the values in va_parameters.

Description

This error message occurs when the number of variation tables does not equal twice the number of the values in *va_parameters*.

The following are the possible variation tables that you can specify under *pin_based_variation*:

```
va_receiver_capacitance1_rise
va_receiver_capacitance2_rise
va_receiver_capacitance1_fall
va_receiver_capacitance2_fall
```

in -25i

The following are the possible variation tables that you can specify under *timing_based_variation*:

```
va_receiver_capacitance1_rise
va_receiver_capacitance2_rise
va_receiver_capacitance1_fall
va_receiver_capacitance2_fall
va_rise_constraint
va_fall_constraint
va_compact_ccs_rise
va_compact_ccs_fall
```

The total number of these tables must be exactly twice number of values in *va_parameters*.

The following example shows an instance where this message occurs: In the following example, there are 5 *va_receiver_capacitance1_rise groups* under *timing_based_variation*. Since the size of va_parameters is 2, var1 and var2, the total number of *va_receiver_capacitance1_rise* groups will be 4 instead of 5.

Feedback

```
timing_based_variation() {
  va_parameters(var1, var2);
  nominal_va_values(15.0, 25.0);
  va_receiver_capacitance1_rise ( va_TB2INVXC_rise_1 ) {
    va_values(16.0, 25.0);
    values ( \
      "1.100, 1.100", "1.100, 1.100", "1.100, 1.100");
  }
  va_receiver_capacitance1_rise ( va_TB2INVXC_rise_1 ) {
    va_values(14.0, 25.0);
    values ( \
      "1.200, 1.200", "1.200, 1.200", "1.200, 1.200");
  }
  va_receiver_capacitance1_rise ( va_TB2INVXC_rise_1 ) {
    va_values(15.0, 26.0);
    values ( \
      "1.300, 1.300", "1.300, 1.300", "1.300, 1.300");
  }
  va_receiver_capacitance1_rise ( va_TB2INVXC_rise_1 ) {
    va_values(15.0, 24.0);
    values ( \
      "1.400, 1.400", "1.400, 1.400", "1.400, 1.400");
  }
  va_receiver_capacitance1_rise ( va_TB2INVXC_rise_1 ) {
    va_values(15.0, 23.0);
    values ( \
      "1.400, 1.400", "1.400, 1.400", "1.400, 1.400");
  }
 ...
```

What Next

Check the library source file, make the necessary corrections, and run the command again.

LBDB-816

(error) %s in this group and %s defined in %s\n \tshall have identical values on all but one.

Description

The values you specified in va_values and nominal_va_values must be identical except for one value.

The following example shows an instance where this message occurs:

```
pin_based_variation() {
  va_parameters(var1, var2, var3, var4);
  nominal_va_values(15.0, 25.0, 35.0, 45.0);
  va_receiver_capacitance1_rise ( pinTB2INVXC_rise_1 ) {
    va_values(15.0, 25.0, 35.0, 45.0);
    values ( \
```

```
      "1.100, 1.100, 1.100");
  }

  va_receiver_capacitance1_rise ( pinTB2INVXC_rise_1 ) {
    va_values(14.0, 25.0, 35.0, 45.0);
    values ( \
      "1.200, 1.200, 1.200");
  }

  va_receiver_capacitance1_rise ( pinTB2INVXC_rise_1 ) {
    va_values(15.0, 26.0, 36.0, 45.0);
    values ( \
      "1.300, 1.300, 1.300");
  }
   ...
```

In the first va_receiver_capacitance1_rise, all values in nominal_va_values and va_values are the same, which is wrong. There must be one value difference.

In the second va_receiver_capacitance1_rise, var1 has different value between va_values and nominal_va_values, which is okay.

In the third va_receiver_capacitance1_rise, var2 and var3 have different values between va_values and nominal_va_values, which is wrong. Only one value is allowed to be different.

The following is an example message:

```
Error: Line 381, va_values in this group and nominal_va_values defined in
 pin_based_variation
        shall have identical values on all but one.      (LBDB-816)
```

What Next

Check the library source file, and make the necessary correction.

LBDB-817

(error) For %s groups in %s, one characterization point\n \tis required and up to two points are allowed for each parameter.

Description

At least one characterization point is required for each parameter, and only up to two points are allowed. The value of characterization point must be different from the nominal value. If there are two points, then one must be greater than nominal value, and the other must be less than nominal value.

This rule also applies for all va_leakage_current groups under the same state condition.

Feedback

The following example shows an instance where this message occurs:

```
timing_based_variation() {
  va_parameters(var1, var2);
  nominal_va_values(15.0, 25.0);
  va_compact_ccs_rise(va_lut) {
     va_values(16.0, 25.0);
     values ( ... );
  }
  va_compact_ccs_rise(va_lut) {
     va_values(19.0, 25.0);
     values ( ... );
  }
  va_compact_ccs_rise(va_lut) {
     va_values(15.0, 26.0);
     values ( ... );
  }
  va_compact_ccs_rise(va_lut) {
     va_values(15.0, 24.0);
     values ( ... );
  }
  ...
}
```

For the parameter var1, there are two variations (19.0 and 16.0), and both of them are greater than nominal value 15.0, which is wrong.

The following example shows another instance where this message occurs:

```
timing_based_variation() {
        va_parameters(var1, var2);
        nominal_va_values(15.0, 25.0);
            va_rise_constraint(va_sup_hld) {
                va_values(16.0, 25.0);
                index_1(" 0.006, 0.04, 0.1, 0.2, 1");
                index_2(" 0.006, 0.04, 0.1, 0.2, 1");
                values( ...);
                }
            va_rise_constraint(va_sup_hld) {
                va_values(14.0, 25.0);
                index_1(" 0.006, 0.04, 0.1, 0.2, 1");
                index_2(" 0.006, 0.04, 0.1, 0.2, 1");
                values( ...);
                }
            va_rise_constraint(va_sup_hld) {
                va_values(16.0, 25.0);
                index_1(" 0.006, 0.04, 0.1, 0.2, 1");
                index_2(" 0.006, 0.04, 0.1, 0.2, 1");
                values( ...);
                }
           va_rise_constraint(va_sup_hld) {
                va_values(15.0, 24.0);
                index_1(" 0.006, 0.04, 0.1, 0.2, 1");
```

Feedback

```
                index_2(" 0.006, 0.04, 0.1, 0.2, 1");
                values( ...);
                }
        ...
```

For parameter var1, there are three variation values (16.0, 14.0 and 16.0 again). This is wrong because only up to 2 points are allowed. For parameter var2, there is only one variation value (24.0), which is okay.

The following example shows another instance where this message occurs:

```
cell_based_variation() {
        va_parameters(var1, var2);
        nominal_va_values(15.0, 25.0);
            va_leakage_current() {
                when : "A1";
                va_values(17.0, 25.0);
                 ...
                }
            va_leakage_current() {
                when : "A1";
                va_values(13.0, 25.0);
                 ...
                }
            va_leakage_current() {
                when : "!A1";
                va_values(17.0, 25.0);
                 ...
                }
            va_leakage_current() {
                when : "!A1";
                va_values(15.0, 29.0);
                 ...
                }
            va_leakage_current() {  /* default state */
                va_values(16.0, 25.0);
                 ...
                }
            va_leakage_current() {  /* default state */
                va_values(15.0, 26.0);
                 ...
                }
       } /* end of cell_based_variation */
         ...
```

Under the when statement "A1", there is no characterization point for var2, which is wrong, and var1 have two points (17.0 and 13.0), which are okay. For the cases with state condition "!A1" and without any state condition (default state), both are okay.

The following is an example message:

```
Error: Line 552, For va_rise_constraint groups in timing_based_variation,
 one characterization point
```

Feedback

```
        is required and up to two points are allowed for each parameter.
 (LBDB-817)
```

What Next

Check the library source file, and make the necessary correction.

LBDB-818

(error) At least, one of the variation-aware groups is absent.

Description

This message indicates that at least you are missing one of the variation-aware tables. Here is the rule : if both of nominal tables are defined, then either no variation-aware table is required or all variation-aware tablea are required. Meaning that if all nominal tables are defined, then you can't not just define partial of correspoding variation-aware tables.

The following example shows an instance where this message occurs:

```
timing() {
       ...
         fall_constraint(sup_hld) {
            index_1(" 0.006    ,  0.04     ,  0.1      ,  0.2      ,  1
     ");
            index_2(" 0.006    ,  0.04     ,  0.1      ,  0.2      ,  1
     ");
            values( ...
         }
         rise_constraint(sup_hld) {
            index_1(" 0.006    ,  0.04     ,  0.1      ,  0.2      ,  1
     ");
            index_2(" 0.006    ,  0.04     ,  0.1      ,  0.2      ,  1
     ");
            values( ...
         }
         timing_based_variation() {
         ...
            va_rise_constraint(va_sup_hld) {
              ...
              values( ...
         ...}
      ...}
 ,,,}
```

In this case, both nominal tables (fall_constraint and rise_constraint) are defined and only one of variation-aware tables (va_rise_constraint) is defined, which is wrong. To fix the problem, add va_fall_constraint:

```
timing() {
       ...
```

Feedback

```
      fall_constraint(sup_hld) {
         index_1(" 0.006    ,  0.04     ,  0.1      ,  0.2      ,  1
   ");
         index_2(" 0.006    ,  0.04     ,  0.1      ,  0.2      ,  1
   ");
         values( ...
      }
      rise_constraint(sup_hld) {
         index_1(" 0.006    ,  0.04     ,  0.1      ,  0.2      ,  1
   ");
         index_2(" 0.006    ,  0.04     ,  0.1      ,  0.2      ,  1
   ");
         values( ...
      }
      timing_based_variation() {
      ...
         va_rise_constraint(va_sup_hld) {
           ...
           values( ...
      ...}
         va_fall_constraint(va_sup_hld) {
           ...
           values( ...
      ...}

   ...}
...}
```

or remove va_rise_constraint from the timing arc :

```
timing() {
     ...
      fall_constraint(sup_hld) {
         index_1(" 0.006    ,  0.04     ,  0.1      ,  0.2      ,  1
   ");
         index_2(" 0.006    ,  0.04     ,  0.1      ,  0.2      ,  1
   ");
         values( ...
      }
      rise_constraint(sup_hld) {
         index_1(" 0.006    ,  0.04     ,  0.1      ,  0.2      ,  1
   ");
         index_2(" 0.006    ,  0.04     ,  0.1      ,  0.2      ,  1
   ");
         values( ...
      }
      timing_based_variation() {
      ...
   ...}
...}
```

Feedback

The following is an example message:

```
Error: Line 552 At least, one of the variation-aware groups is absent.
 (LBDB-818)
```

What Next

Check the library source file, and make the necessary correction.

LBDB-819

(warning) The %s %s is not present, so\n \taccuracy can be deteriorated.

Description

You will get the warning due to the following reason : - If CCS timing driver model is defined, then CCS timing receiver model is expected to be there, too.

The following example shows an instance where this message occurs:

```
...
    pin(I) {
      direction : input ;
      capacitance : 0.0014397 ;
      rise_capacitance : 0.0013000 ;
      fall_capacitance : 0.0012000 ;
    }
    pin(Z) {
      direction : output ;
      max_capacitance : 0.17890 ;
      function : "I" ;

      timing() {
        related_pin : "I" ;
        timing_sense : positive_unate ;
        cell_rise(delay_template_7x7) {
          ...
        }
        rise_transition(delay_template_7x7) {
          ...
        }
        cell_fall(delay_template_7x7) {
                  ...
        }
        fall_transition(delay_template_7x7) {
                   ...
        }
        output_current_fall() {
           ...
        }
        output_current_rise() {
           ...
```

```
        }
        ...
      }
    ...
```

In this case, ccs receiver data for pin 'I' is expected because ccs driver model is defined.

The following is an example message:

```
Warning: Line 3186, The CCS receiver data is not present, so
        accuracy can be deteriorated. (LBDB-819)
```

What Next

Check the library source file, and make the necessary correction.

LBDB-819e

(error) The %s %s is not present, so\n \taccuracy can be deteriorated.

Description

If CCS timing driver model is defined, then CCS timing receiver model is expected to be there, too. If both pin-based and arc-based receiver model is missing for the pin in a CCS library, you will get this error.

The following example shows an instance where this message occurs:

```
...
    pin(I) {
      direction : input ;
      capacitance : 0.0014397 ;
      rise_capacitance : 0.0013000 ;
      fall_capacitance : 0.0012000 ;
    }
    pin(Z) {
      direction : output ;
      max_capacitance : 0.17890 ;
      function : "I" ;

      timing() {
        related_pin : "I" ;
        timing_sense : positive_unate ;
        cell_rise(delay_template_7x7) {
          ...
        }
        rise_transition(delay_template_7x7) {
          ...
        }
        cell_fall(delay_template_7x7) {
                  ...
        }
```

```
        fall_transition(delay_template_7x7) {
                  ...
        }
        output_current_fall() {
           ...
        }
        output_current_rise() {
           ...
        }
        ...
      }
    ...
```

In this case, ccs receiver data for pin 'I' is expected because ccs driver model is defined.

The following is an example message:

```
Warning: Line 3186, The CCS receiver data is not present, so
        accuracy can be deteriorated. (LBDB-819e)
```

What Next

Check the library source file, and add the missing receiver model.

LBDB-820

(error) The %s is preferred pg type.

Description

If the cell is an always_on cell, then for all signal pins, the backup_power is preferred pg_type that related_power_pin shall refer to, and backup_ground is preferred pg_type that related_ground_pin shall refer to.

The following example shows an instance where this message occurs:

```
cell(test) {
   always_on : TRUE;
   pg_pin(PWR) {
   voltage_name : VDD;
   pg_type : primary_power;
   }
   pg_pin(GND) {
   voltage_name : VSS;
   pg_type : primary_ground;
   }
   pg_pin(GND1) {
   voltage_name : VSS1;
   pg_type : backup_ground;
   }
   pg_pin(VDDI) {
   voltage_name : VDDH;
```

Feedback

```
    pg_type : backup_power;
    }
    ...
    pin(A1) {
         always_on : TRUE;
         direction : input;
         related_power_pin : PWR;
         related_ground_pin : GND1;
       ...
    }
    pin(A2) {
         direction : input;
         related_power_pin : VDDI;
         related_ground_pin : GND;
      ...
    }
    ...
}
```

For the always_on pin, A1 , the related_power_pin is pointing to PWR, which is not backup_power. For the non always_on pin, A2, the related_ground_pin is pointing to GND, which is not backup_ground either. Both of them shall connect to backup PG.

The following is an example message:

```
Error: Line 335, The backup_power is preferred pg type. (LBDB-820)
Error: Line 385, The backup_ground is preferred pg type. (LBDB-820)
```

What Next

Check the library source file, and make the necessary correction.

LBDB-821

(error) The always_on pin is required for always_on cells.

Description

An always_on cell requires at least one or more always_on pin under it.

The following example shows an instance where this message occurs:

```
cell(test) {
    always_on : TRUE;
    ...
    pin(sp) {
         direction : input;
         related_power_pin : PWR;
         related_ground_pin : GND;
       ...
    }
    pin(a) {
```

```
        ...
    }
    ...
}
```

Since 'test' cell is an always_on cell, the always_on attribute is required to be specified at least in one of pins under 'test' cell.

The following is an example message:

```
Error: Line 1548, The always_on pin is required for always_on cells.
 (LBDB-821)
```

What Next

Check the library source file, and make the necessary correction.

LBDB-822

(error) A pin can only has either non-programmable or\n \tprogrammable driver types.

Description

Under a pin, there can only be either non-programmable driver type or programmable driver types, but not both.

The following example shows an instance where this message occurs:

```
pin(ZN) {
  direction : inout;
  pull_up_function : "!A1 * !A2 * !A3";
  pull_down_function : "A1 * A2 * !A3";
  bus_hold_function : "A1 * !A2 * !A3";
  driver_type : pull_up;
  ...
 }
```

In pin ZN, there are three programmable driver types, pull_up_function, bus_hold_function, and pull_down_function. Also, the non-programmable driver type, "driver_type : pull_up", is defined under the same pin, which is wrong. Please remove either programmable driver types or non-programmable driver type from the pin.

The following is an example message:

```
Error: Line 104, A pin can only has either non-programmable or
        programmable driver types. (LBDB-822)
```

What Next

Check the library source file, and make the necessary correction.

Feedback

LBDB-823

(information) The %s %s is not present, so\n \taccuracy can be deteriorated.

Description

You will get the message due to one of following reasons : - ccs model is expected to be defined to improve the data accuracy.

The following example shows an instance where this message occurs:

```
...
      timing() {
        related_pin : "I" ;
        timing_sense : positive_unate ;
        cell_rise(delay_template_7x7) {
          ...
        }
        rise_transition(delay_template_7x7) {
          ...
        }
        cell_fall(delay_template_7x7) {
                  ...
        }
        fall_transition(delay_template_7x7) {
                   ...
        }
        ...
      }
```

In this case, there is no ccs timing model but NLDM, and we expected ccs timing models for better accuracy.

The following is an example message:

```
Information: Line 582, The CCS data output_current_rise is not present,
 so
        accuracy can be deteriorated. (LBDB-823)
Information: Line 582, The CCS data output_current_fall is not present,
 so
        accuracy can be deteriorated. (LBDB-823)
```

What Next

Check the library source file, and make the necessary correction.

LBDB-824

(error) This static '%s' group cannot be specified in a '%s' group at line %u.

Feedback

Description

This message indicates that a static ccsn_*_stage or input/output_ccb group has been specified in a timing arc or input/internal pin. This is not allowed.

A static CCS/CCB noise model captures the behaviors of a static channel connected block. A static channel connected block does not have any input terminal or the voltage level at the input terminal does not affect the output current of the block. It cannot be used for propagating crosstalk delay or noise waveforms through the cell under study. Consequently, the only use for a static noise model is for a tie-off pin that is permanently 0 or 1. Please refer to "CCS Noise Library Characterization Guide" for detailed information.

The following is an example message:

```
Error: Line 27, The 'timing' group cannot specify a static
 'ccsn_first_stage' group. (LBDB-824)
```

What Next

Replace the aforementioned data with a non-static ccsn_*_stage or *_ccb group.

LBDB-826

(error) The %s entry cannot be found for %s(%s) of cell(%s).

Description

This message indicates that you do not specify the relative entry in the map file required by add_pg_pin_to_db command.

The following example shows an instance where this message occurs:

The following is an example message:

```
Error: The pg_to_voltage_map entry cannot be found for pg_pin(VDD) of
 cell(sample). (LBDB-826)
```

LBDB-826w

(warning) The %s entry cannot be found for %s(%s) of cell(%s).

Description

This warning message occurs when there is no related entry for *pg_pin*, *rail_connection*, or other attributes specified in the map file required by the *add_pg_pin_to_db* command.

The following example shows an instance where this message occurs:

The following is an example message:

```
Warning: The pg_to_voltage_map entry cannot be found for pg_pin(VDD) of
 cell(sample). (LBDB-826w)
```

What Next

This is only a warning message. No action is required.

However, you can eliminate this warning message by adding the required entry to the map file.

LBDB-827

(error) The input library '%s' has not been read in.

Description

This message indicates that the input library has not been read in.

The following example shows an instance where this message occurs:

The following is an example message:

```
Error: The input library 'a.db' has not been read in. (LBDB-827)
```

LBDB-828

(error) The input library '%s' is pg_pin-based library.

Description

This message indicates that the input library is pg_pin-based.

The following example shows an instance where this message occurs:

The following is an example message:

```
Error: The input library 'a.db' is pg_pin-based library. (LBDB-828)
```

What Next

The input library is already pg_pin based, and no need to be converted by the utility. However, if you want to add or update the library with pg or power management attributes, you should specify a tcl file with update_lib_model and associated commands.

Feedback

LBDB-828w

(warning) The input library '%s' is pg_pin-based library.

Description

This message indicates that the input library is pg_pin-based.

The following example shows an instance where this message occurs:

The following is an example message:

```
Warning: The input library 'a.db' is pg_pin-based library. (LBDB-828w)
```

What Next

The input library is already pg_pin based, and only incremental update will be performed.

LBDB-829

(error) The input library '%s' does not have default operating_conditions.

Description

This message indicates that the input library does not have default operating_conditions.

The following example shows an instance where this message occurs:

The following is an example message:

```
Error:  The input library 'A.db' does not have default
 operating_conditions. (LBDB-829)
```

LBDB-830

(error) The input library '%s' does not have 'voltage' attribute in the default operating_conditions '%s'.

Description

This message indicates that the input library does not have default operating_conditions.

The following example shows an instance where this message occurs:

The following is an example message:

```
Error:  The input library 'A.db' does not have 'voltage' attribute  in
 trhe default operating_conditions 'nom_pvt'. (LBDB-830)
```

Feedback

LBDB-831

(error) The converted voltage_map table is empty.

Description

This message indicates that converted voltage_map table is empty.

The following example shows an instance where this message occurs:

The following is an example message:

```
Error:  The converted voltage_map table is empty. (LBDB-831)
```

LBDB-832

(error) The number of pg_pin's generated for cell(%s) is %d, which is less than 2.

Description

This message indicates that the number of generated pg_pin's for the cell is less than the required minimum value (2).

The following example shows an instance where this message occurs:

The following is an example message:

```
Error:  The number of pg_pin's generated for cell(A) is 1, which is less
 than 2. (LBDB-832)
```

LBDB-833

(error) The related_pg_pin for %s %s power_level(%s) of cell(%s) cannot be found.

Description

This message indicates that the related_pg_pin entry cannot be found for internal_power/ leakage_power group.

The following example shows an instance where this message occurs:

The following is an example message:

```
Error:  The related_pg_pin for cell-level internal_power power_level(VDD)
 of cell(A). (LBDB-833)
```

LBDB-834

(error) The related_pg_pin for %s %s of cell(%s) cannot be found.

Feedback

Description

This message indicates that the related_pg_pin entry cannot be found for internal_power/ leakage_power group.

The following example shows an instance where this message occurs:

The following is an example message:

```
Error:  The related_pg_pin for cell-level internal_power of cell(A).
 (LBDB-834)
```

LBDB-835

(error) For cell(%s), the %s(%s) which is the %s of pin(%s) cannot be found.

Description

This message indicates that you do not specify the power/ground pg_pin of a cell in the map file required by add_pg_pin_to_db command.

The following example shows an instance where this message occurs:

The following is an example message:

```
Error: For cell(sample), the pg_pin(VDD) which is the related_power_pin
 of pin(A) cannot be found. (LBDB-835)
```

LBDB-836

(warning) Unable to convert to %s from pin(%s) of cell(%s).

Description

This message indicates that add_pg_pin_to_db or update_lib_model command cannot 1) convert to pg_pin from the signal pin. In the following cases, it cannot be converted to pg_pin: a) pin(VDD) with timing, internal_power, ccsn_first_stage/ccsn_last_stage or receiver_capacitance group, where VDD is a PG pin in FRAM view. b) pin(VDD) referenced in function/statetable expressions in the cell. c) pin(VDD) referenced in the when or related_pin of the other pin's internal_power groups or when in other pin's ccsn_first_stage, ccsn_last_stage or receiver_capacitance groups or leakage_power, dynamic_current, leakage_current or intrinsic_parasitic groups in the cell. 2) generate related_power_pin/related_ground_pin for the specfied signal pin.

The following example shows an instance where this message occurs:

The following is an example message:

```
Warning: Unable to convert to pg_pin from pin(VDD) of cell(r1hd).
 (LBDB-836)
```

What Next

You can correct the pin group as described above. For example, if pin(VDD) has ccsn_first_stage group and you deem it is a pg_pin, you should remove the group under the pin to make the conversion. However, if it is an analog pin, you should not remove such a group and no conversion to pg_pin will be performed.

LBDB-837

(error) The %s for pin(%s) of cell(%s) cannot be found.

Description

This message indicates that the related_power_pin/related_ground_pin cannot be found for the specified pin.

The following example shows an instance where this message occurs:

The following is an example message:

```
Error:  The related_power_pin for pin(A) of cell(sample) cannot be found.
 (LBDB-837)
```

LBDB-838

(error) Failed to find the file name for %s option.

Description

In add_pg_pin_to_db command, some options have dependency and requirement. (1) An output db file name must be specified in -output option and must be different from the input db file. (2) If -mw_library_name is not specified, -pg_map_file must be specified, and vice versa. (3) If the Milkyway library does not cover all cells in db, -pg_map_file must be specified. (4) the map file name must be valid and exists in disk.

The following example shows an instance where this message occurs:

```
add_pg_pin_to_db input.db -output pg_pin.db
```

In this case, neither -pg_map_file nor -mw_library_name is specified. You will get the second error message in the following example.

The following is an example message:

```
Error: Failed to find the file name for -output option. (LBDB-838)
Error: Failed to find the file name for either -pg_map_file or
 -mw_library_name. (LBDB-838)
Error: Failed to find the file name for -pg_map_file option. (LBDB-838)
```

Feedback

What Next

Check the options to this command, and specify all the necessary ones.

LBDB-839

(warning) Partial Milkyway library for the input library file.

Description

In add_pg_pin_to_db command, when you specify -mw_library_name and the Milkyway library does not cover all cells in the input db, this warning will occur. This includes missing cells, as well as missing and mismatched pins. This is shown after check_library command is invoked under the hood, and you will also see Logic vs. physical library check summary: Number of cells missing in logic library: <number of missing cells>

The following example shows an instance where this message occurs:

```
add_pg_pin_to_db input.db -mw_library_name mwlib -pg_map_file pg.map
 -output pg_pin.db

In this case, Milkyway library mwlib does not cover all cells in
 input.db.
You will get the second error message in the following example.
```

The following is an example message:

```
Logic vs. physical library check summary:
Number of cells missing in logic library:       23
Logic library is INCONSISTENT with physical library.
Warning: Partial Milkyway library for the input library file. (LBDB-839)
```

What Next

First you need to check if the Milkyway library you specified is the correct one. Otherwise, you should specify mapping in the map file for those cells that do not exist or exist but have missing or mismatched pins in the Milkyway library. Otherwise, later checking in the flow will find such cells are not specified in the map file and pg_pin based db will not be generated. If you want to get a list of the missing cells and/or missing and mismatched pins, run check_library command for logic vs. physical library cross checking with default options. You do not need to use set_check_library_options command to set options. You only need to specify logic and Milkyway library names in check_library command.

LBDB-840

(warning) No %s found in map file.

Feedback

Description

In the map file, if any of the following occurs: (1) No BEGIN <section_name> or END <section_name> (2) incorrect <section_name> (3) incorrect key words in title line this message will be printed out. Valid section names include: PG_PIN_MAP PG_TO_VOLTAGE_MAP VOLTAGE_MAP POWER_DOWN_FUNCTION_MAP

Key words in title line include: (1) PG_TO_VOLTAGE_MAP section cell, pg_pin, voltage_name, pg_type and direction where key word direction is optional. (2) PG_PIN_MAP section cell, pin, rail_connection and pg_pin (3) VOLTAGE_MAP section voltage_name and voltage_value (4) POWER_DOWN_FUNCTION_MAP cell, pin and power_down_function

The key words in each title line should be in the above order and delimited by Tab or space(s). Invalid record will be ignored. If BEGIN or END section line or title line is missing, the whole section will be ignored. In the map file, the following lines are legal but will be ignored: (1) a comment line starting with # is a comment line and (2) a blank line

The following example shows an instance where this message occurs:

```
BEGIN PG_TO_VOLTAGE_MAP
cell            pg_pin          voltage_name    pg_type
ADDFHX1         VDD             VDD             power
ADDFHX1         VSS             VSS             primary_ground
END PG_TO_VOLTAGE_MAP
```

The following is an example message:

```
Warning: Line 14, No END section found in map file. (LBDB-840)
Warning: Line 20, No BEGIN section found in map file. (LBDB-840)
Warning: Line 44, No title line found in map file. (LBDB-840)
```

What Next

You should correct the syntax errors in the map file.

LBDB-841

(error) Failed to read input library '%s'.

Description

This message occurs when one or more of the following exist: 1) the input library file does not exist 2) the file cannot open for read 3) the library is not a valid technology library 4) the library file cannot compile. 5) .lib file loaded by read_db

The following example shows an instance where this message occurs:

The following is an example message:

```
Error: Failed to read input library 'rail.db'. (LBDB-841)
```

What Next

Check for the input library file name and location to make sure it exists with read permission. If it does, check if the input library is a valid technology library. If the library cannot compile, please check the Error messages during compilation, and correct them.

LBDB-842

(warning) Number of rail_connections %d for cell '%s' is not equivalent to number of power pins %d in %s.

Description

In cell group in db, rail_connection is used to specify power rails, not ground or internal pins. Therefore, if a rail_connection is for ground, such as VSS in the following example, the rail_connection is not valid.

The following example shows an instance where this message occurs:

```
cell (test) {
        rail_connection(VDD, VDD);
        rail_connection(VDD_AUX, VDD1);
        rail_connection(VSS, VSS);
        ...
    }

    In Milkyway library, cell test has VDD and VSS, but no VDD1.
```

The following is an example message:

```
Warning: Number of rail_connections 3 for cell 'test' is not equivalent
 to number of power pins 1 in Milkyway. (LBDB-842)
```

What Next

If you have more rail_connections in db than power pins in Milkyway or map file, check if the extra rail is proper or not. If not, you should remove it from db. Otherwise, there is mismatch between db and Milkyway (or map file if the cell is from map file) and the command will stop conversion for a new pg_pin db.

LBDB-843

(error) %s cell '%s' does not have %s pg_pins.

Feedback

Description

Each cell with NLDM, CCS-T and CCS-N has at least 2 pg_pins (1 power and 1 ground) while a load or pull_up (tieoff high) or pull_down (tieoff low) cell has at least one pg_pin as documented in LC manual. Further, a pull_up cell should have a power pg_pin while a pull_down cell should have a ground pg_pin.

The following example shows an instance where this message occurs:

```
BEGIN PG_TO_VOLTAGE_MAP
cell            pg_pin          voltage_name    pg_type
tieoff_pullup   VDD             VDD             primary_power
tieoff_pulldown VSS             VSS             primary_power
END PG_TO_VOLTAGE_MAP
where tieoff_pulldown cell does not have a ground pg_pin.
```

The following is an example message:

```
Error: Tieoff cell 'tieoff_pulldown' does not have ground pg_pins.
 (LBDB-843)
Error: cell 'ADDFHX4' pin 'A' does not have related_power pg_pins.
 (LBDB-843)
```

What Next

Check and specify the correct pg_pin in the map file: 1) for a cell with NLDM, CCS-T and CCS-N, check if there are at least 1 power and 1 ground pg_pin's, and 1 power and 1 ground pg_pin's for each signal pin. 2) for a load cell, check if there are at least 1 pg_pin 3) for a pull_up cell, check if there is 1 power pg_pin 4) for a pull_down cell, check if there is 1 ground pg_pin

---

LBDB-843w

(warning) %s cell '%s' does not have %s pg_pins.

Description

Each cell with NLDM, CCS-T and CCS-N has at least 2 pg_pins (1 power and 1 ground) while a load or pull_up (tieoff high) or pull_down (tieoff low) cell has at least one pg_pin as documented in LC manual. Further, a pull_up cell should have a power pg_pin while a pull_down cell should have a ground pg_pin.

The following example shows an instance where this message occurs:

```
BEGIN PG_TO_VOLTAGE_MAP
cell            pg_pin          voltage_name    pg_type
tieoff_pullup   VDD             VDD             primary_power
tieoff_pulldown VSS             VSS             primary_power
END PG_TO_VOLTAGE_MAP
where tieoff_pulldown cell does not have a ground pg_pin.
```

The following is an example message:

```
Warning: Tieoff cell 'tieoff_pulldown' does not have ground pg_pins.
 (LBDB-843w)
```

What Next

Check and specify the correct pg_pin in the map file: 1) for a cell with NLDM, CCS-T and CCS-N, check if there are at least 1 power and 1 ground pg_pin's, and 1 power and 1 ground pg_pin's for each signal pin. 2) for a load cell, check if there are at least 1 pg_pin 3) for a pull_up cell, check if there is 1 power pg_pin 4) for a pull_down cell, check if there is 1 ground pg_pin

---

LBDB-844

(warning) %s '%s' does not exist in input db. Remove it from map.

Description

When a cell and/or pin specified in the map file does not exist in the input db, it will be ignored and removed from the map. The cell may come from the map file or Milkyway. If it comes from Milkyway, no line number is printed out.

The following example shows an instance where this message occurs:

The following is an example message:

```
Warning: Line 24, Cell 'test' does not exist in input db. Remove it from
 map. (LBDB-844)
```

What Next

Check if the cell and/or pin is what you want. If so, you need to check the input db for the missing cell. Otherwise, ignore it or remove it from the map file.

LBDB-845

(error) %s '%s' is missing in %s.

Description

This error message occurs when a .db cell and/or pin is missing in the map file or its Milkyway library.

The following is an example message:

```
Error: Cell 'test' is missing in map file. (LBDB-845)
Error:  'Map data or FRAM' is missing in input. (LBDB-845)
```

Feedback

What Next

Add the mapping in the map file or specify the correct Milkyway library for the missing cells to generate a complete pg_pin based .db file. You can use the * (asterisk) wildcard character for all cells that are not explicitly specified in the map file. For dirty flow and on-the-fly PG library updates, input either Milkyway library or map data for non-rail_based .dbs. In the case of incremental updates to a PG library, specify a map file or a Tcl file for maps.

LBDB-845w

(warning) %s '%s' is missing in %s.

Description

If a power management attribute is missing in the cell, this message will occur. If a db cell and/or pin is missing in the map file or its Milkyway library, this message will be printed out. You need to add its mapping in the map file to generate a complete pg_pin based db file.

The following example shows an instance where this message occurs:

The following is an example message:

```
Warning: Cell 'LS16FROM16TO20' 'level_shifter_type' is missing in
 library'. (LBDB-845w)
```

What Next

You need to add the missing attribute for power management cells; otherwise, the cells will not be used for UPF. You need to add the mapping in the map file or specify the correct Milkyway library for the missing cells to generate a complete pg_pin based db file. You can use wild card "*" for all the cells that are not explicitly specified in the map file.

LBDB-846

(warning) Cell '%s' has %d %s pins in Milkyway library.

Description

If a cell has multiple power or ground pins in Milkyway and db, you should specify related_power_pin and related_ground_pin for its signal pins.

The following example shows an instance where this message occurs:

```
BEGIN PG_PIN_MAP
cell    pin rail_connection pg_pin
test    LSI VDD             VDD
test    LSO VDD_AUX         VDD_AUX
```

```
test    LSI -               VSS
test    LSO -               VSS
END PG_PIN_MAP
where cell test has 2 power pins: VDD and VDD_AUX.
```

The following is an example message:

```
Warning: Cell 'test' has 2 power pins in Milkyway library. (LBDB-846)
```

What Next

Check PG_PIN_MAP section in the map file to see if related_power_pin and related_ground_pin's are specified for these cells that have multiple P/G pins. This is only a warning message. In the flow that follows this message, there are other checkings that will catch error if you did not specify related_power_pin and related_ground_pin for these cells.

LBDB-847

(error) Too many values (%d) specified in the table.

Description

This message indicates that there are too many values specified in the table. (number = index1_size * index2_size [* index3_size] [*index4_size]). The number exceed the limit (32767) that Library Compiler current handles.

The following is an example message:

```
Error: Line 307, Too many values (45000) specified in the table.
 (LBDB-847)
```

What Next

Split the table, to make each table's size less than the limit.

LBDB-848

(error) There is no '%s' %s defined for '%s' %s.

Description

This message indicates the library does not define the voltage_map for the voltage_name specified in a pg_pin, or input_signal_level/output_signal_level defined in a pin, or the active state of pg pin/pg setting in pg_setting_value group.

The following example shows an instance where this message occurs:

```
voltage_map(VDD, 1.08);
      voltage_map(VDD1, 1.1);
```

Feedback

```
      voltage_map(VSS, 0.0);

        ...
      cell(sample) {
        pg_pin(VDD) {
                voltage_name : VDD2;
                ...
        }
        ...
      }
      ...
```

In this case, there is no voltage_map defined for voltage_name VDD2. To fix the problem, add the voltage_map attribute for VDD2 at the library level:

```
voltage_map(VDD, 1.08);
      voltage_map(VDD1, 1.1);
      voltage_map(VDD2, 1.2);
      voltage_map(VSS, 0);

        ...
      cell(sample) {
        pg_pin(VDD) {
                voltage_name : VDD2;
                ...
        }
        ...
      }
      ...
```

The following is an example message:

```
Error: Line 23, There is no 'VDD2' voltage_map defined for 'VDD2'
 voltage_name. (LBDB-848)
```

What Next

Add the missing voltage_map.

LBDB-848w

(warning) There is no '%s' %s defined for '%s' %s.

Description

This message indicates the library does not define the voltage_map for the voltage_name specified in a pg_pin, or input_signal_level/output_signal_level defined in a pin, or the active state of pg pin/pg setting in pg_setting_value group.

Feedback

The following example shows an instance where this message occurs:

```
voltage_map(VDD, 1.08);
      voltage_map(VDD1, 1.1);
      voltage_map(VSS, 0.0);

        ...
      cell(sample) {
        pg_pin(VDD) {
                voltage_name : VDD2;
                ...
        }
        ...
      }
      ...
```

In this case, there is no voltage_map defined for voltage_name VDD2. To fix the problem, add the voltage_map attribute for VDD2 at the library level:

```
voltage_map(VDD, 1.08);
      voltage_map(VDD1, 1.1);
      voltage_map(VDD2, 1.2);
      voltage_map(VSS, 0);

        ...
      cell(sample) {
        pg_pin(VDD) {
                voltage_name : VDD2;
                ...
        }
        ...
      }
      ...
```

The following is an example message:

```
Warning: Line 23, There is no 'VDD2' voltage_map defined for 'VDD2'
 voltage_name. (LBDB-848w)
```

What Next

Add the missing voltage_map.

LBDB-849

(warning) The '%s' group is overwritten by the '%s' group on line %d.

Description

The same group has been defined multiple times and only the last one will be recoded in the library db.

Feedback

The following example shows an instance where this message occurs:

The following is an example message:

```
Warning: The 'dc_current' group is overwritten by the 'dc_current' group
 on line 120. (LBDB-849)
```

What Next

Check the dc_current groups for wrong information and fix.

LBDB-850

(warning) Missing %s value under section %s in map file.

Description

If data entered in map file is incomplete, this message will be printed out. In PG_TO_VOLTAGE_MAP section, there are four fields: cell, pg_pin, pg_type and voltage_name. If one or more fields are left blank, you will see missing data in this section. The same is true for other sections. In VOLTAGE_MAP, for multi-rail library you should specify voltage_map entry with voltage_value = 0. Invalid record will be ignored. In POWER_DOWN_FUNCTION_MAP, if power_down_function values are missing for some cell/pins, the default values !VDD1+!VDD2+...+VSS1+VSS2 will be used where VDDi and VSSi are pg_pins of the cell.

The following example shows an instance where this message occurs:

```
BEGIN PG_TO_VOLTAGE_MAP
cell            pg_pin          voltage_name    pg_type
ADDFHX1         VDD             VDD
ADDFHX1         VSS             VSS             primary_ground
END PG_TO_VOLTAGE_MAP
```

The following is an example message:

```
Warning: Line 14, Missing pg_type value under section PG_TO_VOLTAGE_MAP
 in map file. (LBDB-850)
Warning: Line 20, Missing voltage value under section VOLTAGE_MAP in map
 file. (LBDB-850)
```

What Next

You should enter values for each field in the map file. Do not leave blank in any field except optional direction field in PG_TO_VOLTAGE_MAP section.

LBDB-851

(error) %s section %s in map file.

Feedback

Description

If the whole map section is missing (neither in map file nor derivable) or no pg_pins are available, this message will be printed out. For single-rail library, only PG_TO_VOLTAGE_MAP is required if no Milkyway library. If there is complete Milkyway library to cover all the cells in the input db, no map file is required. In this case, VOLTAGE_MAP will be derived from the input db that includes one voltage_map for nominal voltage and the other one for ground (voltage value = 0). For multi-rail library, PG_PIN_MAP, PG_TO_VOLTAGE_MAP, VOLTAGE_MAP and POWER_DOWN_FUNCTION_MAP sections are all required. If there are rail_connection's, PG_PIN_MAP is required in any case. Please note that invalid entries in the map section are ignored and removed. So even though these entries exist in the map section, the final map table may not include such entries. If pg_pins defined in FRAM have the same name pins in db as signal pins and these pins are unable to be converted to pg_pins due to complexity of these pins such as having timing, noise or power groups, most likely analog pins, they will stay as signal pins in db and no pg_pins of the same names are added.

The following example shows an instance where this message occurs:

```
BEGIN PG_TO_VOLTAGE_MAP
cell    pg_pin  voltage_name    pg_type
*       VDD     VDD             primary_power
*       VSS     VSS             primary_ground
*       VSS1    VSS1            backup_ground
END PG_TO_VOLTAGE_MAP
BEGIN POWER_DOWN_FUNCTION_MAP
cell    pin     power_down_function
test    test    VSS
*       *       !VDD+VSS+VSS1
END POWER_DOWN_FUNCTION_MAP
```

The following is an example message:

```
Error: Missing section PG_PIN_MAP in map file. (LBDB-851)
Error: Missing section VOLTAGE_MAP in map file. (LBDB-851)
```

What Next

Enter the missing section. For multi-rail library, specify all the four map sections with complete data. You can use "*" in cell and/or pin fields for all the others that are not listed in the map section. For single-rail library, specify at least PG_TO_VOLTAGE_MAP section with complete pg_pin, voltage_name and pg_type for each cell. Otherwise, check if those complex pins are analog pins or pg_pins. If pg_pins, remove the defined groups or attributes that make the pins complex so that they can be converted to pg_pins.

Feedback

LBDB-852

(error) %s found in %s is missing in %s.

Description

This message occurs during cross checking of map sections. (1) PG_PIN_MAP and PG_TO_VOLTAGE_MAP It is two-way checking. It is to check consistency of pg_pin associated with a cell between the two map sections. If a pg_pin for a cell exists in one map section but either the pg_pin or cell is missing in the other section, you will see this message. (2) PG_PIN_MAP and POWER_DOWN_FUNCTION_MAP It is to check signal pin consistency between the two sections. If a pin for a cell exists in POWER_DOWN_FUNCTION_MAP but is missing in PG_PIN_MAP, you will see this message. This checking is for multi-rail library. (3) PG_TO_VOLTAGE_MAP and VOLTAGE_MAP It is to check voltage_name consistency between the two sections. If the voltage_name for the nominal voltage is specified in VOLTAGE_MAP but is missing in PG_TO_VOLTAGE_MAP, you will see a message saying so. Please also refer to LBDB-854. In VOLTAGE_MAP, you can have more entries than necessary.

The following example shows an instance where this message occurs:

```
BEGIN PG_PIN_MAP
cell    pin rail_connection pg_pin
ADDFHX1 A       -   VSS
ADDFHX1 A       -   VDD
ADDFHX1 A       -   VDD1
END PG_PIN_MAP
BEGIN PG_TO_VOLTAGE_MAP
cell    pg_pin  voltage_name    pg_type
ADDFHX1 VDD     VDD primary_power
ADDFHX1 VSS     VSS primary_ground
END PG_TO_VOLTAGE_MAP
```

The following is an example message:

```
Error: Line 14, Cell 'test' pg_pin 'VDD1' found in PG_PIN_MAP is missing
 in PG_TO_VOLTAGE_MAP. (LBDB-852)
```

What Next

Check if the missing data (cell, pg_pin or pin) is what is required in the map section or extra data in the section where it exists. In the following example, if it is a multi-rail library and pg_pin VDD1 is what you should need in the library, you should list its entry in PG_TO_VOLTAGE_MAP, in the form of ADDFHX1 VDD1 VDD1 backup_power Otherwise, if it is a single-rail library, you should remove the entry for VDD1 from PG_PIN_MAP.

Feedback

LBDB-853

(warning) Voltage value %g for voltage_name '%s' is replaced by %g from input library.

Description

In add_pg_pin_to_db, it takes the data in the input db as higher priority. Therefore, if you defined a voltage_map in the map file while there is a different voltage value in the db for this voltage_name, the user defined value will be replaced by the value from the db, e.g. power_rail. The voltage value from the input db is taken in the following order: 1. If the library db has defined default_operating_conditions, then the specified voltage value in operating_condition will be used as the nominal voltage. 2. Otherwise, nom_voltage value defined at the library level will be used as the nominal voltage.

The following example shows an instance where this message occurs:

```
BEGIN VOLTAGE_MAP
voltage_name    voltage_value
VDD             1.1
VSS             0.0
END VOLTAGE_MAP
in default_operating_conditions,
   power_rail (VDD, 1.2)
```

The following is an example message:

```
Warning: Voltage value 1.1 for voltage_name 'VDD' is replaced by 1.2 from
 input library. (LBDB-853)
```

LBDB-854

(warning) voltage_name '%s' for nominal voltage not referenced in %s.

Description

This warning message occurs when you specify a voltage_map with the nominal voltage (or in the case of a single-rail or 1P1G library, a default voltage_map for the nominal voltage is automatically derived from the input db), but this voltage name is not referenced in the PG_TO_VOLTAGE_MAP table for add_pg_pin_to_db/lib or pg_pin group in .lib.

The following example shows an instance where this message occurs: The following is an example:

```
BEGIN PG_TO_VOLTAGE_MAP
cell    pg_pin  voltage_name   pg_type
test    VDD1    VDD1           primary_power
test    VSS     VSS            primary_ground
END PG_TO_VOLTAGE_MAP

BEGIN VOLTAGE_MAP
```

```
voltage_name    voltage_value
VDD             1.2
VDD1            1.08
VSS             0.0
END VOLTAGE_MAP
where 1.2 is nominal voltage.
```

The following is an example message:

```
Warning: voltage_map 'VCC' for nominal voltage not referenced in
 PG_TO_VOLTAGE_MAP. (LBDB-854)
Warning: voltage_name 'VCC' for nominal voltage not referenced in pg_pin
 group.  (LBDB-854)
```

What Next

Check if this nominal voltage and voltage name are correct. If so, add its mapping entry from pg_pin to voltage_map with the nominal voltage in PG_TO_VOLTAGE_MAP or reference the voltage_name in a pg_pin group in .lib. If you have not specified the correct voltage name for the nominal voltage in voltage_map, correct the voltage name. If you have not specified the voltage_map in the map file for the nominal voltage and it is derived by the utility, specify the voltage map for the nominal voltage using the correct voltage name from PG_TO_VOLTAGE_MAP.

LBDB-855

(warning) Invalid %s found under section %s in map file.

Description

In the map file, if any of the following is incorrect, (1) pg_type (2) pg_pin direction (3) voltage value (4) wild card or - in wrong field (5) incorrect section name or keywords in title line (6) pin direction in POWER_DON_FUNCTION_MAP (7) duplicate data specified on the same cell/pin (8) incorrect rail_connection this message will occur.

Valid pg_type values include: primary_power primary_ground backup_power backup_ground internal_power internal_ground Valid pg_pin direction values include input output inout internal nwell pwell deepnwell deeppwell

Valid voltage values are non-negative floating point numbers. Valid pin directions in POWER_DOWN_FUNCTION_MAP are output or inout. Valid power_down_functions are double quoted strings or unquoted strings if no space within the strings and the strings must contain only the power and ground pin names. rail_connection value should be derived from input .lib/db for the cell. If no rail_connection, please enter -.

Wild cards "*" and "-" can only be entered in some specific fields: (1) PG_PIN_MAP section "*" can be entered in cell and pin fields, and "-" can be entered in pin and rail_connection fields. (2) POWER_DOWN_FUNCTION_MAP section "*" can be entered in cell and pin fields. (3) PG_TO_VOLTAGE_MAP section "*" can be entered in cell

field only, and "-" can be entered in optional direction field. (4) VOLTAGE_MAP section No "*" or "-" can be entered in any field in this section. Caret "^" cannot be entered in the first entry of each map section. In checking title lines, the key words and their order should be exactly the same as mentioned in the spec. If an invalid value is entered or the value is entered in the wrong field in the map file, the whole record will be ignored for all fields except optional field in which only optional value is ignored. For example, if the pg_pin direction value is invalid, only the invalid value in this field is ignored. However, if the value is invalid in other fields, the whole line of record wil be ignored. (5) POWER_MANAGEMENT_ATTRIBUTE_MAP section If you specify duplicate entries on the same cell/pin/attribute, the last one will be ignored. For example, if you specify retention_2 sv retention_pin (save, "1") retention_2 sv retention_pin (restore, "0") you will receive this message and the second entry will be ignored. If you want to specify pin SAVE as both save and restore, specify it in this way, retention_2 sv retention_pin (save_restore, "0")

The following example shows an instance where this message occurs:

```
BEGIN PG_TO_VOLTAGE_MAP
cell            pg_pin          voltage_name    pg_type
ADDFHX1         VDD             VDD             power
ADDFHX1         VSS             VSS             primary_ground
GEND PG_TO_VOLTAGE_MAP
```

The following is an example message:

```
Warning: Line 14, Invalid pg_type found under section PG_TO_VOLTAGE_MAP
 in map file. (LBDB-855)
Warning: Line 20, Invalid wild card found under section PG_PIN_MAP in map
 file. (LBDB-855)
```

What Next

You should correct the invalid values in the map file. For example, in pg_type field, if you enter power, you will receive this message. The correct pg_type should be primary_power.

LBDB-856

(error) For pin(%s) of cell(%s), the %s entry for %s of pin(%s) cannot be found.

Description

This message indicates that you do not specify the relative_power_pin/related_ground_pin of the signal pin in the PG_PIN_MAP section of the map file used by add_pg_pin_to_db command.

Feedback

The following example shows an instance where this message occurs:

The following is an example message:

```
Error: For pin(A) of cell(sample), the pg_pin_map entry for
 related_power_pin of pin(A) cannot be found. (LBDB-856)
```

LBDB-857

(error) Missing %s under section %s.

Description

You will receive this Error if the following occurs: (1) VOLTAGE_MAP for multi-rail library if you do not specify voltage_map entry with voltage_value = 0 (2) POWER_MANAGEMENT_ATTRIBUTE_MAP if you do not specify a complete set of power management attributes in the map file, or the input .lib has partial power management attributes but you do not specify the ones that are missing in the library

The following example shows an instance where this message occurs:

```
BEGIN VOLTAGE_MAP
voltage_name    voltage_value
VDDlow      1.6
VDDhigh     2.0
VSS             0.1
END VOLTAGE_MAP
```

The following is an example message:

```
Error: Missing voltage value 0 under section VOLTAGE_MAP. (LBDB-857)
Error: Missing power_pin_class for cell 'retention' pin 'sv' under
 section POWER_MANAGEMENT_ATTRIBUTE_MAP. (LBDB-857)
```

What Next

You should enter values for each field in the map file. Do not leave blank in any field except optional direction field in PG_TO_VOLTAGE_MAP section. In VOLTAGE_MAP, for multi-rail library you should specify voltage_map entry with voltage_value = 0. In POWER_MANAGEMENT_ATTRIBUTE_MAP, specify the missing power attributes. In converting power_gating_pin, it uses power_pin_class and map_to_logic attributes in DB, and change power_pin_class = 6, 7, 8 to pin class "save", "restore" and "save_restore", respectively, and take the value of map_to_logic as <disable_value>. If the input .lib does not have power_pin_class = 6, 7 or 8, you should specify retention_pin_class as in the example RET_1 sv retention_pin (save, "0")

LBDB-858

(error) The timing arc %s->%s with when condition "%s" doesn't have ccs noise model.

Feedback

Description

For every timing arc, there must be one of the followings: (1) arc-based ccs noise models with the same "when" condition as the "when" of the timing arc, (2) pin-based ccs noise models with the same "when" condition as the "when" of the timing arc, or (3) pin-based ccs noise models with default (i.e., no "when") "when" condition.

For example,

```
pin(CO) {
  timing() {
    when : "!B&A";
    ...
    ccsn_first_stage() {
      /* no when condition */
      ...
    } /* qualified model 1 */
  }

  ccsn_last_stage() {
    when : "!B&A";
    ...
  } /* qualified model 2 */

  ccsn_last_stage() {
    /* no when condition */
    ...
  } /* qualified model 3 */

  ...
}
```

when condition "default" means that this timing arc has no "when" attribute.

The following is an example message:

```
Error: The timing arc CI->CO with when condition "!B&A" doesn't have ccs
 noise model. (LBDB-858)
```

What Next

Add ccs noise model with the qualified "when" condition.

LBDB-859

(error) There is no cross point in this %s group with input_net_transition %s.

Description

For expanded ccs power, if *pg_current* is represented as a sparse cross table, if there is no *input_net_transition*, then there must be one and only one cross point in one of the

vectors. if *input_net_transition* is specified, then one and only one cross point is required for each *input_net_transition*.

For compact ccs power, if *pg_current* is represented as a sparse cross table, then the typical capacitance of the pin specified in "index_output" must be one of the values in index with variable "total_output_net_capacitance".

The following example shows an instance where this message occurs:

```
dynamic_current() {
    ...
    related_outputs : "Q QN QN1 QN2";
    typical_capacitances(10.0, 12.0, 14.0, 16.0);
    switching_group() {
      ...
      pg_current(VDD) {
        vector(CCS_power_1) {
          index_output : "QN1";
          index_1 ("0.01");
          index_2 ("14.0"); /* cross point */
          ...
        }
        vector(CCS_power_1) {
          index_output : "QN2";
          index_1 ("0.02");
          index_2 ("11.0"); /* non cross point */
          ...
        }
      }
      ...
    }
  }
```

In this case, pg_current has only two vectors. There is no cross point with input_net_transition 0.02. So error message LBDB-859 will be issued.

The following is an example message:

```
Error: There is no cross point in this pg_current group with
 input_net_transition 0.02. (LBDB-859)
```

What Next

Add cross point for each input_net_transition.

LBDB-860

(warning) This cross point vector is inconsistent with a previous one with the same input_net_transition on Line %d.

Feedback

Description

If two cross point *vector* groups have the same *index* value of *input_net_transition*, then waveform of the I-t curve and *reference_time* must be the same for both vectors.

Two I-t curve waveforms are "equal" means,

Step1. Use the 1st waveform as a reference. For each time point in the reference waveform, get the current from the 2nd waveform. (may involve linear interpolation).

Step2. Take the sum of absolute difference on currents for each time point at the reference waveform. Assume total num of points in the reference waveform is N.

Step3. Calculate relative waveform difference as Sum_of_difference_on_current / (peak_from_reference * N), which should <= 2%.

Step4. Calculate relative peak difference as ABS (peak_from_2nd - peak_from_reference) / peak_from_reference, which should <= 2%.

The following example shows an instance where this message occurs:

```
dynamic_current() {
    ...
    related_outputs : "Q QN";
    typical_capacitances(10.0, 12.0);
    switching_group() {
      ...
      pg_current(VDD) {
        vector(CCS_power_1) {
          index_output : "Q";
          reference_time : 0.01;
          index_1 ("0.02"); /* input_net_transition */
          index_2 ("10.0"); /* total_output_net_capacitance */
          index_3 ("0.000, 0.0873, 0.135, 0.764"); /* time */
          values ("0.002, 0.009, 0.134, 0.546");
        }
        vector(CCS_power_1) {
          index_output : "QN";
          reference_time : 0.04;
          index_1 ("0.02"); /* input_net_transition */
          index_2 ("12.0"); /* total_output_net_capacitance */
          index_3 ("0.000, 0.0873, 0.135, 0.764"); /* time */
          values ("0.002, 0.009, 0.134, 0.546");
        }
      }
      ...
    }
  }
```

In this case, pg_current is a sparse cross table, two vectors are represented as cross points, and both have the same input_net_transition 0.02. In such a case, I-t curve

Feedback

waveform and reference_time (0.01 and 0.04, not identical. Issue a warning.) must be the same.

The following is an example message:

```
Warning: This cross point vector is inconsistent with a previous one with
 the same input_net_transition on line 57191. (LBDB-860)
```

What Next

Correct one of the cross points to make them consistent.

LBDB-861

(error) This vector is repeated with a previous one under the same pg_current group.

Description

Under the same *pg_current* group, no two vectors can have the same *index_output* and values of all *index* attributes except for the last *index* (time). Otherwise, this vector will be regarded as repeated.

The following example shows an instance where this message occurs:

```
pg_current(VDD) {
        vector(CCS_power_1) {
          index_output : "QN1";
          reference_time : 0.01;
          index_1 ("0.01"); /* input_net_transition */
          index_2 ("14.0"); /* total_output_net_capacitance */
          index_3 ("0.001, 0.003, 0.006"); /* time */
          ...
        }
        vector(CCS_power_1) {
          index_output : "QN1";
          reference_time : 0.01;
          index_1 ("0.01"); /* input_net_transition */
          index_2 ("14.0"); /* total_output_net_capacitance */
          index_3 ("0.004, 0.007, 0.009"); /* time */
          ...
        }
      }
```

In this case, index_output (QN1), input_net_transition (0.01), and total_output_net_capacitance(14.0) are all the same between two vectors. So error message LBDB-861 will be issued.

The following is an example message:

```
Error: This vector is repeated with a previous one under the same
 pg_current group. (LBDB-861)
```

Feedback

What Next

Correct one of the vectors to make them different.

LBDB-862

(error) The dense table under the pg_current group is incomplete with input_net_transition %s.

Description

If a <template> with two *total_output_net_capacitance* variables is applied to all vectors under a *pg_current* group, then all possible combination of capacitances between two output pins must be specified if all of them have the same *input_net_transition*.

The following example shows an instance where this message occurs:

```
pg_current(VDD) {
        vector(CCS_power_dense) {
          reference_time : 0.01;
          index_1 ("0.01"); /* input_net_transition */
          index_2 ("1.0"); /* total_output_net_capacitance */
          index_3 ("2.0"); /* total_output_net_capacitance */
          index_4 ("0.000, 0.0873, 0.135, 0.764"); /* time */
          values ("0.002, 0.009, 0.134, 0.546");
        }
        vector(CCS_power_dense) {
          reference_time : 0.01;
          index_1 ("0.01"); /* input_net_transition */
          index_2 ("1.5"); /* total_output_net_capacitance */
          index_3 ("2.5"); /* total_output_net_capacitance */
          index_4 ("0.100, 0.0873, 0.135, 0.764"); /* time */
          values ("0.113, 0.110, 0.243, 0.657");
        }
        vector(CCS_power_dense) {
          reference_time : 0.01;
          index_1 ("0.01"); /* input_net_transition */
          index_2 ("1.5"); /* total_output_net_capacitance */
          index_3 ("2.0"); /* total_output_net_capacitance */
          index_4 ("0.000, 0.0873, 0.135, 0.764"); /* time */
          values ("0.224, 0.221, 0.358, 0.769");
        }
      }
```

In this case, all possible combinations of (c1, c2) with input_net_transition 0.01 are (1.0, 2.0), (1.5, 2.5), (1.0, 2.5) and (1.5, 2.0). But (1.0, 2.5) is missing. So error message LBDB-862 will be issued.

Feedback

The following is an example message:

```
Error: The dense table under the pg_current group is incomplete with
 input_net_transition 0.01. (LBDB-862)
```

What Next

Add vectors to make the dense table complete.

LBDB-863

(error) Size or values of total_output_net_capacitance are not identical for output pin %s.

Description

The size and values of *total_output_net_capacitance* for the same output pin or *index_output* (cross type) shall be identical for all vectors which have different *input_net_transition* index values.

In other words, every fixed (without tolerance) input_net_transition needs the same set of total_output_net_capacitance.

In the message, "output pin" means index_output (cross type) or all pins in "related_outputs" (dense type and diagonal type).

The following example shows an instance where this message occurs:

```
dynamic_current() {
    ...
    related_outputs : "Q QN";
    typical_capacitances(10.0, 12.0);
    switching_group() {
      ...
      pg_current(VDD) {
        vector(CCS_power_1) {
          index_output : "Q";
          reference_time : 0.01;
          index_1 ("0.01"); /* input_net_transition */
          index_2 ("5.0"); /* total_output_net_capacitance */
          ...
        }
        vector(CCS_power_1) {
          index_output : "Q";
          reference_time : 0.01;
          index_1 ("0.01"); /* input_net_transition */
          index_2 ("10.0"); /* total_output_net_capacitance */
          ...
        }
        vector(CCS_power_1) {
          index_output : "Q";
          reference_time : 0.01;
          index_1 ("0.01"); /* input_net_transition */
```

Feedback

```
    index_2 ("15.0"); /* total_output_net_capacitance */
    ...
  }
  vector(CCS_power_1) {
    index_output : "QN";
    reference_time : 0.01;
    index_1 ("0.01"); /* input_net_transition */
    index_2 ("6.0"); /* total_output_net_capacitance */
    ...
  }
  vector(CCS_power_1) {
    index_output : "QN";
    reference_time : 0.01;
    index_1 ("0.01"); /* input_net_transition */
    index_2 ("12.0"); /* total_output_net_capacitance */
    ...
  }
  vector(CCS_power_1) {
    index_output : "QN";
    reference_time : 0.01;
    index_1 ("0.01"); /* input_net_transition */
    index_2 ("18.0"); /* total_output_net_capacitance */
    ...
  }
  vector(CCS_power_1) {
    index_output : "Q";
    reference_time : 0.01;
    index_1 ("0.02"); /* input_net_transition */
    index_2 ("5.0"); /* total_output_net_capacitance */
    ...
  }
  vector(CCS_power_1) {
    index_output : "Q";
    reference_time : 0.01;
    index_1 ("0.02"); /* input_net_transition */
    index_2 ("11.0"); /* total_output_net_capacitance */
    ...
  }
  vector(CCS_power_1) {
    index_output : "Q";
    reference_time : 0.01;
    index_1 ("0.02"); /* input_net_transition */
    index_2 ("15.0"); /* total_output_net_capacitance */
    ...
  }
  vector(CCS_power_1) {
    index_output : "QN";
    reference_time : 0.01;
    index_1 ("0.02"); /* input_net_transition */
    index_2 ("6.0"); /* total_output_net_capacitance */
    ...
  }
  vector(CCS_power_1) {
```

Feedback

```
          index_output : "QN";
          reference_time : 0.01;
          index_1 ("0.02"); /* input_net_transition */
          index_2 ("12.0"); /* total_output_net_capacitance */
          ...
        }
        vector(CCS_power_1) {
          index_output : "QN";
          reference_time : 0.01;
          index_1 ("0.02"); /* input_net_transition */
          index_2 ("18.0"); /* total_output_net_capacitance */
          ...
        }
        vector(CCS_power_1) {
          index_output : "QN";
          reference_time : 0.01;
          index_1 ("0.02"); /* input_net_transition */
          index_2 ("24.0"); /* total_output_net_capacitance */
          ...
        }
      }
      ...
    }
  }
```

When input_net_transition is 0.01 and output pin is Q, total_output_net_capacitance size=3, values = (5.0, 10.0, 15.0). /*group1*/ When input_net_transition is 0.01 and output pin is QN, total_output_net_capacitance size=3, values = (6.0, 12.0, 18.0). /*group2*/ When input_net_transition is 0.02 and output pin is Q, total_output_net_capacitance size=3, values = (5.0, 11.0, 15.0). /*group3*/ When input_net_transition is 0.02 and output pin is QN, total_output_net_capacitance size=4, values = (6.0, 12.0, 18.0, 24.0). /*group4*/ group1 and group3 have different values. group2 and group4 have different sizes. So error message LBDB-863 will be issued.

The following is an example message:

```
Error: Size or values of total_output_net_capacitance are not identical
 for output pin Q. (LBDB-863)
Error: Size or values of total_output_net_capacitance are not identical
 for output pin QN. (LBDB-863)
```

What Next

Change the size or values of total_output_net_capacitance with a input_net_transition value to make the size and values consistent.

LBDB-864

(error) The design '%s' has separate intrinsic_parasitic groups.

Feedback

Description

This error occurs when there are two intrinsic_parasitic groups in the same cell, where the only difference is that one group has only intrinsic_resistance, and the other group has only intrinsic_capacitance.

However, it is allowed that only intrinsic_resistance or intrinsic_capacitance is defined for the intrinsic_parasitic group.

The following example shows an instance where this message occurs:

```
cell (AND3) {
  ...
  intrinsic_parasitic() {
    /* default state */
    intrinsic_resistance(G1) {
       related_output : "ZN";
       value : 9.0;
    }
  }

  intrinsic_parasitic() {
    /* default state */
    intrinsic_capacitance(G2) {
       value : 8.2;
    }
  }
}
```

In this case, cell 'AND3' has both an intrinsic_parasitic group with only intrinsic_resistance and an intrinsic_parasitic group with only intrinsic_capacitance. So error message LBDB-864 will be issued.

The following is an example message:

```
Error: The design 'AND3' has separate intrinsic_parasitic groups.
 (LBDB-864)
```

What Next

Combine the separate intrinsic_parasitic groups into one group.

LBDB-868

(warning) The estimated time when output signal reaches\n \tVDD level is out of range [%g, %g].

Feedback

Description

The time when output signal reaches VDD level is estimated as T = reference time + NLDM delay Reference time means the time when input signal reaches VDD level. T has to be within the range of the current waveform (min and max of time in current waveform).

The way to evaluate NLDM delay is to lookup the cell_rise/cell_fall table in the corresponding timing arc with the given input_net_transition and total_output_net_capacitance in the vector.

If the given input_net_transition and total_output_net_capacitance can not be found in the cell_rise/cell_fall table, use the nearest index to get the delay value.

The following example shows an instance where this message occurs:

```
lu_table_template (table_dodelaycell_rise_0k0aa01m1) {
  variable_1 : total_output_net_capacitance
  variable_2 : input_net_transition
  index_1 (" 0.006404, 0.055194, 0.147118 ");
  index_2 (" 0.060000, 0.400000, 0.800000 ");
}
pg_current_template(t1) {
  variable_1 : input_net_transition;
  variable_2 : total_output_net_capacitance;
  variable_3 : time;
  index_1("0.6 0.9");
  index_2("0.6 0.9");
  index_3("0.3 4.7");
}

cell (AND3) {
  dynamic_current() {
    ...
    related_inputs : "A2 A3";
    related_outputs : "ZN ZN1";
    typical_capacitances(0.3 0.4);
    switching_group() {
      ...
      pg_current(V2) {
        vector(t1) {
          reference_time : 15.6;
          index_output : "ZN1";
          index_1("0.5");
          index_2("0.043");
          index_3("18.2 18.3 19.0");
          values("13.78 192.4 1100.1");
        }
      }
    }
  }

  pin(ZN1) {
```

```
    ...
    timing() {
      related_pin : "A1 A2"
      cell_rise( scalar ) {
        values("0.28"); }
      cell_fall( scalar ) {
        values("0.0"); }
      ...
    }
    timing() {
      related_pin : "A3"
      cell_rise ("table_dodelaycell_rise_0k0aa01m1") {
      values (\
        "0.1729, 0.2200, 0.2397 ",\
        "0.3494, 0.4012, 0.4273 ",\
        "0.6499, 0.7018, 0.7281 "\
      );
    }
    cell_fall( scalar ) {
      values("0.0"); }
    }
  }
}
```

In this case, the information on the given current waveform is, (1) the time range is [18.2, 19.0]; (2) reference time is 15.6; (3) input pins are "A2 A3", output pin is ZN1; (4) input_net_transition is 0.5; (5) total_output_net_capacitance is 0.043.

In the section of pin(ZN1), (1) the first timing arc is specified with input pin "A1 A2", overlaped with "A2 A3" in the current waveform. So the delay is needed. delay1 = MAX(0.28, 0.0) = 0.28.

(2) the second timing arc is specified with input pin "A3", overlaped with "A2 A3" in the current waveform. So the delay is needed.

Look up cell_rise table with (input_net_transition=0.5, total_output_net_capacitance=0.043). The nearest index is values[1][1] = 0.4012. delay2 = MAX(0.4012, 0.0) = 0.4012.

max_delay = MAX(delay1, delay2) = 0.4012.

reference_time + max_delay = 15.6+0.4012 = 16.0012. It isn't within the range [18.2, 19.0]. So warning message LBDB-868 will be issued.

The following is an example message:

```
Warning: The estimated time when output signal reaches VDD level is out
 of range [18.2, 19.0]. (LBDB-868)
```

What Next

Extend current waveform, or change reference time and delay.

Feedback

LBDB-869

(information) Failure rate of the library cells will be overwritten.

Description

Failure rate is a Design-For-Yield concept, it is a integer number, value from 0 ~ 1e9, means the number of failures per billion.

In Liberty syntax, there are two models can describe the cell yield, under the same cell level group, functional_yield_metric().

```
cell (my_cell) {
  ...
  functional_yield_metric() {
    /* 1st method */
    average_number_of_faults(<template>) {
      values("float...float");
    }
    /* 2nd method */
    critical_area_table(<template>) {
      defect_type:enum(short, open, short_and_open);
      related_layer:<layer_name>;
      index_1("float...float"); /*particle diameter array*/
      values("float...float"); /*critical area values */
    }
  }
  ...
}
```

Using the 1st method can defined the average failure rate and derive a cell failure rate directly by Library Compiler.

The 2nd method, besides the critical area table in .lib, user need particle distribution function file, using command calculate_caa_based_yield2db to calculate out the failure rate.

This message is reported when the command calculate_caa_based_yield2db is called to calculate the CAA based yield (failure rate), while the failure rate attribute is already exist in the library(db file), regardless the failure rate is calculated by 1st or 2nd method before.

The following is an example message:

```
Information: Failure rate of the library cells will be overwritten.
 (LBDB-869)
```

What Next

This is just an information to update the status, you can just ignore it.

Feedback

LBDB-870

(information) Redundant cross point vector with input_net_transition %s is removed.

Description

If there are more than one cross point vectors with the same input_net_transition under a pg_current group, read_lib will only keep the first one. Others will be removed.

The following example shows an instance where this message occurs:

```
dynamic_current() {
    ...
    related_outputs : "Q QN QN1 QN2";
    typical_capacitances(10.0, 12.0, 14.0, 16.0);
    switching_group() {
      ...
      pg_current(VDD) {
        vector(CCS_power_1) {
          index_output : "QN1";
          index_1 ("0.01");
          index_2 ("14.0"); /* cross point */
          ...
        }
        vector(CCS_power_1) {
          index_output : "QN2";
          index_1 ("0.01");
          index_2 ("16.0"); /* cross point */
          ...
        }
      }
      ...
    }
  }
```

In this case, there are two cross points with input_net_transition 0.01. So the second one will be removed.

The following is an example message:

```
Info: Redundant cross point vectors with input_net_transition 0.01 are
 removed. (LBDB-870)
```

What Next

It's just an information. Change in .lib is not required. However, in order to remove this message, keep only one cross point vector with the specified input_net_transition.

Feedback

LBDB-871

(error) The difference between the first point \n \t current value(%f) and the peak current value (%f) is less than 0.001%%.

Description

This error is issued when init current value is numerically identical to the peak current in CCS Timing or Compact CCS Timing data. The tolerance is set to 0.001%, that is: if fabs((I(first_point) - I(peak_point))/I(peak_point)) < 0.001%,

This could potentially cause larger errors in the calculation if data is truncated during reading, when these two values are too close.

The following example shows an instance where this message occurs:

```
output_current_rise() {
        vector(ccs) {
        reference_time : 1.493117e+00;
        index_1(2.986235e+00);
        index_2(2.500000e+01);
        index_3("8.216709e+00, 8.391117e+00, 1.775112e+01, 3.249112e+01,
 4.366012e+01, 6.033512e+01, 7.932612e+01, 9.818012e+01, 1.184101e+02,
 1.420501e+02, 1.728901e+02, 1.851275e+02");
        values( "4.299772e-01, 4.299781e-01, 4.117592e-01, 3.890655e-01,
 3.539464e-01, 2.690953e-01, 1.685153e-01, 9.581405e-02, 4.934546e-02,
 2.188565e-02, 7.340714e-03, 5.989923e-03");
        }
      }
```

The following is an example message:

```
Error: Line 3383, The first point current value(0.429977) is almost
        the same as peak point current value(0.429978). (LBDB-871)
```

What Next

Check the library source file and correct the data, most likely, you may need to re-characterize the library cells for CCS timing data.

LBDB-872

(warning) Curve parameters in %s are not exact for compact CCS power.

Feedback

Description

This warning message occurs when the curve parameters are not exact for compact CCS power. If a compact_lut_template is for compact CCS power, the value of the curve_parameters index (the last index) must be the following:

```
init_time, init_current, bc_id1, point_time1, point_current1, bc_id2,
[point_time2, point_current2, bc_id3, ...], end_time, end_current
```

This is a pattern instead of a specified series because the compact CCS power table varies in size.

The following example shows an instance where this message occurs: The following example results in this warning message:

```
compact_lut_template(t1) {
    variable_1 : input_net_transition;
    variable_2 : total_output_net_capacitance;
    variable_3 : curve_parameters;
    index_1 : ("...");
    index_2 : ("...");
    index_3 : ("init_time, init_current, bc_id1");
  }
```

The values in index_3 are not exact for compact CCS power.

What Next

This is only a warning message. No action is required.

However, to avoid this warning message you can change the values in the curve_parameters index and run the command again.

- LBDB-877

LBDB-873

(error) Invalid size of data for I-t curve #%d in "values".

Description

In compact ccs power, an I-t curve is always described with the pattern init_time, init_current, bc_id1, point_time1, point_current1, bc_id2, [point_time2, point_current2, bc_id3, ...], end_time, end_current

Feedback

So the size of data within a pair of quotation (e.g., data for an I-t curve) should be able to reprented as 8+3i (i>=0).

"I-t curve #?" means the order of this curve in "values". For example, "I-t curve #2" means the 2nd curve in "values".

The following example shows an instance where this message occurs:

```
compact_ccs_power(t1) {
    ...
    values("0.0, 1, 0.32, 1.08, 2, 0.87, -0.33, 3, 1.03, 0.0, 4, 1.50,
 0.67", /* size = 13 */\
           "0.0, 0.0, 1, 0.28, 0.93, 2, 0.45, 0.28", /* size = 8 */\
           "0.0, 0.0, 1, 0.36, 1.05, 2, 0.52, -0.49, 3, 0.88, 0.22",/*
 size = 11 */\
           "0.0, 0.0, 1, 0.33, 1.31, 2, 0.61, -0.83, 3, 0.96, 0.66" /*
 size = 11 */);
  }
```

In this example, size of the first line in "values" is 13, which is invalid. Sizes of other lines are valid.

The following is an example message:

```
Error: Line 388, Invalid size of data for I-t curve #1 in "values".
 (LBDB-873)
```

What Next

Change size and data in "values".

LBDB-874

(error) Time values in I-t curve #%d in "values" should be monotonically increasing.

Description

In compact ccs power, an I-t curve is always described with the pattern init_time, init_current, bc_id1, point_time1, point_current1, bc_id2, [point_time2, point_current2, bc_id3, ...], end_time, end_current

Time values with corresponding parameter "init_time", "point_time*" and "end_time" in an I-t curve should be monotonically increasing.

"I-t curve #?" means the order of this curve in "values". For example, "I-t curve #2" means the 2nd curve in "values".

The following example shows an instance where this message occurs:

```
compact_ccs_power(t1) {
    ...
```

```
    values("0.0, 0.0, 1, 1.32, 1.08, 2, 0.87, -0.33, 3, 1.03, 0.0, 4,
 1.50, 0.67", ...
  }
```

In this example, time-related data are {0.0, 1.32, 0.87, 1.03, 1.50}, which are not monotonically increasing.

The following is an example message:

```
Error: Line 388, Time values for I-t curve #1 in "values" should be
 monotonically increasing. (LBDB-874)
```

What Next

Change values of time-related data in "values".

LBDB-875

(warning) %s value %f in I-t curve #%d is too small and may be reset 0.

Description

In a I-t curve, all time values with corresponding parameter "init_time", "point_time*" and "end_time" can't be too diverse. Otherwise, small values will be reset 0. Similarly, all current values with corresponding parameter "init_current", "point_current*" and "end_current" can'be too diverse, either. "I-t curve #?" means the order of this curve in "values". For example, "I-t curve #2" means the 2nd curve in "values".

The following example shows an instance where this message occurs:

```
compact_ccs_power(t1) {
    ...
    values("0.0, 0.0, 1, 1.32, 1.08, 2, 0.87, -0.33, 3, 1.03, 0.0, 4,
 1e+100, 0.67", ...
  }
```

In this example, "end_time" is 1e+100, which will make other non-zero time values 1.32, 0.87 and 1.03 reset 0.

The following is an example message:

```
Warning: Line 388, Time value 1.32 in I-t curve 1 is too small and may be
 reset 0. (LBDB-875)
```

What Next

Change time or current values.

Feedback

LBDB-876

(error) Variables are specified behind indexes in compact_lut_template.

Description

compact_lut_template requires variables are specified before indexes. Other templates don't have this requirement.

The following example shows an instance where this message occurs:

```
compact_lut_template (t1) {
    index_1 ("0, 1");
    index_2 ("0, 1");
    index_3 ("init_time, init_current, bc_id1, point_time1,
 point_current1,
              bc_id2, [point_time2, point_current2, bc_id3, ...],
              end_time, end_current");
    variable_1 : input_net_transition;
    variable_2 : total_output_net_capacitance;
    variable_3 : curve_parameters;
  }
```

The following is an example message:

```
Error: Line 388, Variables are specified behind indexes in
 compact_lut_template. (LBDB-876)
```

What Next

Put all variables in front of indexes.

LBDB-877

(error) Variables in compact_lut_template are invalid.

Description

Variables in compact_lut_template must satisfy, (1) The last variable is "curve_parameters"; (2) The variables before the last one are "input_net_transition" and "total_output_net_capacitance".

If this template is applied in compact ccs timing or va compact ccs timing, (3) There should be exactly one "input_net_transition" and one "total_output_net_capacitance".

If this template is applied in compact ccs power, (3) There should be at most one "input_net_transition" and at most two "total_output_net_capacitance".

Feedback

The following example shows an instance where this message occurs:

```
compact_lut_template(t1) {
    variable_1 : input_net_transition;
    variable_2 : curve_parameters;
    variable_3 : total_output_net_capacitance;
  }
```

To fix the problem, exchange the values between variable_2 and variable_3.

The following is an example message:

```
Error: Line 388, Variables in compact_lut_template are invalid.
 (LBDB-877)
```

What Next

Make necessary change in variable and index.

LBDB-878

(error) One point current value(%f) is almost\n \tthe same as the adjacent point current value(%f).

Description

This error is issued when current value in one point is numerically identical to that in the adjacent point in Compact CCS Power data. The tolerance is set to 0.001%, that is: if fabs((I(first_point) - I(second_point))/I(second_point)) < 0.001%,

This could potentially cause larger errors in the calculation if data is truncated during reading, when these two values are too close.

The following example shows an instance where this message occurs:

```
compact_ccs_power(t1) {
    ...
    values("0.0, 0.0, 1, 0.28, 0.93, 2, 0.45, 0.929999", ...
  }
```

The following is an example message:

```
Error: Line 388, One point current value(0.93) is almost the same as the
 adjacent point current value(0.929999). (LBDB-878)
```

What Next

Check the library source file and correct the data, most likely, you may need to re-characterize the library cells for CCS power data.

Feedback

LBDB-879

(error) Pin '%s' can't be a pll %s pin.

Description

This message is issued because pin direction doesn't match the required direction of pll reference/feedback/output pin. If a pin is set "is_pll_reference_pin" or "is_pll_feedback_pin" true, it should be an input pin. If a pin is set "is_pll_output_pin" true, it should be an output pin.

The following example shows an instance where this message occurs:

```
cell (AND2) {
  is_pll_cell : true;
  pin (A1) {
    direction : input;
    is_pll_output_pin : true;
  }
  ...
}
```

The following is an example message:

```
Error: Pin 'A1' can't be a pll output pin. (LBDB-879)
```

What Next

Specify the attribute "is_pll_reference_pin", "is_pll_feedback_pin" or "is_pll_output_pin" under another pin with consistent direction.

LBDB-880

(error) More than one exclusive pll pin attributes are specified in pin '%s'.

Description

In a cell, pll reference pin, pll feedback pin and pll output pin must be different pins. Therefore in a pin group, at most one of the three attributes "is_pll_reference_pin", "is_pll_feedback_pin" and "is_pll_output_pin" can be set true.

The following example shows an instance where this message occurs:

```
cell (AND2) {
  is_pll_cell : true;
  pin (ZN1) {
    direction : input;
    is_pll_reference_pin : true;
    is_pll_feedback_pin : true;
  }
```

```
  ...
}
```

The following is an example message:

```
Error: More than one exclusive pll pin attributes are specified in pin
 'ZN1'. (LBDB-880)
```

What Next

Move all pll pin specifications except one to other pins.

LBDB-881

(error) Pll cell '%s' has wrong pll %s pin defined.

Description

If a cell is specified as a pll cell, then the cell group should contain one and only one pll reference pin, one and only one pll feedback pin, and one or more pll output pins.

The following example shows an instance where this message occurs:

```
cell (AND2) {
  is_pll_cell : true;
  pin (ZN1) {
    direction : input;
    is_pll_reference_pin : true;
  }
}
```

The following is an example message:

```
Error: Pll cell 'AND2' has wrong pll feedback pin defined. (LBDB-881)
Error: Pll cell 'AND2' has wrong pll output pin defined. (LBDB-881)
```

What Next

Correct pins under the pll cell.

LBDB-882

(warning) Pll pin tags in non-pll cell '%s' will be ignored.

Description

If a cell is not set "is_pll_cell" true, then pin level attributes "is_pll_reference_pin", "is_pll_feedback_pin" and "is_pll_output_pin" will be ignored.

Feedback

The following example shows an instance where this message occurs:

```
cell (AND2) {
  pin (ZN1) {
    direction : input;
    is_pll_reference_pin : true;
  }
}
```

The following is an example message:

```
Warning: Pll pin tags in non-pll cell 'AND2' will be ignored. (LBDB-882)
```

What Next

Remove pll pin tags from the non-pll cell.

LBDB-883

(error) More than one physical only cell types are specified in design '%s'.

Description

In a pin group, at most one of the three attributes "is_decap_cell", "is_filler_cell" and "is_tap_cell" can be set true.

The following example shows an instance where this message occurs:

```
cell (S1CAP1) {
  is_filler_cell : true;
  is_decap_cell : true;
  ...
}
```

The following is an example message:

```
Error: More than one physical only cell types are specified in design
 'S1CAP1'. (LBDB-883)
```

What Next

Remove all physical only cell type specifications except one.

LBDB-884

(error) Physical only cell '%s' can't contain I/O pins.

Description

If one of the three attributes "is_decap_cell", "is_filler_cell" and "is_tap_cell" is set true, this cell is a physical only cell. It should contain pg-pin only and has no signal pins in it.

Feedback

The following example shows an instance where this message occurs:

```
cell (S1CAP1) {
  is_decap_cell : true;
  pin(A1) {
    ...
  }
  ...
}
```

The following is an example message:

```
Error: Physical only cell 'S1CAP1' can't contain I/O pins. (LBDB-884)
```

What Next

Remove I/O pins in this cell.

LBDB-885

(error) There is no bias pin named '%s' related to this\n \tsignal pin's related power or ground pin.

Description

This error message is reported when the association of power/ground pin and bias pin in signal is incorrect.

A signal pin's related bias pin must one of the related bias pins of this signal pin's related power/ground pin.

The following is an example message:

```
Error: Line 546, There is no bias pin named vpw related to this signal
 pin's
related power/ground pin.(LBDB-885)
```

What Next

Check if this related bias pin is related to this signal pin's power pin or ground pin.

LBDB-885w

(warning) There is no bias pin named '%s' related to this\n \tsignal pin's related power or ground pin.

Description

This warning message is reported when the association of power/ground pin and bias pin in signal is incorrect.

Feedback

A signal pin's related bias pin must one of the related bias pins of this signal pin's related power/ground pin.

The following is an example message:

```
Waring: Line 546, There is no bias pin named vpw related to this signal
 pin's
related power/ground pin.(LBDB-885w)
```

What Next

Check if this related bias pin is related to this signal pin's power pin or ground pin.

LBDB-886

(error) Bias pg_pin '%s' can not be properly associated to\n \tthe pg_pin.

Description

This error message is reported when bias pin %s can not be properly associated to a pg_pin.

Power type pg_ppin should be associated with a nwell type bias pg pin; ground type pg_pin should be associated with a pwell type bias pg pin.

The following example shows an instance where this message occurs:

```
pg_pin(PWR) {
    voltage_name : VDD;
    pg_type : primary_power;
    related_bias_pin : "vpw"
  }
  pg_pin(vpw) {
    voltage_name : VDDL;
    pg_type : pwell;
    bias_connection : routing_pin;
  }
```

The following is an example message:

```
Error: Line 546, Bias pg_pin vpw can not be properly associated to the
pg_pin.(LBDB-886)
```

What Next

Check the pg_type of the pg_pin to be assoicated and the pg_type of the bias pg_pin.

LBDB-887

(warning) Only one (P or N)well bias pin exists.

Feedback

Description

This message is indicates that only one bias pin with pg_type P or N well is exists. Generally, pwell and nwell bias pins should be exsit as a pair.

The following is an example message:

```
Warning: Line 546, Only one (P or N)well bias pin vpw exists.(LBDB-887)
```

What Next

Delete the odd bias pin or add a new bias pin to be couple with the odd one.

LBDB-888

(error) physical_connection is associated with an invalid pg_type.

Description

This error message occurs when the physical_connection is associated with an invalid pg_type. The pg_type of a bias PG pin must be one of the predefined bias types: pwell, nwell, deeppwell, or deepnwell.

The following is an example message:

```
Error: Line 546,  physical_connection is associated with an invalid
 pg_type.
(LBDB-888)
```

What Next

Make sure the pg_type of the bias PG pin is one of the valid types listed above.

LBDB-889

(error) The pg_type of bias pg pin '%s' to be related is invalid.

Description

This error message is reported when a bias pg pin is related to a pg_pin or a signal pin, its type_type is not one of the predefined bias types: pwell|nwell|deeppwell|deepnwell.

The following is an example message:

```
Error: Line 546, The pg_type of bias pg pin vpw to be related
is invalid.(LBDB-889)
```

What Next

Check the pg_type of the bias pg pin.

Feedback

LBDB-890

(warning) Isolation cell '%s' contains more than two input pins.

Description

The following example shows an instance where this message occurs:

The following is an example message:

```
Warning: Line 202, Isolation cell 'acell' contains more than two input
 pins. (LBDB-890)
```

What Next

Delete unwanted input pins to keep the input pin number is no less than 2.

LBDB-891

(error) Retention cell '%s' has no retention pin.

Description

This error message occurs because a retention cell (identified by the *retention_cell* or *power_gating_cell* attribute), must have at least one control pin (identified by the retention_pin or power_gating_pin function).

The following example shows the correct control pin in the retention cell:

```
cell(retention_dff) {
  ...
  retention_cell : "my_retention_dff" ;
  clock_gating_integrated_cell : "generic";

  pin(SAVE) {
    ...
    direction : input;
  retention_pin (save, "0") ;
  }

  pin(RESTORE) {
    ...
    direction : input;
  retention_pin (restore, "0") ;
  }
}
```

The following is an example message:

```
Error: Retention cell 'retention_dff' has no retention pin. (LBDB-891)
```

Feedback

What Next

Add retention pins to the given cell and run the command again.

LBDB-892

(error) Pin name '%s' is duplicated with pg pin name.

Description

Names of Signal pins should be different with pg pin names and vice-versa.

The following is an example message:

```
Error: Pin name 'VSS' is duplicated with pg pin name.(LBDB-892)
```

What Next

Change the duplicated signal pin name or pg pin name.

LBDB-894

(warning) No scaling is done in '%s' because nominal process can not be found.

Description

This message is issued because scaling feature is turned on and there is no nominal process defined in the library.

Nominal process is selected in this order of precedence:

(1) if "default_operating_conditions" is specified, nominal process is taken from attribute "process" in the default "operating_conditions" group; (2) nominal process is taken from library-level attribute "nom_process".

The following example shows an instance where this message occurs:

The following is an example message:

```
Warning: No scaling is done because nominal process can not be found.
 (LBDB-894)
```

What Next

Define nominal process in library to continue scaling.

LBDB-895

(warning) "values" in "%s" group won't be scaled because "%s" is not found.

Feedback

Description

This message is issued because scaling feature is turned on and there is no corresponding k-factor defined for the specified attribute.

Here is the mapping table of supported k-factors and db attributes.

Nominal process is selected in this order of precedence:

k-factor name db_attribute_name k_process_cell_rise timing -> cell_rise -> values k_process_cell_fall timing -> cell_fall -> values k_process_rise_propagation timing -> rise_propagation -> values k_process_fall_propagation timing -> fall_propagation -> values k_process_rise_transition timing -> rise_transition -> values k_process_fall_transition timing -> fall_transition -> values k_process_setup_rise timing -> rise_constraint ->values (when "timing_type" is "setup_rising" or "setup_falling") k_process_setup_fall timing -> fall_constraint ->values (when "timing_type" is "setup_rising" or "setup_falling") k_process_hold_rise timing -> rise_constraint ->values (when "timing_type" is "hold_rising" or "hold_falling") k_process_hold_fall timing -> fall_constraint ->values (when "timing_type" is "hold_rising" or "hold_falling") k_process_recovery_rise timing -> rise_constraint ->values (when "timing_type" is "recovery_rising" or "recovery_falling") k_process_recovery_fall timing -> fall_constraint ->values (when "timing_type" is "recovery_rising" or "recovery_falling") k_process_removal_rise timing -> rise_constraint ->values (when "timing_type" is "removal_rising" or "removal_falling") k_process_removal_fall timing -> fall_constraint ->values (when "timing_type" is "removal_rising" or "removal_falling")

The following example shows an instance where this message occurs:

The following is an example message:

```
Warning: "values" in "cell_rise" group won't be scaled because
 "k_process_cell_rise" is not found. (LBDB-895)
```

What Next

Add corresponding k-factor.

LBDB-896

(error) Invalid %s found under section %s in map file.

Description

This error message occurs if any the following are incorrect in the map file:

- `voltage_name`
- `voltage value`
- `power management attributes`

Feedback

A valid voltage_name must be a valid string that starts with either an uppercase character A-Z or a lowercase character a-z.

The voltage_name in the PG_TO_VOLTAGE_MAP section must be the name used in VOLTAGE_MAP. The name could be a rail name, and can be the same as the pg_pin name. You cannot use an invalid value such as "-" or "*" in the voltage_name field in PG_TO_VOLTAGE_MAP or VOLTAGE_MAP section.

Valid voltage values are non-negative floating point numbers, for example, 0.9, that are valid voltage values in the input library.

For valid power management attributes see the *Library Compiler Modeling Timing, Signal Integrity, and Power in Technology Libraries User Guide*. The following are some examples of power management attributes:

- valid switch_cell_type is coarse_grain and fine_grain
- valid level_shifter_type is HL, LH and HL_LH
- always_on pins are related to backup power
- a switch cell has VVDD+VDD or VVSS+VSS and VVDD has pg_function where VVDD is virtual VDD;
- a valid retention_cell must be a sequential cell with retention_cell and retention_pin attributes

The following example shows an instance where this message occurs: The following example shows a "-" in the voltage name field, resulting in the error message:

```
BEGIN PG_TO_VOLTAGE_MAP
cell            pg_pin          voltage_name    pg_type
ADDFHX1         VDD             -               power
ADDFHX1         VSS             VSS             primary_ground
END PG_TO_VOLTAGE_MAP
```

What Next

Correct the invalid values or voltage_name in the map file. For example, if there is a "-" in the voltage_name field, this message occurs. You must input a valid voltage_name; for example, VDD.

LBDB-897

(error) The input library '%s' has pg_pin's defined as signal pins.

Feedback

Description

When pg_pin's are as signal pins in the library, this message occurs. add_pg_pin_to_db abd add_pg_pin_to_lib have limitation. In the above case, the utility will stop generation of map template and pg_pin based .lib/db.

The following example shows an instance where this message occurs:

The following is an example message:

```
Error: The input library 'test.lib' has pg_pin's defined as signal pins.
 (LBDB-897)
```

What Next

Check the contents of the library to see if there are pg_pin's or rail names or in/output_signal_level as signal pins. If so, remove these pin groups in your .lib and try to rerun the utility add_pg_pin_to_lib.

LBDB-898

(warning) both 'stage_type : pull_up' and 'stage_type : pull_down' '%s' groups are specified with an identical or overlapping when condition.

Description

This warning message occurs when both "stage_type : pull-up" and "stage_type : pull_down" ccs_first_stage/ccs_last_stage groups are specified with an identical or overlapping when condition.

If a first (last) CCB can physically make both rising and falling output transition under the same side-pin condition, then the stage_type of the CCB should be marked as both. The CCSN data should not be split into two stage_type pull_up/pull_down. Otherwise, the characterized result will not be correct.

The following example shows incorrect usage of the *stage_type* attribute, resulting in the warning message:

```
cell(bad) {
    ...
        Pin (A) {
        ...
        ccsn_first_stage() {
        stage_type : PULL_UP;
        when : "B";
                }

        ccsn_first_stage() {
        stage_type : PULL_DOWN;
        when : "B";
```

Feedback

```
                    }
            }

    }
```

In this example, pin 'A' has both "stage_type : pull-up" and "stage_type : pull_down" ccs_first_stage groups specified with an identical or overlapping when condition.

What Next

Check the library source file and correct the incorrect *stage_type* attribute.

LBDB-899

(warning) there is no CCS Noise information.

Description

This warning message occurs when checking cells for CCS Noise information. The tool determined that there are some cells that have CCS Noise data, but no CCS Noise information is defined for the specified cell.

What Next

This is only a warning message. No action is required.

If CCS Noise information is not needed for the cell, you can ignore this message. Otherwise, you can add CCS Noise data for the cell and run the command again.

LBDB-900

(error) The %f value of the power distribution table is not between 0 and 1.

Description

This error message occurs when the values of the power distribution tables are not between 0 and 1.

What Next

Modify the values of the power distribution tables to meet the requirements. Make sure the values are between 0 and 1.

See Also

- LBDB-901
- LBDB-902
- LBDB-903

Feedback

LBDB-901

(error) Missing power distribution tables in %s.

Description

This error message occurs when a cell contains one leakage power group with power distribution tables, but not all leakage power groups have power distribution tables, or when a pin contains one internal power group with power distribution tables, but not all internal power groups have power distribution tables.

What Next

Make sure that all leakage power groups have power distribution tables in a cell, or that all internal power groups have power distribution tables in a pin. Add the missing distribution tables in the .lib file before reading it in.

LBDB-902

(error) The sum of the values in all the distribution tables\n \tattached to %s table is not equal to 1.

Description

This error message occurs when the sum of all values in the distribution tables are not equal to 1. Each value in the distribution table must be between 0 and 1, and the sum of them should be 1.

What Next

Check all the values in all distribution tables attached to the specified leakage power or internal power to make sure that each value is between 0 and 1, and the sum of them is 1. Update the values as needed to meet the requirements.

LBDB-903

(error) In an internal power group, the number of values for power and power\n \tdistribution tables are not the same.

Feedback

Description

This error message occurs when the number of values in the paired power and power distribution tables are not the same in the internal power group. For example, there are 5 values in the rise power table, but there are 6 values in the paired rise power distribution table.

What Next

Check the internal power group for the number of values between the power group and paired power distribution table, rise power group and paired rise power distribution table, or fall power group and paired fall power distribution table. Make sure the number is the same.

LBDB-904

(error) The %s distribution tables are not paired with the %s tables in\n \tthe internal power group.

Description

This error message occurs when power, rise, or fall power distribution tables are not paired with the related power group. For example, when the rise power distribution table is found in the internal power group but no rise power table is found, the tool issues this error message.

What Next

Check the power distribution tables in the internal power group. When the power, rise power, or fall power distribution tables are found, there must be paired power, rise power, fall power groups. If this is not the case, remove the unpaired power distribution tables or add paired power, rise power, fall power groups before reading in the .lib file.

LBDB-905

(error) Indices for the distribution tables are not matched with the\n \tpaired rise power, fall power, or power groups.

Description

This error message occurs when the indices for the distribution tables are not matched with the paired rise power, fall power, or power groups.

What Next

In the internal power group, check the power template and indices for distribution tables and its paired rise power, fall power, or power groups. If the power template is used, they should be the same for distribution tables and its paired rise power, fall_power, or power

Feedback

groups. Index_1 and index_2 for distribution tables and its paired rise power, fall power, or power groups should also be the same. If necessary, update the power template and indices to meet the requirements.

LBDB-906

(error) Missing related_ground_pin in the power distribution table.

Description

This error message occurs when no related_ground_pin is specified in the power distribution table.

What Next

Check the power distribution table to determine if the related_ground_pin attribute is specified. If necessary, add the missing attribute before reading in the .lib file.

LBDB-907

(error) Invalid ground_pin %s with incorrect pg_type.

Description

This error message occurs when the ground_pin is not a valid PG pin defined for the cell with pg_type of primary_ground, backup_ground, or internal_ground.

What Next

Check the pg_type of the related_ground_pin in the power distribution table to see if it is primary_ground, backup_ground, or internal_ground. If the related_ground_pin is not specified as one of the 3 types, it is not a valid ground pin in the power distribution table. Re-specify a valid ground pin for power distribution.

LBDB-908

(error) The logic (%s) represented by %s 'when' attribute on line %u is incompatible with or is a subset of the logic (%s) represented by %s '%s' attribute on line %u.

Description

This error message indicates that the "when" attribute in the noise data group is a subset of the "when" attribute in the current timing group or incompatible with the function attribute of the pin. Note that a noise group is a ccsn_first_stage or ccsn_last_stage for the old format, or an input_ccb or output_ccb referenced in active_input_ccb, active_output_ccb, or propagating_ccb for the new format.

Feedback

The "when" condition in the noise group can only be equal or superset of the "when" condition in the current timing group. Otherwise, the characterized result is not correct.

The following example results in this error. The "when" condition "A" in the ccsn_first_stage is a subset of the "when" condition "A+B" of the timing group. When (A=0 & B=1), the timing group is active, but the ccsn_first_stage group is disabled. This behavior contradicts the fact the ccsn_first_stage is supposed to propagate noise.

```
cell(bad) {
      pin (Out) {
         function : "(A+B) C";
         timing () {
     related_pin : C;
            when : "A+B";
            ccsn_first_stage() {
               when : "A";
               ...
            }
            ...
         }
         ...
      }
      ...
   }
```

The following is the example message:

Error: Cell 'bad', pin 'A', the logic represented by the 'when' attribute (A) in 'ccsn_first_stage' group is a subset of the logic represented by the 'when' attribute (A+B) in the timing group.

Note: OUTPUT PINS NOT PERMITTED You may not use an output pin in the "when" attribute. You need to replace the pin with the expression stored in its "function" attribute.

What Next

Check the library source file, and correct the incorrect "when" attribute.

LBDB-909

(warning) The cell should have at least 1 primary_ground pg_pin and at least 1 primary_power pg_pin. It's being marked as dont_use, dont_touch.

Description

This warning message occurs because in the new libraries based on pg_pin, all of the cells must have at least 1 primary_ground pg_pin and at least 1 primary_power pg_pin.

Feedback

What Next

This is only a warning message. No action is required if users do not want to modify the cell pg pin modeling.

However, if users want to avoid this warning message, add the missing primary_ground pg_pin or primary_power pg_pin and run the command again.

LBDB-910

(warning) The cell skips partial PG requirement checking. It's being marked as dont_use, dont_touch.

Description

This warning message advises you that cells in the specified category skip PG pin requirement checking. The cells could have partial PG pins, meaning the cells are without a primary_power pg_pin or a primary_ground pg_pin. Currently, there is only one type ETM cell in the category.

What Next

This is only a warning message. No action is required.

However, to avoid this warning message, add the missing primary_ground pg_pin or primary_power pg_pin and run the command again.

LBDB-911

(error) The attribute '%s' violates the variation-aware consistence rule.

Description

This warning message advises you that the variation data in the library violates the consistence rule. If any variation attribute contains N/2N data entries, all variation attributes in the same library must also contain N/2N entries at the same N/2N process points (va_values). The number of data entries must be either N or 2N for any variation attribute. This checking rule includes the following models:

- `VA Timing Constraint Model`
- `VA Compact CCS Timing Driver Model`
- `VA CCS Timing Receiver Model (arc-based and pin-based)`

Feedback

What Next

Add the missing variation attribute or correct the process point (va_values). This message appears only once on the first violation entry. Check the other entries in the variation group for violations.

LBDB-912

(error) The variation needs to be consistent across corresponding arcs.

Description

This error message occurs when a variation inconsistency is found among the timing arcs. If the timing_based_variation group exists in a timing arc, all its corresponding timing arcs must also contain the timing_based_variation group. Otherwise, none of the arcs can contain the timing_based_variation group.

What Next

Add the missing timing_based_variation in the corresponding timing arcs and run the command again.

LBDB-913

(warning) is missing '%s' pg_pin, so it will become a black-box cell for multivoltage functional optimization flow. It is being marked dont_touch, dont_use.

Description

This warning message occurs when a cell has 2 or more power or ground pins, but there is no backup power or backup ground pin.

The following conditions apply to retention and isolation cells:

- If cell has 2 or more power pins, there must be a backup power pin.
- If cell has 2 or more ground pins, there must be a backup ground pin.

If the conditions, are not met, the tool issues this warning message. The cell is black box for the multivoltage flow and is being marked as a dont_touch, dont_use (d,u). The black box cannot be recognized during functional optimization by the tools (Power Compiler and IC Compiler).

What Next

This is only a warning message. No action is required.

However, if the result is not what you intended, add or correct the backup_ground pg_pin or backup_power pg_pin and run the command again.

Feedback

LBDB-913e

(error) is missing '%s' pg_pin, so it will become a black box cell for multivoltage functional optimization flow. This cell should be marked as dont_touch, dont_use.

Description

This error message occurs when a cell has 2 or more power or ground pins, but there is no backup power or backup ground pin.

The following conditions apply to retention and isolation cells:

- If the cell has 2 or more power pins, there must be a backup power pin.
- If the cell has 2 or more ground pins, there must be a backup ground pin.

If the above conditions are not met, the tool issues this error message. The cell is black box for the multivoltage flow and should be marked as dont_touch, dont_use (d,u). The black box cannot be recognized during functional optimization by the tools (Power Compiler and IC Compiler).

What Next

If the result is not what you intended, add or correct the backup_ground pg_pin or backup_power pg_pin and run the command again. Alternatively, you can mark this cell as dont_touch, dont_use.

LBDB-914

(warning) is missing related_power_pin to a '%s' pg_pin, so it will become a black box cell for multivoltage functional optimization flow. It is being marked as dont_touch, dont_use.

Description

This warning message occurs when a cell has no related_power_pin, or when the related_power_pin relates to an incorrect pg_pin.

For retention cells, if save or save_restore pins exist, they should be related to the backup power or ground, depending on whether backup power or ground is available. All other signal pins should be related to the primary power or ground. For isolation cells, if a backup power pin exists, the output pin must be related to backup power through a related_power_pin.

The cell is black box for the multivoltage flow and is marked as dont_touch, dont_use (d,u). it cannot be recognized during functional optimization by the tools (Power Compiler and IC Compiler).

Feedback

The following example shows an instance where this message occurs:

```
cell(Isolation_Cell2){
  area : 1.0;
is_isolation_cell : true;
dont_touch : true;
dont_use : true;

pg_pin(VDDB) {
  voltage_name : VDDB;
  pg_type : backup_power;
}

pg_pin(VDD) {
  voltage_name : VDD;
  pg_type : primary_power;
}

pg_pin(VSS) {
  voltage_name : VSS;
  pg_type : primary_ground;
}

  leakage_power() {
    when : "!A";
    value : 1.5;
    related_pg_pin : VDD;
  }
  leakage_power() {
    value : 0.5;
    related_pg_pin : VDD;
  }

pin(A) {
  direction : input;
  related_power_pin : VDD;

  }

    }/* end pin group*/
  }
```

The following is an example message:

```
Warning: Line 192, Cell 'Isolation_Cell2', pin 'Y', Cell
 'Isolation_Cell2', pin 'Y', is missing related_power_pin to a
 'backup_power' pg_pin, so it will become a black box cell for
 multivoltage functional optimization flow. It is being marked as
 dont_touch, dont_use.  (LBDB-914)
```

What Next

Check the library source file to add or correct related_power_pin attributes.

LBDB-914e

(error) is missing related_power_pin to a '%s' pg_pin, so it will become a black box cell for multivoltage functional optimization flow. This cell should be marked as dont_touch, dont_use.

Description

This error message occurs when a cell has no related_power_pin, or when the related_power_pin relates to an incorrect pg_pin.

For retention cells, if save or save_restore pins exist, they should be related to the backup power or ground, depending on whether backup power or ground is available. All other signal pins should be related to the primary power or ground. For isolation cells, if a backup power pin exists, the output pin must be related to backup power through a related_power_pin.

The cell is black box for the multivoltage flow and should be marked as dont_touch, dont_use (d,u). The cell cannot be recognized during functional optimization by the tools (Power Compiler and IC Compiler).

What Next

If the result is not what you intended, add or correct the related_power_pin and run the command again. Alternatively, you can mark this cell as dont_touch, dont_use.

LBDB-915

(warning) is missing related_ground_pin to a '%s' pg_pin, so it will become a black box cell for multivoltage functional optimization flow. It is being marked as dont_touch, dont_use.

Description

This warning message occurs when a cell has no related_ground_pin, or when the related_ground_pin is related to an incorrect pg_pin.

For retention cells, if save and restore pins exist, they should be related to the backup power or ground, depending on whether backup power or ground is available. All other signal pins should be related to the primary power or ground.

The cell is black box for the multivoltage flow and is marked as dont_touch, dont_use (d,u). It cannot be recognized during functional optimization by the tools (Power Compiler and IC Compiler).

The following example shows an instance where this message occurs:

```
cell(retention_dff) {
  area : 1.0;
  retention_cell : "my_retention_dff" ;

  pg_pin(VDDB) {
    voltage_name : VDDB;
    pg_type : backup_power;
  }
  pg_pin(VDD) {
    voltage_name : VDD;
    pg_type : primary_power;
  }
  pg_pin(VSS) {
    voltage_name : VSS;
    pg_type : primary_ground;
```

Feedback

```
}
pg_pin(VSS1) {
  voltage_name : VSS1;

 }
```

The following is an example message:

```
Warning: Line 103, Cell 'retention_dff', pin 'SAVE', is missing
 related_ground_pin to a 'backup_ground' pg_pin, so it will become a
 black box cell for multivoltage functional optimization flow. It is
 being marked as dont_touch, dont_use. (LBDB-915)
Warning: Line 116, Cell 'retention_dff', pin 'RESTORE', is missing
 related_ground_pin to a 'primary_ground' pg_pin, so it will become a
```

```
black box cell for multivoltage functional optimization flow. It is
being marked as dont_touch, dont_use. (LBDB-915)
```

What Next

Check the library source file to add or correct related_ground_pin attributes.

LBDB-915e

(error) is missing related_ground_pin to a '%s' pg_pin, so it will become a black box cell for multivoltage functional optimization flow. This cell should be marked as dont_touch, dont_use.

Description

This error message occurs when a cell has no related_ground_pin, or when the related_ground_pin is related to an incorrect pg_pin.

For retention cells, if save and restore pins exist, they should be related to the backup power or ground, depending on whether backup power or ground is available. All other signal pins should be related to the primary power or ground.

The cell is black box for the multivoltage flow and should be marked as dont_touch, dont_use (d,u). It cannot be recognized during functional optimization by the tools (Power Compiler and IC Compiler).

What Next

If the result is not what you intended, add or correct the related_ground_pin and run the command again. Alternatively, mark this cell as dont_touch, dont_use.

LBDB-916

(warning) pin '%s' and pin '%s' have different related_power_pin settings, so it will become a black box cell for multivoltage functional optimization flow. It is being marked as dont_touch/dont_use.

Description

This warning message occurs when the 2 specified pins do not relate to the same related_power_pin.

For a level-shifter cell, the related power pin of enable pin should be either same as the related power pin of output pin or data pin, or a backup power pin which is not of std_cell_main_rail.

Feedback

The cell is black box for the multivoltage flow and is marked as dont_touch, dont_use (d,u). It cannot be recognized during functional optimization by the tools (Power Compiler and IC Compiler).

The following example shows an instance where this message occurs:

```
cell (LVLHLEHX2){
  cell_footprint : lvlhleh

  pg_pin(VDDI) {
 voltage_name : "VDDH";
 pg_type : primary_power;
  }
  pg_pin(VDDO) {
 voltage_name : "VDDL";
 pg_type : primary_power;
  }
  pg_pin(VSS) {
 voltage_name : "VSS";
 pg_type : primary_ground;
  }

  is_level_shifter : true ;

  area : 5.883500;
  pin(A) {
    direction : input;
    input_signal_level : VDDH;
    related_power_pin : VDDI;
    related_power_pin : VDDO; /* warning : LBDB-16 */
    related_ground_pin : VSS;
    capacitance : 0.001462;
    ...
  }
  pin(EN) {
    direction : input;
    input_signal_level : VDDH;
    related_power_pin : VDDI;
    related_ground_pin : VSS;
    level_shifter_enable_pin : true ;
    capacitance : 0.001699;
    internal_power();
    ...
  }
  pin(Y) {
    direction : output;
    output_signal_level : VDDL;
    related_power_pin : VDDO;
    related_ground_pin : VSS;
    capacitance : 0.0;
    function : "(A EN)";
    ...
  }
```

Feedback

```
}
```

The following is an example message:

```
Warning: Line 308, Cell 'LVLHLEHX2', pin 'Y' and pin 'EN' have different
 related_power_pin settings, so it will become a black box cell for
 multivoltage functional optimization flow. It is being marked as
 dont_touch/dont_use. (LBDB-916)
```

What Next

Check the library source file to correct related_power_pin attributes.

LBDB-916e

(error) pin '%s' and pin '%s' have different related_power_pin settings, so it will become a black box cell for multivoltage functional optimization flow. This cell should be marked as dont_touch, dont_use.

Description

This error message occurs when the 2 specified pins do not relate to the same related_power_pin.

For a level-shifter cell, the enable pin and the output pin must be related to the same power pin.

The cell is black box for the multivoltage flow and should be marked as dont_touch, dont_use (d,u). It cannot be recognized during functional optimization by the tools (Power Compiler and IC Compiler).

What Next

If the result is not what you intended, make sure the specified pins have the same related_power_pin and run the command again. Alternatively, you can mark this cell as dont_touch, dont_use.

LBDB-917

(warning) no pg_pin or signal pin in this pad cell.

Description

This message indicates this pad cell hasn't a signal pin or pg_pin.

The following example shows an instance where this message occurs:

```
cell(AN2) {
      pad_cell : true;
```

```
    ...
}
```

In this case, the IO cell has no signal pin or pg_pin. To fix the problem, add one signal pin or pg_pin with attribute "is_pad : true".

Warning: Line 12, Cell 'AN2', no pg_pin or signal pin in this pad cell. (LBDB-917)

What Next

Add one signal pin or pg_pin with attribute "is_pad : true".

LBDB-918

(error) The cell '%s' has a retention pin, but it is not a retention cell.

Description

This error message occurs because retention pin and retention cell attributes are considered in pairs. A retention cell is defined with the *retention_cell* or *power_gating_cell* attribute. The cell must have at least one retention control pin, which is defined with the *retention_pin* or *power_gating_pin* attribute.

This means that if one of the pins within a cell is a retention control pin, then the cell might be a retention cell. The retention pin and cell attributes are considered in pairs.

The following example shows an instance where this message occurs: In the following example, there is a *retention_pin* attribute, but there is no *retention_cell* attribute. Remove the comment from the *retention_cell* attribute to correct the problem.

```
cell(retention_dff) {
  ...
  /* retention_cell : "my_retention_dff"; */
  clock_gating_integrated_cell : "generic";

  pin(SAVE) {
    ...
    direction : input;
    retention_pin (save, "0");
  }

  pin(RESTORE) {
    ...
    direction : input;
    retention_pin (restore, "0");
  }
}
```

Feedback

The following is an example message: The above example results in the following error message:

```
Error : The cell 'retention_dff' has a retention pin, but it is not a
retention cell. (LBDB-918)
```

What Next

Resolve the issue by either removing the *retention_pin* attribute or adding a *retention_cell* attribute.

See Also

- LBDB-891

LBDB-919

(warning) Retention cell '%s' is a zero pin design.

Description

This warning message occurs because a retention cell (identified by the *retention_cell* or *power_gating_cell* attribute), might not have a retention pin.

The following example shows an instance where this message occurs: The following design does not have a retention pin, so it is a zero pin retention cell:

```
cell(retention_dff) {
  ...
  retention_cell : "my_retention_dff" ;

  pin(SAVE) {
    ...
    direction : input;
  }

  pin(RESTORE) {
    ...
    direction : input;
  }
}
```

The following is an example message:

```
Warning: Retention cell 'retention_dff' is a zero pin design (LBDB-919)
```

What Next

Check that the design is a real zero pin retention cell.

Feedback

- LBDB-891
- LBDB-918

LBDB-920

(warning) The is_inverting attribute of ccsn_first_stage and ccsn_last_stage are not matched with the arc's timing_sense type.

Description

This warning message occurs when the timing arc's CCS noise data does not match with the timing_sense of this arc. The tool expects the following matching between arc-based noise data and timing_sense:

- When both *ccsn_first_stage* and *ccsn_last_stage* have is_inverting = TRUE, the expected timing_sense is pos_unate.
- When both *ccsn_first_stage* and *ccsn_last_stage* have is_inverting = FALSE, the expected timing_sense is pos_unate.
- When either *ccsn_first_stage* or *ccsn_last_stage* has is_inverting = TRUE, and the other has is_inverting = FALSE, the expected timing_sense is neg_unate.

  The following example shows an instance where this message occurs: The incorrect input below causes this warning message:

```
pin(CO) {
  timing() {
    timing_sense : neg_unate ;
    ccsn_first_stage() {
      is_inverting = true;
      ...
    } /* qualified model 1 */
    ccsn_first_stage() {
      is_inverting = true;
      ...
    } /* qualified model 1 */
  }
  ...
}
```

In this example, the CO pin has a two stage arc, and both the first and last stages are inverting, so a positive arc is expected. To fix the problem, change timing_sense to positive.

The following is an example message: The following is an example of the warning message:

```
Warning: The is_inverting attribute of ccsn_first_stage and
ccsn_last_stage are not matched with the arc's timing_sense type.
```

What Next

This is only a warning message. No action is required.

However, if the result is not what you intended, correct the noise modeling. If the noise modeling comes from the noise characterization tool, check with the noise characterization tool to determine why this type of data was generated.

LBDB-921

(warning) %s is missing in timing arc in pin %s.

Description

This warning message occurs when a timing arc has *receiver_capacitance_rise* or *receiver_capacitance_fall*, but not both.

The following is an example message: The following is an example of the warning message:

```
Warning: Line 206, receiver_capacitance_fall is missing in timing arc
in pin A.(LBDB-921)
```

What Next

This is only a warning message. No action is required.

LBDB-922

(warning) In '%s' group, ccsn_first_stage at line %u and\n \tccsn_last_stage at line %u have different values for related_ccb_node.

Description

related_ccb_node of the ccsn_first_stage and ccsn_last_stage in the same timing group should be identical.

The following example shows an instance where this message occurs:

```
library(test) {
  cell (flop) {
    ...
    pin (CP) {
      ...
```

Feedback

```
    }
    pin (Q) {
      ...
      timing () {
        ...
        related_pin :CP;
        ccsn_first_stage() {
          related_ccb_node : "net3:3";
          ...
        }
        ccsn_last_stage() {
          related_ccb_node : "net7:5";
          ...
        }
      }
    }
    ...
  }
}
```

The following is an example message:

```
Warning: Line 32, In 'timing' group, ccsn_first_stage at line 35 and
        ccsn_last_stage at line 39 have different values for
 related_ccb_node. (LBDB-922)
```

What Next

Use same values for the related_ccb_node of the ccsn_first_stage and ccsn_last_stage in the same timing group.

LBDB-923

(error) %s but not %s is needed in this timing arc %s.

Description

This error message occurs when a mismatched *receiver_capacitance_rise* exists in a timing arc. For example, when timing_type = combinational_rise and timing_sense = positive_unate, then *receiver_capacitance_rise* is needed. The error occurs when the timing arc has only *receiver_capacitance_fall*.

The following is an example message: The following is an example of the error message:

```
Error: Line 206, receiver_capacitance_rise but not
receiver_capacitance_fall is needed in timing arc.(LBDB-921)
```

Feedback

What Next

Correct the timing modeling. If the timing modeling comes from the timing characterization tool, check with the timing characterization tool to determine why this type of data was generated.

LBDB-924

(warning) There are more than %d %s in %s. \n

Description

This message indicates that the object number is not as expected.

Only one pg_pin can be specified in pg_function Boolean expression of a non-macro switch cell, otherwise the cell will be marked dont use.

The following example shows an instance where this message occurs:

```
cell(lbdb136) {
      area : 9;
      pg_pin(VDD) {
        pg_type : primary_power;
        voltage_name :VDD;
      }
      pg_pin(VSS) {
        pg_type : primary_ground;
        voltage_name :VSS;
      }
      pg_pin(VVDD) {
        pg_type : internal_power;
        voltage_name :VVDD;
        switch_function : "sleep";
        pg_function : "!VDD+VSS";
      }
    }
```

In this case, the pg_function is composed by two pg_pin, which suppose to be 1.

The following is an example message:

```
Warning: Line 1848, There are more than 1 pg_pin in pg_function.
 (LBDB-924)
```

What Next

Refer to the "Library Compiler User Guide" to determine the object number. Make the correction.

Feedback

LBDB-925

(warning) The %s of %s%s%s should be %s. \n

Description

This message indicates that the value or attribute is not as expected.

For non-macro switch cell, the pg_pin specified in pg_function of a power pg_pin must be primary/backup power, the pg_pin specified in pg_function of a ground pg_pin must be primary/backup ground.

For macro switch cell, the pg_pin specified in pg_function of a power pg_pin must be primary/internal/backup power, the pg_pin specified in pg_function of a ground pg_pin must be primary/internal/backup ground.

The following example shows an instance where this message occurs:

```
cell(lbdb136) {
      area : 9;
      pg_pin(VDD) {
        pg_type : primary_power;
        voltage_name :VDD;
      }
      pg_pin(VSS) {
        pg_type : primary_ground;
        voltage_name :VSS;
      }
      pg_pin(VVDD) {
        pg_type : internal_power;
        voltage_name :VVDD;
        switch_function : "sleep";
        pg_function : "!VDD+VSS";
      }
    }
```

In this non-macro case, the pg_function is specified on pg_pin VVDD, whose pg_type is internal_power. So the pg_function should be composed by pg_pin whose pg_type is primary_power or backup_power.

The following is an example message:

```
Warning: Line 848, The pg_type of pin VDD in pg_function should be
 primary_power or backup_power. (LBDB-925)
```

What Next

Refer to the "Library Compiler User Guide" to determine the value or attribute. Make the correction.

Feedback

LBDB-926

(warning) The %s '%s' is missing the attribute '%s'.

Description

You receive this message when the required attribute is missing.

The following example shows an instance where this message occurs:

```
cell(lbdb926) {
      area : 9;
      pg_pin(VDD) {
        pg_type : primary_power;
        voltage_name :VDD;
      }
      pg_pin(VSS) {
        pg_type : primary_ground;
        voltage_name :VSS;
      }
      pg_pin(VVDD) {
        pg_type : internal_power;
        voltage_name :VVDD;
      }
    }
```

In this case, there is no pg_function when pg_type is internal_power

The following is an example message:

```
Warning: Line 848, The pg_pin 'VVDD' is missing the attribute
 'pg_function'. (LBDB-926)
```

This is another example:

```
cell(lbdb926) {
      area : 9;
      pg_pin(VDD) {
        pg_type : primary_power;
        voltage_name :VDD;
      }
      pg_pin(VSS) {
        pg_type : primary_ground;
        voltage_name :VSS;
      }
      pg_pin(VVDD) {
        pg_type : internal_power;
        voltage_name :VVDD;
        switch_function : "sleep";
      }
    }
```

Feedback

In this case, there is only switch_function in pg_pin VDD, which should coexist with pg_function.

The following is an example message:

```
Warning: Line 848, The pg_pin 'VVDD' is missing the attribute
 'pg_function'. (LBDB-926)
```

What Next

Specifiy the missing attribute.

LBDB-927

(warning) It is invalid to specify the '%s' %s \n \ton the '%s' %s%s.

Description

This message indicates that you specified an invalid attribute/group on a cell/pin.

The following example shows an instance where this message occurs:

```
cell (p) {
    clocked_cell : rising_edge;
    pin(clk) {
        clock : true;
    }

    pin(out) {
        function : "clk";
    }
  }
```

To solve this issue, we need to add "combinational" timing arcs between "clk" pin and "out" pin.

The following is an example message:

```
Warning: Line 67, It is invalid to specify the 'clocked_cell' attribute
        on the 'p' cell. (LBDB-927)
```

What Next

Check the library source file, and correct the problem. For example, in order to specify the "clocked_cell" attribute, the cell needs to satisfy the following 2 conditions: - has only 1 clock pin whose "clock" attribute is set to "true". - has at least 1 timing arc between the clock pin and an output pin.

Feedback

LBDB-928

(warning) The pin '%s' specified in the '%s' is neither\n \tan %s pin nor an inout pin.

Description

This message indicates that direction of the pin you specified in a *related_inputs*, *related_outputs*, *related_output*, *index_output* or *gate_leakage* is wrong.

The following example shows an instance where this message occurs:

```
cell(lbdb730) {
  area : 2;
  pin(A) {
    direction : input;
    capacitance : 1;
  }
  pin(B) {
    direction : input;
    capacitance : 1;
  }
  pin(Z) {
    direction : output;
    function : "A B";
    timing() {
      intrinsic_rise : 1.0;
      intrinsic_fall : 1.0;
      rise_resistance : 0.1;
      fall_resistance : 0.1;
      slope_rise : 0.0;
      slope_fall : 0.0;
      related_pin : "A B";
    }
  }
  leakage_current() {
     when : "A & !B & Z";
     pg_current(V1) {
      ...
     }
     ...
     gate_leakage(Z) {  /* must be input or inout pin */
       input_high_value : 2.1;
       input_low_value : -1.7;
     }
  }
  dynamic_current() {
    when : "A";
    related_inputs : "Z";
    related_outputs : "B"
    typical_capacitances(0.3);
    switching_group() {
      input_switching_condition(fall);
```

Feedback

```
        output_switching_condition(rise);
        pg_current(<pg_name>) {
          vector(<lu_template_name>) {
            reference_time : 93.2;
            index_output : "A";
            index_1("5.1");
            index_2("0.3");
            index_3("8.2 9.4 9.8");
            values("1.78 12.4 110.1");
          }
        }
       ...
      }
    }
    intrinsic_parasitic() {
      /* default state */
      intrinsic_resistance(<pg_name>) {
         related_output : "B";
         value : 9.0;
      }
      intrinsic_capacitance(<pg_name>) {
         value : 8.2;
      }

    }
    ...
}
```

In this case, all related_output, related_outputs, related_inputs, index_output and gate_leakage have a wrong pin name. To fix the problems, change the name from 'Z' to either 'A' or 'B' in the related_inputs, change the name from 'B' to 'Z' in the related_outputs, change the name from 'A' to 'Z' in the index_output, change the name from 'B' to 'Z' in the related_output and change the name from 'Z' to either 'A' or 'B' in the gate_leakage.

The following is an example message:

```
Warning: Line 272, The pin 'Z' specified in the 'related_inputs' is
 neither
        an input pin nor an inout pin. (LBDB-928)
Warning: Line 471, The pin 'B' specified in the 'related_outputs' is
 neither
        an output pin nor an inout pin. (LBDB-928)
Warning: Line 526, The pin 'A' specified in the 'index_output' is neither
        an output pin nor an inout pin. (LBDB-928)
Warning: Line 890, The pin 'B' specified in the 'related_output' is
 neither
        an output pin nor an inout pin. (LBDB-928)
Warning: Line 749, The pin 'Z' specified in the 'gate_leakage' is neither
        an input pin nor an inout pin. (LBDB-928)
```

Feedback

What Next

Check the library source file, and make the necessary correction.

LBDB-929

(error) The %s cell is invalid for missing %s%s. It's being marked as dont_use.\n

Description

This message indicates that there are some attribute/group missing for the cell.

The following example shows an instance where this message occurs:

```
cell(lbdb136) {
      switch_cell_type : coarse_grain;
      area : 9;
      pg_pin(VDD) {
        pg_type : primary_power;
        voltage_name :VDD;
      }
      pg_pin(VSS) {
        pg_type : primary_ground;
        voltage_name :VSS;
      }
      pg_pin(VVDD) {
        pg_type : internal_power;
        voltage_name :VVDD;
        pg_function : "VDD";
      }
    }
```

In this case, the switch cell has no internal_power|ground pg_pin with both "switch_function" and "pg_function".

The following is an example message:

```
Error: Line 820, The switch cell is invalid for missing
 internal_power|ground
pg_pin with both switch_function and pg_function. It's being marked as
 dont_use. (LBDB-929)
```

What Next

Refer to the "Library Compiler User Guide" to sepcify the attribute/group. Make the correction.

LBDB-930

(warning) The %s cell is invalid for missing %s%s. \n

Feedback

Description

This message indicates that there are some attribute/group missing for the cell.

The following example shows an instance where this message occurs:

```
cell(lbdb136) {
      switch_cell_type : coarse_grain;
      area : 9;
      pg_pin(VDD) {
        pg_type : primary_power;
        voltage_name :VDD;
      }
      pg_pin(VSS) {
        pg_type : primary_ground;
        voltage_name :VSS;
      }
      pg_pin(VVDD) {
        pg_type : internal_power;
        voltage_name :VVDD;
        pg_function : "VDD";
      }
    }
```

In this case, the switch cell has no internal_power|ground pg_pin with both "switch_function" and "pg_function".

The following is an example message:

```
Warning: Line 820, The switch cell is invalid for missing
 internal_power|ground
pg_pin with both switch_function and pg_function. (LBDB-930)
```

What Next

Refer to the "Library Compiler User Guide" to sepcify the attribute/group in source lib file. Make the correction and regenerate a new db file.

LBDB-931

(error) The %s number is less than %d in %s.

Description

This message indicates that the object number is not as expected.

The following example shows an instance where this message occurs:

```
cell(lbdb136) {
      area : 9;
      is_level_shifter : TRUE;
      pin_opposite("A", "BB");
```

Feedback

```
      contention_condition : "A";
      pin(A) {
        direction : input;
        level_shifter_data_pin : TRUE;
      }
      pin(BB) {
        direction : input;
        level_shifter_data_pin : TRUE;
      }
      pin(Y) {
        direction : output;
        function : "A+BB"
      }
    }
```

In this case, the contention_condition is composed by one pin, which suppose to be at least 2.

The following is an example message:

```
Error: Line 1848, The pin number is less than 2 in contention_condition
 for a differential level shifter. (LBDB-931)
```

What Next

Refer to the "Library Compiler User Guide" to determine the object number. Make the correction.

LBDB-932

(warning) The %s%s%s%s is missing%s.

Description

This message indicates that there is object/group missing.

The following example shows an instance where this message occurs:

```
cell(lbdb136) {
      area : 9;
      is_level_shifter : TRUE;
      pin_opposite("A", "BB");
      contention_condition : "!(A^BB)";
      pin(A) {
        direction : input;
        level_shifter_data_pin : TRUE;
      }
      pin(BB) {
        direction : input;
        level_shifter_data_pin : TRUE;
      }
      pin(Y) {
```

```
        direction : output;
        function : "A+BB"
      }
    }
```

In this case, there should be the timing constraints group between A and BB.

The following is an example message:

```
Warning: Line 1848, The nonsequential timing constraints group between
 pin A and pin BB is missing for a differential level shifter. (LBDB-932)
```

What Next

Refer to the "Library Compiler User Guide" to determine if the object/group is required. Make the correction.

LBDB-933

(error) The value of '%s' is %g, and is not in the range of %s which is between %g and %g.

Description

This message indicates that the attribute value you have specified is not in the required range. For example: For input_signal_level, Library Compiler will check if it is in pin level "input_voltage_range". If there is no pin level "input_voltage_range", check the range of cell level "input_voltage_range"; . For output_signal_level, Library Compiler will check if it is in pin level "output_voltage_range". If there is no pin level "output_voltage_range", check the range of cell level "output_voltage_range"; .

The following example shows an instance where this message occurs:

```
cell (ls) {
    input_voltage_range(0.5, 1.2);
    pin(A) {
      input_signal_level : 1.3;
    }

    pin(Y) {
      function : "A";
    }
  }
```

To correct the error, change the input_signal_level to 1.2, which is in the range of (0.5 ~ 1.2)

Feedback

The following is an example message:

```
Error: Line 77, Cell 'ls', pin 'Y', The value of 'input_signal_level' is
 1.3, and is not in the range of input_voltage_range which is between 0.5
 and 1.2. (LBDB-933)
```

What Next

Check the library source file, and ensure the attribute value is consistent with corresponding range.

LBDB-934

(warning) Overwrite '%s' defined in 'operating_condition' by '%s' value %f.

Description

In existing .db files, nom PVT can be copied over to all PVT (process, voltage and temperature) defined in default_operating_conditions.

The warning message indicates that whatever PVT defined in default_operating_conditions have been overwritten by values of nom PVT.

The following example shows an instance where this message occurs:

```
library(libdb934) {
 ...
  nom_process : 1.3
  nom_temperature : 20.0;
  nom_voltage : 4.0;

  operating_conditions ( TYPICAL ) {
    process : 1.0 ;
    temperature : 22.0 ;
    voltage : 3.0 ;
    tree_type : balanced_tree ;
  }
  default_operating_conditions :  TYPICAL;
   ...
  voltage_map(VDD1, 4.0); /* new pg pin syntax */
  voltage_map(VDD2, 4.5);
   ...
  cell (and2) {
   ...
  pg_pin(V1) { /* new pg pin syntax */
     voltage_name : VDD1;
     pg_type : primary_power;
  }
  pg_pin(V2) {
     voltage_name : VDD2;
     pg_type : backup_power;
```

```
  }
  ...
```

In this case, process defined in default operating_conditions group will be overwritten by "nom_process" value 1.3. Temperature defined in default operating_conditions group will be overwritten by "nom_temperature" value 20.0. Voltage defined in default operating_conditions group will be overwritten by "nom_voltage" value 4.0.

The following are example messages:

```
Warning: Line 100, Overwrite 'process' defined in 'operating_conditions'
 by default 'nom_process' value 1.3. (LBDB-934)
Warning: Line 100, Overwrite 'voltage' defined in 'operating_conditions'
 by default 'nom_voltage' value 20.0. (LBDB-934)
Warning: Line 100, Overwrite 'temperature' defined in
 'operating_conditions' by default 'nom_temperature' value 4.0.
 (LBDB-934)
```

LBDB-935

(error) Attribute %s is not allowed in this ccs noise stage.

Description

input_signal_level and output_signal_level are used to provide additional information on the operation of a CCS noise stage, but not to override voltages that can be determined from the pin, or related pin.

The following usage is disallowed:

```
input_signal_level in a pin-based ccsn_first_stage group
output_signal_level in a pin-based ccsn_last_stage group
input_signal_level or output_signal_level in an arc-based
 ccsn_first_stage
or ccsn_last_stage group

The following example shows an instance where this message occurs:
library(lbdb935) {
  ...
  voltage_map(COREVDD1,1.080000);
  voltage_map(COREGND1,0.000000);
  voltage_map(COREVDD2,0.900000);
  voltage_map(COREVDD3,0.990000);
  ...
  cell (INV_PIN_BASED) {
    ...
    pg_pin(VDD) {
      voltage_name : VDD1;
      ...
    }
    pg_pin(VDDL) {
```

```
      voltage_name : VDD2;
      ...
    }
    pg_pin(VSS) {
      voltage_name : GND1;
      ...
    }
    pin (I) {
      direction : input;
      related_power_pin : VDDL;
      ccsn_first_stage {
        input_signal_level : COREVDD1;
        ...
      }
      ...
    }
    pin (Z) {
      direction : output;
      related_power_pin : VDD2;
      ccsn_last_stage {
        output_signal_level : COREVDD1;
        ...
      }
      ...
    }

  ...
```

The input signal level of the ccsn_first_stage group is determined by related_power_pin of pin I. The output signal level of the ccsn_last_stage group is determined by the related_pin of pin Z.

The following are example messages:

```
Error: Line 4303, Cell 'INV_PIN_BASED', pin 'I', Attribute
 input_signal_level not allowed in this ccs noise stage (LBDB-935)

Error: Line 4455, Cell 'INV_PIN_BASED', pin 'Z', Attribute
 output_signal_level not allowed in this ccs noise stage (LBDB-935)
```

LBDB-936

(error) %s is an invalid signal value.

Description

The signal level referenced by input_signal_level or output_signal_level of a CCS or CCB noise stage must already be defined in a pg_pin. Also the signal level must has a positive and non-zero voltage.

Feedback

The following example shows an instance where this message occurs:

```
library(lbdb936) {
  ...
  voltage_map(COREVDD1,1.080000);
  voltage_map(COREGND1,0.000000);
  voltage_map(COREVDD2,0.900000);
  voltage_map(COREVDD3,0.990000);
  ...
  cell (INV_BAD_SIGNAL_LEVEL) {
    ...
    pg_pin (VDD) {
      voltage_name : COREVDD1;
      ...
    }
    pg_pin (VDDL) {
      voltage_name : COREVDD2;
      ...
    }
    pg_pin (VSS) {
      voltage_name : COREGND1;
      ...
    }
    pin (I) {
      direction : input;
      related_ground_pin : VSS;
      related_power_pin : VDDL;
      ...
      ccsn_first_stage () {
        ...
        output_signal_level : COREVDD3;
...
    }
    ...
  }
  ...
```

The output_signal_level COREVDD3 is not declared in any pg_pins of cell INV_BAD_SIGNAL_LEVEL

The following is an example message:

```
Error: Line 187, Cell 'INV_BAD_SIGNAL_LEVEL', pin 'I', COREVDD3 is an
 invalid signal level. (LBDB-936)
```

What Next

Correct the problem.

LBDB-937

(error) Arc-based level-shifting CCS noise stages have inconsistent voltages.

Feedback

Description

This error message concerns arc-based, two-stage noise models (ccsn_first_stage/ ccsn_last_stage pair inside a timing group) that are level shifting. The voltage value given in the output_signal_level attribute of the first stage does not agree with that from the input_signal_level attribute of the last stage.

The following example shows an instance where this message occurs:

```
library(lbdb937) {
  ...
  voltage_map(VDD1,1.080000);
  voltage_map(GND1,0.000000);
  voltage_map(VDD2,0.900000);
  ...
  cell (INV_ARC_LS) {
    ...
    pg_pin (VDD) {
      voltage_name : VDD1;
      ...
    }
    pg_pin (VDDL) {
      voltage_name : VDD2;
      ...
    }
    pg_pin (VSS) {
      voltage_name : GND1;
      ...
    }
    pin (I) {
      direction : input";
      related_power_pin : VDDL;
      ...
   }
   pin (Z) {
     direction : output;
     related_power_pin : VDD;
     timing () {
       related_pin : I;
       ccsn_first_stage {
         output_signal_level: VDD2;
       }
       ccsn_last_stage {
         input_signal_level: VDD1;
       }
     ...
     }
  ...
```

The first stage has an output level of 0.9V, but the last stage has an input level of 1.08V. Correct the problem.

Feedback

The following is an example message:

```
Error: Line 1255, Cell 'INV_ARC_LS', pin 'Z', arc-based level-shifting
 CCS noise stages have inconsistent voltages" (LBDB-937)
```

LBDB-938

(error) The related_pins in this timing group have incompatible input signal levels.

Description

A timing group may be shared by multiple input pins by putting the names of the input pins in the related_pin attribute. For CCS noise model sharing to be valid, the inputs must have the same signal levels.

The following example shows an instance where this message occurs:

```
library(lbdb938) {
  ...
  voltage_map(VDD1,1.080000);
  voltage_map(GND1,0.000000);
  voltage_map(VDD2,0.900000);
  ...
  cell (BAD_RELATED_PINS) {
    ...
    pg_pin (VDD) {
      voltage_name : VDD1;
      ...
    }
    pg_pin (VDDL) {
      voltage_name : VDD2;
      ...
    }
    pg_pin (VSS) {
      voltage_name : GND1;
      ...
    }
    pin (E) {
      direction : "input";
      level_shifter_enable_pin : true;
      related_ground_pin : "VSS";
      related_power_pin : "VDD";
      ...
    }
    pin (I) {
      direction : "input";
      level_shifter_data_pin : true;
      related_ground_pin : "VSS";
      related_power_pin : "VDDL";
      ...
    }
    pin (Z) {
```

Feedback

```
      direction : output;
      related_power_pin : VDDL;
      timing () {
        function : "I' E'";
        related_pin : "I E";  /* two pins */
        ccsn_first_stage () { /* this is a shared arc-based noise model
 */
        ...
      }
     ...
    }
  ...
```

The ccsn_first_stage is shared by input pins E and I. However, pins E and I have different signal levels, which is illegal.

The following is an example message:

```
Error: Line 198, Cell 'BAD_RELATED_PINS', pin 'Z', The related_pins in
 this timing group have incompatible input signal levels" (LBDB-938)
```

LBDB-939

(warning) This CCS noise stage group is missing %s attribute

Description

A level shifter cell is likely to have a CCS noise stage group that is level shifting. This particular group is assumed to be single voltage. If it is actually a low-to-high level shifting stage, you will also most likely encounter errors LBDB-706 and LBDB-953 as well. See section EXAMPLE MESSAGE at the end.

The following example shows a liberty modeling snippet where this message occurs:

```
voltage_map("VDD1",1.080000);
  voltage_map("VSS", 0.000000);
  voltage_map("VDD2",0.900000);

  cell (low_to_high_LS) {
    is_level_shifter : true;
    level_shifter_type : "LH";
    input_voltage_range(0.900000,1.320000);
    output_voltage_range(0.900000,1.320000);
    ...
    pg_pin (VDD1) {
      pg_type : "primary_power";
      voltage_name : "VDD1";
      std_cell_main_rail : true;
    }
    pg_pin (VDD2) {
      pg_type : "primary_power";
      voltage_name : "VDD2";
```

```
    }
    pg_pin (VSS) {
      pg_type : "primary_ground";
      voltage_name : "VSS";
    }
    pin (I) {
      direction : "input";
      level_shifter_data_pin : true;
      related_ground_pin : "VSS";
      related_power_pin : "VDD2";
      ccsn_first_stage () {
        /* output_signal_level : "VDD1"; */
        ...
      }
      ...
    }
    pin (Z) {
      direction : "output";
      function : "I'";
      related_ground_pin : "VSS";
      related_power_pin : "VDD1";
      ...
      ccsn_last_stage () {
        /* input_signal_level : "VDD2"; */
        ...
      }
      ...
  }
```

The ccsn_first_stage group is missing the output_signal_level attribute. The ccsn_last_stage group is missing the input_signal_level attribute

The following is an example message:

```
Warning: Line 180, Cell 'low_to_high_LS', pin 'I', This CCS noise stage
 group is missing output_signal_level (LBDB-939)
Error: Line 180, Cell 'low_to_high_LS', pin 'I', output_voltage_fall
 analysis failed during CCS Noise compilation (LBDB-706)
Warning: Line 332, Cell 'low_to_high_LS', pin 'Z', This CCS noise stage
 group is missing input_signal_level (LBDB-939)
```

What Next

Add the missing input_signal_level or output_signal_level with a correct voltage name.

LBDB-940

(error) The level shifter cell contains invalid related power/ground pin configuration for input pin '%s' and output pin '%s'.

Feedback

Description

The tool issues this error message if the related power and ground pin configuration for the specified input and ouput pins is modeled incorrectly for a level-shifter cell.

Liberty supports the following types of power and ground pin configurations for the input and output pins of a level shifter:

- Power level shifters

  The related power pins are different and the related ground pins are the same.

- Ground level shifters

  The related ground pins are the same and the related power pins are different.

- Power and ground level shifters

  Both the related power pins and the related ground pins are different.

This error occurs when both the related power pins and the related ground pins are the same for the input and output of a level-shifter cell.

The following example shows an instance where this message occurs: The following example shows a level shifter with incorrect modeling and the resulting error message in the PG syntax:

```
library (test) {
  ...
  voltage_map( VSS, 0.0);
  voltage_map( VDDH, 0.9);
  voltage_map( VDDL, 0.7);
  ...
  cell(LS) {
  ...
    pg_pin(GND) {
      voltage_name : VSS;
      pg_type : primary_ground;
    }
    pg_pin(VDD2) {
      voltage_name : VDDH;
      pg_type : primary_power;
    }
    pg_pin(VDD1) {
      voltage_name : VDDL;
      pg_type : primary_power;
    }

    is_level_shifter : true;
    ...
    pin(in) {
      ...
      related_power_pin : VDD1;
```

Feedback

```
      related_ground_pin : GND;
    }
    pin(out) {
      ...
      related_power_pin: VDD1;
      related_ground_pin : GND;
    }
  }
  ...
}

Error: Line 191, Cell 'LS', The level shifter cell contains invalid
related power/ground pin configuration for input pin 'in' and output
pin 'out'. (LBDB-940)
```

What Next

Modify the modeling information of the level shifter to meet the requirements.

To correct the modeling of the previous example, make the *related_power_pin* value of the input pin different from the *related_power_pin* value of the output pin as follows:

```
cell(LS) {
  is_level_shifter : true;
  ...
  pin(in) {
    ...
    related_power_pin: VDD1;
    related_ground_pin : GND;
  }
  pin(out) {
    ...
    related_power_pin: VDD2;
    related_ground_pin : GND;
  }
}
```

LBDB-941

(error) Attribute "scan_start_pin" can only be specified under an output/inout bus/bundle.

Description

This message indicates that the direction of the bus/bundle with attribute "scan_start_pin" is not output/inout.

The following example shows an instance where this message occurs:

```
cell (mb_cell) {

    bundle(Q) {
      members(Q0, Q1)
```

Feedback

```
     direction       : internal;
      scan_start_pin : Q0;
      ...
    }

    ...

  }
```

The following is an example message:

```
Error: Line 253, Cell 'SDFF2_SO', pin 'Q', Attribute "scan_start_pin" can
 only be specified under an output/inout bus/bundle. (LBDB-941)
```

What Next

Check the library source file, and make sure the attribute "scan_start_pin" is specified under the correct bus/bundle.

LBDB-942

(error) Can't find single-bit scan input/output pin in the multi-bit scan cell.

Description

This message indicates that the multi-bit scan cell with attribute "scan_start_pin" must have both single-bit scan input pin and scan output pin defined. The single-bit scan input/output pin should be specified with signal_type "test_scan_in"/"test_scan_out" in test_cell.

The following example shows an instance where this message occurs:

```
cell (mb_cell) {

    pin(SI) {
        direction          : input;
        ...
    }
    pin(SO) {
        direction          : output;
        ...
    }

    bundle(Q) {
        members(Q0, Q1)
        direction       : output;
        scan_start_pin : Q0;
        ...
    }

    test_cell() {
        pin(SI) {
            direction          : input;
```

```
            signal_type         : "test_scan_in";
            ...
        }
        pin(SO) {
            direction           : output;
            /* signal_type      : "test_scan_out"; */
            ...
        }
    }
    ...

}
```

The following is an example message:

```
Error: Line 149, Cell 'SDFF2_SO', Can't find single-bit scan input/output
 pin in the multi-bit scan cell. (LBDB-942)
```

What Next

Check the library source file, and make sure the correct signal_type attribute is specified in test_cell.

LBDB-943

(error) Can't find attribute "single_bit_degenerate" in the multi-bit scan cell.

Description

This message indicates that the attribute "single_bit_degenerate" is missing for the multi-bit scan cell with attribute "scan_start_pin" on bus/bundle. To mapping a complex multi-bit scan cell with serial scan chain and dedicate scan output, a single-bit degenerate cell is needed for mapping the multi-bit cell to N-slice single-bit cell.

The following example shows an instance where this message occurs:

```
cell (mb_cell) {

    /* single_bit_degenerate : sb_cell; */

    bundle(Q) {
      members(Q0, Q1)
     direction       : output;
      scan_start_pin : Q0;
      ...
    }

    ...

  }
```

Feedback

The following is an example message:

```
Error: Line 149, Cell 'SDFF2_SO', Can't find attribute
 "single_bit_degenerate" in the multi-bit scan cell. (LBDB-943)
```

What Next

Check the library source file, and make sure the attribute "single_bit_degenerate" is specified under the cell

---

LBDB-944

(error) The value of "scan_start_pin" can only be the first or last bit pin of the bus/bundle.

Description

This message indicates that the value of attribute "scan_start_pin" can only be the first/last bit pin of the bus/bundle.

The following example shows an instance where this message occurs:

```
cell (mb_cell) {

    bundle(Q) {
      members(Q0, Q1, Q2, Q3)
     direction       : output;
      scan_chain_path : Q2;
      ...
    }

    ...

  }
```

The following is an example message:

```
Error: Line 199, Cell 'mb_4_scanin_gated_scanout1', pin 'Q', The value
 of "scan_start_pin" can only be the first or last bit of the parent
 bus/bundle. (LBDB-944)
```

What Next

Check the library source file, and make sure the value of attribute "scan_start_pin" is the first/last bit pin of the bus/bundle.

LBDB-945

(warning) Since the function of the cell is understood the "single_bit_degenerate" attribute will be ignored.

Feedback

Description

This message indicates that the "single_bit_degenerate" attribute is not needed for this multi-bit cell function specification, and will be ignored in function extraction. User should remove it from the Liberty file.

The function of this multi-bit scan cell can be recognized, and the corresponding single-bit cell can be degenerated from the multi-bit cell itself.

This attribute is only required when the multi-bit cell function is too complex, that corresponding single-bit cell can't be denegerated from the multi-bit cell.

What Next

Check the library source file, and remove attribute "single_bit_degenerate".

LBDB-946

(error) The voltage value %f of the insulated PG pin voltage_map '%s' is not the same as the value %f of voltage of the tied to power/ground PG pin voltage_map '%s'.

Description

This message indicates the insulated well PG pin voltage_map attribute specify the different voltage value from that of the voltage of the tied to power/ground PG pin. They should be equal.

The following example shows an instance where this message occurs:

```
library(insulatedPgpin) {
  ...
   voltage_map (vdd, 1.0);
   voltage_map (gnd, 0.0);
   voltage_map (vddo, 1.0);
   voltage_map (gndo, 0.0);
   voltage_map (vdds, 0.0);
   voltage_map (gnds, 1.0);
   voltage_map (vdds', 1.0);
   voltage_map (gnds', 1.0);
cell (insulated_well) {
   area : 0.3264;
   pg_pin(gndo){
    pg_type : backup_ground;
    voltage_name : gndo;
    related_bias_pin : gnds';
   }

   pg_pin(vddo){
    pg_type : backup_power;
    voltage_name : vddo;
    related_bias_pin : vdds';
```

```
    }
    pg_pin(gnds') {
     pg_type : pwell;
     voltage_name : gnds';
     is_insulated : TRUE;
     tied_to : gndo;
     direction : internal;
     }
     pg_pin(vdds') {
     pg_type : nwell;
     voltage_name : vdds';
     is_insulated : TRUE;
     tied_to : vddo;
     direction : internal;
     }
     pg_pin(gnds) {
     pg_type : pwell;
     voltage_name : gnds;
     direction : internal;
     physical_connection : device_layer;
     }
     pg_pin(vdds) {
     pg_type : nwell;
     voltage_name : vdds;
     direction : internal;
     physical_connection : device_layer;
     }
     }
} /* end library */
```

The following is an example message:

```
Error: Line 58, Cell 'insulated_well', pin 'gnds'', The voltage value
 1.000000 of the insulated PG pin voltage_map 'gnds'' is not the same
 as the value 0.000000 of voltage of the tied to power/ground PG pin
 voltage_map 'gndo'. (LBDB-946)
```

What Next

Correct the voltage value of the insulated well PG pin's voltage_map.

LBDB-947

(warning) is an insulated well but not PG pin is tied to. The cell is being marked dont_touch/dont_use.

Description

This warning message occurs when the insulated substrate well PG pin do not tie off to other PG pin.

For a insulated substrate well PG pin, it must be tied off to a power/ground PG pin.

Feedback

The cell is black box for the multivoltage flow and is marked as dont_touch, dont_use (d,u). It cannot be recognized during functional optimization by the tools (Power Compiler and IC Compiler).

The following example shows an instance where this message occurs:

```
library(insulatedPgpin) {
 ...

   voltage_map (vdd, 1.0);
   voltage_map (gnd, 0.0);
   voltage_map (vddo, 1.0);
   voltage_map (gndo, 0.0);
   voltage_map (vdds, 0.0);
   voltage_map (gnds, 1.0);
   voltage_map (vdds', 1.0);
   voltage_map (gnds', 0.0);
cell (insulated_well) {
   area : 0.3264;

    pg_pin(vdds') {
    pg_type : nwell;
    voltage_name : vdds';
    is_insulated : TRUE;
    direction : internal;
/*    physical_connection : device_layer;*/
    }
    }
} /* end library */
```

The following is an example message:

```
Warning: Line 65, Cell 'insulated_well', pin 'vdds'' is an insulated well
 but not PG pin is tied to. The cell is being marked dont_touch/dont_use.
 (LBDB-947)
```

What Next

This is only a warning message. No action is required.

However, if the result is not what you intended, make sure the specified PG pins have the tied power/ground PG pin and run the command again.

LBDB-948

(error) Insulated substrate well PG pin is associated with an invalid pg_type.

Feedback

Description

This error message occurs when the insulated substrate well PG pin is associated with an invalid pg_type. The pg_type of a bias PG pin must be one of the predefined bias types: pwell, nwell, deeppwell, or deepnwell.

The following example shows an instance where this message occurs:

```
library(insulatedPgpin) {

   voltage_map (vdd, 1.0);
   voltage_map (gnd, 0.0);
   voltage_map (vddo, 1.0);
   voltage_map (gndo, 0.0);
   voltage_map (vdds, 0.0);
   voltage_map (gnds, 1.0);
   voltage_map (vdds', 1.0);
   voltage_map (gnds', 0.0);
cell (insulated_well) {
   area : 0.3264;

   pg_pin(gnds') {
    pg_type : internal_power;
    voltage_name : gnds';
    is_insulated : TRUE;
    tied_to : gndo;
    direction : internal;
    /*physical_connection : device_layer;*/
    }
  ...
  }
} /* end library */
```

The following is an example message:

```
Error: Line 54, Cell 'insulated_well', pin 'gnds'', Insulated substrate
 well PG pin is associated with an invalid pg_type. (LBDB-948)
```

What Next

Make sure the pg_type of the bias PG pin is one of the valid types listed above.

LBDB-949

(error) Exactly 5 measurement points are required for this vector group inside %s.

Description

When AWP mode is enabled on CCS noise modeling, each vector group inside a output_voltage_rise or output_voltage_fall group must have exactly 5 time-voltage point

Feedback

in waveform measurement. Note that time and voltage values are stored in "index_3" and "values" respectively.

The following example shows an instance where this message occurs:

```
ccsn_first_stage () {
    is_needed : "true";
    stage_type : "both";
    is_inverting : "true";
    miller_cap_fall : "0.00266914";
    miller_cap_rise : "0.00252059";
    output_voltage_rise() {
      vector("ccsn_ov") {
        index_1("0.01");
 index_2("0.0407");
        index_3("0.0137562, 0.0212768, 0.0403229, 0.0554306");
        values("0.081, 0.243, 0.567, 0.729");
      }
      ...
    }
    ...
  }
```

The following is an example message:

```
Error: Line 19484, Cell "test_ccsn", pin "z", Exactly 5 measurement
 points are required for this vector group in output_voltage_rise
```

What Next

Correct the problem in the characterization setup.

LBDB-950

(error) The 5 voltage points in this vector group is not consistent with those of the first group.

Description

When AWP mode is enabled on CCS Noise modeling, all measurements within an output_voltage_rise or output_voltage_fall group must have the same voltage values. Note that voltage values are store in attribute "values" of a "vector" group.

The following example shows an instance where this message occurs:

```
voltage_map("vddfx", 0.8100);
  ...
  cell (test) {
    ...
    pin (z) {
      direction : output;
      related_power_pin : vddfx;
```

Feedback

```
      ...
      ccsn_last_stage () {
        is_needed : "true";
        stage_type : "both";
        is_inverting : "true";
        miller_cap_fall : "0.00266914";
        miller_cap_rise : "0.00252059";
        output_voltage_rise() {
          vector("ccsn_ov") {
            index_1("0.01");
          index_2("0.0407");
            index_3("0.0137562, 0.0212768, 0.0299644, 0.0403229,
0.0554306");
            values("0.081, 0.243, 0.405, 0.567, 0.729");
          }
  vector("ccsn_ov") {
            index_1("0.01");
            index_2("0.0263933");
            index_3("0.0150596, 0.0229561, 0.0316666, 0.0417733,
0.0562343");
            values("0.091, 0.253, 0.410, 0.562, 0.719");
          }
        ...
      }
    ...
```

The *"values"* attributes have different numbers.

The following is an example message:

```
Error: Line 19484, Cell "test_ccsn", pin "z", the 5 voltage points given
 in the "values" attribute should be of specific values.
```

What Next

Correct the problem in the characterization setup.

LBDB-951

(warning) The 5 voltage points should be of specific values in %s group.

Description

When AWP mode is enabled on CCS noise modeling, the five voltage points (stored in attribute "values") in each vector group of output_voltage_rise group should be 10%, 30%, 50%, 70%, 90% of Vdd, and for output_voltage_fall group, 90%, 70%, 50%, 30%, 10% of vdd.

The following example shows an instance where this message occurs:

```
voltage_map("vddfx", 0.8100);
  ...
```

Feedback

```
 cell (test) {
   ...
   pin (z) {
     direction : output;
     related_power_pin : vddfx;
     ...
     ccsn_last_stage () {
       is_needed : "true";
       stage_type : "both";
       is_inverting : "true";
       miller_cap_fall : "0.00266914";
       miller_cap_rise : "0.00252059";
       output_voltage_rise() {
         vector("ccsn_ov") {
           index_1("0.01");
         index_2("0.0407");
           index_3("0.0137562, 0.0212768, 0.0299644, 0.0403229,
0.0554306");
           values("0.089, 0.243, 0.405, 0.567, 0.729");
         }
         ...
       }
output_voltage_fall() {
  vector("ccsn_ov") {
           index_1("0.01");
           index_2("0.0263933");
           index_3("0.0150596, 0.0229561, 0.0316666, 0.0417733,
0.0562343");
           values("0.729, 0.567, 0.405, 0.243, 0.089");
         }
       ...
     }
   ...
```

The following is an example message:

```
Error: Line 19484, Cell "test_ccsn", pin "z", the 5 voltage points given
 in the "values" attribute should be of specific values.
```

What Next

Correct the problem in the characterization setup.

LBDB-952

(warning) Incomplete when condition coverage for CCS receiver capacitance model%s.

Description

This warning message occurs when pin-based/arc-based receiver capacitance has incomplete "when" condition coverage. To be more specific, for input/inout pin has

pin-based receiver capacitance, or the timing arc from this pin has arc-based receiver capacitance: 1. If default receiver capacitance exists on pin (without when), skip checking. 2. If receiver capacitance exists on default timing arc, skip checking. 3. Combine all pin-based when condition and arc-based when condition for each input->output arc respectively, it should be a complete set. 4. warning will be issued for in-complete states. Note: if there is no arc-based receiver capacitance, the message will be issued on input pin. Or else, the message will be issued on output pin.

The following example shows an instance where this message occurs:

```
...
    pin(I) {
      direction : input ;
      receiver_capacitance () {
        when : "A*!B";
        ...
      }
      receiver_capacitance () {
        when : "!A*B";
        ...
      }
      /*
      receiver_capacitance () {
        when : "!A*!B";
        ...
      }
      */
    }
    pin(Z) {
      direction : output ;
      function : "A*B*I" ;
      timing() {
        related_pin : "I" ;
        when : "A*B";
        receiver_capacitance_*() {...}
        ...
      }
    }
    ...

In the example above, input pin"I" does not have a receiver capacitance
 model
for the when condition "!A*!B".

The following is an example message:
The following is an example of the warning message:

Warning: Line 206, cell 'test', pin 'Z', Incomplete when condition
 coverage for CCS receiver capacitance model of related_pin 'I'.
 (LBDB-952)
```

Feedback

What Next

Complete the receiver model. Either introduce a receiver capacitance model with the missing "when" condition, or add a default model (without the "when" attribute). If the timing modeling comes from the timing characterization tool, check with the timing characterization tool to determine why this type of data was generated.

LBDB-953

(warning) CCS/CCB noise output DC swing (%g, %g) is not within %.1f%% of rail voltages (%g, %g)

Description

For a normal CMOS circuit, the DC output swing is rail to rail. This CCS/CCB noise tage has abnormal output swing according to its dc_current table.

If either the output low has a significant offset to ground, or the output high has a significant droop with respect to Vdd, or both, the output is deemed to have inadequate swing. The problem may be caused by cell characterization issues using improper supply voltage, or it may be due to serious DC leakage in the design. An LBDB-706 error may also be reported.

If the output high is larger than Vdd, the problem is caused by improper voltage used in cell characterization.

Note that if the stage_type attribute is "pull_up" or "pull_down", the output starting voltage is not analyzed, and assumed to be 0 or Vdd respectively.

The following is an example message:

```
Error: Line 1934, Cell "test", pin "a", DC output swing (0.023, 0.849) is
not within 5.0% of rail voltages (0.0, 0.9);
```

What Next

SolvNet article 2069871 has explanation about LBDB-706. Apply the same demonstration of example 4 using the dc_current group where one of the LBDB-706/LBDB-953 occurs to understand why the CCS/CCB noise output DC swing is not within 5% of rail voltages.

LBDB-954

(error) an invalid zero or negative capacitance value of '%s' is found.

Description

This message indicates zero or negative value is found of the capacitance attributes.

Feedback

This checker is triggered when lc_enable_10nm_mode set true, and capacitance attributes are specified under connected input pin, otherwise it's skipped and another warning message LBDB-163 reported.

Consider of single precision for values stored in .db, the checker uses a tolerance of 1e-6, if value < 1e-6, LC treats it less than or equal to 0.

LC checks these capacitance values:

Pin level attributes: capacitance, rise_capacitance, fall_capacitance:

There is a special case: when there is no pin capacitance attribute defined in .lib, and library level input/inout/outpu default capacitances equal to zero, e.g. library (my_library) { default_input_pin_cap : 0 ; default_output_pin_cap : 0 ; default_inout_pin_cap : 0 ; .... cell (my_cell) { ... pin (ABC) { direction : input; /* no capacitance attribute defined */ ... } /* end pin 'ABC' */ } /* end cell */ } In this case, input pin 'ABC' capacitance will inherit from library level attribute "default_input_pin_cap" which happens to be zero with a LBDB-172 warning, e.g. Warning: Line 100, Cell 'my_cell', pin 'ABC', The 'capacitance' attribute is not specified. Using 0.00. (LBDB-172)

Then LBDB-954 error will be reported for pin 'ABC' capacitance. Users can define pin capacitance attribute to override the value in library "default_input_pin_cap".

The following example shows an instance where this message occurs:

```
pin (I) {
…
direction : input;
capacitance : 0.0; /*wrong*/
rise_capacitance: 0.0000001; /*<1e-6, wrong*/
fall_capacitance: 0.001; /*correct*/
}
```

The following is an example message:

```
Error: Line 385, Cell 'HP_SHDFFNX1', pin 'I', an invalid zero or negative
 capacitance value of 'capacitance' is found. (LBDB-954)
Error: Line 386, Cell 'HP_SHDFFNX1', pin 'I', an invalid zero or negative
 capacitance value of 'rise_capacitance' is found. (LBDB-954)
```

What Next

Change the value of the attributes to positive, make sure value >= 1e-6.

LBDB-954w

(warning) an invalid zero or negative capacitance value of '%s' is found.

Feedback

Description

This message indicates zero or negative value is found in the capacitance model.

Consider of single precision for values stored in .db, the checker uses a tolerance of 1e-6, if value < 1e-6, LC treats it less than or equal to 0 .

LC checks these capacitance values:

1. the first value of N-cap model under pin or timing level.
2. receiver_capacitance1_rise|fall value under pin or timing level.
3. miller_cap_rise/miller_cap_fall under first/last_ccsn_stage or input/output_ccb group, this checker is controlled by lc_enable_10nm_mode.

The following example shows an instance where this message occurs:

```
pin(I)  {
   ...
receiver_capacitance() {
 receiver_capacitance1_fall(LTT1) {
 index_1 ("0.05,0.075,0.100,0.225,0.400");
 values (\
 "0.0,1.960000e-03,1.992000e-03,2.031000e-03,2.185000e-03"\
 );
}
pin(Z)  {
    direction : output;
    function : "I";
    timing() {
      related_pin : "I";
 ...
 receiver_capacitance1_fall (LTT2) {
 index_1 ("0.05,0.075,0.100,0.225,0.400");
 index_2 ("0.010,0.025,0.040,0.075");
 values (\
 "1.947000e-03,1.959000e-03,1.988000e-03,2.016000e-03",\
 "1.960000e-07,1.969000e-03,1.994000e-03,2.020000e-03",\
 "1.992000e-03,1.997000e-03,2.012000e-03,2.030000e-03",\
 "2.031000e-03,2.032000e-03,2.035000e-03,2.043000e-03",\
 "2.185000e-03,2.184000e-03,2.179000e-03,2.171000e-03"\
 );
 }
```

The following is an example message:

```
Warning: Line 374, Cell 'BUFFD0', pin 'I', an invalid zero or negative
 capacitance value of 'receiver_capacitance1_fall' is found. (LBDB-954w)
Warning: Line 415, Cell 'BUFFD0', pin 'Z', an invalid zero or negative
 capacitance value of 'receiver_capacitance1_fall' is found. (LBDB-954w)
```

Feedback

What Next

Change the value of the attributes to positive, make sure value >= 1e-6.

LBDB-955

(warning) an illegal value of '%s' %f is found, it cannot be %s than \ '%s' value '%s %f'.

Description

```
This message indicates that the values of all capacitance
 models/attributes is not correct.

the capacitance values should meet the following 4 rules:

C1 = receiver_capacitance1_[rise|fall] values
C2 = receiver_capacitance2_[rise|fall] values
Cmiller_rise = miller_cap_rise value
Cmiller_fall = miller_cap_fall value

pin_capacitance = rise_capacitance or fall_capacitance or if missing, use
 pin capacitance

1. C1 < (2 * pin_capacitance);
2. C2 <= (5 * pin_capacitance)
3. Cmiller_rise/fall >= 10% * pin_capacitance;
4. Cmiller_rise/fall < pin_capacitance;
```

The following example shows an instance where this message occurs:

```
pin(I)  {
    direction : input;
    capacitance : 0.002;
    receiver_capacitance() {
 receiver_capacitance1_rise(LTT1) {
 index_1 ("0.05,0.075,0.100,0.225,0.400");
 values (\
 "0.002,0.005,1.992000e-03,2.031000e-03,2.185000e-03"\
 );
}
```

The following is an example message:

```
Warning: Line 364, Cell 'BUFFD0', pin 'I', an illegal value of 'values'
 0.005000 is found, it cannot be more than '2 * capacitan' value '2 *
 0.002000'. (LBDB-955)
```

What Next

Change the value of the attributes to meet the screener rules.

Feedback

LBDB-956

(warning) 'miller_cap_rise' cannot more than 5 times value of 'miller_cap_fall'.

Description

This message indicates that the difference of miller_cap_rise and miller_cap_fall is wrong.Cmiller_rise/Cmiller_fall must be less than 5.

The following example shows an instance where this message occurs:

```
pin(I) {
      direction : input;
      max_transition : 2100.0;
      capacitance : 0.002000;
      fanout_load : 1;

      /* test pin-level */
        ccsn_first_stage ( ) {
          is_needed     : true;
          is_inverting    : true;
          stage_type      : both;
          miller_cap_rise : 0.0021;
          miller_cap_fall : 0.0002;
    ...
  }
```

The following is an example message: Warning: Line 106, Cell 'inv0d0', pin 'I', 'miller_cap_rise' cannot more than 5 times value of 'miller_cap_fall'. (LBDB-956)

What Next

Change the value of the attributes to non-zero, make sure Cmiller_rise/Cmiller_fall < 5.

LBDB-957

(warning) No driver waveform defined in the %s.

Description

In cell characterization, the shape of the Waveform driving the characterized circuit can have a significant impact on the final results.

This message is reported when there is no "normalized_driver_waveform" group defined in the library. Or there is normalized_driver_waveform group in library, but a library cell does not have driver waveform defined By any of following cell level or pin level attributes: driver_waveform, driver_waveform_rise and driver_waveform_fall.

The checkers is for 10nm library.

Feedback

The following is an example message:

```
Missing normalized_driver_waveform in library:
Warning: Line 6, No driver waveform defined in the library. (LBDB-957)

Missing driver_waveform, driver_waveform_rise, driver_waver_fall in cell:
Warning: Line 594, Cell 'TCAINVXC', No driver waveform defined in the
 cell. (LBDB-957)
```

What Next

Define normalized_driver_waveform group in library or define driver_waveform, driver_waveform_rise, driver_waver_fall in cell or pin level.

LBDB-958

(warning) dc_current values not correct for tied output

Description

For an output pin that is tied to low or high, the dc_current table of its ccsn_last_stage must be of a special form. In a strict sense, this ccsn stage does not have an input (because the function is 0 or 1). To conform the current data to the input/output format, we repeat the same values for all input voltages, as shown below:

```
dc_current {
   ...
   values( \\
      "0.0672194, 0.0647206, 0.0628569, 0.0621341 ..." \\
      "0.0672194, 0.0647206, 0.0628569, 0.0621341 ..." \\
      "0.0672194, 0.0647206, 0.0628569, 0.0621341 ..." \\
      ...)
   ...
}
```

The following is an example message:

```
Warning: Line 214, Cell 'hptiehi', pin 'Z', dc_current values not correct
 for tied output. (LBDB-958)
```

What Next

Review the "values" attribute of the affected "dc_current" group, root cause the differences in row values, and re-characterize with correct settings.

LBDB-959

(warning) suspicious dc_current value (%g) detected at row %d, entry %d

Feedback

Description

The "values" attribute in dc_current group contains complex, two-dimensional numerical data. A potentially bad value has been identified at the shown location. An example is given below:

```
dc_current {
   ...
   values( \\
      "0.270561, 0.111316, ... 0.0110591, -1.465e-05, ...",\\ (1st row)
      ...
      "0.348481, 0.137316, ... -0.0899564, 1.45095e+31, ...", \\ (25th
 row)
      ...)
   ...
}
```

The 23rd entry of the 25th row is abnormally large (1.45095e+31). A subsequent LBDB-706 error is possible.

The following is an example message: Warning: Line 120, Cell 'inv', pin 'Z', suspicious dc_current value (1.45095e+31) detected at row 25, entry 23 (LBDB-959)

What Next

Review the "values" attribute of the affected "dc_current" group. Re-generate the library with corrected data.

LBDB-960

(error) "%s" is not a valid characterization model for %s%s.

Description

This error is issued when <char_model> is not one of the valid enumerated values for all attributes, a specific attribute, or a specific value of a atribute.

The following is an example message:

```
Error: Line 10, "invalid_char_model" is not a valid characterization
 model for all attributes. (LBDB-960)
```

What Next

Check the library source file, correct the <char_model> definition.

LBDB-961

(warning) Attribute driver_waveform, driver_waveform_rise, driver_waveform_fall defined outside of char_config group.

Feedback

Description

This error is issued when char_config is defined but there is driver_waveform, driver_waveform_rise, driver_waveform_fall defined outside of char_config group.

If char_config is defined, all driver_waveform attributes should be defined inside char_config group.

The following is an example message:

```
Warning: Line 10, Attribute driver_waveform, driver_waveform_rise,
 driver_waveform_fall defined outside of char_config group. (LBDB-961)
```

What Next

Check the library source file, remove driver_waveform attributes which defined outside char_config group.

LBDB-962

(error) "%s" is not a valid selection method.

Description

For these two attributes:

default_value_selection_method(<char_model>, <method>);
merge_selection(<char_model>, <method>);

This error is issued when <method> is not one of these enumerated values: any min max average min_mid_table max_mid_table follow_delay

The following is an example message:

```
Error: Line 10, "invalid_method" is not a valid selection method.
 (LBDB-962)
```

What Next

Check the library source file, correct the <method> definition.

LBDB-963

(warning) Missing driver_waveform_name in normalized_driver_waveform group.

Description

When char_config() group is defined, the default driver_waveform should be defined by using "all" as <char_model> in driver_waveform definition. In this case, all normalized_driver_waveform group should have a driver_waveform_name.

Feedback

The following is an example message:

```
Warning: Line 10, Missing driver_waveform_name in
 normalized_driver_waveform group. (LBDB-963)
```

What Next

Check the library source file, either add driver_waveform_name to all normalized_driver_waveform group, or delete the normalized_driver_waveform which do not have driver_waveform_name.

LBDB-964

(warning) default char_config attribute %s is not defined for the library.

Description

For characterization configuration, each attribute may have a default value in the library level. If it is intended not to use a default value for the whole library, this warning can be ignored.

The following is an example message:

```
Error: Line 10, default char_config attribute dirver_waveform for nldm
 model is not defined for the library. (LBDB-964)
```

What Next

Check the library source file, define the default attribute for the library.

LBDB-965

(warning) default char_config attribute %s is not defined for the library when "%s" is defined.

Description

This is for when a default char_config attribute is required defined for the library but is not defined. Sometimes a default attribute is required to be defined if char_config group is used. Sometimes a default attribute is required to be defined if another default attribute is defined.

The following is an example message:

```
Warning: Line 10, default "ccs_timing_segment_voltage_tolerance_rel"
 attribute is not defined for the library when char_config is defined.
 (LBDB-965)
```

Feedback

What Next

Check the library source file, define the default attribute for the library.

LBDB-966

(information) The '%s' pg_pin is not '%s' of any signal \n \t pin on the cell.

Description

This information is issued when a pg_pin group satisfies the following conditions: - the pg_pin must be a 'primary_power' or 'primary_ground' pg_pin. - the pg_pin must be a 'std_cell_main_rail' pg_pin. - if the pg_pin is 'primary_power', the pg_pin is not the related power pin of any signal pin. - if the pg_pin is 'primary_ground', the pg_pin is not the related ground pin of any signal pin. The 'voltage_name' is optional for this pg_pin.

The following example shows an instance where this message occurs:

```
cell(ls) {
    is_level_shifter : true;

    pg_pin(VDD) {
        voltage_name : VDDL;
        pg_type : primary_power;
        std_cell_main_rail : true;
    }
    ...
  }
```

The following is an example message:

```
Information: Line 84, The 'VDD' pg_pin is not a 'related_power_pin'
 pg_pin of any signal pin on the cell. (LBDB-966)
```

What Next

If any screener rule fails on 'voltage_name', delete the 'voltage_name' under the pg_pin.

LBDB-967

(error) The delay trip point "%s" is not in the range between slew lower trip point "%s" and slew upper trip point "%s".

Description

This message indicates that the attribute value you have specified is not in the required range. For the 4 delay trip point attributes below, their value should be in the range of slew lower and upper trip point. input_threshold_pct_rise input_threshold_pct_fall output_threshold_pct_rise output_threshold_pct_fall

Feedback

Below are the attributes for slew upper/lower trip point. slew_lower_threshold_pct_rise slew_upper_threshold_pct_rise slew_lower_threshold_pct_fall slew_upper_threshold_pct_fall

For example: slew_lower_threshold_pct_rise < input_threshold_pct_rise < slew_upper_threshold_pct_rise slew_lower_threshold_pct_fall < input_threshold_pct_fall < slew_upper_threshold_pct_fall slew_lower_threshold_pct_rise < output_threshold_pct_rise < slew_upper_threshold_pct_rise slew_lower_threshold_pct_fall < output_threshold_pct_fall < slew_upper_threshold_pct_fall

The following example shows an instance where this message occurs:

```
library (test) {
    slew_lower_threshold_pct_rise : 30.0;
    slew_upper_threshold_pct_rise : 70.0;
    slew_lower_threshold_pct_fall : 30.0;
    slew_upper_threshold_pct_fall : 70.0;
    input_threshold_pct_rise : 50.0;
    input_threshold_pct_fall : 50.0;
    output_threshold_pct_rise : 50.0;
    output_threshold_pct_fall : 80.0;

  }
```

To correct the error, change the output_threshold_pct_fall to 50.0, which is in the range of (30.0 ~ 70.0)

The following is an example message:

```
Error: Line 30, The delay trip point "output_threshold_pct_fall" is not
 in the range between
  slew lower trip point "slew_lower_threshold_pct_fall" and slew upper
 trip point
  "slew_upper_threshold_pct_fall". (LBDB-967)
```

What Next

Check the library source file, and ensure the attribute value is consistent with corresponding range.

LBDB-968

(Error) This %s group does not have a driver waveform associated with input %s.

Description

This library uses input_ccb and output_ccb for noise/timing applications, instead of ccsn_first_stage and ccsn_last_stage. An associated change is that all output_voltage_rise &_voltage_fall data (in input_ccb & output_ccb) are obtained with a driver waveform that is consistent with timing characterization.

Feedback

The driver waveform must be specified at the pin or cell level using driver_waveform, driver_waveform_rise, or driver_waveform_fall attribute. If these attributes are missing, a default normalized_driver_waveform group (without the "driver_waveform_name" attribute) needs to be present at the library level.

This message indicates the above search fails to find a waveform.

Examples

Line 786, Cell 'inv0d0', pin 'ZN', This output_ccb group does not have a driver waveform associated with input fall. (LBDB-968)

What Next

Check the library source file, add an appropriate cell-level driver_waveform attribute or a default normalized_driver_waveform group at the library level.

LBDB-969

(error) The '%s' group should not be used in a non-retention cell.

Description

This error message occurs because user specifies following groups in a non-retention cell. retention_condition clock_condition clear_condition preset_condition Retention cell must have cell level attribute "retention_cell", otherwise it is a non-retention cell. These groups can only work in a retention cell.

The following example shows an instance where this message occurs: In the following example, there is a *retention_condition* group, but there is no *retention_cell* attribute. Remove the comment from the *retention_cell* attribute to correct the problem.

```
cell(retention_dff) {
  ...
  /* retention_cell : "my_retention_dff"; */

  retention_condition() {
    required_condition : "!sleep";
    power_down_function : "!vcc+vss" ;
  }

}
```

The following is an example message: The above example results in the following error message:

```
Error: Line 192, Cell 'retention_latch_with_async_preset_clear', The
 'retention_condition'
  group should not be used in a non-retention cell. (LBDB-969)
```

Feedback

What Next

Resolve the issue by either removing these groups or adding a *retention_cell* attribute.

LBDB-970

(error) Invalid parent group '%s' of the user defined %s '%s'.

Description

This message indicates that the group where the user defined attribute belongs to is not valid.

The following example shows an instance where this message occurs:

```
library(test) {
  define(user_defined_attribute, user_defined_group, string);
  define_group(another_user_defined_group, user_defined_group);
  ...
}
```

The following is an example message:

```
Error: Line 2, Invalid parent group 'user_defined_group' of the user
 defined attribute 'user_defined_attribute'.  (LBDB-970)
Error: Line 3, Invalid parent group 'user_defined_group' of the user
 defined group 'another_user_defined_group'.  (LBDB-970)
```

What Next

Check the parent group, define it before this line or fix the group name it is a typo.

LBDB-971

(error) User defined group '%s' cannot use the same name as its parent group.

Description

This message indicates that the user defined group is using same name as its parent group in define_group function.

The following example shows an instance where this message occurs:

```
library(test) {
  define_group(user_defined_group, library);
  define_group(user_defined_group, user_defined_group);
  ...
}
```

The following is an example message:

```
Error: Line 2, User defined group 'user_defined_attribute' cannot use the
 same name as its parent group.  (LBDB-971)
```

What Next

Check the define_group, using different name between the user defined group and its parent group.

LBDB-972

(error) The scan pin '%s' should not be used in the non-scan mode function.

Description

The test_cell is describing the non-scan mode of the scan cell, scan pin should not be used in the test_cell function. Only non-scan pin is allowed. Currently, scan input pin and scan enable pin is not allowed to be used in the ff group under test_cell.

The following example shows an instance where this message occurs:

```
cell(test) {
  ...
    test_cell() {
      ...
      pin(SD) {
        direction : input ;
        signal_type : test_scan_in ;
      }
      pin(SE) {
        direction : input ;
        signal_type : test_scan_enable ;
      }
      ...
      ff(IQ, IQN) {
        clocked_on : "CK" ;
        next_state : "((RT&((SE&SD)|(!SE&D))&SL)|(IQ&!RT&SL))" ;
      }
      ...
    }
  ...
}
```

In this case, the scan input pin "SD" and scan enable pin "SE" are used in the ff group "next_state" attribute inside test_cell. This is not allowed, user should correct the next_state attribute, remove the scan pin inside.

Feedback

The following is an example message:

```
Error: Line 2759, Cell 'scan_cell', test_cell, The scan pin 'SE' should
 not be used in the non-scan mode function. (LBDB-972)
Error: Line 2759, Cell 'scan_cell', test_cell, The scan pin 'SD' should
 not be used in the non-scan mode function. (LBDB-972)
```

What Next

Check the test_cell function and scan pin, remove the scan pin in function description.

LBDB-973

(error) Attribute '%s' should be '%s',\n \t\twhich is conflict with user sepcified info.

Description

For multibit scan cell with dedicated scan output pin, user should specify attribute "scan_start_pin" to indicate the scan chain direction, and attribute "scan_pin_inverted" to indicate if the scan signal shifting between sequential elements is inverted. In the mean time, LC will also auto-derive these two attributes. For each MB scan cell with auto-derived scan_start_pin/scan_pin_inverted, if user also specifies these attributes explicitly, a consistency check will be performed. This message reports the conflict if the user-given values are different from the derived values.

The following example shows an instance where this message occurs:

```
cell(test) {

  ...
  statetable (" D  CP  SE  SI " ,         "IQ IQN" )
    { table : " -  ~R     -    -  : - - :  N  N ,   \
                H/L  R     L   -  : - - : H/L H/L,  \
                 -   R   H  H/L  : - - : H/L L/H";
    }

  bundle(Q){
    scan_start_pin : Q1; /* This is wrong, should be Q0 */
    scan_pin_inverted : true;

    pin(Q0) {
      internal_node : "IQ" ;
      input_map : " D0  CP  SE  SI";
      ...
    }
    pin(Q1) {
      internal_node : "IQ" ;
      input_map : " D1  CP  SE  Q0";}
      ...
    }
    ...
```

```
  }
  pin(SO) {
    state_function : "SE * Q1" ;
    ...
  }
  ...
}
```

The attribute "scan_start_pin" should be "Q0"

The following is an example message:

```
Error: Line 437, Cell 'test', pin 'Q', Attribute 'scan_start_pin' should
 be 'Q0',
        which is conflict with user sepcified info.  (LBDB-973)
```

What Next

Check library file, correct attribute "scan_start_pin" and "scan_pin_inverted"

LBDB-974

(warning) The logic represented by the '%s' attribute (%s)\n \tis not equal or a subset of the logic represented by the '%s' attribute (%s)

Description

This error message indicates that the 'char_when', 'char_when_rise' or 'char_when_fall' attribute should be equal or a subset of the "when" attribute.

The following example shows an instance where this message occurs: The following example results in this warning. The "char_when" condition "A" in the receiver_capacitance is a superset of the "when" condition "A*B".

```
cell(bad) {
      Pin (A) {
         receiver_capacitance () {
            when : "A*B";
            char_when : "A";
            ...
         }
         ...
      }
      ...
   }
```

The following is an example message:

```
Warning: Line 84, The logic represented by the 'char_when' attribute (A)
        is not equal or a subset of the logic represented by the 'when'
 attribute (A*B). (LBDB-974)
```

Feedback

What Next

Check the library source file, and correct the incorrect attribute.

LBDB-975

(information) The "scan_start_pin" attribute is not needed for multi-bit function extraction and is ignored.

Description

This message indicates that the multi-bit scan cell can derive the mulbit-bit mapping info from cell function, attribute "scan_star_pin" is useless and should be removed from the cell. Attribute 'scan_start_pin' is only needed in multi-bit scan cell with single-bit scan output pin.

The following example shows an instance where this message occurs:

```
cell (test) {
  ...
  statetable (" D  CP SE SI ",         "QN   QT") {
     table : "  - ~R   -  -  : -  - :  N    N, \
                H/L R   L  -  : -  - : L/H  L/H, \
                  -  R   H H/L : -  - : L/H  H/L";
  }
  bundle(QN) {
    members (QN1, QN2);
    direction : output;
    scan_start_pin : QN1;
    ...
    pin(QN1) {
      internal_node : "QN";
      input_map : "D1 CP SE SI";
      max_capacitance : 0.0724592;
    }
    pin(QN2) {
      internal_node : "QT";
      input_map : "D2 CP SE QN1";
      max_capacitance : 0.0724218;
    }
  }

  /* no single-bit scan output pin */

  ...
}
```

The following is an example message:

```
Information: Line 303, Cell 'test', The "scan_start_pin" attribute is not
 needed for multi-bit function extraction and is ignored. (LBDB-975)
```

Feedback

What Next

Check the library source file, and remove attribute "scan_start_pin".

LBDB-976

(Warning) The multi-bit retention cell should be modeled with\n \treference_input attribute for multi-bit pin mapping.

Description

The mutli-bit retention scan cell must be modeled with 1-pair of sequential groups and reference_input, then the 1-pair of sequential can be used for the slice modeling for function processing. Warning if it is wrongly modeled with N-pairs sequential groups.

The multi-bit cell function cannotbe recognized by Design Compiler during banking/de-banking flow.

The following example shows an instance where this message occurs:

```
cell(test) {
  ...
    latch(iq1_1,iqn1_1) {
      enable : "(CK * RET)'" ;
      data_in : "D[0] * !SE + SI * SE" ;
      power_down_function : "!VDD+VSS" ;
    }
    latch(iq1_2,iqn1_2) {
      enable : "(CK * RET)" ;
      data_in : "iq1_1" ;
      power_down_function : "!VDDB+VSS" ;
    }
    latch(iq2_1,iqn2_1) {
      enable : "(CK * RET)'" ;
      data_in : "D[1] * !SE + iq1_2 * SE" ;
      power_down_function : "!VDD+VSS" ;
    }
    latch(iq2_2,iqn2_2) {
      enable : "(CK * RET)" ;
      data_in : "iq2_1" ;
      power_down_function : "!VDDB+VSS" ;
    }
    bundle(Q) {
   members(Q[0], Q[1]);
   direction : output ;
   pin(Q[0]) {
    function : iq1_2;
        ...
   }
   pin(Q[1]) {
    function : iq2_2;
```

```
        ...
    }
  }
  ...
}
```

In this case, the cell is using 2 pairs of latch groups (4 latches), which can't be analyaze in function processing. User should correct the cell modeling with 1-pair of latch groups and reference_input as below.

```
cell(test) {
  ...
    latch("pa pb", iq1, iqn1) {
      enable : "(CK * RET)'" ;
      data_in : "pa * !SE + pb * SE" ;
    power_down_function : "!VDD+VSS" ;
    }
    latch("pc", iq2, iqn2) {
      enable : "(CK * RET)" ;
      data_in : "pc" ;
    power_down_function : "!VDDB+VSS" ;
    }
   bundle(Q) {
   members(Q[0], Q[1]);
   direction : output ;
   pin(Q[0]) {
    function : iq2;
        reference_input : "QT[0]";
   }
   pin(Q[1]) {
    function : iq2;
        reference_input : "QT[1]";
   }
  }
    bundle(QT) {
   members(QT[0], QT[1]);
      direction : internal;
      pin(QT[0]) {
        reference_input : "D[0] SI";
        function : iq1;
      }
      pin(QT[1]) {
        reference_input : "D[1] Q[0]";
        function : iq1;
      }
    }
  ...
}
```

Feedback

The following is an example message:

```
Warning: Line 32, Cell 'MB2_scan_retention_1control_master_slave_design',
 The multi-bit retention cell should be modeled with
 reference_input attribute for multi-bit pin mapping. (LBDB-976)
```

What Next

Check the cell function, correct the cell modeling with reference_input.

LBDB-977

(warning) In attribute '%s', CCB groups '%s' and '%s' have different values for related_ccb_node.

Description

related_ccb_node of the CCB noise stages specified in propagating_ccb should be identical.

The following example shows an instance where this message occurs:

```
library(test) {
  cell (flop) {
    ...
    pin (CP) {
      ...
      input_ccb("CCB_CP2") {
        related_ccb_node : "net3:3";
      }
      ...
    }
    pin (Q) {
      ...
      output_ccb("CCB_Q1") {
        related_ccb_node : "net7:5";
      }
      timing () {
        related_pin : CP;
        active_input_ccb ("CCB_CP1");
        propagating_ccb("CCB_CP2", "CCB_Q1");
      }
      ...
    }
    ...
  }
}
```

The following is an example message:

```
Warning: Line 32, In attribute 'propagating_ccb', CCB groups 'CCB_CP2'
 and
 'CCB_Q1' have different values for related_ccb_node.
```

What Next

Use same values for the related_ccb_node of the CCB noise stages specified in propagating_ccb.

LBDB-978

(error) Old CCSN stage noise model cannot co-exist with new CCB noise model.

Description

If the presence of input_ccb or output_ccb is detected, the library is assumed to use the new CCB format. Any ccsn_first_stage or ccsn_last_stage will trigger an error.

The following is an instance where this error occurs:

```
library (test) {
  ...
  cell (flop) {
    pin (D) {
      input_ccb("CCB_D1") {
        is_needed : true;
        related_ccb_node : "net1:5";
      }
      ccsn_first_stage() {
        is_needed : true;
        related_ccb_node : "net1:5";
      }
    }
  }
  ...
}
```

The following is an example message:

```
Error: Line 9, Cell 'flop', pin 'D', Old CCSN stage noise model cannot
 co-exist
with new CCB noise model. (LBDB-978)
```

What Next

Use either old CCSN stage noise model or new CCB noise model.

Feedback

LBDB-979

(warning) attribute '%s'. '%s' stage at\ line %u has a value (%g) in '%s/vector/%s' (line %u) that does\ not match any values of '%s' in '%s' at line %u.

Description

In the referenced ccs noise data modeling, output_voltage_rise and output_voltage_fall are characterized in ways to be closer to timing behavior. Their "input slew" (vector/index_1) and "output load" (vector/index_2) values form a 2D grid, similar to various timing lookup tables.

To best match timing behavior, the ccb's referenced by the 'propagating_ccb' attribute need to meet the following guideline on input slew and output load values:

The starting/ending values must match those of NLDM delay data (cell_rise/cell_fall). See LBDB-980

Intermediate values may be sparse, but they have to match some entries in the delay data.. This message, LBDB-979, addresses the mimsatch.

Note that there is a different requirement one the output load of input_ccb in an input_ccb/output_ccb two-stage configuration. See LBDB-588.

The following example shows an instance where this message occurs:

```
library(test) {
  ...
  normalized_driver_waveform(ndw1) {
    driver_waveform_name : "driver_waveform_default_fall" ;
    index_1("0.003209, 0.0133113, 0.033516, 0.0726625, 0.152218,
 0.31133");
    ...
  }
  ...
  cell (flop) {
    ...
    pin(A) {
      ...
      driver_waveform_fall : driver_waveform_default_fall ;
      ...
      input_ccb(ccb1) {
        ...
        output_voltage_fall() {
          vector(vec1) {
            index_1("0.013209");
            ...
          }
          ...
        }
        ...
```

Feedback

```
        }
      ...
      }
      pin (Y) {
        ...
        timing() {
          related_pin : "A" ;
          ...
          propagating_ccb(ccb1, ccb2);
        }
        ...
      }
      ...
    }
}
```

Examples

Warning: Line 10287, Cell 'xyz', pin 'nx2', attribute 'propagating_ccb'. 'input_ccb' stage at line 2321 has a value (0.005) in 'output_voltage_rise/vector/index_1' (line 2380) that does not match any values of 'index_1' in 'cell_fall' at line 9728. (LBDB-979)

What Next

Correct the characterization procedure.

LBDB-980

(warning) attribute '%s'. '%s' stage at line %u has a %s value (%g) in '%s/vector/%s' (line %u) that does not match the %s value of '%s' in '%s' at line %u.

Description

In the referenced ccs noise data modeling, output_voltage_rise and output_voltage_fall are characterized in ways to be closer to timing behavior. Their "input slew" (vector/index_1) and "output load" (vector/index_2) values form a 2D grid, similar to various timing lookup tables.

To best match timing behavior, the ccb's referenced by the 'propagating_ccb' attribute need to meet the following guideline on input slew and output load values:

The starting/ending values must match those of NLDM delay data (cell_rise/cell_fall). This message, LBDB-980, addresses the mismatch.

Intermediate values may be sparse, but they have to match some entries in the delay data. See LBDB-979.

Note that there is a different requirement one the output load of input_ccb in an input_ccb/output_ccb two-stage configuration. See LBDB-588.

Feedback

The following example shows an instance where this message occurs:

```
library(test) {
  ...
  normalized_driver_waveform(ndw1) {
    driver_waveform_name : "driver_waveform_default_fall" ;
    index_1("0.003209, 0.0133113, 0.033516, 0.0726625, 0.152218");
    ...
  }
  ..
  cell (flop) {
    ...
    pin(A) {
      ...
      driver_waveform_fall : driver_waveform_default_fall ;
      ...
      input_ccb(ccb1) {
        ...
        output_voltage_fall() {
          vector(vec1) {
            index_1("0.002209");
            ...
          }
          ...
        }
        ...
    }
    ...
    pin (Y) {
      ...
      timing() {
        related_pin : "A" ;
        ...
        propagating_ccb(ccb1, ccb2);
      }
      ...
    }
    ...
  }
}
```

Examples

Warning: Line 7492, Cell 'xyz', pin 'nx2', attribute 'propagating_ccb'. 'input_ccb' stage at line 488 has a min value (0.005) in 'output_voltage_rise/vector/index_1' (line 561) that does not match the first value of 'index_1' in 'cell_fall' at line 6933. (LBDB-980)

What Next

Correct the characterization procedure.

Feedback

LBDB-981

(warning) For the referenced ccs noise data modeling, each delay timing arc needs to have valid CCB model.

Description

```
For the referenced ccs noise data modeling, each delay timing arc needs
 to have:
1.  at least one active input_ccb which is being referenced by
 active_input_ccb
or propagating_ccb
2.  one or two active output_ccb which is being referenced by
 active_output_ccb
or propagating_ccb, in case of two output_ccb, one is of
 stage_type:pull_up, the
other is of stage_type:pull_down
If any of above is not satisfied, the warning is issued.
```

The following example shows an instance where this message occurs:

```
library(test981) {
  ...
  cell(BUF) {
    pin(Z) {
      timing() {
      }
      output_ccb(BUFX) {
      ...
      }
    }
  }
}
```

The following is an example message:

```
Warning: Line 223, Cell 'BUF', pin 'Z', For the referenced ccs noise data
modeling, each delay timing arc needs to have valid CCB model. (LBDB-981)
```

What Next

Resolve the issue by providing appropriate CCB combinations for each timing.

LBDB-982

(warning) is a '%s' class retention pin but is missing all recommended attributes.

Description

This message occurs in either of following situations: 1. Missing following 'save' related retention attributes in a save class retention pin. save_action save_condition

Feedback

1. Missing following 'restore' related retention attributes in a restore class retention pin. restore_action restore_condition restore_edge_type
2. Missing following 'save' or 'restore' related retention attributes in a save_restore class retention pin. save_action save_condition restore_action restore_condition restore_edge_type

The following example shows an instance where this message occurs: In the following example, this pin is a *save* class retention pin, but retention attributes *save_action* and *save_condition* are missing. To correct the problem, add both *save_action* and *save_condition* in this retention pin.

```
cell(retention_dff) {
  ...
  retention_cell : "my_retention_dff";

  pin(SAVE) {
    retention_pin (save, 1);
    /* save_action : L; */
    /* save_condition : CK; */
  }

}
```

The following is an example message: The above example results in the following error message:

```
Warning: Line 192, Cell 'retention_dff', Pin 'SAVE', is a 'save' class
 retention pin but is missing all recommended attributes.(LBDB-982)
```

What Next

Resolve the issue by add the missing retention attributes in the retention pin.

LBDB-983

(warning) Found inconsistency between attribute '%s' and retention pin disable value.

Description

Retention pin disable value and save_action/restore_action must be consistent as below: 1. For a save class retention pin When save_action is "L" or "R", disable value should be "1" When save_action is "H" or "F", disable value should be "0" 2. For a restore class retention pin When restore_action is "L", disable value should be "1" When restore_action is "H", disable value should be "0" When restore_action is "R", and restore_edge_type is "leading", disable value should be "0" When restore_action is "F", and restore_edge_type is "leading", disable value should be "1" When restore_action is "R", and restore_edge_type is "trailing" or missing, disable value should be "1" When

Feedback

restore_action is "F", and restore_edge_type is "trailing" or missing, disable value should be "0"

The following example shows an instance where this message occurs: In the following example, this pin is a *save* class retention pin, and *save_action* is 'L', but the disable value is not '1'. To correct the problem, change disable value to '1'.

```
cell(retention_dff) {
  ...
  retention_cell : "my_retention_dff";

  pin(SAVE) {
    retention_pin (save, 0);
    save_action : L;
    save_condition : CK;
  }

}
```

The following is an example message: The above example results in the following error message:

```
Warning: Line 192, Cell 'retention_dff', Pin 'SAVE', Found inconsistency
 between attribute 'save_action' and retention pin disable
 value.(LBDB-983)
```

What Next

Resolve the issue by correct the save_action/restore_action attribute or retention pin disable value.

LBDB-984

(warning) Missing attribute required_condition under retention_condition group of the zero-pin retention cell, this cell will be black-box for multi-voltage functional flow. It is marked as dont_touch and dont_use.

Description

```
For zero-pin retention cell, user must specify group retention_condition
and sub-attribute required_condition, otherwise the cell will be marked
as black-box.
This attribute is important to client tools in power opimization flow.
```

The following example shows an instance where this message occurs:

```
library(test) {
 ...
  cell (zpr) {
    ...
    latch(IQ1,IQN1) {
```

Feedback

```
      enable : "!clk" ;
      data_in : "d" ;
      power_down_function : "!vcc+vss" ;
    }
    latch(IQ2,IQN2) {
      enable : "clk" ;
      data_in : "IQ1" ;
      power_down_function : "!vcc_in+vss" ;
    }

    retention_condition() {
      /* required_condition : "!clk"; */
      power_down_function : "!vcc+vss" ;
    }

    ...
  }
}
```

The following is an example message:

```
Warning: Line 3, Cell 'zpr', Missing attribute required_condition under
 retention_condition group
of the zero-pin retention cell, this cell will be black-box for
 multi-voltage
functional flow. It is marked as dont_touch and dont_use. (LBDB-984)
```

What Next

```
Add the missing retention_condition and sub-attribute required_condition
```

LBDB-985

(error) The pin '%s' specified in required_condition attribute should be an input signal pin powered by backup power or backup ground.

Description

```
For zero-pin retention cell, the pins specified in required_condition
 attribute
must be input signal pins powered by backup_power or backup_ground.

For other types of retention cell (like 1-pin or 2-pin), the pins
 specified in
required_condition attribute must be retention pins, or input signal pins
 powered by
backup_power or backup_ground.
```

The following example shows an instance where this message occurs:

```
library(test) {
 ...
```

Feedback

```
  cell (zpr) {
    ...
    pin(clk) {
      direction : input ;
      related_ground_pin : VSS ;
      related_power_pin : VDD_BAK ;
      ...
    }

    pin(d) {
      direction : input ;
      related_ground_pin : VSS ;
      related_power_pin : VDD ;
      ...
    }

    latch(IQ1,IQN1) {
      enable : "!clk" ;
      data_in : "d" ;
      power_down_function : "!VDD+VSS" ;
    }
    latch(IQ2,IQN2) {
      enable : "clk" ;
      data_in : "IQ1" ;
      power_down_function : "!VDD_BAK+VSS" ;
    }

    retention_condition() {
      required_condition : "!clk + d"; /* d is incorrect */
      power_down_function : "!VDD+VSS" ;
    }

    ...
  }
}
```

The following is an example message:

```
Error: Line 3, Cell 'zpr', The pin 'd' specified in required_condition
 attribute should be
 an input signal pin powered by backup power or backup ground. (LBDB-985)
```

What Next

```
Add correct pins specified in required_condition under
 retention_condition group of the cell.
```

LBDB-986

(warning) The '%s' pin '%s' specified in required_condition attribute is not using the '%s' value.

Feedback

Description

```
For zero-pin retention cell, the clock pin logic in required_condition
 must be
the disable value.
For zero-pin retention cell, the async preset/clear pin logic in
 required_condition
must be the inactive value.

For 2-pin retention cell, the "save" signal logic in required_condition
 must using
the disable value.
For 1-pin retention cell, the "save_restore" signal logic in
 required_condition must using
the enable value.
```

The following example shows an instance where this message occurs:

```
library(test) {
 ...
  cell (zpr) {
    ...
    pin(clk) {
      direction : input ;
      related_ground_pin : vss ;
      related_power_pin : vcc_in ;
      ...
    }

    latch(IQ1,IQN1) {
      enable : "!clk" ;
      data_in : "d" ;
      power_down_function : "!vcc+vss" ;
    }
    latch(IQ2,IQN2) {
      enable : "clk" ;
      data_in : "IQ1" ;
      power_down_function : "!vcc_in+vss" ;
    }

    retention_condition() {
      required_condition : "clk"; /* "clk" is incorrect, should be "clk"
 */
      power_down_function : "!vcc+vss" ;
    }

    ...
  }
}
```

Feedback

The following is an example message:

```
Warning: Line 3, Cell 'zpr', The 'clock' pin 'clk' specified in
 required_condition attribute is not using the 'disable' value.
 (LBDB-986)
```

What Next

```
Add correct the pin logic specfied in required_condition of
 retention_condition.
```

LBDB-987

(warning) Can't find '%s' in zero-pin retention cell.

Description

```
Zero-pin retention cell with master-slave latches must have an alive
 latch
to save data in the retention mode.

The alive latch is the latch contains backup power or backup ground
in its power_down_function.

For zero-pin retention cell modeled with ff grorup, the ff group also
 needs
power_down_function attribute with backup power or backup ground.
```

The following example shows an instance where this message occurs:

```
library(test) {
 ...
  cell (zpr) {
    ...
    pin(clk) {
      direction : input ;
      related_ground_pin : vss ;
      related_power_pin : vcc_in ;
      ...
    }

    latch(IQ1,IQN1) {
      enable : "!clk" ;
      data_in : "d" ;
      power_down_function : "!vcc+vss" ;
    }
    latch(IQ2,IQN2) {
      enable : "clk" ;
      data_in : "IQ1" ;
      power_down_function : "!vcc+vss" ;  /* should be "!vcc_in + vss" */
    }
```

```
    retention_condition() {
      required_condition : "!clk";
      power_down_function : "!vcc+vss" ;
    }

    ...
  }
}
```

The following is an example message:

```
Warning: Line 3, Cell 'zpr', Can't find 'alive latch' in zero-pin
 retention cell.
```

What Next

```
Add or correct the power_down_function in the ff/latch group.
```

LBDB-988

(error) Can't specify "retention_pin" attribute in zero-pin retention cell.

Description

```
Zero-pin retention cell is a retention cell with no retention pin.
User cannot specify "retention_pin" attribute on clock pin.
```

The following example shows an instance where this message occurs:

```
library(test) {
 ...
  cell (zpr) {
    ...
    pin(clk) {
      direction : input ;
      related_ground_pin : vss ;
      related_power_pin : vcc_in ;
      retention_pin(save_restore, 1); /* wrong attribute, should be
 removed */
      ...
    }

    latch(IQ1,IQN1) {
      enable : "!clk" ;
      data_in : "d" ;
      power_down_function : "!vcc+vss" ;
    }
    latch(IQ2,IQN2) {
      enable : "clk" ;
      data_in : "IQ1" ;
      power_down_function : "!vcc_in+vss" ;
    }
```

```
    retention_condition() {
      required_condition : "!clk";
      power_down_function : "!vcc+vss" ;
    }

    ...
  }
}
```

The following is an example message:

```
Error: Line 3, Cell 'zpr', Can't specify "retention_pin" attribute in
 zero-pin retention cell.
```

What Next

```
Remove the "retention_pin" attribute in this cell.
```

LBDB-989

(error) the cell has bad antenna diode type.

Description

This message means that value of attribute "antenna_diode_type" doesn't meet the following requirement.

(1) The cell is not an antenna cell. Antenna cell signal pin should be direction input or inout.

(2) If diode_cell_type is "power-ground", the signal pin must specify "antenna_diode_related_power_pins" and "antenna_diode_related_ground_pins".

If diode_cell_type is "power", the signal pin must specify "antenna_diode_related_power_pins".

If diode_cell_type is "ground", the signal pin must specify "antenna_diode_related_ground_pins".

The following is an example message:

```
Error: Line 1023, Cell 'ANTENNA', pin 'a', the cell has bad diode cell
 type. (LBDB-989)
```

What Next

Correct either the signal pin or "antenna_diode_type" attribute.

Feedback

LBDB-989w

(warning) the antenna cell has more than one signal pin. It is marked as dont_touch and dont_use.

Description

Antenna cell should have only one signal pin. This message means that this antenna cell has more than one signal pin, it is marked as dont_touch and dont_use, it can not be auto inferred by galaxy design tools (e.g. ICC1/ICC2 router).

The following is an example message:

```
Warning: Line 1023, Cell 'ANTENNA', the antenna cell has more than one
 signal pin. It is marked as dont_touch and dont_use. (LBDB-989w)
```

What Next

Correct either the signal pin or "antenna_diode_type" attribute.

LBDB-990

(error) the pin has bad antenna diode type.

Description

This message means that pin-level attribute "antenna_diode_type" doesn't meet the following requirement.

If antenna_diode_type is "power-ground", the signal pin must specify "antenna_diode_related_power_pins" and "antenna_diode_related_ground_pins".
If antenna_diode_type is "power", the signal pin must specify "antenna_diode_related_power_pins". If antenna_diode_type is "ground", the signal pin must specify "antenna_diode_related_ground_pins".

The following is an example message:

```
Error: Line 1023, Cell 'HM_MACRO', PIN 'Z', the pin has bad antenna diode
 type. (LBDB-990)
```

What Next

Correct attribute "antenna_diode_type".

LBDB-991

(error) attribute antenna_diode_type is defined in both cell and pin.

Feedback

Description

This message means the cell specifies attribute "antenna_diode_type", and one or more of its signal pins also specifies attribute "antenna_diode_type".

Cell-level attribute "antenna_diode_type" is used in a dedicated antenna diode cell, which basically has only one signal pin for static diffusion.

If a cell has a build-in diode port for static diffusion protection, this port should specify pin-level attribute "antenna_diode_type".

So cell-level attribute "antenna_diode_type" and pin-level attribute "antenna_diode_type" can't coexist in one cell.

The following is an example message:

```
Error: Line 1023, Cell 'ANTENNA', attribute "antenna_diode_type" is
 defined in both cell and pin. (LBDB-991)
```

What Next

Keep at most one "antenna_diode_type" attribute in this cell.

LBDB-992

(error) The '%s' related retention attributes can't be specified in a %s retention pin.

Description

This error message occurs in either of following situations: 1. user specifies following 'save/restore' related retention attributes in a non-retention pin. save_action save_condition restore_action restore_condition restore_edge_type 2. user specifies following 'save' related retention attributes in a restore class retention pin. save_action save_condition 3. user specifies following 'restore' related retention attributes in a save class retention pin. restore_action restore_condition restore_edge_type

Retention pin must have pin level attribute "retention_pin", and the retention pin class spcified in it must be consistent with retention attributes.

In the following example, this pin has *save_action* and *save_condition* attributes, but the retention pin class in *retention_pin* attribute is *restore* To correct the problem, either change the 'restore' to 'save' in the retention_pin attribute, or use 'restore' retention attribute instead of 'save' in this pin.

```
cell(retention_dff) {
  ...
  retention_cell : "my_retention_dff";

  pin(SAVE) {
    retention_pin (restore, 1);
```

Feedback

```
    save_action : L;
    save_condition : CK;
  }

}
```

The above example results in the following error message:

```
Error: Line 192, Cell 'retention_dff', Pin 'SAVE', The 'save' related
 retention attributes
  can't be specified in a restore class retention pin. (LBDB-992)
```

What Next

Resolve the issue by add/correct the *retention_pin* attribute, or use correct save/restore retetion attributes.

LBDB-993

(error) The pin '%s' specified in required_condition attribute should be a retention pin, or an input signal pin powered by backup power or backup ground.

Description

```
For zero-pin retention cell, the pins specified in required_condition
 attribute
must be input signal pins powered by backup_power or backup_ground.

For other types of retention cell (like 1-pin or 2-pin), the pins
 specified in
required_condition attribute must be retention pins, or input signal pins
 powered by
backup_power or backup_ground.
```

The following example shows an instance where this message occurs:

```
library(test) {
 ...
  cell (nonzpr) {
    ...
    pin(save) {
      direction : input ;
      retention_pin(save, "1");
      related_ground_pin : VSS ;
      related_power_pin : VDD_BAK ;
      ...
    }

    pin(d) {
      direction : input ;
      related_ground_pin : VSS ;
      related_power_pin : VDD ;
```

Feedback

```
      ...
    }

    latch(IQ1,IQN1) {
      enable : "!clk" ;
      data_in : "d" ;
      power_down_function : "!VDD+VSS" ;
    }
    latch(IQ2,IQN2) {
      enable : "clk" ;
      data_in : "IQ1" ;
      power_down_function : "!VDD_BAK+VSS" ;
    }

    retention_condition() {
      required_condition : "!save + d"; /* d is incorrect */
      power_down_function : "!VDD+VSS" ;
    }

    ...
  }
}
```

The following is an example message:

```
Error: Line 3, Cell 'nonzpr', The pin 'd' specified in required_condition
 attribute should be
a retention pin, or an input signal pin powered by backup power or backup
 ground. (LBDB-993)
```

What Next

```
Add correct pins specified in required_condition under
 retention_condition group of the cell.
```

LBDB-994

(error) In attribute '%s', The ccsn noise stage referenced is insufficient for this timing.

Description

The ccsn noise stage referenced(thereafter, "ccb") in active_output_ccb must be pull-up/down compatible with the timing. The valid ccb(s) with proper stage_type could be any one of the following:

1. when output of the timing could be rise and fall. (e.g. timing_type:"combinational")

1. one ccb with stage_type:both

2. two ccb's, one with stage_type:pull_up, the other with stage_type:pull_down

    a. when output of the timing always rise. (e.g. timing_type:"combinational_rise")

Feedback

3. one ccb with stage_type:both
4. one ccb with stage_type:pull_up
    a. when output of the timing always fall. (e.g. timing_type:"combinational_fall")
5. one ccb with stage_type:both
6. one ccb with stage_type:pull_down

The following example shows an instance where this message occurs:

```
library(test) {
    cell(INV) {
      pin(X) {
        direction : "output" ;
        ...
        output_ccb(o_rise) {
          stage_type : pull_up ;
          ...
        }
        timing() {
          timing_type : "combinational" ;
          ...
          active_output_ccb(o_rise);
        }
      }
    }
  }
```

The following is an example message:

```
Error: Line 3401, Cell 'INV', pin 'X', In attribute 'active_output_ccb',
 The
ccsn noise stage referenced is insufficient for this timing. (LBDB-994)
```

What Next

Provide the valid ccb(s) accordingly.

LBDB-995

(error) it's not allowed to specify both intrinsic_capacitance and total_capacitance in macro cell intrinsic_parasitic group.

Description

If cell is macro cell, user can specify only intrinsic_capacitance or total_capacitance, but not both.

Feedback

The following example shows an instance where this message occurs:

```
cell (my_macro_cell) {
  ...
  power_cell_type : macro;
  intrinsic_parasitic() {
    when : "A1";
    total_capacitance(V2) {
       value : 9.0;
    }
    intrinsic_capacitance(G1) {
       value : 62.2;
    }
  }
}
```

In this case, cell 'my_macro_cell' is a macro cell, both total_capacitance and intrinsic_capacitance are specified in intrinsic_parasitic. So error message LBDB-995 will be issued.

The following is an example message:

```
Error: Line 115, Cell 'my_macro_cell', it's not allowed to specify
 both intrinsic_capacitance and total_capacitance in macro cell
 intrinsic_parasitic group. (LBDB-995)
```

What Next

Remove intrinsic_capacitance or total_capacitance group.

LBDB-996

(error) The timing arc's fpga_arc_condition attribute contains \n \tinvalid format '%s.%s'.

Description

This message indicates that you specified invalid <pin_name>.<pin_status> or <fpga_cond_name>.<fpga_cond_value_name> in the fpga_arc_condition attribute of the timing arc.

The following example shows an instance where this message occurs:

```
cell(test) {

  ...
  pin(A) {
        ...
  }
  pin(B) {
        ...
        timing() {
                ...
```

```
                fpga_arc_condition: "wrong_pin.CONNECTED";
                ...
        }
        ...
  }
  ...
}
```

We can correct it by replace "wrong_pin" with "A".

The following is an example message:

```
Error: Line 206, The timing arc's fpga_arc_condition attribute contains
        invalid format 'wrong_pin.CONNECTED'. (LBDB-996)
```

What Next

Modify <A>.<B> to make it as a valid <pin_name>.<pin_status> or <fpga_cond_name>.<fpga_cond_value_name>.

LBDB-997

(warning) The fpga_condition(%s) group is defined\n \tmultiple times.

Description

This message indicates that you specified the same fpga_condition group multiple times. Only the last one is retained.

The following example shows an instance where this message occurs:

```
cell(CGNP) {
  area : 1;

  fpga_condition(cond1) {
    ...
  }
  fpga_condition(cond1) {
    ...
  }
  ...
}
```

The following is an example message:

```
Warning: Line 206, The fpga_conditino(cond1) group is defined
        multiple times. (LBDB-997)
```

What Next

Change the group name, or delete the duplicated group.

Feedback

LBDB-998

(error) The fpga condition '%s' has no values defined.

Description

A fpga_condition group must have at least one fpga condition value defined.

The following example shows an instance where this message occurs:

```
cell(CGNP) {
  area : 1;
  fpga_condition(cond1) {
  }
  ...
}
```

The following is an example message:

```
Error: Line 206, The fpga condition 'cond1' has no values defined.
 (LBDB-998)
```

What Next

Define the fpga condition values.

LBDB-999

(warning) The fpga_condition_value(%s) group is defined\n \tmultiple times.

Description

This message indicates that you specified the same fpga_condition_value group multiple times. Only the last one is retained.

The following example shows an instance where this message occurs:

```
cell(CGNP) {
  area : 1;

  fpga_condition(cond1) {
    fpga_condition_value(normal) {
      fpga_arc_condition : "operation_mode=normal";
    }
    fpga_condition_value(normal) {
      fpga_arc_condition : "operation_mode=arithmetic";
    }
  }
}
```

The following is an example message:

```
Warning: Line 206, The fpga_condition_value(normal) group is defined
        multiple times. (LBDB-999)
```

What Next

Change the group name, or delete the duplicated group.

LBDB-1000

(error) The fpga_arc_condition attribute is not specified\n \tfor the fpga_condition_value.

Description

This message indicates that you have not specified fpga_arc_condition attribute within fpga_condition_value.

The following example shows an instance where this message occurs:

```
cell(CGNP) {
  area : 1;
  fpga_condition(cond1) {
    fpga_condition_value(normal) {
      fpga_arc_condition : "operation_mode=normal";
    }
  }
  ...
}
```

The following is an example message:

```
Error: Line 206, The fpga_arc_condition attribute is not specified for
 the
        fpga_condition_value. (LBDB-1000)
```

What Next

Add the missing fpga_arc_condition attribute.

LBDB-1001

(error) Found one or more cells defined before '%s' group.

Description

This message indicates the named group in phys_library is not defined before all cell groups.

Feedback

The following example shows an instance where this message occurs:

```
phy_library(test) {
        ...
        macro (cell1) {
         ...
        }
        resource ( std_cell ) {
          ...
        }
    }
```

The following is an example message:

```
Error: Line 59, Found one or more cells defined before 'resource' group.
 (LBDB-1001)
```

What Next

Move this group inside the physical library so that it is defined in front of all cell groups.

LBDB-1002

(error) The resource name is not supported.

Description

Library Compiler accepts resource with the following names: - std_cell - array

This message indicates the resource group is using a name other than mentioned above.

The following example shows an instance where this message occurs:

```
phys_library(test) {
        ...
        resource ( wrong_name ) {               /* ERROR */
          ...
        }
    }
```

The following is an example message:

```
Error: Line 5, The resource name is not supported. (LBDB-1002)
```

What Next

Change the resource group name to either "std_cell" or "array".

LBDB-1003

(error) The resource group does not contain any layer definition.

Feedback

Description

Library Compiler requires that one or more layer definition be defined in the resource group. A layer definition can be one of the following functions / groups: - device_layer - contact_layer - overlap_layer - routing_layer

This message indicates there is none of the above defined in the resource group.

The following example shows an instance where this message occurs:

```
phys_library(test) {
        resource ( std_cell ) {          /* ERROR */
        }
        ...
    }
```

The following is an example message:

```
Error: Line 3, The resource group does not contain any layer definition.
 (LBDB-1003)
```

What Next

Add layer information into resource group.

LBDB-1004

(error) The resource group does not contain any site / tile definition.

Description

Library Compiler requires that one or more site / tile groups be defined in the resource group.

This message indicates there is neither any site nor any tile groups defined in the resource group.

The following example shows an instance where this message occurs:

```
phys_library(test) {
        resource ( std_cell ) {          /* ERROR */
        }
        ...
    }
```

The following is an example message:

```
Error: Line 3, The resource group does not contain any site / tile
 definition. (LBDB-1004)
```

Feedback

What Next

Add site information into resource group.

LBDB-1005

(warning) Found a duplicate %s attribute. Using the first value.

Description

This message indicates an attribute has been defined twice. The second definition is ignored.

The following example shows an instance where this message occurs:

```
phys_library(test) {
        ...
        macro(and2) {
          ...
        }
        macro(and2a) {
          ...
        }
        macro(and2a1) {
          ...
          eq_cell : and2a;
          eq_cell : and2;
          ...
        }
    }
```

The following is an example message:

```
Warning: Line 34, Found a duplicate eq_cell attribute. Using the first
 value. (LBDB-1005)
```

What Next

Remove the duplicate definition of the attribute.

LBDB-1006

(error) Cannot accept the '%s' pin as the logically equivalent pin.

Description

This message indicates the eq_pin attribute value is an unacceptable pin name. An unacceptable eq_pin is defined as either - a name equivalent to the current pin name; or - a pin that is not already defined.

Feedback

The following example shows an instance where this message occurs:

```
phys_library(test) {
        ...
        macro(and2) {
          ...
          pin(a) {
            eq_pin : a1;        /* error */
            ...
          }
          pin(a1) {
          }
        }
    }
```

The following is an example message:

```
Error: Line 34, Cannot accept the 'a1' pin as the logically equivalent
 pin. (LBDB-1006)
```

What Next

Check the pin name and change it. Also make sure the pin specified in the eq_pin attribute is pre-defined.

LBDB-1007

(error) The %s name '%s' is an undefined layer name.

Description

This message indicates the obs / geometry group name is not a legal layer name.

The following example shows an instance where this message occurs:

```
phys_library(test) {
        ...
        macro(and2) {
          ...
          pin(a) {
            ...
            obs(new_layer) {    /* error */
              ...
            }
          }
        }
    }
```

The following is an example message:

```
Error: Line 34, The obs name 'new_layer' is an undefined layer name.
 (LBDB-1007)
```

Feedback

What Next

Use a pre-defined layer name as the name for the obs / geometry group.

LBDB-1008

(error) The %s function has inconsistent number of arguments.

Description

This message indicates the path / polygon / rectangle function has wrong number of arguments. In Library Compiler, - a path function requires odd number of arguments no less than 3; - a polygon function requires even number of arguments no less than 8; - a rectangle function requires 4 arguments.

The following example shows an instance where this message occurs:

```
phys_library(test) {
        ...
        macro(and2) {
          ...
          pin(a) {
            ...
            obs(new_layer) {
              rectangle(0.1, 0.3);  /* error */
            }
          }
        }
    }
```

The following is an example message:

```
Error: Line 34, The rectangle function has inconsistent number of
 arguments. (LBDB-1008)
```

What Next

Make sure the right argument is used for each function.

LBDB-1009

(error) Non-positive number found in the size function.

Description

This message indicates either the width or the height of the size function is a non-positive number.

Feedback

The following example shows an instance where this message occurs:

```
phys_library(test) {
        ...
        macro(and2) {
          ...
          size (-1.5, 2.0);       /* error */
        }
    }
```

The following is an example message:

```
Error: Line 34, Non-positive number found in the size function.
 (LBDB-1009)
```

What Next

Make sure both width or height of the size function are positive numbers.

LBDB-1010

(error) The site '%s' is not defined in the resource group.

Description

This message indicates name of the site attribute is not a pre-defined site.

The following example shows an instance where this message occurs:

```
phys_library(test) {
        ...
        macro(and2) {
          ...
          site : new_site;       /* error */
        }
    }
```

The following is an example message:

```
Error: Line 34, The site 'new_site' is not defined in the resource group.
 (LBDB-1010)
```

What Next

Make sure the site attribute uses a pre-defined site.

LBDB-1011

(error) Cannot accept the '%s' macro as the equivalent cell.

Feedback

Description

This message indicates the eq_cell attribute value is an unacceptable macro name. An unacceptable macro name is defined as either - a name equivalent to the current macro name; or - a macro that is not already defined.

The following example shows an instance where this message occurs:

```
phys_library(test) {
        ...
        macro(and2a1) {
          ...
          eq_cell : and2;               /* error */
          ...
        }
        macro(and2) {
          ...
        }
    }
```

The following is an example message:

```
Error: Line 34, Cannot accept the 'and2' macro as the electrically
 equivalent cell. (LBDB-1011)
```

What Next

Check the macro name and change it. Also make sure the macro specified in the eq_cell attribute is pre-defined.

LBDB-1012

(error) The layer name, '%s', in the '%s' group is not unique.

Description

Each via group can specify up to 3 geometry groups with the 'layer1', 'contact' and 'layer2' groups. The name of each group gives the name of the layer on which all geometry shapes are defined. The 3 geometry groups must be defined on different layers. This error message indicates that 2 or more geometry groups are specified on the same layer.

The following example shows an instance where this message occurs:

```
phys_library(test) {
        ...
        resource(std_cell) {
          ...
          via (test) {
            ...
            layer1(met1) {
                ...
```

```
            }
            contact(con1) {
                ...
            }
            layer2(met1) {      /* error */
                ...
            }
          ...
          }
        }
    }
```

The following is an example message:

```
Error: Line 34, The layer name, 'met1', in the 'layer2' group is not
 unique. (LBDB-1012)
```

What Next

Check the layer names on the 'layer1', 'contact' and 'layer2' groups and make sure they call for different layer names.

LBDB-1013

(error) The %s function has inconsistent number of arguments.

Description

This message indicates the via / via_iterate function has wrong number of arguments. In Library Compiler, - a via function requires 3 arguments: a name followed by x / y coordinates; - a via_iterate function requires 7 arguments: 2 integers (for x-iteration and y-iteration), 2 real numbers (for x-spacing and y-spacing), a name and another 2 real numbers for the first x / y coordinates.

The following example shows an instance where this message occurs:

```
phys_library(test) {
        ...
        macro(and2) {
          ...
          pin(a) {
            ...
            obs(new_layer) {
              via(0.1, 0.3);  /* error */
            }
          }
        }
    }
```

Feedback

The following is an example message:

```
Error: Line 34, The via function has inconsistent number of arguments.
 (LBDB-1013)
```

What Next

Make sure the right argument is used for each function.

LBDB-1014

(error) The via group does not have a 'contact' group.

Description

Each via group is required to have a 'contact' group defined for the geometry in the contact layer. This error message indicates that the 'contact' group is missing from the current via group.

The following example shows an instance where this message occurs:

```
phys_library(test) {
        ...
        resource(std_cell) {
          ...
          via (test) {  /* error */
            layer1(met1) {
                ...
            }
            layer2(met2) {
                ...
            }
          ...
          }
        }
    }
```

The following is an example message:

```
Error: Line 34, The via group does not have a 'contact' group.
 (LBDB-1014)
```

What Next

Make sure the 'contact' group is defined in current 'via' group.

LBDB-1015

(error) One or more rectangles are required in this group.

Feedback

Description

The 'layer1', 'contact' and 'layer2' sub-groups inside a 'via' group define the geometry shapes for the via. This error message indicates that the current sub-group has no rectangle specified.

The following example shows an instance where this message occurs:

```
phys_library(test) {
        ...
        resource(std_cell) {
          ...
          via (test) {
            layer1(con1) { }    /* error */
            ...
          }
        }
    }
```

The following is an example message:

```
Error: Line 34, One or more rectangles are required in this group.
 (LBDB-1015)
```

What Next

Make sure there are at least 1 rectangle defined in the current sub-group. Otherwise, remove the sub-group altogether.

LBDB-1016

(error) The routing_grid function has inconsistent number of arguments.

Description

This message indicates the routing_grid function has wrong number of arguments. In Library Compiler, - a routing_grid function requires 6 arguments: x-starting-coordinate, number-of-columns, x-space, y-start-coordinate, number-of-rows, y-space.

The following example shows an instance where this message occurs:

```
phys_library(test) {
      ...
      array(ABC) {
        routing_grid(100, 200);
        ...
      }
      ...
    }
```

Feedback

The following is an example message:

```
Error: Line 34, The routing_grid function has inconsistent number of
 arguments. (LBDB-1016)
```

What Next

Make sure the right arguments are used for each function.

LBDB-1017

(error) The floorplan group contains mismatching site_array group.

Description

This message indicates that either: - the default floorplan (with no given name) is missing site_array with "regular" placement_rule; or - the non-default floorplan contains site_array with "regular" placement_rule.

The default floorplan should contain one or more "regular" site_array groups. The non-default floorplan should not contain any "regular" site_array group.

The following example shows an instance where this message occurs:

```
phys_library(test) {
      ...
      array(ABC) {
        floorplan() {
          site_array(new) {
            placement_rule : can_place;
            ...
          }
        }
        ...
      }
      ...
    }
```

The following is an example message:

```
Error: Line 34,  The floorplan group contains mismatching site_array
 group.  (LBDB-1017)
```

What Next

Check all site_array groups under the current floorplan and make sure the above rules are followed.

Feedback

LBDB-1018

(warning) The floorplan group does not contain can_place/cannot_occupy\n \t site_array groups.

Description

This message indicates that the current floorplan group only contain site_array groups with "regular" placement_rule.

The following example shows an instance where this message occurs:

```
phys_library(test) {
      ...
      array(ABC) {
        floorplan() {
          site_array(new) {
            placement_rule : regular;
            ...
          }
        }
        ...
      }
      ...
    }
```

The following is an example message:

```
Warning: Line 34,  The floorplan group does not contain
 can_place/cannot_occupy
                 site_array groups.  (LBDB-1018)
```

What Next

Make sure this is the correct physical library technology data.

LBDB-1019

(error) The array group does not contain base floorplan.

Description

This message indicates that the current array group contain no base floorplan data. An array group must have a base floorplan group - i.e. a floorplan group defined with no given name.

The following example shows an instance where this message occurs:

```
phys_library(test) {
      ...
      array(ABC) {
```

Feedback

```
        floorplan(NEW) {
            ...
          }
      }
        ...
      }
      ...
    }
```

The following is an example message:

```
Error: Line 34,  The floorplan group does not contain base floorplan.
 (LBDB-1018)
```

What Next

Add base floorplan data into this array group.

LBDB-1020

(error) The '%s' function has inconsistent number of arguments.

Description

This message indicates the iterate function in the current site_array has wrong number of arguments. In Library Compiler, - a iterate function requires 4 numerical arguments.

The following example shows an instance where this message occurs:

```
phys_library(test) {
      ...
      array(ABC) {
        site_array(test) {
          iterate (100, 200);
          ..
        }
        ...
      }
      ...
    }
```

The following is an example message:

```
Error: Line 34, The iterate function has inconsistent number of
 arguments. (LBDB-1020)
```

What Next

Make sure the right arguments are used for each function.

Feedback

LBDB-1021

(error) The resource group does not contain any via definition.

Description

Library Compiler requires that one or more via groups be defined in the resource group.

This message indicates there is no via groups defined in the resource group.

The following example shows an instance where this message occurs:

```
phys_library(test) {
        resource ( std_cell ) {          /* ERROR */
        }
        ...
    }
```

The following is an example message:

```
Error: Line 3, The via group does not contain any site definition.
 (LBDB-1021)
```

What Next

Add via information into resource group.

LBDB-1022

(error) The resource group must be defined before the\n \ttopological_design_rules group.

Description

Library Compiler requires all physical library plib file to specify the resource group before specifying the topological_design_rules group.

This message indicates there is no resource group defined before the topological_design_rules group.

The following example shows an instance where this message occurs:

```
phys_library(test) {
        topological_design_rules ( ) {          /* ERROR */
        }
        ...
    }
```

The following is an example message:

```
Error: Line 2, The resource group must be defined before the
               topological_design_rules group.  (LBDB-1022)
```

Feedback

What Next

Add or move the resource group to the front of the topological_design_rules group.

LBDB-1023

(warning) No '%s' group defined in the topological_rules group.

Description

There is no specified group information in the current library.

The following example shows an instance where this message occurs:

```
phys_library(test) {
      resource(std_cell) {
        ...
      }
      topological_rules() {
      }
      ...
    }
```

The following is an example message:

```
Warning: Line 34,  No via_rule group defined in the topological_rules
 group. (LBDB-1023)
```

What Next

Make sure the library is correct.

LBDB-1024

(error) The %s function has inconsistent number of arguments.

Description

This message indicates the min_generate_via_size function has wrong number of arguments. In Library Compiler, it requires 2 floating numbers in the min_generated_via_size function.

The following example shows an instance where this message occurs:

```
phys_library(test) {
        min_generated_via_size (0.1, 0.2, 0.1);
        ...
    }
```

Feedback

The following is an example message:

```
Error: Line 2, The min_generated_via_size function has inconsistent
 number of arguments. (LBDB-1024)
```

What Next

Make sure the right argument is used for the function.

LBDB-1025

(error) The '%s' function cannot be supplied a \n \tnonpositive value.

Description

This message indicates that the specified function cannot have a nonpositive value.

The following example shows an instance where this message occurs:

```
min_generate_via_size(-1, 0.3);
```

The following is an example message:

```
Error: Line 18, The 'min_generate_via_size' function cannot be supplied a
       nonpositive value. (LBDB-1025)
```

What Next

Change all value of the function to positive in the physical library file.

LBDB-1026

(error) The '%s' function has inconsistent arguments.

Description

This message indicates the same_net_min_spacing function has wrong arguments. In Library Compiler, it requires 2 layer names followed by a floating numbers and a boolean value (TRUE or FALSE) in the same_net_min_spacing function.

The following example shows an instance where this message occurs:

```
phys_library(test) {
        same_net_min_spacing (metal1, metal2, 0.1);
        ...
    }
```

The following is an example message:

```
Error: Line 2, The 'same_net_min_spacing" function has inconsistent
 arguments. (LBDB-1026)
```

Feedback

What Next

Make sure the right argument is used for the function.

LBDB-1027

(error) The '%s' function has inconsistent arguments.

Description

This message indicates the contact_spacing function has wrong arguments. In Library Compiler, it requires 2 floating numbers in the contact_spacing function.

The following example shows an instance where this message occurs:

```
phys_library(test) {
        ...
        contact_spacing (0.1, 0.2);
        ...
    }
```

The following is an example message:

```
Error: Line 158, The 'contact_spacing" function has inconsistent
 arguments. (LBDB-1027)
```

What Next

Make sure the right argument is used for the function.

LBDB-1028

(error) The '%s' layer name is of invalid layer type. A %s name is expected.

Description

This message indicates that you specified an layer name with wrong type for the current attribute or function. The name should be a routing_layer or contact_layer name as indicated in the error message.

The following example shows an instance where this message occurs:

```
contact_min_spacing(metal1, contact1, 0.1);
```

The following is an example message:

```
Error: Line 104, The 'metal1' layer name is of invalid layer type.  A
 contact_layer name is expected.  (LBDB-1028)
```

Feedback

What Next

Check your library to see if you have an error in either previous layer definition or the current attribute / function.

LBDB-1029

(error) There is no rectangle defined in the contact_formula group.

Description

There is no rectangle defined in the current contact_formula group. Library Compiler requires at least 1 rectangle being specified in each contact_formula group.

The following example shows an instance where this message occurs:

```
via_rule_generate(GEN1) {
      contact_formula(con1) {   /* error */
        routing_direction : horizontal;
        resistance : 0.2;
      }
    }
```

The following is an example message:

```
Warning: Line 34,  There is no rectangle defined in the  contact_formula
 group. (LBDB-1029)
```

What Next

Define the rectangle shape for the contact_formula group.

LBDB-1030

(error) The '%s' attribute value is larger than the '%s' attribute value.

Description

This message indicates that the 'min_wire_width' value is larger than 'max_wire_width' value. Library Compiler requires that the 'min_wire_width' is no larger than 'max_wire_width' value.

The following example shows an instance where this message occurs:

```
routing_layer_rule(met1) {
      min_wire_width : 2.0;
      max_wire_width : 1.0;
      ...
    }
```

Feedback

The following is an example message:

```
Error: Line 18, The 'min_wire_width' attribute value is larger than the
 'max_wire_width' attribute value.  (LBDB-1030)
```

What Next

Change all related values follow the requirement.

LBDB-1031

(error) The wire_rule group is empty.

Description

This message indicates the wire_rule group does not have any layer_rule / via group or same_net_min_spacing function defined. Library Compiler requires that the wire_rule group not be empty.

The following example shows an instance where this message occurs:

```
wire_rule(rule1) {
    }
```

The following is an example message:

```
Error: Line 34, The wire_rule group is empty. (LBDB-1031)
```

What Next

Make sure the the wire_rule group is not empty.

LBDB-1032

(error) Cannot accept the '%s' pin as the must_join pin.

Description

This message indicates the must_join pin attribute value is an unacceptable pin name. An unacceptable must_join is defined as either - a name equivalent to the current pin name; or - a pin that is not already defined.

The following example shows an instance where this message occurs:

```
phys_library(test) {
        ...
        macro(and2) {
          ...
          pin(a) {
            must_join : a1;     /* error */
            ...
```

Feedback

```
            }
            pin(a1) {
            }
        }
    }
```

The following is an example message:

```
Error: Line 34, Cannot accept the 'a1' pin as the must_join pin.
 (LBDB-1032)
```

What Next

Check the pin name and change it. Also make sure the pin specified in the must_join attribute is pre-defined.

LBDB-1033

(error) The '%s' function has inconsistent arguments.

Description

This message indicates the ranged_spacing function has wrong arguments. In Library Compiler, it requires 3 floating numbers in the ranged_spacing function.

The following example shows an instance where this message occurs:

```
phys_library(test) {
        ranged_spacing (0.1, 0.2);
        ...
    }
```

The following is an example message:

```
Error: Line 2, The 'ranged_spacing" function has inconsistent arguments.
 (LBDB-1033)
```

What Next

Make sure the right argument is used for the function.

LBDB-1034

(warning) The '%s' %s group already exists and\n \tcannot be overwritten. The first definition will be used.

Description

This message indicates that you multiply defined a site group. Library Compiler does not allow the overwriting of existing site groups.

Feedback

The following example shows an instance where this message occurs:

```
site(IOsite) {
         ...
        }
        site(IOsite) {
         ...
        }
```

The following is an example message:

```
Error: Line 31, The 'IOsite' site group already exists and
       cannot be overwritten. The first definition will be used.
 (LBDB-1034)
```

What Next

Delete the second specification of the site group.

LBDB-1035

(error) The '%s' array must have '%d' entries.

Description

You receive this message because the specified array has a different size from the one expected.

Where *N* is the number of routing layers, the following criteria are set:

```
plate_cap array must have ((N * (N-1)) / 2) entries
overlap_wire_ratio must have (N * (N-1)) entries
adjacent_wire_ratio must have N entries
wire_ratio_x must have N entries
wire_ratio_y must have N entries
```

The following example shows an instance where this message occurs:

```
plate_cap( "0.05, 0.06, 0.03" );
```

The following is an example message: Error: Line 127, The 'plate_cap' array must have '6' entries. (LBDB-1035)

What Next

Correct the values in the specified array.

LBDB-1036

(error) The sum of values in the '%s' array attribute does not meet the requirement.

Feedback

Description

You receive this message because the sum of ratios does not match the specified criteria. The following criteria are set:

overlap_wire_ratio: the sum of value[i(N-1)] to value[i(N-1)+(N-2)] must not exceed 100.0 (100 percent); where *N* is the number of routing layers and *i* is the routing layer id in the range of i=0..N-1.

adjacent_wire_ratio: n/a (not applicable);

wire_ratio_x: the sum of all values must equal 100.0 (100 percent);

wire_ratio_y: the sum of all values must equal 100.0 (100 percent).

The following example shows an instance where this message occurs:

```
wire_ratio_x( "40.1, 20.0, 20.5" );
```

The following is an example message: Error: Line 127, The sum of values in the 'wire_ratio_x' array attribute does not meet requirement. (LBDB-1036)

What Next

Correct the values in the specified array.

LBDB-1037

(error) Cannot accept the '%s' as the default_routing_wire_model value.

Description

You receive this message because the default_routing_wire_model attribute value is an unacceptable routing_wire_model name, that is, one that is a routing_wire_model that has not already been defined.

The following example shows an instance where this message occurs:

```
phys_library(test) {
        ...
        resource(...) {
          ...
          default_routing_wire_model : model_1;          /* error */
          ...
          routing_wire_model(model_1) {
          ...
          }
        }
    }
```

Feedback

The following is an example message: Error: Line 34, Cannot accept the 'model_1' as the default_routing_wire_model value. (LBDB-1037)

What Next

Change the routing_wire_model name. Ensure that the routing_wire_model specified in the default_routing_wire_model attribute is predefined.

LBDB-1038

(error) The plate_cap attribute is not predefined.

Description

You receive this message because the *plate_cap* attribute is not predefined. It has not been defined before the routing_wire_model() group is defined.

The following example shows an instance where this message occurs:

```
phys_library(test) {
    ...
    resource(...) {
      ...
      routing_wire_model(model_1) { /* error: LBDB-1038 */
      ...
      }
      plate_cap ("0.05, 0.04, 0.06");
    }
}
```

The following is an example message: Error: Line 34, The plate_cap attribute is not predefined. (LBDB-1038)

What Next

Ensure that *plate_cap* is defined before the routing_wire_model() group is defined.

LBDB-1039

(error) The '%s' attribute has an out-of-range '%f' ratio.

Description

You receive this message because a percentage ratio in an array attribute is larger than 100.0 (100%) or less than 0 (0%); it has not been accepted.

The following example shows an instance where this message occurs:

```
phys_library(test) {
        ...
```

Feedback

```
        resource(...) {
          ...
          routing_wire_model(model_1) {
            ...
            wire_ratio_x ("21.3, 305.4, 19.4"); /* error */
            ...
          }
        }
    }
```

The following is an example message: Error: Line 34, The 'wire_ratio_x' attribute has an out-of-range '305.4' ratio. (LBDB-1039)

What Next

Ensure that all values are between 0.0 (0%) and 100.0 (100%).

LBDB-1040

(error) The %s function has an inconsistent number of arguments.

Description

You receive this message because the *obs_clip_box* or *keepout_clip_box* function has the wrong number of arguments. In Library Compiler, the specified command requires four floating numbers in the *obs_clip_box* or *keepout_clip_box* function.

The following example shows an instance where this message occurs:

```
keepout_clip_box (0.1, 0.2, 0.1);
        ...
```

The following is an example message: Error: Line 25 The keepout_clip_box function has an inconsistent number of arguments. (LBDB-1040)

What Next

Ensure that the right argument is used for the specified function.

LBDB-1041

(error) The %s function has inconsistent arguments.

Description

You receive this message because the *gds2_layer_map* function has the wrong number or type of arguments. In Library Compiler, the specified function requires an integer, a string, and an integer in the *gds2_layer_map* function.

Feedback

The following example shows an instance where this message occurs:

```
gds2_layer_map (0.1, METAL1, 1);
```

The following is an example message: Error: Line 30, The gds2_layer_map function has inconsistent arguments. (LBDB-1041)

What Next

Ensure that the right argument is used for the function.

LBDB-1042

(warning) The dist_conversion_factor value '%d' is not allowed. Using default value '%d'.

Description

You receive this message because you specified a dist_conversion_factor value that either is not a multiple of 100 or may be a nonpositive number.

The following example shows an instance where this message occurs:

```
dist_conversion_factor : 123;
```

The following is an example message: Warning: Line 85, The dist_conversion_factor value '123' is not allowed. Using default value '1000'. (LBDB-1042)

What Next

Examine the library source file, and correct the dist_conversion_factor value.

LBDB-1043

(error) The gds2_conversion_factor value '%d' is not allowed.

Description

You receive this message because you specified a *gds2_conversion_factor* value that is not a multiple of 100s or may be a nonpositive number.

The following example shows an instance where this message occurs:
gds2_conversion_factor : -100;

The following is an example message: Warning: Line 85, The gds2_conversion_factor value '-100' is not allowed. (LBDB-1043)

What Next

Examine the library source file, and correct the *gds2_conversion_factor* value.

Feedback

LBDB-1044

(error) The process resource group must be defined after the \n \tresource group and the topological design rules group.

Description

This message indicates that there is no resource group and/or topological design rules group defined before the process resource group. Library Compiler requires all physical library plib files to specify the resource group and the topological_design_rules group before specifying the process_resource group.

The following example shows an instance where this message occurs:

```
phys_library(test) {
        process_resource (...) {                /* ERROR */
        }
        ...
    }
```

The following is an example message:

```
Error: Line 2, The process_resource group must be defined after the
               resource group and the topological_design_rules group.
 (LBDB-1044)
```

What Next

Add or move the resource group and the topological design rules group to the front of the process resource group.

LBDB-1045

(error) The %s name '%s' is an undefined %s name.

Description

This error message means that the specified process routing layer, process via, or process wire rule name was not predefined.

The following example shows an instance where this message occurs:

```
phys_library(test) {
        resource(...) {
          routing_layer (met1) {
          }
        }
        process_resource(...) {
          process_routing_layer(METAL1) { /* ERROR: METAL 1 is not
 defined.  Use met1 instead */
          }
```

Feedback

```
        ...
        macro(and2) {
          ...
          pin(a) {
            ...
            obs(new_layer) {    /* error */
              ...
            }
          }
        }
    }
```

The following is an example message:

```
Error: Line 34, The process_routing_layer name 'METAL1' is an undefined
 routing_layer name. (LBDB-1045)
```

What Next

Use the *read_lib* command and specify a predefined routing layer, via, or process wire rule.

LBDB-1046

(warning) The boundary_layer attribute is not defined in\n \t gds2_extraction_rules.

Description

This warning message tells you that you used the *read_lib* command and specified the *boundary_layer* attribute, but the *boundary_layer* attribute is not defined in gds2_extraction_rules. In Library Compiler, the *boundary_layer* attribute specifies a layer ID for GDSII extraction to look for the designated macro boundary for the macro size in the PLIB file. When this attribute is missing, the macro size in the PLIB file is determined by the bounding box of all geometries.

The following is an example message: Warning: The boundary_layer attribute is not defined in gds2_extraction_rules. (LBDB-1046)

What Next

Make sure you did not intend to specify the boundary layer. If you did intend to specify the boundary layer, define the *boundary_layer* attribute and reexecute the command.

Feedback

LBDB-1047

(error) The '%s' function has inconsistent arguments.

Description

This message indicates the lateral_oxide function has wrong arguments. In Library Compiler, it requires 2 floating numbers in the lateral_oxide function.

The following example shows an instance where this message occurs:

```
lateral_oxide (0.1, 0.2, 0.3);
```

The following is an example message:

```
Error: Line 2, The 'lateral_oxide" function has inconsistent arguments.
 (LBDB-1047)
```

What Next

Make sure the right argument is used for the function.

LBDB-1048

(error) The '%s' permittivity value is less than 1.00.

Description

The permittivity value must be at least 1.00. It also includes the second value in lateral_oxide() complex attribute.

The following example shows an instance where this message occurs:

```
lateral_oxide ( 3.9, 0.99 );
```

The following is an example message:

```
Error: Line 46, The 'lateral_oxide' permittivity value is less than 1.00.
  (LBDB-1048)
```

What Next

Check your library and use correct permittivity value.

LBDB-1049

(error) The '%s' thickness value is less than zero.

Feedback

Description

The thickness value must be positive. It also applies to the first value in lateral_oxide() complex attribute.

The following example shows an instance where this message occurs:

```
lateral_oxide ( -3.9, 3.99 );
```

The following is an example message:

```
Error: Line 46, The 'lateral_oxide' thickness value is less than zero.
 (LBDB-1049)
```

What Next

Check your library and use correct thickness value.

LBDB-1050

(error) There is no rectangle defined in the via_contact_layer group.

Description

There is no rectangle defined in the current via_contact_layer group. Library Compiler requires at least 1 rectangle being specified in each via_contact_layer group.

The following example shows an instance where this message occurs:

```
default_via_generate(GEN1) {
      via_contact_layer(con1) {          /* error */
        resistance : 0.2;
      }
    }
```

The following is an example message:

```
Warning: Line 34,  There is no rectangle defined in the
 via_contact_layer group. (LBDB-1050)
```

What Next

Define the rectangle shape for the via_contact_layer group.

LBDB-1051

(error) The %s attribute is obsolete.

Feedback

Description

This message indicates the named attribute is obsolete and need to be changed accordingly.

The following example shows an instance where this message occurs:

```
lateral_oxide_thickness : 0.5 ;
```

The following is an example message:

```
Error: Line 34, The lateral_oxide_thickness attribute is obsolete.
 (LBDB-1051)
```

What Next

Refer to the Library Compiler User Guide for the newest attribute names.

LBDB-1052

(error) The 'layer_antenna_factor' function has inconsistent arguments.

Description

This message indicates the layer_antenna_factor function has wrong arguments. In Library Compiler, it requires one layer name followed by a floating number in the layer_antenna_factor function.

The following example shows an instance where this message occurs:

```
phys_library(test) {
        ...
        layer_antenna_factor (metal1, metal2, 0.1);
        ...
    }
```

The following is an example message:

```
Error: Line 25, The 'layer_antenna_factor' function has inconsistent
 arguments. (LBDB-1052)
```

What Next

Make sure the right argument is used for the function.

LBDB-1053

(error) The '%s' group contains conflicting layer specification styles,\n \t'%s' and '%s'.

Feedback

Description

This message indicates the gds2 layer id definition styles are found. For example, you should either use obs_layer_map or obs_layer_id to specify geometry layer id and/or data type, but never use both functions in the same plib/pplib file.

The following example shows an instance where this message occurs:

```
phys_library(test) {
        ...
        gds2_extraction_rules() {
          obs_layer_map ( "14, 16, 18, 20", "07, 08, 09, 10");
          obs_layer_id (22, 0, 11, 0);
        ...
    }
```

The following is an example message:

```
Error: Line 25, The 'gds2_extraction_rules' group contains conflicting
 layer specification styles,
        'obs_layer_map' and 'obs_layer_id'. (LBDB-1053)
```

What Next

Make sure only one style is used in layer id definition.

LBDB-1054

(warning) The port '%s' does not have the attribute '%s' specified. The value (%f, %f) will be assigned to the attribute.

Description

You receive this error message when the *rise_capacitance* and *fall_capacitance* attributes are specified for a port, but the *rise_capacitance_range* and *fall_capacitance_range* attribute are not. (*rise_capacitance*, *rise_capacitance*) will be assigned to attribute *rise_capacitance_range\ and (fall_capacitance, fall_capacitance) will be assigned to attribute fall_capacitance_range respectively.*

What Next

If you accept the value assigned to the attribute referenced in the error message, no action is required on your part. If not, assign a value to the attribute.

LBDB-1055

(error) The '%s' function has inconsistent arguments.

Feedback

Description

This message indicates the contact_min_spacing function, min_overhang function or diff_net_min_spacing function has wrong arguments. In Library Compiler, it requires 2 layer names followed by a floating numbers in the contact_min_spacing function, min_overhang function or diff_net_min_spacing function.

The following example shows an instance where this message occurs:

```
phys_library(test) {
        ...
        topological_design_rules() {
          contact_min_spacing (contact1, 0.5);
          min_overhang (metal1, contact1, 0.3);
          diff_net_min_spacing (metal1, contact1, 0.6);
          ...
        }
        ...
    }
```

The following is an example message:

```
Error: Line 245, The 'contact_min_spacing" function has inconsistent
 arguments. (LBDB-1027)
```

What Next

Make sure the right argument is used for the function.

LBDB-1056

(warning) The '%s' value '%d' is not allowed. Using default value '%d'.

Description

You receive this message because you specified a conversion factor value that either is not a multiple of 100 or may be a nonpositive number. A conversion factor can be - capacitance_conversion_factor, or - resistance_conversion_factor, or - current_conversion_factor, or - inductance_conversion_factor.

The following example shows an instance where this message occurs:

```
capacitance_conversion_factor : 123;
```

The following is an example message: Warning: Line 85, The 'capacitance_conversion_factor' value '123' is not allowed. Using default value '1000'. (LBDB-1056)

What Next

Examine the library source file, and correct the conversion factor value.

Feedback

LBDB-1057

(error) Found milkyway_layer_map group defined before '%s' group.

Description

This message indicates the named group in phys_library is not defined before milkyway_layer_map group.

The following example shows an instance where this message occurs:

```
phy_library(test) {
        ...
        milkyway_layer_group () {
         ...
        }
        resource ( std_cell ) {
          ...
        }
    }
```

The following is an example message:

```
Error: Line 59, Found milkyway_layer_group defined before 'resource'
 group. (LBDB-1001)
```

What Next

Move this group inside the physical library so that it is defined in front of milkyway_layer_map group.

LBDB-1058

(error) The '%s' color name is invalid.

Description

This message indicates that you specified an invalid color name for the current attribute or function. The color name should match a color name previously defined in the color groups.

The following example shows an instance where this message occurs:

```
color : foo ;
```

The following is an example message:

```
Error: Line 104, The 'foo' color name is invalid.  (LBDB-1058)
```

Feedback

What Next

Check your library to see if you have an error in either previous color definition or the current attribute / function.

LBDB-1059

(error) The '%s' '%s' name is invalid.

Description

This message indicates that you specified an invalid line_style/stipple name for the current attribute or function. The color name should match a line_style/stipple name previously defined in the line_style/stipple groups.

The following example shows an instance where this message occurs:

```
stipple : foo ;
```

The following is an example message:

```
Error: Line 104, The 'foo' 'stipple' name is invalid.  (LBDB-1059)
```

What Next

Check your library to see if you have an error in either previous line_style/stipple definition or the current attribute / function.

LBDB-1060

(error) The tile '%s' is not defined in the resource group.

Description

This message indicates name of the tile attribute is not a pre-defined tile.

The following example shows an instance where this message occurs:

```
phys_library(test) {
        ...
        macro(and2) {
          ...
          in_tile : new_tile;   /* error */
        }
    }
```

The following is an example message:

```
Error: Line 34, The tile 'new_tile' is not defined in the resource group.
 (LBDB-1060)
```

Feedback

What Next

Make sure the tile attribute uses a pre-defined tile.

LBDB-1061

(error) The %s shape has zero or negative area.

Description

This message indicates the path / polygon / rectangle function has zero or negative size. That is not a real geometrical shape.

The following example shows an instance where this message occurs:

```
phys_library(test) {
        ...
        macro(and2) {
          ...
          pin(a) {
            ...
            obs(new_layer) {
              rectangle(0.1, 0.3, 0.1, 0.3);  /* error */
            }
          }
        }
    }
```

The following is an example message:

```
Error: Line 34, The rectangle shape has zero area. (LBDB-1061)
```

What Next

Make sure it is a real geometry.

LBDB-1062

(error) The '%s' via name is invalid.

Description

This message indicates that you specified an invalid name for the current attribute or function. The via name should match a name previously defined in the resource group.

The following example shows an instance where this message occurs:

```
reference_cut_table( my_template ) {
        values ( "via12, via12a, via12b");
   }
```

Feedback

The following is an example message:

```
Error: Line 104, The 'via12a' via name is invalid.  (LBDB-1062)
```

What Next

Check your library to see if you have an error in either previous layer definition or the current attribute / function.

LBDB-1063

(warning) The argument value %d of the '%s' function\n \tis out of range. It is expected to be between 0 and 1.

Description

This message indicates that the out-of-range value has been set to the specified function.

```
pattern( 0, 1, 0, 1 );                /* correct */
```

The following example shows an instance where this message occurs:

```
pattern( 0, 20, 0, 1 );               /* incorrect */
```

The following is an example message:

```
Warning: Line 17, The argument value 20 of the 'pattern' function
        is out of range.  It is expected to be 0 or 1.  (LBDB-1063)
```

What Next

Change the physical library to correct the arguments.

LBDB-1064

(error) Invalid attribute '%s' value '%d' is detected. The value must be\n \tunique among all '%s' objects.

Description

This message indicates a non-unique id is found. - All via are required to have a unique via_id value. - All mask layers (device_layer, poly_layer, routing_layer, cont_layer) must have a unique mw_map id specified in its corresponding stream_layer group.

The following example shows an instance where this message occurs:

```
via (via12) {
    via_id : 12 ;
    ...
  }
  via (via23) {
```

```
    via_id : 12 ;
    ...
  }
```

The following is an example message:

```
Error: Line 56, Invalid attriute 'via_id' value '12' is detected.  The
 value must be
        unique among all 'via' objects. (LBDB-1064)
```

What Next

Make sure the specified id value is unique among all named objects.

LBDB-1065

(warning) No '%s' attribute has been specified for the\n \t%s '%s'. It is set to default value '%d'.

Description

This message indicates that the library, perhaps an older PLIB file, does not contain the newly required object id's and default values are assigned to it. - All via are required to have a unique via_id value, from 1 to 255. - All mask layers (device_layer, poly_layer, routing_layer, cont_layer) must have a unique mw_map id specified in its corresponding stream_layer group. Datatype in mw_map is always default to 0.

The following example shows an instance where this message occurs:

```
via (via12) {
    ...
  }
```

The following is an example message:

```
Warning: Line 56, No 'via_id' attribute has been specified for the
        via 'via12'.  It is set to default value '12'.  (LBDB-1065)
```

What Next

Enhance PLIB file to - specify a unique via_id for each via specification; - specify a corresponding stream_layer (with mw_map attribute) for each mask layer. These stream_layer should have unique mw_map layer id among them.

LBDB-1066

(warning) Cannot locate corresponding layer id and layer datatype\n \tfor display_layer '%s'. It is set to layer id %d and layer datatype %d.

Feedback

Description

This message indicates that the library, perhaps an older PLIB file, does not contain the newly required matching stream_layer object and mw_map(id, datatype) attribute values for all display_layer object. A unique mw_map(id, datatype) is automatically assigned to it.

The following example shows an instance where this message occurs:

```
display_layer (m1_pg) {
    ...
  }
```

The following is an example message:

```
Warning: Line 56,  Cannot locate corresponding layer id and layer
 datatype
for display_layer 'm1_pg'. It is set to layer id 23 and layer datatype
 '3'. (LBDB-1066)
```

What Next

Enhance PLIB file to - specify a corresponding stream_layer (with mw_map attribute) for each display layer. These stream_layer should have unique mw_map(id, datatype) value pair.

LBDB-1067

(error) The '%s' attribute value(s) is out of range.\n

Description

This message indicates that the gds_map or mw_map attribute has out-of-range values.

The acceptable value ranges are:

id <= 255 datatype <= 255 where mw_map (id , datatype); gds_map (id, datatype);

The following example shows an instance where this message occurs:

```
mw_map ( 23, 256 );
```

In this case, the datatype value 256 is out of range.

The following is an example message:

```
Error: Line 912, The 'mw_map' attribute' attribute value is out of range.
 (LBDB-1067)
```

What Next

Change the attribute value to satisfy the value range.

Feedback

LBDB-1068

(warning) Floating-point value %s in '%s' attribute is too precise and\n \twill be truncated to %s.

Description

This warning message occurs when the specified floating-point number cannot be completely stored in the database and must be rounded off.

When storing floating-point numbers in the database, the number is scaled by multiplying the floating-point number by dist_conversion_factor. Digits to the right of the decimal point are dropped. When nonzero digits are dropped, this message appears.

The following example shows an instance where this message occurs:

```
min_width : 0.1155 ;
```

The following is an example message:

```
Warning: Floating-point value 0.11550 in 'min_width' attribute is too
 precise and
         will be truncated to 0.115. (LBDB-1068)
```

What Next

This is a warning message only. No action is required.

However, if the result is not what you intended, you can increase the dist_conversion_factor or reduce the number of digits in the floating-point number, and then run the command again.

LBDB-1069

(error) The %s object '%s' has a width %d and height %d\n \tthat is inconsistent with the pattern size %d.

Description

This error message occurs when the pattern length of the specified section does not match the size specified by the pattern width and height. The number of elements in the pattern list must equal the product of the pattern width and height.

The following example shows an instance where this message occurs:

```
stipple ( S1 ) {
        width : 3 ;
        height : 2 ;
        pattern ( 1, 1, 0, 0 );
     }
```

Feedback

The following is an example message:

```
Error: Line 67, Stipple object 'S1'  has a width 3 and height 2
        that is inconsistent with the pattern size 4. (LBDB-1069)
```

What Next

Change the width and height attribute values or add or remove Boolean values to the pattern list. After making your changes, run the command again.

LBDB-1070

(warning) Layer '%s' has a pitch %.4f that is less than the minimum spacing\n \tand width sum %.4f.

Description

This warning message occurs when the specified Layer section contains an invalid pitch, minimum spacing or minimum width. The pitch must be greater than or equal to the sum of the layer's minimum spacing and minimum width.

The following example shows an instance where this message occurs:

```
layer ( M1 ) {
        min_width : 0.10 ;
        spacing : 0.12 ;
        pitch : 0.15 ;
     }
```

The following is an example message:

```
Warning: Line 24, Layer 'M1' has a pitch 0.1500 that is less than the
 minimum spacing
and width sum 0.2200.  (LBDB-1069)
```

What Next

This is a warning message only. No action is required.

However, if the result is not what you intended, change the pitch, minimum spacing, or minimum width to meet the requirement that the pitch be greater than or equal to the sum of the layer's minimum spacing and minimum width.

LBDB-1071

(warning) Routing_layer '%s' has invalid spacing_table value %.4f.

Feedback

Description

This warning message occurs when the specified routing_layer contains an invalid spacing_table value. The spacing_table values must be equal to or greater than the routing_layer spacing value.

The following example shows an instance where this message occurs:

```
layer ( M1 ) {
        spacing : 0.12 ;
        spacing_table (1d_table) {
          values (" 0.1 , 0.15, 0.24" );
        }
     }
```

The following is an example message:

```
Warning: Line 235, Routing_layer 'M1' has invalid spacing_table value
 0.100. (LBDB-1071)
```

What Next

This is only a warning message. No action is required.

However, it is best practice to change the spacing_table value of the specified routing_layer so the values are equal to or greater than the layer spacing value. After making your changes, run the command again.

LBDB-1072

(error) Routing_layer '%s' has invalid spacing_table value %.4f.

Description

This warning message occurs when the specified routing_layer contains an invalid spacing_table value. The spacing_table values must be equal to or greater than the routing_layer spacing value. And values[0] = spacing.

The following example shows an instance where this message occurs:

```
layer ( M1 ) {
        spacing : 0.12 ;
        spacing_table (1d_table) {
          values (" 0.1 , 0.15, 0.24" );
        }
     }
```

The following is an example message:

```
Error: Line 235, Routing_layer 'M1' has invalid spacing_table value
 0.100. (LBDB-1072)
```

Feedback

What Next

Change the spacing_table value so the value in the list are equal to or greater than the layer spacing value. After making your changes, run the command again.

LBDB-1073

(warning) Layer '%s' has a pitch %.4f that does not match the recommended\n \twire-to-via pitch %.4f.

Description

This warning message occurs when the pitch of the specified layer does not match the recommended pitch. The wire-to-via pitch is the recommended pitch and provides the best wire track resources for routing.

The wire-to-wire pitch is more aggressive, the via-to-via is more conservative and neither are recommended. The metal layer pitch must match the wire-to-via pitch in the routing direction.

The horizontal wire-to-via pitch is calculated as follows:

```
(min spacing) + (min width)/2 + (via metal width)/2

The vertical wire-to-via pitch is calculated as follows:

    (min spacing) + (min width)/2 + (via metal height)/2
```

The via metal width and height are based on the larger of the lower and upper default contact codes.

The following example shows an instance where this message occurs:

```
layer ( metal3 ) {
        spacing : 1.9;
        min_width : 1.8;
        pitch : 4.5;
        ...
     }

     via (via23) {
        ...
        via_layer(metal3) {
          rectangle ( -1.1, -1.1, 1.1, 1.1 );
        }
     }
     via (via34) {
        ...
        via_layer(metal3) {
          rectangle  ( -1.1, -1.1, 1.1, 1.1 );
```

```
        }
     }
```

The following is an example message:

```
Warning : Line 36, Layer 'metal3' has a pitch 4.500 that does not match
 the recommended
        wire-to-via pitch 3.900. (LBDB-1073)
```

What Next

This is only a warning message. No action is required.

You can leave the pitch of the specified layer at the current setting, or you can change the pitch of the layer to the recommended pitch.

LBDB-1074

(warning) Layer '%s' has a pitch %.4f that is not aligned with\n \tbottom layer pitch %.4f.

Description

This warning message occurs when the pitch of the specified layer is not double or triple the pitch of the lower metal layer with the same routing direction. Doubling or tripling the pitch value, maximizes routing resources and minimizes overlap with other metal layers.

The following example shows an instance where this message occurs:

```
layer ( metal1 ) {
        pitch : 1.9;
        ...
     }
        ...
     layer ( metal3 ) {
        pitch : 3.9;
        ...
     }
```

The following is an example message:

```
Warning : Line 36, Layer 'metal3' has a pitch 3.900 that is not aligned
 with
        bottom layer pitch 1.900. (LBDB-1074)
```

What Next

This is only a warning message. No action is required.

You can either leave the pitch of the specified layer unchanged, or change the pitch to the doubled or tripled pitch and run the command again.

Feedback

LBDB-1075

(error) The attribute '%s' has %d entries, which exceeds the maximal\n \tallowed 8 entries.

Description

This error message occurs when the specified index array in routing_layer/cont_layer group that is too large. The index array size must be beween 1 and 8 inclusive.

The following example shows an instance where this message occurs:

```
layer ( metal1 ) {
        spacing_table ( 1d_stable ) {
          index_1 (0.0, 1.3, 2.4, 4.5, 6.6, 7.1, 9.3, 12.2, 25.0, 33.9);
        }
        ...
     }
```

The following is an example message:

```
Warning : Line 36, The attribute 'index_1' has 10 entries, which exceeds
 the maximal
        allowed 8 entries. (LBDB-1075)
```

What Next

Change the index array so that it does not exceed 8 entries. Then run the command again.

LBDB-1076

(warning) The attribute '%s' has invalid threshold values %.4f.

Description

This warning message occurs when the specified table index contains an invalid threshold values. The threshold list must meet the following requirements:

- The first value must be between 0 and the default_routing_width inclusively.
- The second value must be greater than the layer min_width.

The following example shows an instance where this message occurs:

```
layer ( metal1 ) {
        min_width : 1.5 ;
        spacing_table ( 1d_stable ) {
          index_1 (0.0, 1.3, 2.4, 4.5, 6.6, 7.1, 9.3, 12.2, 25.0, 33.9);
          ...
        }
        ...
     }
```

Feedback

The following is an example message:

```
Warning : Line 36, The attribute 'index_1' has invalid index value 1.3.
 (LBDB-1076)
```

What Next

This is only a warning message. No action is required.

However, it is best practice to change the index values to meet the above requirements. After making your changes, run the command again.

LBDB-1077

(error) The attribute '%s' has invalid threshold values %.4f.

Description

This warning message occurs when the specified table index contains an invalid threshold values. The threshold list must meet the following requirements:

- The first value must be between 0 and the min_width inclusively.
- The second value must be greater than the layer min_width.

The following example shows an instance where this message occurs:

```
layer ( metal1 ) {
        min_width : 1.5 ;
        spacing_table ( 1d_stable ) {
          index_1 (0.0, 1.3, 2.4, 4.5, 6.6, 7.1, 9.3, 12.2, 25.0, 33.9);
          ...
        }
        ...
     }
```

The following is an example message:

```
Error : Line 36, The attribute 'index_1' has invalid index value 1.3.
 (LBDB-1077)
```

What Next

Change the index values to meet the above requirements. After making your changes, run the command again.

LBDB-1078

(error) Layer '%s' has a default_routing_width value %.4f that is less than its\n \tmin_width value %.4f.

Feedback

Description

This error message occurs when the default width or minimum width of the specified Layer section is invalid. The default width (default_routing_width) of each layer must be greater than or equal to its minimum width (min_width).

The following example shows an instance where this message occurs:

```
layer ( metal1 ) {
        min_width : 1.5 ;
        default_routing_width : 1.3;
          ...
        }
        ...
     }
```

The following is an example message:

```
Error : Line 36, Layer 'metal1' has a default_routing_width value 1.3000
 that is less than its
        min_width value 1.5000. (LBDB-1078)
```

What Next

Change the default_routing_width or min_width of the specified Layer section so that the default_routing_width is greater than or equal to the min_width. After making your changes, run the command again.

LBDB-1079

(warning) The attribute '%s' has rounded threshold value %.4f.

Description

This warning message occurs when the threshold value from the index array contains rounded values. It is best practice to avoid ending threshold values with a 0 digit in the most precise position. This practice minimizes the confusion between tools that interpret the thresholds as exclusive, rather than inclusive, lower bounds.

The following example shows an instance where this message occurs:

```
layer ( metal1 ) {
        spacing_table ( 1d_spacing ) {
          index_1 ( "0.0, 1.500, 3.015" );
          ...
        }
        ...
     }
```

Feedback

The following is an example message:

```
Warning : Line 36, The attribute 'index_1' has rounded threshold value
 1.5000. (LBDB-1079)
```

What Next

This is only a warning message. No action is required.

However, you can either increase the rounded threshold value by one grid resolution value and run the command again, or you can leave the threshold value at the current setting.

LBDB-1080

(warning) Attribute '%s' has insignificant differences between\n \tthreshold values %.4f and %.4f.

Description

This warning message occurs when the index threshold contains insignificant differences between the threshold values. It is best practice to have thresholds differ by more than half of the min_width and more than ten percent of the greater threshold. If they do not differ by these amounts, then the table values can contain redundant data, be unnecessarily large, and increase router run-time dramatically.

The following example shows an instance where this message occurs:

```
layer ( metal1 ) {
        min_width : 1.5;
        spacing_table ( 1d_spacing ) {
          index_1 ( "0.0, 1.905, 1.915" );
          ...
        }
        ...
     }
```

The following is an example message:

```
Warning : Line 36, The attribute 'index_1' has insignificant differences
 between
        threshold values 1.9050 and 1.9150. (LBDB-1080)
```

What Next

This is only a warning message. No action is required.

However, you can check the table values for redundant data. If you find redundant data, then reduce the index dimension and the number of threshold values. After making your changes, rerun the command.

Feedback

LBDB-1081

(warning) Routing layer '%s' does not contain positive min_enclosed_area value.

Description

The value of the *minEnclosedArea* attribute for default metal layers should be greater than 0. Other values can affect the quality of the application results and can cause excessive design rule constraint violations during physical verification.

The following example shows an instance where this message occurs:

```
layer ( metal1 ) {
          ...
     }
```

The following is an example message:

```
Warning : Line 36, Routing layer 'metal1' does not contain positive
 min_enclosed_area value. (LBDB-1081)
```

What Next

This is only a warning message. No action is required.

However, it is best practice to check the min_enclosed_area or min_enclosed_area_table attribute value of the specified layer, and then change the value to a value greater than 0, if necessary. After making your changes, run the command again.

LBDB-1082

(error) The u_shaped_wire_spacing attribute value %.4f in routing layer '%s'\n \tis less than spacing value %.4f.

Description

This message indicates that the u_shaped_wire_spacing value is less than the spacing value, which is not allowed. It is required that u_shaped_wire_spacing attribute value be no less than the spacing attribute value of the same routing layer.

The following example shows an instance where this message occurs:

```
layer ( metal1 ) {
          spacing : 1.4;
          u_shaped_wire_spacing : 1.0;
          ...
     }
```

Feedback

The following is an example message:

```
Error : Line 45, The u_shaped_wire_spacing attribute value 1.0000 in
 routing layer 'metal1'
        is less than the spacing attribute value 1.400. (LBDB-1082)
```

What Next

Change u_shaped_wire_spacing value so that it is equal or more than the spacing value. Then run the command again.

LBDB-1083

(error) The same_net_min_spacing attribute value %.4f in routing layer '%s'\n \tis more than spacing value %.4f.

Description

This message indicates that the same_net_min_spacing value is more than the spacing value, which is not allowed. It is required that same_net_min_spacing be no more than the spacing attribute value of the same routing layer.

The following example shows an instance where this message occurs:

```
layer ( metal1 ) {
          spacing : 1.4;
          same_net_min_spacing : 1.7;
          ...
     }
```

The following is an example message:

```
Error : Line 45, The same_net_min_spacing attribute value 1.7000 in
 routing layer 'metal1'
        is more than the spacing attribute value 1.400. (LBDB-1083)
```

What Next

Change same_net_min_spacing value so that it is equal or less than the spacing value. Then run the command again.

LBDB-1084

(warning) Tile '%s' has size %.4f that is not a multiple of\n \t%s routing layer pitch %.4f.

Description

This warning message occurs when: - in horizontal floorplan, tile width is not consistent with first vertical routing layer pitch; or - in vertical floorplan, tile height is not consistent with first horizontal routing layer pitch.

Feedback

It is recommended that the tile dimension lines up with pitch to maximize utilization.

The following example shows an instance where this message occurs:

```
layer ( metal2 ) {
          routing_direction : vertical ;
          pitch : 1.4;
          ...
     }
        ...
     tile (unit) {
          size ( 1.6, 5.5 );
          ..
     }
```

The following is an example message:

```
Warning : Line 45, Tile 'unit' has size 1.6000 that is not a multiple of
        metal2 routing layer pitch 1.4000. (LBDB-1084)
```

What Next

This is a warning message only. No action is required.

However, it is best practice to either change the size value in question to the suggested pitch, or change the specified routing layer pitch to match tile dimension. After making your changes, run the command again.

LBDB-1085

(error) Cannot find via defined for contact layer '%s'.

Description

This error message occurs when there is no via defined with a specific contact layer between 2 metal layers.

At least one via must be defined between 2 metal layers in a library.

The following is an example message:

```
Error : Cannot find via defined for contact layer 'via12'. (LBDB-1085)
```

What Next

Define at least one via for the contact layer. Run the command again.

LBDB-1086

(warning) The %s attribute value in via '%s' specifies\n \tnon-positive metal enclosure.

Feedback

Description

This warning message occurs when the specified via section contains non-positive metal enclosure dimensions or non-positive enclosure metal rectangle. If the non-positive metal enclosure values are set intentionally, this warning can be ignored. Otherwise, the values may cause the router to create enclosures that violate design rule constraints, such as completely enclosed spaces or donuts.

The following example shows an instance where this message occurs:

```
via ( via12 ) {
        via_layer( metal1 ) {
          enclosure ( 0, 0 );
        }
     }
```

The following is an example message:

```
Warning : Line 45, The enclosure attribute value in via 'via12' specifies
        non-positive metal enclosure. (LBDB-1086)
```

What Next

This is a warning message only. No action is required.

However, if the zero metal enclosure values are not intentional, you can change either the rectangle coordinates or change enclosure value in via group to avoid potential design rule violations.

LBDB-1088

(warning) There are more than 255 layers in this library.

Description

This warning message occurs when more than 255 layers are found in the current library. It does not include display layers. Currently Milkyway database can accommodate up to 255 layers. Upper layers exceeding the limit will be ignore in the database.

The following is an example message:

```
Warning : There are more than 255 layers in this library. (LBDB-1088)
```

What Next

This is a warning message only. No action is required.

However, it is best practice to make sure that the total number of layers do not exceed the limit. After making your changes, run the command again.

Feedback

LBDB-1089

(warning) '%s' and '%s' layers in %s attribute are not\n \tadjacent layers.

Description

This warning message occurs when the 2 layers specified in: - same_net_min_spacing - diff_net_min_spacing - contact_min_spacing - corner_min_spacing - min_overhang - min_enclosure - end_of_line_enclosure complex attributes are not adjacent layers.

It is recommended that the 2 layers must be adjacent routing or contact layers.

The following example shows an instance where this message occurs:

```
diff_net_min_spacing ( met1, met4, 1.4 );
```

The following is an example message:

```
Warning : Line 45, 'met1' and 'met3' layers in diff_net_min_spacing
 attribute are not
        adjacent layers. (LBDB-1089)
```

What Next

This is a warning message only. No action is required.

However, it is best practice to follow the above guideline. After making your changes, run the command again.

LBDB-1090

(warning) Cannot find matching stream_layer for layer '%s'.

Description

This warning message occurs when the layer is specified in resource layer section, but no stream_layer with identical name can be found in milkyway_layer_map group.

It is recommended that a stream_layer is defined for each layer found in resource group.

The following is an example message:

```
Warning : Cannot find matching stream_layer for layer 'metal1'.
 (LBDB-1090)
```

What Next

This is a warning message only. No action is required.

However, it is best practice to add stream_layer definition for the specified layer. After making your changes, run the command again.

Feedback

LBDB-1091

(warning) Reset density value from %4.1f to %4.1f.

Description

Density value defined in density_property in PLIB file should be between 0.0 and 100.0. Else, it will be reset to 0.0 or 100.0.

The following is an example message:

```
Warning: Line 12, Reset density value from 101.6 to 100.0. (LBDB-1091)
```

What Next

Revise density value if the reset value is not expected.

LBDB-1092

(warning) Layer '%s' attribute '%s' has a value of %g.

Description

This warning message occurs when the value of the specified layer attribute may not be optimal.

The values can affect the quality of the application results and can cause excessive design rule constraint violations during physical verification.

For a set of rule, completeness of rule parameters should be maintained:

For enclosed via min edge length rule, if enclosed_via_min_edge_length is specified, min_edge_length should be specified, and enclosed_via_min_edge_length > min_edge_length > 0

For U-shape rule, if you specify u_shaped_min_length or u_shaped_wire_spacing, you should also specify u_shaped_min_depth and min_spacing. And u_shaped_wire_spacing > min_spacing.

For multiple min area rule, "min_area" attribute is needed if "min_polygon_area_rule() -> polygon_min_area" is specified and min_polygon_area_rule()->polygon_min_area > min_area. If both "min_polygon_area_rule() -> polygon_min_area" and "min_polygon_area_rule() -> max_edge_length" are specified, "min_length" should be specified. And min_polygon_area_rule() -> max_edge_length >= min_length

For non-preferred direction routing rule, if you specify non_preferred_dir_width, it will satisfy non_preferred_dir_width > default_routing_width. If you specify both non_preferred_dir_width and non_preferred_dir_max_length, it will satisfy non_preferred_dir_max_length > non_preferred_dir_width-default_routing_width.

Feedback

For min_spacing rule in routing_layer, if you specify min_spacing(x_min_spacing, y_min_spacing), it will satisfy x_min_spacing >= spacing and y_min_spacing >= spacing.

For jog wire corner to corner spacing rule, if you specify aligned_jog_width and unaligned_jog_diag_width, it will satisfy aligned_jog_width >= min_width and unaligned_jog_diag_width >= min_width.

For [x|y]_min_spacing_table, [x|y]_max_spacing_table, the first value, i.e., value[0], will satisfy value[0] >= spacing.

For [x|y]_max_spacing_check_range_table, the first value, i.e., value[0], will satisfy value[0] >= spacing*2 + min_width.

The following is an example message:

```
WARNING : Layer 'M1' attribute 'polygon_min_area' has a value of 0.03.
 (LBDB-1092)
```

What Next

This is only a warning message. No action is required.

However, it is best practice to check the attribute value of the specified layer, and then change the value to a value greater than 0, if necessary. After making your changes, run the command again.

LBDB-1093

(warning) Layer '%s' attribute '%s' is missing.

Description

This warning message occurs when the specified section is missing an important attribute. If the attribute is not specified in PLIB file, the default value is 0 for number attributes, or an empty string for string attributes.

For multiple min area rule, "min_area" attribute is needed if "min_polygon_area_rule() -> polygon_min_area" is specified and min_polygon_area_rule()->polygon_min_area > min_area. If both "min_polygon_area_rule() -> polygon_min_area" and "min_polygon_area_rule() -> max_edge_length" are specified, "min_length" should be specified.

For U-shape rule, if you specify u_shaped_min_length or u_shaped_wire_spacing, you should also specify u_shaped_min_depth and min_spacing.

For enclosed via min edge length rule, if enclosed_via_min_edge_length is specified, min_edge_length should be specified, and enclosed_via_min_edge_length > min_edge_length > 0 If both enclosed_via_min_edge_length and min_edge_length are specified, enclosed_via_adjacent_edge_length should be specified.

Feedback

For 2-line end rule, if end_to_end_min_spacing is specified, end_of_line_metal_max_width should be specified.

For end of line rule, if end_of_line_side_keepout_length is specified, end_of_line_metal_max_width should be specified.

For line end depth rule, if end_of_line_min_length is specified, end_of_line_metal_max_width should be specified.

The following is an example message:

```
WARNING : Layer 'M1' attribute 'min_area' is missing. (LBDB-1093)
```

What Next

This is only a warning message. No action is required.

However, if you do not want to use the default value for the attribute, add the attribute with the desired value to the specified section in PLIB file and rerun the command.

LBDB-1094

(error) The table '%s' can supports 'scalar' template only.

Description

This error message is reported for some table groups, that currently only a scalar value is supported for them by the tool. But found they are using a non-scalar template name.

Following two groups are under the restriction for now:

```
pgate_antenna_ratio(template_name) {
}
ngate_antenna_ratio(template_name) {
}
```

The following is an example message:

```
Error: Line 531, The table 'pgate_antenna_ratio' can supports 'scalar'
 template only. (LBDB-1094)
```

What Next

Modify the plib file accordingly, change the template name to 'scalar' and specify only one value for the table.

Example:

```
antenna_rule("M1_ANTENNA_RULE")
    ...
    pgate_antenna_ratio("antenna_tempalte1") {
        index_1 ("0.0 1.0 2.0 3.0")
```

Feedback

```
        values ("200 200 400 600");
    }
}
```

Modify the group to:

```
antenna_rule("M1_ANTENNA_RULE")
    ...
    pgate_antenna_ratio("scalar") {
        values ("200");
    }
}
```

LBDB-1095

(error) The '%s' should coexist with '%s' in '%s' group.

Description

This error message is reported when there is restriction that two tables/functions/attributes should coexist the group, but only one found.

Example:

In antenna_rule group, the pgate_antenna_ratio table should coexist with ngate_antenna_ratio. If any of the other is not specified when one is present, the error is reported.

```
antenna_rule (M1_mode1_d4) {
    antenna_ratio ("antenna_tempalte") {
        index_1("0, 0.05 0.06 0.6");
        values("100 100 300 500");
    }
    pgate_antenna_ratio("scalar") {
        values("100");
    }
    layer_antenna_factor("M1", 1.0);
}
```

The following is an example message:

```
Error: Line 546, The 'pgate_antenna_ratio' should coexist with
 'ngate_antenna_ratio' in 'antenna_rule' group. (LBDB-1095)
```

What Next

Modify the plib file accordingly, specify both tables/attributes/functions in the group. or remove the existing one.

Feedback

LBDB-1096

(error) There is unsupported antenna data in the group.

Description

This error message is reported when there is unsupported antenna data found in the antenna_rule group. Mainly, the error is issued for following situations:

1. Usage of pgate_antenna_ratio and ngate_antenna_ratio
   pgate_antenna_ratio and ngate_antenna_ratio can't be supported when: antenna_accumulation_calculation_method : accumulative_ratio; with routing_layer_calculation_method : top_area|side_wall_area;

Note that when reading a plib file to Milkyway library, antenna_accumulation_calculation_method is default to accumulative_ratio and routing_layer_calculation_method is default to top_area;

So, if you want to define pgate_antenna_ratio and ngate_antenna_ratio in the antenna_rule group, you can't leave these two attributes undefined, otherwise, this error will be issued too.

1. Usage of antenna area rule The antenna_rule group is defined as antenna area rule, when antenna_ratio_calculation_method == total_routing_area. And there is restrcitions to antenna_accumulation_calculation_method and geometry_calculation_method, according to current tool support. Following combinations are supported now, this error will be issued for other combinations. mode 1: calculate metal area ignore all lower layer segments. antenna_accumulation_cm = single_layer, geometry_cm = connected_only; mode 2: calculate metal area includes lower layer segments to input pins. antenna_accumulation_cm = accumulative_area, geometry_cm = connected_only; mode 3: calculate metal area includes all lower layer segments. antenna_accumulation_cm = accumulative_area, geometry_cm = all_geometries;

Besides above three calculation methods, the antenna_ratio should using scalar template and have only one value defined as max allowable antenna area, attribute max_diode_insertion_distance is used to define max allowable distance from inserted diode to gate.

other attributes and groups defined in antenna area rule are totally ignored during read_plib and not stored into database.

The following is an example message:

```
Error: Line 546, There is unsupported antenna data in the
 group.(LBDB-1096)
```

Feedback

What Next

Modify the plib file accordingly to rule above.

LBDB-1097

(error) Layer '%s' attribute '%s' and '%s' are different.

Description

x_min_spacing_table, y_min_spacing_table, x_max_spacing_table, y_max_spacing_table, x_max_spacing_check_range_table, y_max_spacing_check_range_table currently require the content in index_1 and index_2 are the same.

If both exist, the dimension and content in index_1[] in fat_wire_via_keepout_enclosure_table and in fat_wire_via_keepout_edge_table should be the same.

If both exist, the dimension and content in index_1[] in fat_wire_via_keepout_enclosure_table and in fat_wire_via_spacing_threshold_table should be the same.

The following is an example message:

```
Error : Layer 'M1' attribute 'x_min_spacing/index_1' and
 'x_min_spacing/index_2' are different. (LBDB-1097)
```

What Next

Unify the different elements.

LBDB-1098

(error) Layer '%s' has wrong '%s'.

Description

Values in x_legal_width and y_legal_width should satisfy, (1) the width values are in ascending order; (2) the first value >= min_width; (3) the last value <= max_width if max_width is specified; (4) default_routing_width is among the values.

The following is an example message:

```
Error : Layer 'M1' has wrong 'x_legal_width'. (LBDB-1098)
```

What Next

Re-specify x_legal_width or y_legal_width.

Feedback

LBDB-1099

(error) Layer '%s' '%s' and '%s' can't co-exist.

Description

fat_wire_via_keepout_edge_table and fat_wire_via_spacing_threshold_table can't co-exist in a cont_layer.

The following is an example message:

```
Error : Layer 'M1' 'fat_wire_via_keepout_edge_table' and
 'fat_wire_via_spacing_threshold_table' can't co-exist. (LBDB-1099)
```

What Next

Remove at least one of the two given attributes/functions/groups.

LBDB-1100

(information) Dummy cell '%s' defined in the library.

Description

This info message is reported when there is dummy cell defined in an incremental plib file (that is, the library attribute is_incremental_library : true;)

A dummy cell is identified by following features: 1. The cell name has wildcard '*' used, and the '*' is the last character in the cell name, for example, cell name is "*", or "AND*". 2. There is no cell geometries (macro obs, pin port) defined in the cell.

A dummy cell is expected only in an incremental plib file, and it's used to update cell/pin attributes for FRAM view cells when read plib data to Milkyway database.

What Next

Users do not need to do anything.

LBDB-1101

(error) There is geometry data defined in dummy cell '%s'.

Description

This warning message is reported when there is geometry data defined in the dummy cell.

A dummy cell is identified by following features: 1. The cell name has wildcard '*' used, and the '*' is the last character in the cell name, for example, "*" or "AND*". 2. There is no cell geometries (macro obs, pin port) defined in the cell.

A dummy cell is expected only in an incremental plib file, and it's used to update cell/pin attributes for a set of FRAM view cells (pattern matched cells) when read plib data to Milkyway database.

The following is an example message:

```
Error: Line 546, There is geometry data defined in dummy cell
 '*'.(LBDB-1101)
```

What Next

Remove all geometry data from the cell (macro obs, pin port) if users want to use dummy cell to update cell/pin attributes for a set of cells. Otherwise, rename the cell name to avoid it match with dummy cell naming rule.

LBDB-1111

(error) Incorrect number of arguments specified in '%s' attribute.

Description

This message indicates the number of arguments for an attribute does NOT meet one of the requirements: minimum/maximum number, even/odd number, multiples of certain number, etc.

The following example shows an instance where this message occurs:

```
library(test) {
        ...
        cell(testcell) {
          example(1, 2);            /* line 20 */
        }
    }
```

The requirement is the number of argument of 'example' attribute should be odd and bigger than 2.

The following is an example message:

```
Error: Line 20, Cell 'cell1', Incorrect number of arguments specified in
 'example' attribute. (LBDB-1111)
```

What Next

Make sure the correct argument is used for the attribute.

LBDB-1112

(error) Different number of arguments found in '%s' attributes declared under this %s group.

Feedback

Description

This message indicates this multiply declared attribute under the same parent group have different number of Arguments. The numbers of arguments should be identical among them.

The following example shows an instance where this message occurs:

```
library(test) {
        ...
        cell(testcell) {            /* line 19 */
          example(1, 2, 3);
          example(1, 2, 3, 4, 5);
        }
    }
```

The following is an example message:

```
Error: Line 19, Cell 'cell1', Different number of arguments found in
 'example' attributes declared under this 'cell' group. (LBDB-1112)
```

What Next

Make sure the correct argument is used for the attributes.

LBDB-1150

(error) Invalid value in end_of_line_via_wire_rule.

Description

Name the five values in end_of_line_via_wire_rule as layer1, layer2, end_of_line_via_wire_min_width, end_of_line_via_wire_min_spacing, end_of_line_via_ortho_wire_max_threshold, respectively.

Suppose layer1 is routing_layer, and layer2 is cont_layer. default_via is the default via on layer2. Taking min_width and min_spacing specification from layer1, and compute cut_width by the geometry of default_via.

If there is another design rule for this layer pair

min_enclosure (string, string, float); /* layer1, layer2, min_enclosure */

Take min_enclosure from this specification. Otherwise let min_enclosure=0.

Values should satisfy, (1) end_of_line_via_wire_min_width > min_width (2) end_of_line_via_wire_min_width >= cut_width + 2* min_enclosure (3) end_of_line_via_wire_min_spacing >= min_spacing + min_enclosure (4) end_of_line_via_ortho_wire_max_threshold >= minWidth

Feedback

The following is an example message:

```
Error : Invalid value in end_of_line_via_wire_rule. (LBDB-1150)
```

What Next

Change the value to satisfy all the 4 restrictions.

LBDB-1151

(error) "%s" has invalid value %f.

Description

same_segment_center_min_spacing, same_net_center_min_spacing, diff_segment_center_min_spacing, diff_net_center_min_spacing in cont_layer() group or in topological_design_rules() group should satifsy, [same|diff]_[segment|net]_center_min_spacing >= min_cut_spacing + cut_width

The value of min_cut_spacing and cut_width is explained as follows.

As for [same|diff]_[segment|net]_center_min_spacing in cont_layer() group, let "default_via" to be the default via of this cont_layer. Then min_cut_spacing is taken from contact_spacing specification. Cut_width is taken from the geometry of default_via.

As for [same|diff]_[segment|net]_center_min_spacing in topological_design_rules() group, we only check if both layer1 and layer2 are cont_layers. Let "default_via_1" to be the default via on layer1, "default_via_2" to be the default via on layer2. min_cut_spacing is taken from the function in topological_design_rule():

contact_min_spacing (layer1, layer2, min_cut_spacing)

Cut_width_1 and cut_width_2 are taken from the geometry of default_via_1 and default_via_2, respectively. Let cut_width = (cut_width_1+cut_width_2)/2.

The following is an example message:

```
Error : "diff_segment_center_min_spacing" has invalid value 0.12.
 (LBDB-1151)
```

What Next

Change the value to satisfy the restriction.

LBDB-1152

(error) The '%s' attribute has an invalid sequence of\n \tdata '%g , %g'. The values must be in decreasing order.

Feedback

Description

This message indicates that the set of data is not specified in decreasing order. Content in "values" in min_metal_spacing_table must be in descending order.

The following is an example message:

```
Error: Line 22, The 'values' attribute has an invalid sequence of
        data '1.200000 , 2.300000'. The values must be in decreasing
 order. (LBDB-1152)
```

What Next

Check your library and correct the order of the values.

LBDB-1153

(error) '%s' has 0 or more than %d arguments.

Description

[x|y]_legal_width requires that the argument number is greater than 0 and less than or equal to 16.

The following is an example message:

```
Error: Line 22, 'x_legal_width' has 0 or more than 16 arguments.
 (LBDB-1153)
```

What Next

Add or reduce arguments into the specified function.

LBDB-1154

(error) There is no noise information in the library.

Description

This information occurs when checking library for noise information, but there is no noise information in the library at all.

What Next

If noise information is not needed, cancel the noise checking; If noise information is needed, add I-V characteristics, noise immunity data and noise propagation data.

Feedback

LBDB-1155

(error) Invalid %s found under section %s in map file.

Description

In the map file, if any of the following is incorrect, (1) voltage_name (2) voltage value (3) power management attributes this message will occur.

Valid voltage_name should be a valid string that starts with a character a-z or A-Z. The voltage_name in PG_TO_VOLTAGE_MAP section should be one in VOLTAGE_MAP. It could be a rail name, and could be the same as pg_pin name. But never input an invalid value such as "-" or "*" in voltage_name field in PG_TO_VOLTAGE_MAP or VOLTAGE_MAP section. Valid voltage values are non-negative floating point numbers, for example, 0.9, that are valid voltage values in the input library. For valid power management attributes, please refer to related documents or user guide. The following are only a few examples: valid switch_cell_type is coarse_grain and fine_grain; valid level_shifter_type is HL, LH and HL_LH; always_on pins are related to backup power; a switch cell has VVDD+VDD or VVSS+VSS, and. VVDD has pg_function where VVDD is virtual VDD.

The following example shows an instance where this message occurs:

```
BEGIN PG_TO_VOLTAGE_MAP
cell            pg_pin          voltage_name    pg_type
ADDFHX1         VDD             -       power
ADDFHX1         VSS             VSS             primary_ground
GEND PG_TO_VOLTAGE_MAP
```

The following is an example message:

```
Error: Line 14, Invalid voltage_name found under section
 PG_TO_VOLTAGE_MAP in map file. (LBDB-1155)
```

What Next

You should correct the invalid values and/or voltage_name in the map file. For example, in voltage_name field, if you enter "-", you will receive this message. You must input a valid voltage_name, e.g. VDD.

LBDB-1156

(warning) private variable '%s' is enabled. Do not use the compiled DB in design flow.

Description

This message indicates that a pribate variable is enabled when compiling the DB. The compiled DB file may cause design flow fail.

Feedback

What Next

Disable the private variable and recompile the DB file.

LBDB-1157

(warning) The direction of pg_pin '%s' can only be input or inout when pg_type is '%s'!

Description

You receive this message when pg_type is primary_power or primary_ground but the pg_pin direction is output.

The following example shows an instance where this message occurs:

```
cell(lbdb1157) {
      area : 9;
      pg_pin(VDD) {
        direction : output ;
        pg_type : primary_power;
        voltage_name :VDD;
      }
      pg_pin(VSS) {
        pg_type : primary_ground;
        voltage_name :VSS;
      }
    }
```

In this case, direction of pg_pin VDD is output but its pg_type is primary_power.

The following is an example message:

```
Warning: Line 848, The direction of pg_pin 'VDD' can only be input or
 inout when pg_type is 'primary_power'! (LBDB-1157)
```

What Next

Correct the direction or pg_type

LBDB-1158

(error) Multiple '%s' groups found when same group with type 'both' is defined at line %d!

Description

You receive this message when more than one specified group are specified and the 'type' attribute in one of the group is 'both'.

Feedback

The following example shows an instance where this message occurs:

```
cell(lbdb1158) {
    tap_cell_properties() {
        type : both;
        coverage_distance (23, 10) ;
        min_row_edge_distance : 12;
        coverage_pattern_left : left_full ;
        coverage_pattern_right : right_full;
    }
    tap_cell_properties() {
        type : nwell ;
        coverage_distance (10, 23) ;
        min_row_edge_distance : 16;
        coverage_pattern_left : left_full ;
        coverage_pattern_right : right_full;
  }
}
```

In this case, two tap_cell_properties are specified

The following is an example message:

```
Error : Line 1000, Multiple 'tap_cell_properties' groups found when same
 group with type 'both' is defined at line 1001! (LBDB-1158)
```

What Next

Remove one of the group.

LBDB-1159

(error) The value of '%s' cannot be less than %d!

Description

You receive this message when the value in the attribute is less than minimum allowed number.

The following example shows an instance where this message occurs:

```
cell(lbdb1158) {
    tap_cell_properties() {
        type : both;
        coverage_distance (-1, 10) ;
        min_row_edge_distance : 12;
        coverage_pattern_left : left_full ;
        coverage_pattern_right : right_full;
    }
}
```

In this case, value in coverage_distance is less than 0

Feedback

the following is an example message:

```
Error : Line 1000,  The value of 'coverage_distance' cannot be less than
 0!
```

What Next

Remove one of the group.

LBDB-1161

(error) The attribute '%s' is required for %s.

Description

This message indicates that the required attribute on the specified pin is missing.

For single rail no enable isolation cell, it is a requirement that the output pin has attribute 'alive_during_partial_power_down'.

The following example shows an instance where this message occurs:

```
cell(Isolation_Cell) {
  is_isolation_cell : true;
  pg_pin(DVDDB) {
    voltage_name : DVDDB;
    pg_type : primary_power;
  }
  pg_pin(VSS) {
    voltage_name : VSS;
    pg_type : primary_ground;
  }
  pin(D) {
    direction : input;
    related_power_pin : DVDDB;
    related_ground_pin : VSS;
    isolation_cell_data_pin : true;
  }
  pin(Z) {
    direction : output;
    related_power_pin : DVDDB;
    related_ground_pin : VSS;
    function : "D";
    clamp_0_function : "!DVDDB";
    power_down_function : "VSS";
      timing() {
        related_pin : "D";
        …
      } /* end timing group */
  }/* end pin group*/
}/*end cell group*/
```

Feedback

In this case, the alive_during_partial_power_down is missing in pin Z.

The following is an example message:

```
Error: Line 326, Cell 'Isolation_Cell', pin 'Z', The attribute
 'alive_during_partial_power_down' is required for single rail no enable
 isolation cell. (LBDB-137)
```

What Next

Add required attribute to the output pin.

LBDB-1162

(error) The %s pin '%s' in %s cannot be used in %s!

Description

This message indicates that the pin name should not be in the function.

If pg_function is MUX21, the signal pin used in switch_function should be a different signal pin from pg_function.

The following example shows an instance where this message occurs:

```
cell(LBDB-1162) {
switch_cell_type : coarse_grain;
   pg_pin (VDD) {
        direction : output;
        pg_function : "VDDB * A + !A * VDDA";
        pg_type : internal_power;
        switch_function : "!(A|B)";
        voltage_name : "VDD";
   }

}/*end cell group*/
```

In this case, A cannot be used in switch_function as A is used in pg_function

The following is an example message:

```
Error: Line 326, The signal pin 'A' in switch_function cannot be used in
 pg_function! (LBDB-1162)
```

What Next

remove the signal pin from switch_function.

LBDB-1162w

(warning) The %s pin '%s' in %s cannot be used in %s!

Feedback

Description

This message indicates that the pin name should not be in the function.

If pg_function is MUX21, the signal pin used in switch_function should be a different signal pin from pg_function.

The following example shows an instance where this message occurs:

```
cell(LBDB-1162w) {
switch_cell_type : coarse_grain;
   pg_pin (VDD) {
        direction : output;
        pg_function : "VDDB * A + !A * VDDA";
        pg_type : internal_power;
        switch_function : "!(A|B)";
        voltage_name : "VDD";
   }

}/*end cell group*/
```

In this case, A cannot be used in switch_function as A is used in pg_function

The following is an example message:

```
Warning: Line 326, The signal pin 'A' in switch_function cannot be used
 in pg_function! (LBDB-1162w)
```

What Next

remove the signal pin from switch_function.

LBDB-1163

(error) Invalid pg_function '%s' found for switch cell!

Description

This message indicates that pg_function format is incorrect.

For switch cell, pg_function can only be a single pg_pin, or two pg_pins and one or more signal pins in a MUX21 format (signal pins are the select pins).

The following example shows an instance where this message occurs:

```
cell(LBDB-1162) {
switch_cell_type : coarse_grain;
   pg_pin (VDD) {
        direction : output;
        pg_function : "VDDB * VDDA";
        pg_type : internal_power;
        switch_function : "!(A|B)";
```

```
        voltage_name : "VDD";
   }

}/*end cell group*/
```

In this case, there are two pg pins in pg_function and it is not in MUX21 format

The following is an example message:

```
Error: Line 326, Invalid pg_function 'VDDB * VDDA' found for switch cell!
 (LBDB-1163)
```

What Next

only write one pg pin in pg_function or write the function in MUX21 format.

LBDB-1163w

(warning) Invalid pg_function '%s' found for switch cell!

Description

This message indicates that pg_function format is incorrect.

For switch cell, pg_function can only be a single pg_pin, or two pg_pins and one or more signal pins in a MUX21 format (signal pins are the select pins).

The following example shows an instance where this message occurs:

```
cell(LBDB-1163w) {
switch_cell_type : coarse_grain;
   pg_pin (VDD) {
        direction : output;
        pg_function : "VDDB * VDDA";
        pg_type : internal_power;
        switch_function : "!(A|B)";
        voltage_name : "VDD";
   }

}/*end cell group*/
```

In this case, there are two pg pins in pg_function and it is not in MUX21 format

The following is an example message:

```
Warning: Line 326, Invalid pg_function 'VDDB * VDDA' found for switch
 cell! (LBDB-1163w)
```

What Next

only write one pg pin in pg_function or write the function in MUX21 format.

Feedback

LBDB-1164

(error) Multiple %s '%s' groups are defined at line %d!

Description

You receive this message when more than one specified group are specified.

The following example shows an instance where this message occurs:

```
cell(lbdb1164) {
     site(site_def_1) {
         width: 2;
         height: 3;
         type: pad;
         symmetry (x);
         is_default: true;
     }
     site(site_def_2) {
         width: 2;
         height: 3;
         type: pad;
         symmetry (y);
         is_default: true;
     }

}
```

In this case, two site are specified and they are both default.

The following is an example message:

```
Error : Line 1000, Multiple default 'site' groups are defined at line
 1001! (LBDB-1164)
```

What Next

Remove one of the group.

LBDB-1165

(error) The size of %s [%d] should be an integral multiple of the size of %s [%d]!

Description

When the above-mentioned attributes are specified, the size should be an integral multiple of some attribute.

The following example shows an instance where this message occurs:

```
library(libdb1165) {
  ..
```

Feedback

```
site (unitTile) {
  track_pattern (M1) {
      type : uniform;
      direction: horizontal;
      mask_pattern (“mask_one”, “mask_two”, “mask_one”, “mask_two”);
      spacing : 0.2;
      offsets (“0.3”);
      widths(“0.1”);
      reserved_width_flags(“true”);
      grid_low_offsets(“0.1, 0.2, 0.3, 0.4”);
      grid_high_offsets(“0.1, 0.2, 0.3, 0.4”);
      grid_low_steps(“0.3”, “0.2, 0.4”, “0.2, 0.4”, “0.3, 0.4” );
      grid_high_steps(“0.3, 0.4”, “0.2, 0.4”, “0.2, 0.4”, “0.3, 0.4” );
  }
  ...
}
```

grid_low_steps has size 7 but mask_pattern has size 4. 7 is not integral multiple of 4.

Examples

The following is an example message:

```
Error: Line 18,  The size of grid_low_steps [7] should be an integral
 multiple of the size of mask_pattern [4]! (LBDB-1165)
```

What Next

Check the library source file, and make the necessary correction.

LBDB-1166

(error) The size of '%s' in group '%s' should be %s!

Description

When the above-mentioned attributes are specified, the size should be required size. For track_pattern, 1) if the type is uniform, 1.a) the size of 'offsets', and 'reserved_width_flags' if specified should be 1. 1.b) the size of 'widths' can be either 1 or same as size of 'mask_pattern'. 2) if the type is non-uniform, the size of 'mask_pattern', 'widths' and 'reserved_width_flags' if specified should be same as size of 'offsets'. 3) the size of 'grid_low_offsets' and 'grid_high_offsets' if specified should be same as size of 'mask_pattern'.

The size of resize under derived_layer should be either 2 or 3 or 5. first parameter is layer name and other parameters are float numbers. following are correct resize format. 1) resize(poly, 0.005); If one float value is provided, the left, bottom, right and top are each expanded by the distance 0.005. 2) resize(poly, 0.005, 0.00); If two float values are provided, the left and right edges are each expanded by the first distance 0.005 and the top and bottom edges are each expanded by the second distance 0.00 3) resize(poly,

Feedback

0.005, 0.10, 0.002, 0.0); If four values are provided, the left, bottom, right, and top edges are expanded the respective distances.

The following example shows an instance where this message occurs:

```
library(libdb1166) {
  ..
  site (unitTile) {
    track_pattern (M1) {
        type : uniform;
        direction: horizontal;
        mask_pattern (“mask_one”, “mask_two”, “mask_one”, “mask_two”);
        spacing : 0.2;
        offsets (“0.3 0.2”);
        widths(“0.1”);
        reserved_width_flags(“true”);
        grid_low_offsets(“0.1, 0.2, 0.3, 0.4”);
        grid_high_offsets(“0.1, 0.2, 0.3, 0.4”);
        grid_low_steps(“0.3 0.1”, “0.2, 0.4”, “0.2, 0.4”, “0.3, 0.4” );
        grid_high_steps(“0.3, 0.4”, “0.2, 0.4”, “0.2, 0.4”, “0.3, 0.4” );
    }
    ...
  }
```

offsets has size 2 but its size should be 1. of 4.

Examples

The following is an example message:

```
Error: Line 18,  The size of 'offsets' in group 'track_pattern' should be
 1! (LBDB-1166)
```

What Next

Check the library source file, and make the necessary correction.

LBDB-1167

(error) Invalid single site '%s' defined in attribute '%s'!

Description

The single site specified in attribute 'overlapping_site_mapping' should be exist in attribute 'site_list' in same 'row_pattern' group.

The following example shows an instance where this message occurs:

```
library(libdb1167) {
  ..
  row_pattern() {
     site_list ("unitH182, unitH210, unitH210");
```

Feedback

```
    overlapping_site_alignment("unitH392", "unitH192, unitH210", R0);
    overlapping_site_alignment("unitH392MX", "unitH182, unitH210", MX);
    first_row_orientation: R0;
    last_site_row_index: 0;
  };
 ...
}
```

unitH192 defined in overlapping_site_mapping doesn't exist in 'site_list' of 4.

Examples

The following is an example message:

```
Error: Line 18,  Invalid single site 'unitH192' defined in attribute
 'overlapping_site_alignment'! (LBDB-1167)
```

What Next

Check the library source file, and make the necessary correction.

LBDB-1169

(warning) The values in '%s' are not decreasing %g, %g,\n \twhen %s = %g, %s = %g, %g.

Description

This information appears when the values in the specified table do not decrease monotonically with the increasing output voltage from voltage value of VSS through VDD.

The following example shows an instance where this message occurs:

```
dc_current(template) {
    index_1("-0.675, -0.3375, -0.135, -0.0675, 0, 0.03375, 0.0675,
 0.10125, 0.135, 0.16875, 0.2025, 0.23625, 0.27, 0.30375, 0.3375,
 0.37125, 0.405, 0.43875, 0.4725, 0.50625, 0.54, 0.57375, 0.6075,
 0.64125, 0.675, 0.7425, 0.81, 1.0125, 1.35"); /* input_voltage */
    index_2("-0.675, -0.3375, -0.135, -0.0675, 0, 0.03375, 0.0675,
 0.10125, 0.135, 0.16875, 0.2025, 0.23625, 0.27, 0.30375, 0.3375,
 0.37125, 0.405, 0.43875, 0.4725, 0.50625, 0.54, 0.57375, 0.6075,
 0.64125, 0.675, 0.7425, 0.81, 1.0125, 1.35"); /* output_voltage */
    values("...0.0166949, 0.016715,...")
  }
```

The following is an example message:

```
Warning: Line 762, Cell 'A', pin 'clk', The values in 'dc_current' are
 not decreasing 0.0166949, 0.016715,
        when input_voltage = 0.0675, output_voltage = 0.16875, 0.2025.
 (LBDB-1169)
```

Feedback

What Next

Make sure that the values decrease monotonically with the increasing output voltage from voltage value of VSS through VDD.

LBDB-1170

(error) The '%s' attribute is not specified.

Description

This message indicates that an attribute is missing. start_site_id should be specified for all cells in a cell group. For the cells in a cell group, you can either specify start_site_id for them all, or not specify it at all.

The following example shows an instance where this message occurs:

```
library ( prf ) {
    ...
    cell (A) {
      cell_group: A;
      start_site_id (1, 2);
    }
    cell (A1) {
      cell_group: A;
    }
  }
```

The following is an example message:

```
Error: Line 52, Cell 'A1', The 'start_site_id' attribute is not
 specified. (LBDB-1170)
```

What Next

Add the missing attribute.

LBDB-1171

(error) The '%s' attribute is specified without '%s' attribute specified.

Description

This message indicates that an attribute is specified without another attribute specified in a cell group.

The following example shows an instance where this message occurs:

```
library ( prf ) {
    ...
    cell (A) {
```

```
      delta_tap_distance (-0.18,0.27,0.09,0.09,0.09,0.09,-0.18,0.27);
    }
  }
```

The following is an example message:

```
Error: Line 52, Cell 'A', The 'delta_tap_distance' attribute is specified
 without 'tap_boundary_wall_cell_properties' attribute specified.
 (LBDB-1171)
```

What Next

Add the missing attribute.

LBDB-1172

(error) The '%s' attribute is specified without '%s' attribute specified in the referred '%s (%s)' group at line %u.

Description

This message indicates that an attribute is specified without another attribute specified. One case is that both 'delta_tap_distance' and 'tap_boundary_wall_cell_properties : <prop_name>' attributes are specified in a cell group, however in the referred 'tap_boundary_wall_cell_properties(<prop_name>)' group in the library, the 'tap_distance' attribute is not specified.

The following example shows an instance where this message occurs:

```
library ( prf ) {
    tap_boundary_wall_cell_properties( AAA ) {
    /* tap_distance (TTT, TTT, 0, 0, 0, 0, TTT, TTT); */
    }
    ...
    cell (A) {
      tap_boundary_wall_cell_properties: AAA;
      delta_tap_distance (-0.18,0.27,0.09,0.09,0.09,0.09,-0.18,0.27);
    }
  }
```

The following is an example message:

```
Error: Line 68, Cell 'A', The 'delta_tap_distance' attribute is
 specified without 'tap_distance' attribute specified in the referred
 'tap_boundary_wall_cell_properties ( AAA )' group at line 23.
 (LBDB-1172)
```

What Next

Add the missing attribute.

Feedback

LBDB-1173

(error) Number of elements in %s (%u) is not same as that in %s (%u) at line %u.

Description

This message indicates that the size of 'delta_tap_distance' is not same as the size of 'tap_distance' in the referred 'tap_boundary_wall_cell_properties()' group.

The following example shows an instance where this message occurs:

```
library ( prf ) {
    tap_boundary_wall_cell_properties( AAA ) {
      tap_distance (TTT, TTT, 0, 0, 0, 0, TTT, TTT);
    }
    ...
    cell (A) {
      tap_boundary_wall_cell_properties: AAA;
      delta_tap_distance (-0.18,0.27,0.09,0.09);
    }
  }
```

The following is an example message:

```
Error: Line 52, Cell 'A', Number of elements in delta_tap_distance (4) is
 not same as that in tap_distance (8) at line 24. (LBDB-1173)
```

What Next

Add the missing attribute.

LBDB-1174

(error) Number of elements in %s (%u) is neither 8 nor 4.

Description

This message indicates that the size of 'tap_distance' is neither 8 nor 4.

The following example shows an instance where this message occurs:

```
library ( prf ) {
    tap_boundary_wall_cell_properties( AAA ) {
      tap_distance (0, 0);
    }
    ...
  }
```

The following is an example message:

```
Error: Line 52, Number of elements in tap_distance (2) is neither 8 nor
 4. (LBDB-1174)
```

Feedback

What Next

Provide the correct number of elements for the attribute.

LBDB-1175

(warning) The vector has duplicate indices for input_net_transition and total_output_net_capacitance pair with other vector.

Description

This error message occurs because under the output_voltage_rise|fall, some vector's total_output_net_capacitance and input_net_transition are duplicate with other vector.

The following example shows an output_current_rise group without a dense vector and resulting error message.

```
output_voltage_template(ccsnov) {
  variable_1 : input_net_transition;
  variable_2 : total_output_net_capacitance;
  variable_3 : time;
 }
 . . .
 output_voltage_rise() {
   vector(ccsnov) {
      index_1 ("0.1");
      index_2 ("1");
      index_3 ("1, 2, 3");
      values ("1, 2, 3");
   }
    vector(ccsnov) {
      reference_time : 0.11;
      index_1 ("0.1");
      index_2 ("1");
      index_3 ("3, 4, 6");
      values ("1, 2, 3");
   }
 }

Error: Line 198, The vector has duplicate indices for
 input_net_transition and total_output_net_capacitance with other vector.
 (LBDB-1175)
```

What Next

Check the library source file and correct the vector for input_net_transition and total_output_net_capacitance pair.

Feedback

LBDB-1176

(error) The '%s' in '%s' is invalid.

Description

This message indicates that one of the value in 'tap_distance' is invalid. Each value in 'tap_distance' can be a name of pre-defined 'tap_rule' group, or direct number.

The following example shows an instance where this message occurs:

```
library ( prf ) {
    tap_rule( TTT ) {
      default_tap_distance : 15;
      tap_distance_layer_rule (LUP_075U, 10);
      tap_distance_layer_rule (LUP_045U, 3);
    }
    tap_boundary_wall_cell_properties( AAA ) {
      tap_distance (TTT, TTT, 0, 0, 0, 0, TTT, XXX);
    }
    ...
  }
```

The following is an example message:

```
Error: Line 23, The 'XXX' in 'tap_distance' is invalid. (LBDB-1176)
```

What Next

Provide a name of pre-defined 'tap_rule' group or direct number for each value in 'tap_distance'.

LBDB-1177

(error) The '%s' in '%s' refers to a '%s' group which is defined at line %u after this line.

Description

This message indicates that one of the value in 'tap_distance' refers to a 'tap_rule' group after this line.

The following example shows an instance where this message occurs:

```
library ( prf ) {
    tap_boundary_wall_cell_properties( AAA ) {
      tap_distance (TTT, TTT, 0, 0, 0, 0, TTT, TTT);
    }
    tap_rule( TTT ) {
      default_tap_distance : 15;
      tap_distance_layer_rule (LUP_075U, 10);
      tap_distance_layer_rule (LUP_045U, 3);
```

Feedback

```
    }
    ...
  }
```

The following is an example message:

```
Error: Line 23, The 'TTT' in 'tap_distance' refers to a 'tap_rule' group
 which is defined at line 25 after this line. (LBDB-1177)
```

What Next

Define tap_rule group before using it.

LBDB-1178

(warning) The '%s' under '%s' group must have at least one '%s' which is defined in '%s' group.

Description

This message indicates that 'default_pg_setting' should be specified in one pg_setting under mode_value group for each mode_definition group.

The following example shows an instance where this message occurs:

```
cell(test) {
   pg_setting_definition(PD) {
      default_pg_setting : PV1;
      pg_setting_value(PV1) {
        ...
      }
      pg_setting_value(PV2) {
        ...
      }

   }
   mode_definition(rw) {
      mode_value(read) {
         pg_setting(PD, PV2);
      }
   }
}
```

The following is an example message:

```
Warning: Line 35, The 'pg_setting' under 'mode_value' group must have at
least one 'default_pg_setting' which is defined in
'pg_setting_definition' group. (LBDB-1178)
```

What Next

Add the group if it is missing, or fix the attribute value if it has a typo.

Feedback

LBDB-1179

(error) The '%s' attribute for %s '%s' is specified without '%s' attribute for the same %s.

Description

This message indicates that an attribute is specified without another attribute specified. One case is that there is no corresponding "extra_site_list" for the same name site-array when relative_shift" for the named site-array is specified

The following example shows an instance where this message occurs:

```
library ( prf ) {
    row_pattern (demo) {
       site_list (core);
       extra_site_list (“halo”, R0);
       relative_shift (“halo1”, “-0.025, 0”);
       ……
    }
  }
```

The following is an example message:

```
Error: Line 68,The 'relative_shift' attribute for site-array 'halo1' is
 specified without 'extra_site_list' attribute for the same site-array.
```

What Next

Add the missing attribute.

LBDB-1180

(error) An invalid zero or negative value (%f) of '%s' is found.

Description

This message indicates zero or negative value is found for the attribute.

library (my_library) { lifetime_profile_definition (lifetime_profile_1) { stress_time : 10; stress_voltage : 1.1; stress_temperature : 125; signal_probability : 0.5; activity_factor : 0.5; stress_mode: HCI; /*stress_clock_period cannot be 0 and should be larger than 0*/ stress_clock_period: 0; stress_slew_index: 2; stress_load_index: 0; }

}

The following is an example message:

```
Error: Line 136, An invalid zero or negative value (0.000000) of
 'stress_clock_period' is found. (LBDB-1180)
```

Feedback

What Next

Change the value of the attributes to positive, make sure value >= 1e-6.

LBDB-1181

(warning) There is no %s specified on %s pin, may affect STA accuracy.

Description

This warning message occurs when a internal pin has no related_power_pin/ related_ground_pin attribute.

The following example shows an instance where this message occurs:

```
cell(test_LBDB-1181){
  area : 1.0;

pg_pin(VDDB) {
  voltage_name : VDDB;
  pg_type : backup_power;
}

pg_pin(VDD) {
  voltage_name : VDD;
  pg_type : primary_power;
}

pg_pin(VSS) {
  voltage_name : VSS;
  pg_type : primary_ground;
}

pin(A) {
  direction : internal;
}
}
```

The following is an example message:

```
Warning: Line 192, Cell 'test_LBDB-1181', pin 'A', There is no
 related_power_pin specified on internal pin, may affect STA accuracy.
 (LBDB-1181)
Warning: Line 193, Cell 'test_LBDB-1181', pin 'A', There is no
 related_ground_pin specified on internal pin, may affect STA accuracy.
 (LBDB-1181)
```

What Next

Check the library source file to add or correct related_power_pin/related_ground_pin attributes.

Feedback

LBDB-1210

(error) Incomplete when condition coverage ("%s") for the '%s' group%s.

Description

This message occurs when internal_power, leakage_power or timing group has incomplete "when" condition coverage

The following example shows an instance where this message occurs:

```
...
    pin(Z) {
      direction : output ;
      timing() {
        related_pin : "I" ;
        when : "A*B";
        ...
      }
      timing() {
        related_pin : "I" ;
        when : "A*!B";
        ...
      }
      timing() {
        related_pin : "I" ;
        when : "!A*B";
        ...
      }
      /*
      timing() {
        related_pin : "I" ;
        when : "!A*!B";
        ...
      }
      */
      ...
    }
    ...

In the example above, the arc from 'I' to 'Z' does not have a timing
 model
for the when condition "!A*!B".

The following is an example of the message:

Error: Line 206, cell 'test', pin 'Z', Incomplete when condition
 coverage("A + B") for the 'timing' group of related_pin 'I'. (LBDB-1210)
```

Feedback

What Next

Complete the model. Either introduce a new group with the missing "when" condition, or add a default “when” condition.

LBDB-1211

(error) The value for 'parameter_value_delta' index size must be one.

Description

Currently only support one dimension for 'parameter_value_delta'.

The following example shows an instance where this message occurs:

```
lu_table_template (lle_delta_template_3x3x1) {
    variable_1 : input_net_transition;
    variable_2 : total_output_net_capacitance;
    variable_3 : parameter_value_delta;
    index_1 ("0, 0.0625, 1");
    index_2 ("0, 0.0625, 1");
    index_3 ("0,1");
  }
  ...
  lle_delta_cell_rise (lle_delta_template_3x3x2) {
    related_params : “vth”;
    related_devices : “tr2”;
    index_1 ("0.0018, 0.0743, 1.15149");
    index_2 ("9.35e-05, 0.0025, 0.039");
    index_3 ("0.050,0.06");
    values ("0.000100", "0.000200", "0.000300", \
            "0.001000", "0.002000", "0.003000", \
            "0.010000", "0.020000", "0.030000");
  }
```

The following is an example message:

```
Error: Line 144, The value for 'parameter_value_delta' index size must be
 one. (LBDB-1211)
```

What Next

Check the library source file to see if you defined the 'parameter_value_delta' not one dimension for the specified group.

LBDB-1212

(warning) The timing arc from '%s' to '%s' is missing possible condition: "%s".

Feedback

Description

This message indicate some possible conditions are missing for this timing arc, and there is no default arc.

The following example shows an instance where this message occurs:

```
pin(Z) {
    direction : output;
    function : "(S' * A+S * B)";
    timing () {
      related_pin : "A";
      when :     "B * !S";
      sdf_cond : "B * !S";
      cell_rise(scalar)       { values ( "0.1");}
      rise_transition(scalar) { values ( "0.1");}
      cell_fall(scalar)       { values ( "0.1");}
      fall_transition(scalar) { values ( "0.1");}
    }
```

In this case, the condition "B' S'" is missing for this timing arc from 'A' to 'Z'. To fix the problem, add the following timing group:

```
timing () {
      related_pin : "A";
      when :     "!B * !S";
      sdf_cond : "!B * !S";
      cell_rise(scalar)       { values ( "0.1");}
      rise_transition(scalar) { values ( "0.1");}
      cell_fall(scalar)       { values ( "0.1");}
      fall_transition(scalar) { values ( "0.1");}
    }

The following is an example message:
Warning: Line 190, Cell 'MUX21', pin 'Z', The timing arc from 'A' to 'Z'
 is missing possible condition: "B' S'". (LBDB-1212)
```

What Next

Add the timing arcs with missing conditions between the two pins.

LBDB-1213

(error) The value '%s' for 'related_devices' of lle delay must be listed in 'lle_devices' definition.

Description

The following example shows an instance where this message occurs:

```
cell ( cell_a ) {
      lle_devices: "tr2 tr1";
```

Feedback

```
      lle_params: "vth vth1";
  ...
  }
  lle_delta_cell_rise (lle_delta_template_3x3x2) {
    related_params : “vth”;
    related_devices : “tr3”;
    index_1 ("0.0018, 0.0743, 1.15149");
    index_2 ("9.35e-05, 0.0025, 0.039");
    index_3 ("0.050,0.06");
    values ("0.000100", "0.000200", "0.000300", \
            "0.001000", "0.002000", "0.003000", \
            "0.010000", "0.020000", "0.030000");
  }
```

The following is an example message:

```
Error: Line 144, The value 'tr3' for 'related_devices' of lle delay must
 be listed in 'lle_devices' defined. (LBDB-1213)
```

What Next

Check the value for 'related_devices' to see if your definition is in 'lle_devices' allowable values.

LBDB-1214

(error) The value '%s' for 'related_params' of lle delay must be listed in 'lle_params' definition.

Description

The following example shows an instance where this message occurs:

```
cell ( cell_a ) {
      lle_devices: "tr2 tr1";
      lle_params: "vth vth1";
  ...
  }
  lle_delta_cell_rise (lle_delta_template_3x3x2) {
    related_params : "vth0";
    related_devices : "tr2";
    index_1 ("0.0018, 0.0743, 1.15149");
    index_2 ("9.35e-05, 0.0025, 0.039");
    index_3 ("0.050,0.06");
    values ("0.000100", "0.000200", "0.000300", \
            "0.001000", "0.002000", "0.003000", \
            "0.010000", "0.020000", "0.030000");
  }
```

Feedback

The following is an example message:

```
Error: Line 144, The value 'vth0' for 'related_params' of lle delay must
 be listed in 'lle_params' defined. (LBDB-1214)
```

What Next

Check the value for 'related_params' to see if your definition is in 'lle_params' allowable values.

LBDB-1215

(error) The '%s' group is missing the table definition for %s %s,%s %s.

Description

The following example shows an instance where this message occurs:

```
cell ( cell_a ) {
      lle_devices: "tr2 tr1";
      lle_params: "vth";
  ...
  }
  lle_delta_cell_rise (lle_delta_template_3x3x2) {
    related_params : "vth";
    related_devices : "tr1";
    index_1 ("0.0018, 0.0743, 1.15149");
    index_2 ("9.35e-05, 0.0025, 0.039");
    index_3 ("0.050,0.06");
    values ("0.000100", "0.000200", "0.000300", \
            "0.001000", "0.002000", "0.003000", \
            "0.010000", "0.020000", "0.030000");
  }
```

The following is an example message:

```
Error: Line 27, Cell 'cell_a', pin 'z', The 'lle_delta_cell_rise' group
 is missing the table definition for related_devices tr2,related_params
 vth. (LBDB-1215)
```

What Next

Check lle_delta group to see if you are missing the table definition for all lle_devices and lle_params specified in cell.

LBDB-1216

(warning) is missing internal_power with when condition: "%s" from '%s' to '%s'.

Feedback

Description

This message indicate some possible conditions are missing for this timing arc, and there is no default arc.

The following example shows an instance where this message occurs:

```
pin(Z) {
    direction : output;
    function : "(S' * A+S * B)";
    internal_power () {
      related_pin : "A";
      when :     "B * !S";
    }
```

In this case, the internal_power condition "B' S'" is missing for this arc from 'A' to 'Z'. To fix the problem, add the following internal_power group:

```
internal_power () {
      related_pin : "A";
      when :     "!B * !S";
    }

The following is an example message:
Warning: Line 190, Cell 'MUX21', pin 'Z', is missing internal_power with
 when condition: "B' S'" from 'A' to 'Z'. (LBDB-1216)
```

What Next

Add the internal_power group with missing conditions between the two pins.

LBDB-1217

(warning) is missing internal_power with when condition: "%s".

Description

This message indicate some possible conditions are missing for this input, and there is no default arc.

The following example shows an instance where this message occurs:

```
pin(Z) {
    direction : output;
    function : "a&b&c";
    ...
    }
    pin(a){
    direction : input;
    internal_power(){
      when :   "!b&c";
    }
```

Feedback

```
    internal_power(){
      when :   "!b&!c";
    }
   }
```

In this case, the internal_power condition "b&!c" is missing for this input pin 'a'. To fix the problem, add the following internal_power group:

```
internal_power () {
      when :     "b&!c";
    }

The following is an example message:
Warning: Line 190, Cell 'MUX21', pin 'a', is missing internal_power with
 when condition: "b&!c".(LBDB-1217)
```

What Next

Add the internal_power group with missing conditions for input pin's dynamic power.

LBDB-1218

(warning) The internal_power group with when condition "%s" from '%s' to '%s' is invalid.

Description

A arc from an input pin to an output pin for internal_power is dormant if the signal change on the input pin can never cause the change on the output without simultaneous changes on any other input pins.

The following example shows an instance where this message occurs:

```
cell(a_cell) {
    pin(Z) {
    direction : output;
    function : "A * B";
    internal_power () {
       related_pin : "A";
       when :     "!B";
       rise_power(scalar)       { values ( "0.1");}
       fall_power(scalar) { values ( "0.1");}
    }
   }
  }
```

In this example, if only pin 'A' is changed, pin 'Z' will not have the signal transitions between '0' and '1'. The combinational arc between 'A' and 'Z' is invalid.

The following is an example message:

```
Warning: Line 50000, The internal_power group with when condition "!B"
 from 'A' to 'Z' is invalid. (LBDB-1218)
```

Feedback

What Next

This is caused by the input sharing between 'function', 'three_state', and 'x_function'. The signal transition is not physically possible and generally the arc should not be specified.

LBDB-1219

(warning) The internal_power group with when condition "%s" is invalid.

Description

A arc from an input pin for internal_power(dynamic power) is dormant if the signal change on the input pin can never cause the change on the output without simultaneous changes on any other input pins.

The following example shows an instance where this message occurs:

```
cell(a_cell) {
    pin(Z) {
    direction : output;
    function : "a&b&c";
    ...
    }
    pin(a){
    direction : input;
    internal_power(){
      when :   "b&c";
    }
  }
```

In this example, if input pin 'a' is changed, pin 'Z' will not have the signal transitions between '0' and '1'. So the input pin 'a' for internal_power(dynamic_power) is dormant.

The following is an example message:

```
Warning: Line 50000, The internal_power group with when condition "b&c"
 is invalid. (LBDB-1219)
```

What Next

This is caused by the input sharing between 'function', 'three_state', and 'x_function'. The signal transition is not physically possible and generally the arc should not be specified.

LBDB-1220

(warning) is missing leakage power possible condition: "%s".

Feedback

Description

This message indicate some possible conditions are missing for this cell, and there is no default arc.

The following example shows an instance where this message occurs:

```
cell(std) {
    leakage_power () {
      when :     "B";
    }
```

In this case, the leakage power condition "B'" is missing for this cell 'std'. To fix the problem, add the following leakage_power group:

```
leakage_power () {
      when :     "!B ";
    }

The following is an example message:
Warning: Line 190, Cell 'std', is missing leakage power possible
 condition: "B'". (LBDB-1220)
```

What Next

Add the leakage_power group with missing conditions for the cell.

LBDB-1221

(error) non input signal pin is not allowed to be specified in bump cell.

Description

This message indicate bump cell have not only input signal pins.

The following example shows an instance where this message occurs:

```
cell (simple_front_side_bump) {
    bump_cell: true;
    pin (PAD) {
      direction : output ;
      bump_type: front_side;
    }
  }
```

In this case, the pin "pad" direction is not input signal pin. To fix the problem, change direction to input:

```
cell (simple_front_side_bump) {
    bump_cell: true;
    pin (PAD) {
      direction : input ;
```

```
      bump_type: front_side;
    }
  }
```

```
The following is an example message:
Error: Line 190, Cell 'simple_front_side_bump', pin 'PAD', non input
 signal pin is not allowed to be specified in bump cell. (LBDB-1221)
```

What Next

Change pin to input signal pin for the bump cell.

LBDB-1222

(error) is missing bump_type on signal pin of bump cell.

Description

This message indicate signal pins in bump cell has not bump_type attribute.

The following example shows an instance where this message occurs:

```
cell (simple_front_side_bump) {
    bump_cell: true;
    pin (PAD) {
      direction : input ;
    }
  }
```

In this case, the pin "pad" has no bump_type attribute. To fix the problem, add the following bump_type attribute:

```
cell (simple_front_side_bump) {
    bump_cell: true;
    pin (PAD) {
      direction : input ;
      bump_type: front_side;
    }
  }
```

```
The following is an example message:
Error: Line 190, Cell 'simple_front_side_bump', pin 'PAD', is missing
 bump_type on signal pin of bump cell. (LBDB-1222)
```

What Next

Add bump_type attribute for the bump cell signal pin.

LBDB-1223

(error) the "is_pad" attribute is not allowed to be specified in signal pin of bump cell.

Feedback

Description

This message indicate bump cell contains is_pad pin attributes.

The following example shows an instance where this message occurs:

```
cell (simple_front_side_bump) {
    bump_cell: true;
    pin (PAD) {
      direction : input ;
      bump_type: front_side;
      is_pad   : true;
    }
  }
```

In this case, contains is_pad attributes. To fix the problem, remove the following is_pad attribute:

```
cell (simple_front_side_bump) {
    bump_cell: true;
    pin (PAD) {
      direction : input ;
      bump_type: front_side;
    }
  }

The following is an example message:
Error: Line 190, Cell 'simple_front_side_bump', pin 'PAD', the "is_pad"
 attribute is not allowed to be specified in signal pin of bump cell.
 (LBDB-1223)
```

What Next

Remove pin's is_pad attribute for the bump cell.

LBDB-1224

(error) pg_pin is not allowed to be specified in bump cell.

Description

This message indicate bump cell contains pg_pin.

The following example shows an instance where this message occurs:

```
cell (simple_front_side_bump) {
    bump_cell: true;
    pin (PAD) {
      direction : input ;
      bump_type: front_side;
    }
    pg_pin(VDD){
```

```
    ..
    }
  }
```

In this case, contains pg_pin. To fix the problem, remove the following pg_pin attribute:

```
cell (simple_front_side_bump) {
    bump_cell: true;
    pin (PAD) {
      direction : input ;
      bump_type: front_side;
    }
  }

The following is an example message:
Error: Line 190, Cell 'simple_front_side_bump', pg_pin is not allowed to
 be specified in bump cell. (LBDB-1224)
```

What Next

Remove pg_pin for the bump cell.

LBDB-1225

(error) the "%s" attribute is not allowed to be specified in bump cell.

Description

This message indicate bump cell contains pad_cell or auxiliary_pad_cell attributes.

The following example shows an instance where this message occurs:

```
cell (simple_front_side_bump) {
    bump_cell: true;
    auxiliary_pad_cell : true;
    pin (PAD) {
      direction : input ;
      bump_type: front_side;
    }
  }
```

In this case, the pin "pad" contains auxiliary_pad_cell. To fix the problem, remove the following auxiliary_pad_cell attribute:

```
cell (simple_front_side_bump) {
    bump_cell: true;
    pin (PAD) {
      direction : input ;
      bump_type: front_side;
    }
  }
```

Feedback

```
The following is an example message:
Error: Line 190, Cell 'simple_front_side_bump', the "auxiliary_pad_cell"
 attribute is not allowed to be specified in bump cell. (LBDB-1225)
```

What Next

Remove auxiliary_pad_cell/pad_cell for the bump cell.

LBDB-1230

(error) The value '%s' for 'related_devices' of lle leakage power must be listed in 'lle_devices' definition.

Description

The following example shows an instance where this message occurs:

```
cell ( cell_a ) {
      lle_devices: "tr1 tr2";
      lle_params: "vth vth1";
   ...
   leakage_power() {
        when : "(!A) | (A)" ;
        value : 0.00644538 ;
  lle_delta_leakage_power( lle_template_sample ) {
   related_params : "vth" ;
   related_devices : "tr3" ;
   index_1("-0.1,0.1") ;
   values("4.20784,4.20785");
  }
     }
   }
```

The following is an example message:

```
Error: Line 144, The value 'tr3' for 'related_devices' of lle leakage
 power must be listed in 'lle_devices' defined. (LBDB-1230)
```

What Next

Check the value for 'related_devices' to see if your definition is in 'lle_devices' allowable values.

LBDB-1231

(error) The value '%s' for 'related_params' of lle leakage power must be listed in 'lle_params' definition.

Feedback

Description

The following example shows an instance where this message occurs:

```
cell ( cell_a ) {
      lle_devices: "tr1 tr2";
      lle_params: "vth vth1";
   ...
   leakage_power() {
        when : "(!A) | (A)" ;
        value : 0.00644538 ;
  lle_delta_leakage_power( lle_template_sample ) {
   related_params : "vth2" ;
   related_devices : "tr2" ;
   index_1("-0.1,0.1") ;
   values("4.20784,4.20785");
   }
     }
   }
```

The following is an example message:

```
Error: Line 144, The value 'vth2' for 'related_params' of lle leakage
 power must be listed in 'lle_params' defined. (LBDB-1231)
```

What Next

Check the value for 'related_params' to see if your definition is in 'lle_params' allowable values.

LBDB-1232

(error) The '%s' group is missing the table definition for %s %s,%s %s.

Description

The following example shows an instance where this message occurs:

```
cell ( cell_a ) {
      lle_devices: "tr2 tr1";
      lle_params: "vth";
   ...
   leakage_power() {
        when : "(!A) | (A)" ;
        value : 0.00644538 ;
  lle_delta_leakage_power( lle_template_sample ) {
   related_params : "vth" ;
   related_devices : "tr2" ;
   index_1("-0.1,0.1") ;
   values("4.20784,4.20785");
   }
```

```
      }
    }
```

The following is an example message:

```
Error: Line 27, Cell 'cell_a', leakage_power, The
 'lle_delta_leakage_power' group is missing the table definition for
 related_devices tr1,related_params vth. (LBDB-1232)
```

What Next

Check lle_delta group to see if you are missing the table definition for all lle_devices and lle_params specified in cell.

LBDB-1233

(warning) The same timing arc with different sdf_cond has already been specified%s.

Description

This message indicates the same timing arc with different sdf_cond is specified multiple times.

What Next

Check the library source file if there is a duplicate, gave the warning

EXMAPLES

The following example shows two timing arc definition are same with different sdf_cond.

```
pin(Q) {
            timing(){
               timing_type: rising_edge;
               related_pin: "B";
               sdf_cond : "sdf1";
               when: "A";
             }

            timing(){
               timing_type: rising_edge;
               related_pin: "B";
               sdf_cond : "sdf2";
               when: "A";
             }
        }
```

Examples

```
Warning: Line 456, Cell 'sass', pin 'CLKA', The same timing arc with
 different sdf_cond has already been specified at line 123.(LBDB-1233)
```

Feedback

LBDB-1234

(error) Invalid attribute '%s' value '%s' is detected. The value %s.

Description

This message indicates that you specified an invalid value.

```
lib ( liberty_lde )    {
      lde_boundary_type_names ("w1", "w2");
   ... ...
      cell ( cell_a ) {
     lde_boundary_count : 0 ;
     lde_boundary_types ( "w1" ) ;
        pin(A) {
    timing () {
   lde_delta ( ) {
   ...
   }
    }
  }
      }
      ... ...
  }
```

The following is an example message:

```
Error: Line 12, Invalid attribute 'lde_boundary_count' value '0' is
 detected. The value must be positive integer. (LBDB-1234)
```

What Next

Check the library source file, and correct the attribute value in the library.

LBDB-1235

(error) Invalid attribute '%s' is detected. The size must be same with lde_boundary_count : %d.

Description

This message indicates that you specified an invalid attribute size.

```
lib ( liberty_lde )    {
   lde_boundary_type_names ("w1", "w2");
      cell ( cell_a ) {
     lde_boundary_count : 2 ;
     lde_boundary_types ( "w1" ) ;
        pin(A) {
    timing () {
   lde_delta ( ) {
```

Feedback

```
   ...
   }
    }
  }
      }
      ... ...
    }
```

The following is an example message:

```
Error: Line 22, Cell 'cell_a', Invalid attribute 'lde_boundary_types' is
 detected. The size must be same with lde_boundary_count : 2. (LBDB-1235)
```

What Next

Check the library source file, and correct the attribute size in the library.

LBDB-1236

(error) The '%s' group is missing the table definition for lde_boundary_id:%d, lde_boundary_type:%s.

Description

The following example shows an instance where this message occurs:

```
lib ( liberty_lde )    {
   lde_boundary_type_names ("w1", "w2");
      cell ( cell_a ) {
     lde_boundary_count : 1 ;
     lde_boundary_types ( "w1" ) ;
        pin(z) {
    timing () {
   lde_delta ( ) {
    lde_boundary_id : 1 ;
    lde_boundary_type : "w2" ;
   ...
   }
    }
  }
      }
      ... ...
    }
```

The following is an example message:

```
Error: Line 29, Cell 'cell_a', pin 'z', The 'lde_delta' group is missing
 the table definition for lle_boundary_id:1, lle_boundary_type:w1.
 (LBDB-1236)
```

Feedback

What Next

Check lde_delta group to see if you are missing the table definition for all lde_boundary_count and lde_boundary_type_names specified in cell.

LBDB-1237

(error) The '%s' that required by liberty lde delta model is missing in %s '%s'.

Description

Defined lde_delta groups in .lib, but the dependent attribute is missing in the library or cell.

The following example shows an instance where this message occurs:

```
lib ( liberty_lde )    {
   /*lde_boundary_type_names miss*/
      cell ( cell_a ) {
     lde_boundary_count : 1 ;
     lde_boundary_types ( "w1" ) ;
        pin(A) {
    timing () {
   lde_delta ( ) {
     lde_boundary_id : 1 ;
     lde_boundary_type : "w1" ;
   ...
   }
    }
  }
      }
      ... ...
    }
```

The following is an example message:

```
Error: Line 3, The 'lde_boundary_type_names' that required by liberty lde
 delta model is missing in library 'liberty_lde'. (LBDB-1237)
```

What Next

Check the library source file to see if you missed the required content for the specified group.

LBDB-1237w

(warning) The '%s' is defined in %s '%s', but no lde_delta use it.

Feedback

Description

Defined lde_boundary_type_names attribute in liberty_lde library, but there is no lde_delta group in all timing arcs.

The following example shows an instance where this message occurs:

```
lib ( liberty_lde )    {
   lde_boundary_type_names ( "w1",  "w2" )
      cell ( cell_a ) {
     lde_boundary_count : 1 ;
     lde_boundary_types ( "w1" ) ;
        pin(A) {
    timing () {
   /* No lde_delta in timing arc*/
   ...
   }
    }
  }
      }
      ... ...
    }
```

The following is an example message:

```
Warning: Line 3, The 'lde_boundary_type_names' is defined in library
 'libertyLdeMulti', but no lde delta use it. (LBDB-1237w)
```

What Next

Check the library source file to see if you need the content that not used for the specified group.

LBDB-1238

(error) The number of '%s' in group '%s' should be %s.

Description

When the above-mentioned attributes are specified, the number of the elements should be required size. For track_pattern, the number of <list_of_offsets> in row_grid_low_steps and row_grid_high_steps should be same as the size of grid_low_offsets.

The following example shows an instance where this message occurs:

```
library(libdb1166) {
  ..
  row_pattern (unit10_unit12) {
    track_pattern (M1) {
        type : uniform;
        direction: horizontal;
        mask_pattern (“mask_one”, “mask_two”, “mask_one”, “mask_two”);
```

Feedback

```
        spacing : 0.2;
        offsets (“0.3 0.2”);
        widths(“0.1”);
        reserved_width_flags(“true”);
        grid_low_offsets(“0.1, 0.2, 0.3, 0.4”);
        grid_high_offsets(“0.1, 0.2, 0.3, 0.4”);
        row_grid_low_steps("unit10", “0.3 0.1”, “0.2, 0.4”, “0.2, 0.4”);
        row_grid_high_steps("unit12", “0.3, 0.4”, “0.2, 0.4”, “0.2, 0.4”,
 “0.3, 0.4” );
    }
    ...
  }
```

row_grid_low_steps has number of <list_of_offsets> as 3 but its size should be 4. of 4.

Examples

The following is an example message:

```
Error: Line 18,  The number of '<list_of_offsets> in row_grid_low_steps'
 in group 'track_pattern' should be 4. (LBDB-1238)
```

What Next

Check the library source file, and make the necessary correction.

LBDB-1239

(warning) The '%s' is not supported for this %s group.

Description

This warning indicates that the specified attribute(e.g. receiver_capacitance_rise_delta, receiver_capacitance_fall_delta, leakage_derate) or group(e.g. receiver_capacitance_rise, receiver_capacitance_fall) is not supported by down-steam tools like FC/PT and will be ignored for now.

The following example shows an instance where this message occurs:

```
leakage_power() {
      value : "0.0369201" ;
      related_pg_pin : "VDD" ;

      sensitivity() {
        device_param : "delta_xyz_n1" ;
        perturbation_value : "-0.02" ;
        leakage_derate : "-4.87648e-03" ;
      }
    }
    ...
```

Feedback

The following is an example message:

```
Warning: Line 327, The 'leakage_derate' is not supported for this
 sensitivity group. (LBDB-1239)
```

What Next

Check the library source file to see if you need the content that not supported for now.

LBDB-1240

(error) The switch pin is not found in switch_function of any pin in the cell.

Description

This error indicates that the specified switch pin is not in switch_function of any pin in the current cell.

The following is an example message:

```
Error: Line 326, Cell 'FD1', pin 'sp2', The switch pin is not found in
 switch_function of any pin in the cell. (LBDB-1240)
```

What Next

Check the library source file to see if you need to add the pin to switch_function of a pin or set flag of switch_pin as false or remove switch_pin attribute from the pin.

LDB

LDB-1

(error) Cannot delete views from the non-view-based library .db '%s'.

Description

This error message occurs because views can only be deleted in a view-based library .db file.

What Next

Convert the original .db file into a view-based .db file, and read in the file again.

LDB-2

(error) Cannot delete view '%s'.

Feedback

Description

This error message occurs when the specified view cannot be deleted because it's not a valid view name.

What Next

Check the view name and correct as needed.

LDB-3

(error) Failed to load the skeleton view to get all cell names.

Description

This error message occurs because when reading a view for unspecified cells, the tool reads the skeleton view node to get all cell names. If the skeleton view node cannot be read, this step fails and nothing is loaded.

What Next

Make sure the skeleton view node can be read successfully by ldbatt.

LDB-4

(error) Failed to load view node '%s'.

Description

This error message occurs when there is incorrect data in the input view-based .db file.

The pattern of the view node name is as follows:

```
<path_name>/<view_based_db_file_name>/<lib_name>/<view_name>
```

What Next

Make sure the content in the specified view node is correct (by ldbatt).

LDB-5

(warning) Cannot read cell '%s'.

Description

This error message occurs when the cell name doesn't exist in the library.

What Next

Correct cell name.

Feedback

LEFR

LEFR-001

(error) Cannot find lef file '%s'.

Description

The lef file specified to the set_eco_options command cannot be read.

What Next

Check the existence of the lef file to the set_eco_options in the search_path using the *which* command.

LEFR-002

(error) read lef '%s' failed.

Description

read lef file failed.

What Next

Check the logfile file provided to the set_eco_options for lef file syntax and content related errors.

LEFR-018

(warning) Site '%s' already exists having width %d and height %d, which conflicts with the LEF site width %d and height %d.

Description

The indicated site already exists in the library, and its dimensions do not match the LEF site definition. The LEF site definition cannot overwrite the existing site in the library. The existing library site is not modified.

What Next

Check whether you have read the correct LEF file. Check whether the LEF or existing library site definition is correct.

Feedback

LEFR-021

(error) Layer '%s' does not exist in the library technology information provided at lineNumber %d.

Description

The indicated layer was not defined in the technology file which was provided to the set_eco_options.

What Next

Manually add the missing layer into the technology file, and read in the physical information again.

LEFR-050

(warning) Invalid SITE row '%s' detected with width %d, height %d at lineNumber %d.

Description

The indicated SITE row definition has invalid width or height. This SITE row will be skipped.

What Next

Check the SITE row definition in the LEF file provided to the set_eco_options for correctness.

LEFR-051

(error) Invalid MANUFACTURINGGRID value '%f' at lineNumber %d.

Description

The Manufacturing grid is used for geometry allignment to snap the shapes and cells into the manufacturing grid. The Manufacturing grid value must be a positive number specified in microns.

What Next

Check the MANUFACTURINGGRID value in the LEF file provided to the set_eco_options for correctness.

LEFR-052

(warning) Redefinition of MANUFACTURINGGRID value, previously set to '%s', now set to '%s' found at lineNumber %d.

Feedback

Description

Multiple definitions of the manufacturing grid statement have been detected with different values. Will ignore the duplicate definition and use the previously set MANUFACTURINGGRID value.

What Next

Check the MANUFACTURINGGRID value in the LEF files provided to the set_eco_options for correctness. Multiple definitions suggest the LEF files could belong to different technology nodes.

LEFR-053

(warning) Identified polygon shaped LEF obstruction on a layer not of TYPE OVERLAP at lineNumber %d. This obstruction will be ignored. If this LEF obstruction is intended to create notches in the LEF macro, the notches will not be created and a rectilinear shaped macro will be created instead.

Description

If this polygon shaped LEF obstruction is a routing obstruction, this warning can be ignored. If this polygon shaped LEF obstruction is a placement obstruction it must be defined on a layer of TYPE OVERLAP. LEF layer definitions are usually provided in the technology LEF file. Ensure the technology LEF file is provided to the set_eco_options.

What Next

Check the order of LEF files provided to the set_eco_options for correctness. When multiple LEF files are provided the -tech_lef_files option of set_eco_options should be used to provide the technology lef file. Incase the -tech_lef_files option is not used the first LEF file provided to the -physical_constraint_file will be treated as the technology LEF file. It is not mandatory for Layer definitions to exist in the technology LEF file. However they must be provided in a LEF file prior to usage of the LEF obstruction.

LEFR-054

(warning) No Technology Library Exchange Format (LEF) files provided to set_eco_options.

Description

The set_eco_options command provided the -physical_tech_lib_path option to provide the path to the Technology Library Exchange Format (LEF) files. PrimeTime reads the Technology Library Exchange Format (LEF) files prior to reading in the cell LEF files. The Technology LEF files contain physical constraints that apply to all cell LEF files. Some of the important physical constraints specified in the technology LEF files include

Feedback

layer definitions, via definitions, viarule definitions and overlapped layer constructs used to specify polygon shapes for LEF macros. When multiple LEF files are available it is recommended that this option be exercised to provide the right Technology LEF files. When multiple LEF files are available and the Technology LEF files are not provided, the order in which the LEF files are provided becomes critical. If the order of the LEF files is such that the Technology files are not provided prior to the cell LEF files, physically aware ECO commands will not have the right physical constraint definitions. This can lead to poor QOR and/or incorrect physical ECO results.

What Next

Ensure the Technology LEF files are provided to the set_eco_options.

LEFW

LEFW-001

(error) The specified design '%s' has neither frame view nor design view.

Description

Neither design not frame views created for design.

What Next

Check the existence of the ndm file provided to the set_eco_options in the search_path using the *which* command.

LEFW-002

(error) Cannot find layer of layer number %d.

Description

Missing layer definition.

What Next

Check the existence of the ndm file provided to the set_eco_options in the search_path using the *which* command.

LEFW-003

(error) Fail to write %s '%s' of %s '%s'.

Feedback

Description

Invalid LEF syntax detected.

What Next

Check the existence of the ndm file provided to the set_eco_options in the search_path using the *which* command.

LEFW-004

(Information) Block '%s' has %s view with multiple labels, will write out empty label only.

Description

Multiple labels detected for block.

What Next

Check the existence of the ndm file provided to the set_eco_options in the search_path using the *which* command.

LEFW-005

(warning) Block '%s' has no %s view with empty label, will ignore it.

Description

Ndm block has no views created.

What Next

Check the existence of the ndm file provided to the set_eco_options in the search_path using the *which* command.

LEFW-006

(warning) The frame view with non-empty label '%s' will be written out for block '%s'.

Description

Frame view has non empty labels.

What Next

Check the existence of the ndm file provided to the set_eco_options in the search_path using the *which* command.

Feedback

LEFW-007

(error) Use %s %s as the WRONGDIRECTION width for layer '%s'.

Description

Wrong direction width specified for layer in ndm lef.

What Next

Check the existence of the ndm file provided to the set_eco_options in the search_path using the *which* command.

LEFW-008

(warning) Terminals with eeq_class %d of block '%s' will be outputted in different PORT sections.

Description

Usually, terminals with same eeq_class will be outputted in one PORT section so that when read back the LEF, proper eeq_class can be derived. However, for the terminals of the reported block and eeq_class, they have different classes. So they will be outputted in different PORT section as every PORT section can have only one class. That means the eeq_class information of these terminals will be lost.

What Next

Please correct the eeq_class or class attribute for the reported terminals and try again.

LGL

LGL-001

(error) Placement attributes of instance %s do not match any sites.

Description

Leaglization could not find any sites in the floorplan with the same site definition, voltage area and exclusive move bound as this cell instance.

What Next

Find the site definition the reference cell. Check that the design contains site rows with this site definition. Next, check that the voltage area of the cell includes valid sites. If the voltage area is embedded inside another voltage area, make sure the stacking order allows it to be seen, *i.e.*, it is not completely covered by other voltage areas. Finally, if

Feedback

the cell belongs to an exclusive move bound, make sure it also includes valid sites in the proper voltage area.

LGL-002

(warning) Spare cell instance %s is not placed.

Description

This cell is a spare cell but is marked as unassigned. Legalization will ignore this cell.

What Next

Spare cells should be placed by the *create_placement* or other commands which call *create_placement* internally. If this was done, and the cells are still unplaced, then contact the developers.

LGL-003

(warning) Standard cell instance %s is not placed.

Description

This cell is marked as unassigned. Legalization requires that all non-spare standard cells have a valid placement, otherwise this cell will be ignored during legalization.

What Next

Make sure that *create_placement* was run previously, either as a stand-alone command or from within another command, and succeeded.

LGL-004

(error) Cell instance %s is not placed.

Description

This cell has not been placed in the floorplan.

What Next

Make sure the cell is placed in the floorplan.

LGL-005

(warning) Cell instance %s has no reference cell and cannot be legalized.

The named cell has no reference cell. It will be assumed to be a blockage.

Feedback

What Next

This problem is usually caused when a design is opened and the reference library is missing. Make sure your input is data correct.

LGL-006

(warning) Reference %s has no design and cannot be legalized.

Description

The named reference cell has no design associated with it. Cell instances with this reference will be assumed to be blockage.

LGL-007

(error) Site row %s overlaps %s with the same site definition.

Description

Site rows are not allowed to overlap.

What Next

Check your floorplan to find overlapping rows. Modify your DEF file to eliminate the overlap.

LGL-008

(error) Could not initialize physical design checker.

Description

The legality subsystem could not start the physical design checker.

What Next

Look for PDC-NNN messages for more information.

LGL-009

(error) Site rows with site definition %s are misaligned.

Description

All the site rows with the same site definition must be aligned such that there is no vertical offset between sites.

Feedback

What Next

Change the floorplan so that the rows align properly. Ensure that the distance between x-origins of the different rows is zero modulo the site width.

LGL-010

(Error) Incompatible site rows overlap.

Description

Site rows with different site definitions cannot overlap unless the site definitions are compatible. A site definition is compatible with another site definition if its dimensions are an integral multiple of the dimensions of the other site definition. Rows with compatible site definitions can overlap if their sites are aligned.

What Next

Change the floorplan so that the incompatible rows do not overlap. If the rows should be compatible, make sure they are aligned properly.

LGL-011

(error) Design has no site rows.

Description

There are no site rows defined for the design. Site rows are required for placement.

LGL-012

(error) Cell %s is not in a proper voltage area.

Description

This message is indicating that this cell instance is not inside its corresponding voltage area.

What Next

Move this cell instance into the correct voltage area boundary manually or through command legalize_placement.

LGL-013

(error) This design is not MV ready, please check the UPF setting for your design.

Feedback

Description

This message is indicating that some UPF problem has been detected, and the run cannot proceed.

What Next

Check the UPF setting and correct the problem.

LGL-014

(error) Cell %s is not in a proper movebound.

Description

This message is indicating that this cell instance is not inside its corresponding movebound.

What Next

Move this cell instance into the correct movebound boundary manually or through command legalize_placement.

LGL-015

(error) cell instance %s is illegal for all sites.

Description

This message is indicating that the legalization has detected that the above cell instance is illegal for all sites, in other words, this cell instance cannot be placed legally within this design.

As below are some frequently encountered situations which may cause this issue:

(1) This cell belongs to multiple exclusive bounds, voltage areas at the same time, but these exclusive bounds and/or voltage areas do not have "common area".

(2) This cell may be specified with one site master, but there is no such type of site rows within this design.

(3) This cell may contain some complex pin shape, which may be illegal for all pnet checking.

What Next

Customer may need to double check the design constraint setup, make sure that each cell instance can have some "legal locations" to be placed into.

Feedback

LGL-016

(error) Cell %s violates one or more pnets.

Description

This message is indicating that this cell instance is violating one or more pnet straps in the design.

What Next

Run command legalize_placement.

LGL-017

(error) Cell %s and cell %s are violating one or more standard cell spacing rules.

Description

This message is indicating that this cell instance and one other neighbor cell are violating one or more standard cell spacing rules.

What Next

Run command legalize_placement.

LGL-018

(error) Cell %s and cell %s are violating CTS cell spacing rules.

Description

This message is indicating that this cell instance and one other neighbor cell are violating CTS cell spacing rules.

What Next

Re-run the CTS commands.

LGL-019

(error) Cell %s is unplaced and will not get processed by checker or legalizer

Description

This message is indicating that this cell instance is unplaced.

Feedback

What Next

Assign one initial location for this cell instance.

LGL-020

(error) Cell %s is overlapping with cell %s .

Description

This message is indicating that this cell instance and one other neighbor cell are overlapping each other.

What Next

Run command legalize_placement.

LGL-021

(error) macro cell %s is overlapping with macro cell %s .

Description

This message is indicating that this macro cell and one other neighbor cell are overlapping each other.

What Next

Move the macro cell to remove the overlapping.

LGL-022

(error) cell %s is overlapping with blockage %s .

Description

This message is indicating that this cell instance is overlapping with a blockage.

What Next

Run command legalize_placement.

LGL-023

(error) Cell %s is not in a proper row.

Description

This message is indicating that this cell instance is not inside a proper row.

Feedback

What Next

Run command legalize_placement.

LGL-024

(error) Cell %s has an illegal orientation.

Description

This message is indicating that this cell instance has an illegal orientation.

What Next

Run command legalize_placement.

LGL-025

(warning) Site master "%s" has both X-Symmetry and Y-Symmetry. Usually, this may not be correct, and may cause the legalization to fail.

Description

This message is indicating that the legalization has detected that the above site master has both X-Symmetry and Y-Symmetry at the same time. For a normal design, usually, the site master may have only one "site symmetry", either "X-Symmetry" or "Y-Symmetry". A site master having both "X-Symmetry" and "Y-Symmetry" at the same time may cause the legalization to fail.

What Next

Please double-check the design and library setting and make sure the setting is correct.

LGL-026

(information) Using "Y-Symmetry" for site master "%s" in legalization because this is a horizontal design.

Description

This message is indicating that the legalization has detected that the above site master has both X-Symmetry and Y-Symmetry at the same time. Usually, for a normal horizontal design, the site master may have "site symmetry" of "Y-Symmetry" only.

What Next

Please double-check the design and library setting and make sure the setting is correct.

Feedback

LGL-027

(information) Using "X-Symmetry" for site master "%s" in the legalization because this is a vertical design.

Description

This message is indicating that the legalization has detected that the above site master has both X-Symmetry and Y-Symmetry at the same time. Usually, for a normal vertical design, the site master may have "site symmetry" of "X-Symmetry" only. A site master having both "X-Symmetry" and "Y-Symmetry" at the same time may cause the legalization to fail.

What Next

Please double-check the design and library setting and make sure the setting is correct.

LGL-028

(error) This design has both horizontal site rows and vertical site rows, which cannot be supported.

Description

This message is indicating that the legalization has detected that this design has both horizontal site rows and vertical site rows at the same time.

This type of designs cannot be supported by the legalization at this time. One design can have either horizontal site rows or vertical site rows at one time.

What Next

Please double-check the site row specification.

LGL-029

(error) The legalization cannot place the block because it is over capacity (density is %5.1f%%).\n \tPlease enlarge the size of the legalization working area and/or reduce the number of the contained cells.

Description

This message is indicating that the legalization has detected that the standard cells area is over utilized (more than 100%) in this area, so the legalization cannot produce a legal placement for your block.

Feedback

What Next

Increase the legalization working area (for example, adding more site rows, reducing placement blockage areas, etc), or reduce the number of movable standard cells within this area.

LGL-030

(warning) Cell instance %s (lib_cell: %s) does not have initial location.\n \tAssign it to the low left corner of the core area.

Description

This message is indicating that the legalization has detected that the input cell instance does not have initial location. It is recommended that all cell instances should contine initial locations before running legalization.

What Next

Check the design flow, make sure all cell instances have initial locations before running legalization.

LGL-031

(warning) Site master "%s" has neither X-Symmetry nor Y-Symmetry. The "legal orientations" for the standard cells will be limited.

Description

This message is indicating that the legalization has detected that the above site master has neither X-Symmetry nor Y-Symmetry. For a normal design, usually, the site master may have either "X-Symmetry" or "Y-Symmetry".

If a site master does not have either of "X-Symmetry" and "Y-Symmetry", the standard cells will have limited legal orientations because the standard cells will not be allowed to flip within the site rows.

What Next

Please double-check the design and library setting and make sure the setting is correct.

LGL-032

(information) The Variant-aware Legalization started.

Description

This message is indicating that the Variant-aware Legalization is running.

Feedback

What Next

Check the Variant-aware Legalization result.

LGL-033

(information) The Variant-aware Legalization succeeded.

Description

This message is indicating that the Variant-aware Legalization finished successfully.

What Next

Check the Variant-aware Legalization result.

LGL-034

(error) A legal placement could not be found.

Description

This message is indicating that the legalization cannot find a legal placement for this block. You probably have to enlarge the core area and re-try.

What Next

Check the design setting, and make sure all of the constraints are correct. If no problem has been found, then you may need to enlarge the core area.

LGL-035

(error) Cell %s has a Gemini violation.

Description

This message is indicating that this cell instance is violating one Gemini constraint in the design.

What Next

Run command legalize_placement.

LGL-036

(warning) Cell %s is out of the core area.

Feedback

Description

This message is indicating that this cell instance is out of the core area.

What Next

Move this cell into the core area manually or run command legalize_placement.

LGL-037

(information) Fixed cell %s has been swapped because it has a "gemini_swap_only" attribute.

Description

This message is indicating that this cell instance has been swapped to meet the Gemini constraint in the design. Usually, the legalization should not touch a "fixed cell". However, if a fixed cell contains "gemini_swap_only" attribute, then it is expected that this cell can be "swapped".

What Next

Run command legalize_placement.

LGL-038

(information) %s been swapped because attribute "gemini_swap_only" has been set.

Description

This message is indicating that some fixed cell instances have been swapped to meet the Gemini constraint in the design.

What Next

Run command check_legality.

LGL-039

(error) Cell %s violates CPODE L2 rule

Description

This message is indicating that this cell instance is violating CPODE L2 rule.

What Next

Run command legalize_placement.

Feedback

LGL-040

(error) Color violation detected between cell %s and cell %s .

Description

This message is indicating that color violation is found between two abutted cells.

What Next

Run command legalize_placement.

LGL-041

(error) Cell %s violates OD L5 rule

Description

This message is indicating that this cell instance is violating OD L5 rule.

What Next

Run command legalize_placement.

LGL-042

(Warning) Advanced rule query engine not initialized. No advanced rule checking performed.

Description

This message is indicating that there was an error in initialization of the advanced rule query engine and thus no advanced rule checking will be performed by optimization. This may result in illegal placement.

What Next

Review the design and floorplan preparation.

LGL-043

(error) Cell %s pin color alignment check.

Description

This message is indicating that this cell instance is violating pin color alignment in its current location.

Feedback

What Next

Run command legalize_placement.

LGL-044

(error) Design has vertical site rows.

SH DESCRIPTION There are vertical site rows defined for the design. Vertical site rows are not currently supported.

LGL-045

(error) Site rows with site definition '%s' are not covered by base site rows (%s).

Description

If site rows with different compatible site definitions overlap, then there must be a base site definition whose rows cover all other site rows. When there are multiple site definitions with overlapping rows, the base site definition is determined to be the one with the smallest dimensions whose rows occupy the largest area. All other site definitions must be have dimensions that are multiples of the base.

What Next

Modify the floorplan so that there is a base site definition whose rows completely cover the rows of compatible site definitions.

LGL-046

(Warning) Library cell

Description

The warning message tells user that there are inconsistent setup between design and library. The site def used in current design has different width or height compared to same site def name used in library. User should have consistent setup between design and library, otherwise it may cause legalization error. If any placeable cell instance is from this library cell, it will result in LGL-047 error and legalization will stop.

What Next

Please make sure site def width and height are same between design and libraries.

LGL-047

(Error) Placeable cell %s has inconsistent site def defined in design and library.

Feedback

Description

This error tells user that the site def definition used in current design is not consistent with library. For example, site def defined in current design has width 1240, height 2480. However, the site def used in library cell has width 500, height 1000. When this cell is not fixed, which is placeable, but their definitions are inconsistent between design and library, legalize_placement cannot place it because it cannot place a cell with width 500 and height 1000 into current design's row with width 1240, height 2480.

What Next

Please refer previous warning message LGL-046 to see which library cell and the detail information

---

LGL-048

(Warning) Library cells %s and %s have different supply architectures.

Description

Based on their site definitions and the corresopnding site rows, the two library cells are intended to be placeable together in the same row. In the normal R0 orientation, however, one cell appears to have its ground pin at the bottom while the other has its power pin at the bottom creating a conflict.

What Next

The most common cause of this error is incompatible libraries which use the same site definition being loaded together. Either they need to use different site definitions, or they cannot both be present at the same time.

LGL-049

(Warning) Cannot determine %s supply pin for library cell %s.

Description

When examining the geometries of the power and ground pins, it could not be determined which is at the top or bottom of the cell.

What Next

In most cases this warning can be ignored. This information is only used when the LEF/DEF information is insufficient to determine the legal rows for multi-row cells. It may indicate a problem in library preparation, or this cell may have a special purpose for which the pin geometries are unusual but correct.

Feedback

LGL-050

(Warning) Library cell %s is missing supply pins. Its power structure cannot be determined.

Description

When examining the geometries of the power and ground pins, one or both waas missing. Subsequent analysis will assume that the ground rail lies along the bottom of the cell when in the normal (R0) orientation.

What Next

This information is only used when the LEF/DEF information is insufficient to determine the legal rows for multi-row cells. It may indicate a problem in library preparation.

LGL-051

(warning) Could not find legal location for cell instance %s(%s).

Description

This message is indicates that a legal location could not be found for this cell during legalization. There are many possible causes for this. Below is a partial list.

(1) The legalizer may be trying to place the cell in a region that is over-constrained.

(2) This cell belongs to multiple exclusive bounds, voltage areas at the same time, but these exclusive bounds and/or voltage areas do not have "common area".

(3) This cell may be specified with one site definition, but there is no such type of site rows within this design.

(4) This cell may contain some complex pin shape, which may be illegal for all sites.

What Next

Check the design setup with respect to bounds or voltage areas. If the pass-rate of the reference of this cell is very low or zero (see command 'analyze_lib_cell_placement'), then check the design rule setup (disable individual rules and rerun legalization).

LGL-052

(warning) Unable to swap lib cell from %s to %s (variant index %d) on cell %s due to color alignment check.

Description

This warning message indicated that there is one lib cell cannot be swapped to other lib cell to fix color alignment violation, and the corresponding lib cell and its variant index

number failed due to color alignment check. User will only see this warning message when all variants defined in the variant cell group cannot fix current color alignment violation by swapping. User must go back to check all variants defined in the cell group and investigate why all variants cannot fix the violation.

When variant swapping failed, legalizer will start a normal legalization by moving cells to fix the rest violations. If users don't want to have additional legalization run, they can use *set_app_option -name place.legalize.enable_full_variant_check -value true* to make legalizer performs real check on all queries to make cells defined in invalid cell group will be moved automatically. However, by using that app option, it may have runtime impact depends on the query and variant status.

What Next

report_cell_groups set_app_option -name place.legalize.enable_full_variant_check -value true

---

LGL-053

(warning) Unable to swap lib cell from %s to %s (variant index %d) on cell %s due to pnet check.

Description

This warning message indicated that there is one lib cell cannot be swapped to other lib cell to fix color alignment violation. To fix color alignment by swapping lib cells, legalizer will check both color alignment and pnet, not only color alignment. If user receives this message, but there is no LGL-052 message at all, that means this lib cell has color matched, but it will cause pnet violation so legalizer will not be able to swap this lib cell. If user receives both LGL-052 and LGL-053 messages, that means this variant lib cell is not valid to swap by color alignment check and pnet check.

User will only see this warning message when all variants defined in the variant cell group cannot fix current color alignment violation by swapping. User must go back to check all variants defined in the cell group and investigate why all variants cannot fix the violation.

When variant swapping failed, legalizer will start a normal legalization by moving cells to fix the rest violations. If users don't want to have additional legalization run, they can use *set_app_option -name place.legalize.enable_full_variant_check -value true* to make legalizer performs real check on all queries to make cells defined in invalid cell group will be moved automatically. However, by using that app option, it may have runtime impact depends on the query and variant status.

What Next

report_cell_groups set_app_option -name place.legalize.enable_full_variant_check -value true

Feedback

LGL-054

(information) %s moved %d cells (%.1f%%) with an average displacement of %.3lf and a maximum of %.3lf.

Description

This message indicates how many cells where moved and how much they where moved during a certain phase of the legalizer. The average displacement is the average over all cells that moved.

LGL-055

(error) There %s %d cell%s which cannot be legalized.

Description

This message summarizes the amount of cells for which no legal location could be found. Message LGL-051 indicates which cells are affected.

What Next

Please check whether the design is over-utilized or constraints are not correctly applied.

LGL-056

(warning) Could not find layer '%s' in the design technology library. Ignoring shapes on this layer for pin '%s/%s'.

The given library cell pin has shapes on a layer which is not present in the design's technology library.

What Next

Make sure that all library cells are bound to the same tech library (reference) as the current design.

LGL-057a

(warning) Unbound instance '%s' is ignored by the legalizer.

Description

The instance shown is unbound, that is, it is not mapped to any library cell, or it is not mapped to a library cell with a physical view. As such, it cannot be legalized, so the legalizer is ignoring it. A summary of how many instances are unbound is covered by LGL-057. By default, 10 of these will be displayed when the legalizer is initialized.

Feedback

What Next

Make sure that all cells in the design are bound to a reference library cell.

See Also

- LGL-057

LGL-057

(warning) %d cell%s not bound to any reference.

The given number of cells are unbound, i.e. they are not mapped to any library cell.

What Next

Make sure that all cells in the design are bound to a reference library cell.

LGL-058

(error) The number of references must be greater than 0 for the command.

The command requires the number of references to be greater than 0.

What Next

Ensure that the number of reference value is greater than 0.

LGL-059

(Error) Site '%s' has a height (%s) which is not a multiple of the base site '%s' height (%s).

Description

All sites need to have a height which is a integer multiple of the base site height. All other site configurations are not accepted by the legalizer. An exception are half height sites used in inbound flows. This rule also applies to non-overlapping site rows.

What Next

Please correct the site row definitions.

LGL-060

(warning) Could not find legal location for cell instance %s(%s).

Feedback

Description

This message is indicates that a legal location could not be found for this cell. There are many possible causes for this. Below is a partial list.

(1) The current command may be trying to place the cell in a region that is over-constrained.

(2) This cell belongs to multiple exclusive bounds, voltage areas at the same time, but these exclusive bounds and/or voltage areas do not have "common area".

(3) This cell may be specified with one site definition, but there is no such type of site rows within this design.

(4) This cell may contain some complex pin shape, which may be illegal for all sites.

What Next

If the cause is reason (1) above, the command will usually adapt and this message is informational only. Otherwise, there may be a problem with the design. If 'legalize_placement' also fails, then further investigation is required. If legalization succeeds, then the message may be ignored.

LGL-061

(warning) Cell '%s' has an orientation '%s' with 90 degree rotation. Most rule checks are disabled for this cell.

Description

The given cell is 90 degree rotated. The cell is not legalizable.

What Next

You need to change the orientation of the cell to R0, MX, MY, or R180.

LGL-062

(warning) No site rows found for site '%s'.

Description

The given site definition has no site rows defined. The given site definition will be ignored and all cells referring to that site won't get legalized.

What Next

You need to define site rows for the given site definition.

Feedback

LGL-063

(error) There is no site row or array found in the design.

Description

No site definitions with rows were found in the design. The design cannot be legalized.

What Next

You need to define site definitions with site rows for all sites referred to by the cells in the design.

LGL-064

(error) Unable to find site rows to legalize cell '%s'.

Description

No site rows were found to legalize the given cell.

What Next

You need to define site definitions with site rows for all sites referred to by the cells in the design.

LGL-065

(error) Unable to legalize cell '%s' because cell width '%s' is not multiple of site (%s) width '%s'.

Description

The width of the given cell is not a multiple of the width of the associated site defintion.

What Next

You need to assign a suitable site definition to the lib cell of the given cell.

LGL-067

(error) Cell %s with reference %s is is misaligned.

Description

This message is indicating that this cell instance is not aligned to a site row.

Feedback

What Next

Make sure that all cells are properly placed and aligned to site rows before running the command that generated the error message.

LGL-068

(Error) TPO width error encountered near %s.

Description

You received this error message because tool encounters unexpected condition during TPO width checking around indicated cell. If you encounter this error running filler insertion, the possible cause is design is not legality clean before.

What Next

1. If running filler insertion, please ensure check_legality is clean before filler insertion.
   2. Please use below option to specify cells whose TPO layer not exntend to left or right edge of cell: set_app_options -name place.legalize.cpode_exception_cells -value "BOUNDARY TAP"

LGL-069

(warning) Library cell %s has missing vertical abutment indexes

Description

This library cell provides only partial vertical abutment indexes. Missing indexes will be ignored.

What Next

Make sure library cell contains vertical abutment indexes on both top and bottom edges

---

LGL-070

(warning) Library cell %s has missing vertical abutment indexes; duplicate missing indexes from other side.

Description

This library cell provides only partial vertical abutment indexes. Missing indexes will be duplicated from the top/bottom side with indexes.

What Next

Make sure library cell contains vertical abutment indexes on both top and bottom edges

Feedback

LGL-071

(warning) %s%s%s It cannot be used to reduce displacement during variant aware legalization.

Description

The reported library cells are part of a common cell group (variant definition), but these library cells are not compatible, i.e. one cannot replace the other. The legalizer won't use these library cells as variants for each other.

What Next

Make sure that the library preparation and cell group definiton only references library cells that can be used for sizing a cell. Use the 'report_cell_groups' command to get an overview of the defined sets of variants.

LGL-072

(warning) %s '%s' has cells attached but does not overlap the core area.

Description

This message is printed for move bounds and voltage areas. The given bound or voltage area doesn't overlap the core area and hence the cells attached to it cannot be legalized.

What Next

Make sure that either the bound or voltage area doesn't have any cells attached or it overlaps the core area (standard cell placement area).

LGL-073

(error) The advanced checker/legalizer has detected non-abutting or non-aligned site row %s at coordinate {%s}.

Description

A site row configuration has been found which is not supported by default.

What Next

Try using the app option place.legalize.legalize_non_uniform_va_exbound

LGL-074

(warning) No filler cells present in the reference library of the design.

There are no cells in the design marked as filler cells. Neither does any cell present in the reference library has filler design type, nor has the user provided list of filler cells. This may lead to gaps between the standard cells after placement, and therefore DRC violations or discontinuity in PG rails connections.

What Next

Make sure that there are appropriately defined filler cells in the reference library to avoid any design violations.

LGL-075

(warning) Spacing rules are being applied to lib/CTS cell %s.

Spacing rules on a lib/CTS cell will result in rules being directed to each and every cell having the same lib cell. If applied to a larger number of library or CTS cells might cause a longer runtime in AL.

What Next

Reduce number of lib cells having spacing rules while running advanced legalizer.

LGL-076

(information) Via ladder spacing app_option or command being used which is not required during AL.

App_options and command related to via_ladder_spacing are for classic legalizer and there is no need to use them while running AL. Advanced legalizer supports these setting in a more advanced manner.

LGL-077

(warning) Smallest size of filler cells present in the library is %.2f, which is larger than the smallest site width.

1X size filler cell unavailable in the library to fill gaps. The lack of fillers sized = 1 typically cause extra constraints to legalization as the legalizer can't leave a gap 1X wide.

What Next

Check the filler cell definitions in the reference libraries.

LGL-078

(error) Site symmetry is set incorrectly : Y symmentry = %d, X symmentry = %d.

Feedback

Default site symmentry is "Y" after ICC2 floorplan creation. Since, symmetry determines legal orientations during legalization, incorrect symmetry will result in failure during filler cells insertion in Advanced Legalizer.

What Next

Set the site symmetry correctly before running AL.

LGL-079

(warning) Vertical keepout will be considered as place.legalize.advanced_ignore_vertical_keepout_margin is false. This may cause runtime and displacement issues during legalization.

Description

Vertical keepouts cause significant displacement degradations during legalization. It may lead to over constraining. So the legalizer aborts if many cells have vertical keepout margins.

What Next

Turn on the app option place.legalize.advanced_ignore_vertical_keepout_margin

---

LGL-080

(warning) The bound %s of type %s has a high utilization of %.3g which could lead to high runtime.

Description

The VA or bounds with this high density could lead to longer runtime.

What Next

Stop the run.

LGL-081

(warning) The command set_legalizer_preroute_keepout is not supported by the advanced legalizer.

Description

The preroute keepout command is not supported by the advanced legalizer and nplDRC.

What Next

Do not run this command.

Feedback

LGL-082

(warning) Stream place is not required in Advanced Legalizer

Description

Stream place is no longer needed in Advanced legalizer. Stream place replaces single large displacement with a stream of small displacements but Advanced Legalizer is taking care of this already.

LGL-083

(error) The cell %s is unplaced and outside the core area.

Description

When the cell is present outside the core area and is unplaced, it may lead to longer runtime.

LGL-084

(warning) For color rules defined in tech file, the design has layer with colored routing tracks = %s, and/or colored stdcells' pins = %s.

Color rules for standard cells' pins in the frame and routing tracks on a layer at design level should not be mismatched, i.e., either both or neither must be colored.

LGL-085

(Error) Filler prediction failed due to off-site-row cells.

Description

You received this error message because tool encounters unexpected condition during OD Edge Rule checking due to off-site-row cells. If you encounter this error during check_legality, the possible cause is design is not legalized before.

What Next

If running check_legality, please ensure legalize_placement is run before.

LGL-086

(warning) Cell %s is unplaceable after %d trials.

Feedback

Description

This message is printed if a cell cannot be legalized after specified number of tries during legalization.

What Next

Check the library-cell and the floorplan to see why the cell difficult to legalize. For unlimited number of trials to legalize, set app-option place.legalize.limit_legality_checks to false.

LGL-087

(warning) %lu cells with invalid orientation present in the design.

Description

If a cell has bad orientation, it will not be legalized.

What Next

Check the library-cell and the floorplan to see why the cell has invalid orientation. If such cells are present in the design, run create_placement before legalizer.

LGL-088

(warning) Ignoring cell '%s' from IR-drop optimization%s.

Description

The legalizer cannot move the specified cell due to the given reason. IR-drop optimization will be limited around this cell.

What Next

This message might, for example, show up after clock tree synthesis where most of the sequential cells are marked as fixed. In this case, this user can ignore the warning but should be aware that the IR-drop optimization has limited room to move cells.

LGL-089

(warning) cellmap ignored instance with missing physical info: %s

Description

cellmap is asked by the client to operate on the instance (e.g. add/remove) that doesn't have needed physical info. For instance, the instance may lack a reference (i.e. it is set as NULL) or the reference doesn't have proper definition of sites assigned.

Feedback

What Next

If the instance reported should not have been ignored then the user is to verify that proper physical data present either in the reference library or the given block.

LGL-090

(warning) Via ladder constraint %s of lib cell %s does not match its pin structure, so the via ladder check on the cell instances derived from this lib cell with the given via ladder constraint is bypassed.

Description

You received this warning message because there exists a lib cell, denoted by $lc, in your design having a short pin such that advanced legalizer is not able to grow a via ladder on it based on the given via ladder constraint, because advanced legalizer does NOT support automatically pin extension. Advanced legalizer will automatically bypass the via ladder checks on those cell instances of the lib cell $lc, and still perform via ladder checks on other normal cells if the app option place.legalize.enable_via_ladder_checks was enabled.

What Next

You can take one of the following actions to fix this warning. 1. Modify the mismatched via ladder constraints such that advanced legalizer can grow via ladders on pins without pin extension. For example, decrease the number of cut rows/cuts per row. 2. Modify the cell layout by manually extending the short pins

---

LGL-091

(warning) Found duplicate spacing rule %s(%d) - %s(%d) %u - %u in library '%s'.

Description

The tool picks up spacing rules first from the design library, and then from the reference libraries. This message indicates that duplicate definitions of spacing rules were found. The occurance of this situation has no impact and QoR.

LGL-092

(warning) Ignoring already existing max. horizontal width label '%s' of library '%s'.

Description

The tool picks up maximum horizontal with labels first from the design library, and then from the reference libraries. This message indicates that duplicate definitions of labels were found (see PRF flow).

Feedback

LGL-093

(warning) Ignoring vertical abuttment rules from reference library '%s'.

Description

The tool picks up vertical abuttment rules first from the design library, and then from the reference libraries. This message indicates that abuttment rule definitions were found in the design library as well as in the given reference libary. The ones from the reference library are ignored.

LGL-094

(warning) Routing layer '%s' has a non uniform routing pitch.%s

Description

Certain runtime improvement settings and optimizations require that lower routing layers have a constant track pitch.

LGL-095

(warning) Lib-cell '%s' has %s '%s' which is not a multiple of the VT site %s '%s'. VT information will be ignored.

Description

The given library cell has a width or height which is not an integer multiple of the considered VT site map. The library cell will hence be ignored for any VT implant checks.

LGL-096

(information) Lib-cell '%s' is vertical stacked length exception lib-cell.

Description

The given library cell is ignored for the vertical stacked length design rule check.

LGL-097

(warning) The safety register '%s' is marked as fixed but requires spacing for tap cell insertion.

Feedback

Description

A safety register rule hass been defined for the given cell which requires tap cells next to it. Since the cell is fixed, the legalizer cannot move the cell to enforce enough space net to the cell.

LGL-098

(warning) The design contains library cells, example %s, having very low legalization pass rates.

The design has cells with zero or low pass rates. This will cause a longer runtime during legalization because a cell with low pass rate would mean that as compared to the number of sites tested, it is placeable at a very small number of sites in any orientation.

What Next

Run analyze_lib_cell_placement to identify problem cells.

LGL-099

(warning) On-by-default app options : place.legalize.enable_cell_spreading is set as false = %s ; and place.legalize.enable_cell_ordering is set as false = %s in the design.

Description

On-by-default app options for enable_cell_spreading and enable_cell_ordering, both are required to be always true in advanced legalizer.

What Next

Turn on these app options before running AL.

LGL-100

(warning) Metal1/Metal2 PG rails in the design at coordinates {%s} have shape type = %s.

M1/M2 PG rails should have only one of the following shape types : lib_cell_pin_connect or follow_pin or stripe. If the rails has shape other than these, say "user_route", the legalizer considers it route specific to a specific pin and not the primary PG grid. Any other PG shapes other than the three mentioned above cause long runtime/hang while running advanced legalizer.

What Next

Check the design and set the PG rails properly.

Feedback

LGL-101

(warning) The cell '%s' has incorrect site definition %s.

Lib-cells used in this design either do not have a site association, or have a site def for which there are no site rows nor site arrays in the design. These cells cannot be placed anywhere.

LGL-102

(warning) For overlapping site rows, the dimensions of their site definitions, namely %s and %s, are not an integral multiple of the dimensions of base site def.

If overlapping site rows are present in the design, the height or width of their respective site defs should be integral multiple of the base/unit site def which is determined as the site def with the smallest dimensions.

LGL-103

(warning) Site rows with site definition %s are misaligned.

Description

All the site rows with the same site definition must be aligned such that there is no vertical offset between sites.

What Next

Change the floorplan so that the rows align properly. Ensure that the distance between x-origins of the different rows is zero modulo the site width.

LGL-104

(warning) Library cell %s doesn't have sufficient allowable orientations.

Description

Allowable orientations on lib cells and possible legal orientations on the site rows have no legal orientation in common. The cell won't find a legal placable orientation, hence causing longer runtime.

What Next

Set place.legalize.enable_allowable_orient false.

Feedback

LGL-105

(warning) Cell map created for block %s is invalid.

Description

Current design has one or more invalid cell maps, which might cause the command to assert. Cell map data is not being generated properly. This might occur due to variety of reasons realted to bad/dirty design inputs (such as, missing physical information).

What Next

Check design before running.

LGL-106

(Warning) For color rules defined in tech file, the design has layer %s with colored routing tracks = %s, but colored stdcells' pins = %s.

Color rules for standard cells' pins in the frame and routing tracks on a layer at design level should not be mismatched, i.e., either both or neither must be colored.

What Next

Check the color contraints of the afrementioned layer in this design or revise your app option settings.

See Also

- LGL-084

LGL-107

(warning) Overlapping site rows having site defs %s and %s not completely used in the design floorplan.

Overlapping site rows must cover the entire site array.

LGL-108

(warning) Spare cells present in the design at {%s} are pre-clumped.

Clumping of spare cells together might cause high local density in the design, hence causing longer runtime.

Feedback

LGL-109

(warning) Direction for routing layer %s is not specified.

Routing layer must have a direction (horizontal or vertical) defined.

LGL-110

(warning) Zero spacing blockage %s is present on PG net %s.

Large zero-spacing blockages not excluded from PG net will hang the legalizer engine.

What Next

Please set net type (eg., clock, reset, scan, signal, tie_high, tie_low) for zero spacong blockages.

LGL-111

(warning) %s

Description

This message is to communicate to the user that for the specified cell (or reference cell) cellmap runs into lengthy search operation to find legal location.

What Next

The user needs to be aware that layout internals of the particular cell (or reference cell) may interacts with existing routing that limits available locations where the cell (or reference cell) can be legally placed. Also the user needs to be aware that lacking appropriate filler cells in the library may manifest itself in a similar way. In each case the cell (or reference cell) needs to be looked at from this perspective. Refining settings for cellmap checks may be needed.

See Also

- LGL-113

LGL-112

(warning) %s

Description

This message is to communicate to the user that for the specified cell (or reference cell) cellmap runs into lengthy search operation to find legal location (iterating rows).

Feedback

What Next

The user needs to be aware that layout internals of the particular cell (or reference cell) may interacts with existing routing that limits available locations where the cell (or reference cell) can be legally placed. Also the user needs to be aware that lacking appropriate filler cells in the library may manifest itself in a similar way. In each case the cell (or reference cell) needs to be looked at from this perspective. Refining settings for cellmap checks may be needed.

See Also

- LGL-113

LGL-113

(warning) %s

Description

This message serves to print out Legality Checks Profile that captures effort and statistics for the specified cell (or reference cell) when cellmap does search to find legal location.

What Next

The user needs to be aware that layout internals of the particular cell (or reference cell) may interact with existing routing that limits available locations where the cell (or reference cell) can be legally placed. Also the user needs to be aware that lacking appropriate filler cells in the library may manifest itself in a similar way. In each case the cell (or reference cell) needs to be looked at from this perspective. Refining settings for cellmap checks may be needed.

See Also

- LGL-111
- LGL-112

LGL-114

(information) %s

Description

This message serves to print out Legality Checks Profile for each executed FLL (find legal location) query by cellmap along with additional debug information like number of checks, elapsed CPU and Wall time.

Feedback

What Next

The user can grep these messages from the log file and analyze specific queries in terms of how long each query took to run and how many checks were made in the process along with Legality Checks Profile statistics.

See Also

- LGL-113

LGL-115

(warning) App option place.legalize.enable_pin_color_alignment_check is set to false.

Description

enable_pin_color_alignment_check must be set to true while running AL, which enables legalizer to automatically align cell pin/shapes to track on the given metal layer.

What Next

Turn on the app option before running AL.

LGL-116

(warning) Track offset on layer %s is set incorrectly. One example library cell with shape to track mis-alignment: '%s'.

Description

Lib cells' pins are not center aligned with routing tracks on layer %s.

What Next

Set the following app options before running AL. 1) place.legalize.enable_pin_color_alignment_check to true to enable legalizer to automatically align cell pin/shapes to track on the given metal layer. 2) If above is already true, set place.legalize.disable_advanced_legalizer_rules -value {pg_drc} to bypass the issue from mis-aligned tracks if want to go with dirty design.

LGL-117

(Information) Setting orientation for the cell %s to R0.

Description

This message indicates that this cell has Invalid orientation which might cause problem during legalization.

Feedback

What Next

Check the library-cell and the floorplan to see why the cell has invalid orientation. If such cells are present in the design, run create_placement before legalizer.

LGL-118

(information) Enabling the app option place.legalize.enforce_1x_min_filler

Description

This message indicates that the design does not contain filler cells. As a result, it might cause long runtime or hang at the legalization or check_legality in TPO, VT, OD rules.

What Next

Please doube check the design and the libraries for filler cells.

LGL-119

(information) The bound %s of type %s has utilization > 100%. Hence leaving all the cells inside it unlegalized.

Description

This message indicates that this bound has very high utilization. Any bound with utilization this high cannot be legalized. It will take a lot of runtime and at the end leave cells unlegalized.

What Next

Increase the size of this bound or decrease the number of cells present in it.

LGL-120

(information) Trying to legalize the cell %s in this gap by disabling allowable orient.

Description

This message indicates that for this gap, this lib cell might not have sufficient allowable orientations. As a result of which, legalizer could not find a legal orientation for this gap.

What Next

Please double-check the design and library and make sure the there are asufficient allowable orientations for a given lib cell.

Feedback

LGL-121

(information) Bound has utilization > 120%. Recomputing total density by removing the placeable and total area of the bound.

Description

This messages indicates that the floorplan has utilization greater than 100%. There are bounds having density greater than 120% which might be causing high overall density. Therefore leaving those bounds unlegalized and removing their area from the total floorplan area.

What Next

Increase the total area of the bound or decrease its utilization.

LGL-122

(information) Enabling the app option %s locally.

Description

This messages indicates that the app option place.legalize.enable_cell_spreading and place.legalize.enable_cell_ordering should not be turned off during advanced legalizer.

What Next

Turn on the app options before running legalize_placement for advanced legalizer.

LGL-123

(error) Advanced Legalizer detects incorrect data input; legalization aborts

Description

This messages indicates that advanced legalizer fails to initialize engine because of incorrect data input.

What Next

Check the input data and run check_legalizer_sanity to get warnings related to incorrect data.

LGL-124

(error) Basic rule engine initialization fails

Feedback

Description

This message indicates that advanced legalizer failed to initialize basic rule engine because of incorrect data.

What Next

Check for incorrect data before running advanced legalizer.

LGL-125

(warning) Voltage area '%s' has an empty effective area but cells assigned.

Description

The given voltage area has no effective physical area but at least one cell is assigned to it. All cells assigned to such a voltage area cannot be legalized.

What Next

Correct the voltage area setup. Also check the stacking order which impacts the effective area of the voltage areas.

LGL-126

(error) The legalization cannot place the block because it has no placeable area.\n \tPlease remove some blockages from the design to be able to place cells.

Description

This message is indicating that the legalization has detected that there is no placeable area in this floor plan, so the legalization cannot produce a legal placement for your block.

What Next

Remove some bloackages from the block.

LGL-127

(information) Lib-cell '%s' is a user-defined filler cell.

Description

The given library cell is considered a filler cell due to app-option place.legalize.filler_lib_cells.

Feedback

LGL-128

(information) Via Ladder constraint %s failed to find solution due to PG shapes on layer %s.

Description

Tool could not find legal location for this via ladder constraint. The root cause is the PG layer report in the message.

What Next

Review the PG structure and via ladder constraint. Fix at least one of them to solve the problem.

LGL-129

(warning) Via Ladder check on libCell %s is ignored after failure threshold.

Description

Via ladder failure on libCell meet the threshold, so tool will ignore the libCell.

What Next

Review the PG structure and via ladder constraint.

LGL-130

(information) Legalizer threading is enabled with %s effort

Description

This is an informational message emitted during legalizer initialization reminding you that you requested the legalizer use threading.

See Also

- LGL-131

LGL-131

(information) Legalizer used up to %d thread%s

Description

This is an informational message emitted when the legalizer completes telling you the peak number of threads used for legalization.

Feedback

See Also

- LGL-130

LGL-132

(error) Initialization of the command failed.

Description

This message indicates that command failed because site def grids could not get initialised as part of Basic Rule Engine initialisation.

What Next

Check for incorrect site definitions.

LGL-133

(warning) This design has spacing rules applied on lib cells, causing over constraints. Spacing rule constraints have been relaxed.

Description

This message indicates that the design has spacing rules applied to lib cells. As a result, they are over constrained to be legalized. The spacing rule max constraints have been optimized according to thier utilizations.

What Next

Relax the applied spacing rules.

LGL-134

(warning) The library cell "%s" has implant layers missing in frame.

Description

This message indicates that the design has lib cells with no implant layer which can cause hang or long runtime.

What Next

Rectify the design by assigning the implant layers to the lib cell. Turn on the app option place.legalize.use_virtual_implant_layer.

Feedback

LGL-135

(warning) Using virtual implant layer for lib cell "%s" not having implant layer. Enabling the app option place.legalize.use_virtual_implant_layer locally.

Description

This message indicates that there were some lib cells that had no implant layer assigned to them. To avoid hang a virtual implant layer has been assigned to them.

What Next

Provide implant layer information for all such lib cells.

LGL-136

(warning) Design has high local density %s which may cause higher runtime.

Description

This message indicates that the design has high local density.

What Next

You may need to check your placement constraints.

LGL-137

(warning) Pre clumping of spare cells resulted in an increased density of %s.

Description

This message indicates that the design has high spare cell density.

What Next

You may need to check your placement constraints.

LGL-138

(warning) Missing fillers for %s layer.

No fillers found for the given layer. It can cause legalizer to hang.

What Next

Check the filler cells constraints on the cell lib.

Feedback

LGL-139

(warning) Duplicate color variant %s has been detected. This library cell will be ignored by the legalizer.

Multiple identical color variants make variant legalization useless because any variant swap attempted by Advanced Legalizer would still give the same result.

LGL-140

(warning) Lib-cell '%s' has %s '%s' which is not a multiple of the OD site %s '%s'. OD information will be ignored.

Description

The given library cell has a width or height which is not an integer multiple of the considered OD site map. The library cell will hence be ignored for any OD implant checks.

LGL-141

(warning) Via ladder constraint %s of lib cell %s is blocked by cell's internal objects, so the via ladder check on the cell instances derived from this lib cell with the given via ladder constraint is bypassed.

Description

You received this warning message because there exists a lib cell, denoted by $lc, other objects inside the lib cell generate DRC violation against the via ladder constraint and block via ladder insertion. Advanced legalizer will automatically bypass the via ladder checks on those cell instances of the lib cell $lc, and still perform via ladder checks on other normal cells if the app option place.legalize.enable_via_ladder_checks is enabled.

What Next

You can take one of the following actions to fix this warning. 1. Modify the mismatched via ladder constraints such that advanced legalizer can grow via ladders on pins without causing DRC violation against other objects inside cell. For example, decrease the number of cut rows/cuts per row. 2. Modify the cell layout by manually removing objects block via ladder construction.

LGL-142

(error) Cell '%s' has a height (%s) which is not a multiple of the associated site definition '%s' height (%s). Cell is skipped.

Feedback

Description

The height of the given cell is not a multiple of the height of the associated site defintion.

What Next

You need to regenerate the corresponding lib cell properly.

LGL-143

(error) No special cell has been specified.

Description

This message is indicating that there are no cells defined while setting special cell legalization constraints. Special cell legalization won't take place.

What Next

Correctly specify cells constraint.

LGL-144

(error) Both X max displacement and Y max displacement can't be zero simultaneously.

Description

No correct direction set for moving cells while setting special cell legalization constraints. Special cell legalization won't take place.

What Next

Correctly specify at least one of, X or Y direction displacement for special cell movement.

LGL-145

(Warning) Cell '%s' of ref '%s' does not have a site association compatible with floorplan. Cell cannot be snapped to row.

Description

Site information in the listed lib_cell is either missing or is not compatible with the site_def(s) of the site rows in the current design. Instance cannot be snapped to row for placement.

What Next

Check lib_cell properties.

Feedback

LGL-146

(Warning) Cell '%s' has an invalid orientation '%s'. The cell will be ignored.

Description

The given cell has an orientation which is either not defined or has a 90 degree rotation. Allowed orientations are R0, MX, R180, and MY.

What Next

Use the 'orientation' attribute to define a valid orientation on the cell.

LGL-147

(error) Options for report_special_cell_legalization : -cell = %s, -all = %s, -summary = %s.

Description

Not all options can be specified simultaneously for reporting special cell constraints. Specify only one. If none is provided, summary is printed.

What Next

Correctly specify report special cells constraint.

LGL-148

(error) None of the options for remove_special_cell_legalization have been set.

Description

Both the options (-cell and -all) can't be simultaneously set to false for removing special cell constraints. Specify at least one.

What Next

Correctly specify remove special cells constraint.

LGL-149

(warning) Site master "%s" has no Y-Symmetry. The "legal orientations" for the standard cells will be limited.

Feedback

Description

This message is indicating that the legalization has detected that the above site master has no Y-Symmetry. For a normal design, usually, the site master should have "Y-Symmetry".

If a site master does not have "Y-Symmetry", the standard cells will have limited legal orientations because the standard cells will not be allowed to flip within the site rows.

What Next

Please double-check the design and library setting and make sure the setting is correct.

LGL-150

(information) %s

Description

This message prints information about found lib cells and filler cells in the reference libraries.

LGL-151

(warning) Filler cell '%s' has no VT implant layer shapes.

Description

The given filler cell has no shapes on any implant layer. So this lib cell cannot be used for virtual filler insertion.

What Next

Make sure that the frame view has VT implant layer shapes.

LGL-155

(warning) Filler lib cell %s is set to dont_use and will be ignored during legalization.

Description

Fillers with dont_use attribute set to true will be ignored during legalization/check legality.

What Next

To use this filler lib cell, mark dont_use attribute to false.

Feedback

LGL-156

(warning) Design %s has no EM via ladders defined. Disabling via ladder related checks.

Description

No EM via ladder definitions have been found. Disabling the via ladder related rule checks for this design.

What Next

Enable Electromigration via ladder rule for the design.

LGL-157

(warning) Layer %s has no proper routing tracks.

Description

Tech layer should have routing tracks. No pins can be routed in this layer.

What Next

Repair this layer by adding routing tracks to it.

LGL-158

(warning) Layer '%s' not found.

Description

The layer whose debug parameters were passed by user is not available for this design.

What Next

Correct the layer name specification.

LGL-159

(warning) The available area of Voltage Area shapes%s '%s' is smaller than the cell area for cell '%s'. These shapes are ignored for legalization.

Description

This Voltage Area or Move Bound shape has area less than any cell that belong to this region. Hence this shape is ignored for any legalization.

Feedback

What Next

Increase the area of this shape.

LGL-160

(warning) Cannot enable fast_pg rule due to missing vertical M1 (mask metal2) layer.

Description

Since this design does not have vertical M1 layer, fast_pg rule cannot be enabled here.

What Next

Disable fast pg rule check

LGL-161

(warning) Cross row VT check is not supported for inbound (N12) designs.

Description

The Advanced Legalizer does not support cross row VT checks for inbound designs. Cross row VT checks are not performed.

What Next

Disable cross row VT checks

LGL-162

(warning) Reference %s pin %s does not have port_type attribute set.

Description

The pin does not have port type set. Hence it cannot be used in Advanced Legalizer.

What Next

Set the port type for this pin in the library cell.

LGL-163

(warning) Failed to find legal location for %s (%s) after %d trials.

Description

This cell has exceeded the maximum failed trials for any one cell to find legal location in Advanced Legalizer.

Feedback

What Next

Increase the max trials for legalizer by using the app option place.legalize.max_legality_failures.

LGL-164

(warning) After %d legalization trials, instance %s (%s) has the following legality failures:

Description

This message is printed for a cell after a given interval of legalization trials (default interval : 40000). This signifies that the cell has high failure rate.

What Next

There is a detailed tally of the number of failures for each rule after this message. Debug to find out reason for rule failures.

LGL-165

(information) Printing the legality failure profile for this legalization.

Description

This legality failure profile is printed when the app option place.legalize.profile_legality_failures is set to true. It prints the fail count for each rule in this legalize_placement run.

What Next

Check why these rules are failing and accordingly make changes in the design.

LGL-166

(warning) Unable to set layer shape mask fixed for cell '%s'.

Description

Failed to set layer shape mask fixed for the block instance in NDM.

LGL-167

(warning) Unable to set blockage mask fixed for cell '%s'.

Description

Failed to set blockage mask fixed for the block instance in NDM.

Feedback

LGL-168

(warning) Unable to save %s file %s.

Description

File could not be saved as number of report files already saved in this directory exceed 10000.

What Next

Cleanup the directory as the report exceeds limit.

LGL-169

(warning) %s than 2 spacing rule labels are found from %s, from line %d %s, %s.

Description

For any given spacing rule, only 2 labels are required. If there are more than 2 labels, only 2 are useful and if there are less than 2 labels, that spacing rule cannot be applied. Hence, the rule is ignored.

What Next

Redefine the spacing rules providing only 2 labels for each rule.

LGL-170

(warning) No rule engine found. Pin Access Optimization is not executed.

Description

Basic engine is not initialized for this design. Cannot execute Pin Access Optimization without basic engine.

What Next

Rerun the design with place.legalize.enable_early_data_support to check the reason for basic engine failure and rectify the design accordingly.

LGL-171

(warning) No base site definition found. Pin Access Optimization is not executed.

Feedback

Description

Basic site def is not set for this design. Pin Access Optimization cannot be executed without basic site def.

What Next

Rerun the design with place.legalize.enable_early_data_support to check the reason for no basic site def.

LGL-172

(warning) No grid found with non-zero width. Pin Access Optimization is not executed.

Description

This design does not have a grid with non-zero width. Pin Access Optimization cannot be executed without a non-zero width grid

---

LGL-173

(warning) Pin access %s encountered some internal issue. Reverting changes done by it.

Description

Failed to commit or uncommit a cell or move during pin access optimization. Restoring the cell placement to original state.

LGL-174

(information) Pin access %s used up to %d thread%s.

Description

This is an informational message emitted when the pin access optimization completes telling you the peak number of threads used for it.

LGL-175

(warning) No characterization data in memory. Will use default (method 0) for legalization library characterization.

Description

No characterization data found for legalization library characterization.

Feedback

LGL-176

(warning) There is no legality library to link to the existing legalizer.

Description

Legality library unavailable for the current legalizer.

What Next

Create a legality library for this legalizer.

LGL-177

(warning) Existing legality information is compiled from different %s.

Description

The current legality library compiled does not match the design or rule setting.

What Next

Recompile the legality library for this design and rule setting.

LGL-178

(warning) Resetting existing compiled legality information.

Description

The existing legality information is for different design or rule setting. Hence resetting it.

LGL-179

(warning) There %s %d NDM instance%s out of sync with ALMap's final state (existence %d; reference %d; origin %d; orient %d).

Description

There are instances that are not in sync with the final state after restoring states. There could be multiple reasons for sync failure like 1. Origin mismatch 2. Orient mismatch 3. Library cell mismatch 4. Cell deleted in Advanced Legalizer but not in NDM

LGL-180

(warning) Library cell %s fails compilation/processing. Skipping.

Feedback

Description

The library cell has failed processing or legality compilation because of any of the following reasons. 1. Library cell name not unique. A library cell with same name already exists with same name. 2. Library cell is not standard. 3. Legality file is unreadable.

LGL-181

(warning) Design %s has Short Pins. Advanced Legalizer automatically adjusts DRC rule sets.

Description

This design has short pins. Advanced Legalizer will automatically adjust DRC rules to support them.

LGL-182

(warning) Overwriting CTS spacing constraints (old x=%g y=%g) (new x=%g y=%g) for cell '%s (%s)'.

Description

Updating the CTS spacing contraints for this cell.

LGL-183

(warning) Site '%s' of cell '%s' has no grid width or grid height.

Description

This cell's site map is not initialized properly. Hence the cell cannot be placed anywhere.

What Next

Check the instance data carefully and run the design again.

LGL-184

(warning) Cannot place cell %s into %s %s.

Description

Cannot find site row in Move Bound or Voltage Area matching the site definition for this cell.

Feedback

LGL-185

(warning) Layer %s %s is not a 2 dimentional table. TF information will be ignored.

Description

This table is not a 2 dimentional table. Hence removing the information as it cannot be used.

What Next

Create a 2 dimentional table.

LGL-186

(warning) Cannot place cell %s because the design does not contain site rows with site definition %s.

Description

This cell cannot be placed as there are no site rows available for this site definition.

LGL-187

(warning) Layer has non-constant pitch at the track location %f.

Description

This layer has non constant pitch at the mentioned track location. But the pitches are integral multiple of each other. Choosing the smaller one.

LGL-188

(warning) Cannot find library cell %s in the 2D rule query system.

Description

The 2D query system does not have a library cell. Will not be able to process the VT type for this design.

LGL-189

(warning) Unable to process non-standard pin shapes of %s (%s).

Feedback

Description

Advanced Legalizer can only process pin shapes of type NDM_OBJ_TYPE_POLYGON and NDM_OBJ_TYPE_RECT. Any other pin shapes cannot be processed.

What Next

Only use pins with shapes NDM_OBJ_TYPE_POLYGON and NDM_OBJ_TYPE_RECT for this design.

LGL-190

(warning) Empty repelling bound for %s '%s' is ignored.

Description

Cannot build safety bounds as the repelling bound for heirarchy/group does not have any shapes.

LGL-191

(warning) Library cell %s of site definition %s contains no element site definition.

Description

Cannot build lib cell info for VT or OD rules for this library cell as it does not have an element site definition.

LGL-192

(warning) Library cell %s's %s %d is not an integral multiple of site %s %d.

Description

This library cell's width/height is not an integral multiple of the site width/height. Cannot build library cell information for VT and OD rules for this library cell.

LGL-193

(warning) Library cell %s of height %d is not an integral multiple of its element site definition %s of height %d.

Description

Cannot build library cell information for VT or OD rules as it's height is not an integral multiple of the element site definition's height.

Feedback

LGL-194

(warning) Cannot find%s pin %s from cell %s.

Description

Cannot process power grid blockage rules as the pin for this cell is missing.

LGL-195

(warning) Unable to legalize cell %s.

Description

The cell could not be legalized.

LGL-196

(warning) Library cell %s has no corresponding site definition.

Description

This library cell has no site definition. Hence it cannot be processed or used.

What Next

Define a site definition for this library cell and rerun the design.

LGL-197

(warning) Multiple site id alignment app options are set. Please check the flow used in below message and review app options setup.

Description

There is a problem with the app option set up as multiple site id allignment app options should be set. Site id should have a unique value set.

What Next

Set only one app option for site id allignment.

LGL-198

(warning) Invalid Site Id Alignment Flow. Please check the app options setup.

Feedback

Description

Site Id align should not have 1 set to it. This is invalid site id alignment flow.

LGL-199

(warning) The max number of variants within all cell groups is %d, but the site row cycle is set to %d at This may be design setup issue and may cause legalization failure. Please review cell groups and check design setup.

Description

The current design has a setup failure and can cause legalization failure. The max number of variants within all cell groups is not eqaul to site row cycle.

LGL-200

(warning) Variant Id/N-Variants Id alignment is enabled, but "place.legalize.enable_variant_aware" is disabled.

Description

The app option place.legalize.enable_variant_aware should be set if variant id allignment is enabled.

LGL-201

(warning) Illegal region filter option.

Description

The pin access region filter to be optimized is illegal.

LGL-202

(warning) Invalid %s in golden DRC marker file. Ignoring the file.

Description

Invalid syntax/bbox in the DRC marker file. This file cannot be used for processing the DRC regions. Hence ignoring this file.

LGL-203

(warning) Have tried %d filler combinations for the gap...

Feedback

Description

This message is printed after every 1000 legalizer trials of the filler combinations for the gap.

LGL-204

(warning) Site row not found at {%g %g}.

Description

No site row is present at the given coordinate. Hence cannot place the cell here.

LGL-205

(warning) Unable to fill gap at {%g %g}.

Description

Could not fill these gaps because of the following reasons: 1. Number of trials exceed the threshold trials. 2. Could not find an instance to fill the gap 3. Could not build a new instance with similar cell design as the gap

---

LGL-206

(warning) The app option %s is not set.

Description

The value of this app option returned is the default value.

What Next

Set the app option if required.

LGL-207

(warning) Via0 alignment rule will be ignored.

Description

The via0 allignment rule is ignored because of the following reasons: 1. The app option is not set. 2. Could not find the name of the via0 allignment grid specified by user.

What Next

Set the app option if not set already, and if the app option is set, pass the grid which exists in this design.

Feedback

LGL-208

(warning) Max %s inbound allignment rules/length checks will be ignored.

Description

The specified rules or checks have been ignored because of the app option not set.

LGL-209

(warning) There are no inbound cells in the design. CPOR7 rules will be ignored.

Description

CPOR7 rules cannot be checked without Inbound cells. This design does not have inbound cells.

LGL-210

(warning) %s tech layer was not found.

Description

Metal tech layer not found for this design. Fast PG engine and other PG related parameters will not be initialised and used in this flow.

LGL-211

(warning) Cell %s %sOrientation %d cannot be recognized in Cell Library DRC Soft Rule.

Description

In cell library DRC soft rule, the cell's orientation could not be recognized.

LGL-212

(warning) %s rule info has already been constructed, skipped...

Description

This engine's rule info has already been constructed. Skipping the initialization again.

LGL-213

(warning) Cannot find cell edge alignment grid named %s; cell edge alignment rule will be ignored.

Feedback

Description

Cell edge alignmnet rules are being ignored. Cell edge alignment grid names not found.

LGL-214

(warning) Issue found in calculating ML prediction accuracy. Skipping it.

Description

Could not calculate ML prediction accuracy.

LGL-215

(warning) Skipping ML prediction accuracy as zero floor area.

Description

Cannot calculate ML prediction accuracy as the floor area is zero.

LGL-216

(warning) Evaluation of command returned error code %d, command was %s.

Description

The command returned error with the given code.

LGL-217

(warning) Skipping route-aware pin-access check due to large displacement for inst: %s.

Description

The instance shows a large displacement. Hence skipping route aware pin access check for it.

LGL-218

(warning) Unknown 2D filler rule %s, will be ignored.

Description

This filler rule is not known to Advanced Legalizer, hence will be skipped.

Feedback

LGL-219

(warning) M0PO max length check will be skipped as %s.

Description

The M0PO max length check is skipped because of one of the following reasons: 1. There is no layer with mask name metal0 in the design. 2. M0 layer has no max length info in the tech file.

LGL-220

(error) 3D grid (%u, %u, %u) cannot connect to %s-layer grid due to %s %f".

Description

3D grid could not connect to upper/lower layer because of X/Y rule failure.

LGL-221

(error) 3D grid (%u, %u, %u) cannot connect to %s-layer grid due to wrong index (%d, %d, %u).

Description

Because of wrong index passed, the #D grid cannot connect to upper/lower layer.

LGL-222

(error) Layer %s not found %s.

Description

Could not find any layer in Advanced Legalizer to match the layer name given.

What Next

Please check the layer name passed.

LGL-223

(error) Library cell %s not found %s.

Description

Could not find a library cell with same name as this in the Advanced Legalizer.

Feedback

LGL-224

(error) Unable to obtain base site definition information.

Description

The base site definition information is missing. Legalizer will not function properly if base site definition is not set.

LGL-225

(error) Unable to extract horizontal legal pattern for the library cell %s.

Description

Cannot build legal pattern for this Advanced Legalizer as the tool could not extract the horizontal legal pattern for this given library cell.

LGL-226

(error) Base site def %s %s %g is not a multiple of grid %s %g.

Description

It might be an invalid legalizer design as base site def should always be an integral multiple of the grid width/height.

What Next

Rerun the design with place.legalize.enable_early_data_handling set to true to check if this design is valid or not. Can also use chck_legalizer_sanity command instead of legalize_placement.

LGL-227

(error) Cell %s has an invalid orientation %s.

Description

Cell does not have an orientation set or the orientation set is invalid for Advanced Legalizer. Cannot set keepout for this cell.

What Next

Set a valid orientation for this cell.

Feedback

LGL-228

(error) Cell Map initialization failed.

Description

Cell map could not be initialized properly because of basic engine failure.

LGL-229

(error) compile_legality failed.

Description

This command failed as either the pg_drc rules are not set or legal map initialization failed.

LGL-230

(error) Found a non-regular via color %d.

Description

The via color found is non regular.

LGL-231

(error) Found zero pitch %d.

Description

The layer has zero pitch.

LGL-232

(error) Unable to snap cell %s to row.

Description

The cell could not be snapped to row. Cannot continue legalization.

LGL-234

(error) Pin access %s detected incorrect data input. Aborting.

Feedback

Description

Pin access optimization or cell spreader were aborted because the engines could not be initialized properly. Some incorrect data has been passed in the design.

What Next

Check for reason of engine initialization failure and find out the incorrect data which led to failure.

LGL-235

(error) Could not find hybrid weight for cell '%s'.

Description

Could not get the hybrid weightage for this cell. Hence cannot perform hybrid spreading for the cell.

LGL-236

(error) Lib-cell '%s' is unplaceable. %d success after %d trials; passing rate %g.

Description

This lib-cell is unplaceable. After performing a lot of trials, the success rate or pass rate is very low. Cells of this lib-cell will remain unlegalized during this legalization run.

What Next

Run check_legality for cells of this lib-cell to get the rules which are failing for this cell.

LGL-237

(error) Tcl ""%s"" execution failed.

Description

Could not execute the tcl.

LGL-238

(error) Cell from cell map is NULL or invalid.

Description

Cell passed from cell map is either NULL or invalid. Could not obtain cell's block instance and hence invalid.

Feedback

LGL-239

(error) The via ladder %s has a locked/fixed shape %s. Ignore removing this via ladder.

Description

This via ladder will not be removed as it has locked or fixed shape.

LGL-240

(error) NYPD legalizer is not initialized.

Description

Advanced Legalizer(NYPD legalizer) has not been initialized yet. Rerun the flow after initializing NYPD legalizer object.

What Next

First initialize the NYPD legalizer before calling this functionality.

LGL-241

(error) Unable to uncommit cell %s.

Description

Could not uncommit cell for the current location. There could be different reasons for not being able to uncommit it depending on different rule engines. eg. another cell might be placed at the location where we trying to uncommit this cell.

LGL-242

(error) Found an MX_site cell %s not placed on an MX site %s.

Description

The cell cannot be placed at this site as the cell has MX orientation which does not match the site orientation. The cell will be legalized at another location which matches the orientation.

LGL-243

(error) App option place.legalize.enable_machine_learning is not turned on.

Feedback

Description

The app option place.legalize.enable_machine_learning needs to be set for the Advanced Legalizer to continue lib cell legality query.

What Next

Enable the app option place.legalize.enable_machine_learning and rerun the command.

LGL-244

(error) Got unknown option

Description

Passed an option that does not match the requirements/criterion of spacing rule/label definition.

What Next

Re define the spacing rule/label with proper options.

LGL-245

(error) Range %s

Description

While specifing the spacing rule, the range between labels should always be a non negative integer. Except for adjacent rows, that too only for horizontal spacing.

What Next

Re define the spacing rule, making sure the spacing range is a non negative integer.

LGL-246

(error) Range %s

Description

The given spacing range should be in range of the maximum spacing that can be used for Advanced Legalizer. If the range is specified in micron rather than site width, then it should be within maximum spacing * site width.

What Next

Redefine the spacing label considering the maximum constraints.

Feedback

LGL-247

(error) Range %s

Description

The spacing rule range specified in microns must always be a non-negative real number.

What Next

Redefine the spacing rule with proper range in micron.

LGL-248

(error) Got unknown command

Description

Unknown data passed to the spacing rule command. Could be: 1. Read string not required for the option. 2. Unknown option passed along with the command. 3. Unknown command called. 4. Unknown side passed.

What Next

Rerun teh script with appropriate data/commands.

LGL-249

(error) Cannot specify

Description

Out of vertical and horizontal, only one direction of spacing label can be specified in one command.

What Next

Redefine the spacing labels, such that there is different spacing label for horizontal and vertical spacing label.

LGL-250

(error) Neither -side nor -vertical_side is specified from line %d

Description

Cannot make the spacing labels and spacing rules till the sides are not specified.

Feedback

What Next

Redefine the spacing label with sides defined.

LGL-251

(error) The %s label

Description

Cannot define the spacing rules if the label is not defined.

What Next

Redefine the spacing labels.

LGL-252

(error) Label

Description

Labels have different polarity, i.e both labels should either be horizontal or should be vertical. Mismatch is not allowed.

What Next

Redefine the rule with labels having same polarity.

LGL-253

(error) -adjacent_row cannot be specified with -halo together, from line %d

Description

The two options -adjacent_row and -halo cannot be specified by the user together.

LGL-254

(error) Cannot open vertical spacing rule configuration file name

Description

Cannot load spacing rule information as the vertical spacing rule configuration files could not be opened.

Feedback

LGL-255

(error) LegalMap val %d at index %d,%d is not a valid cellId.

Description

The cell id value in legal map at the given index is not valid. Cannot check for overlap at this location.

LGL-256

(error) Range is not specified for line %d

Description

Cannot define a spacing rule without the range. Hence this spacing rule will be ignored.

What Next

Redefine the spacing rule with maximum and minimum spacing range.

LGL-257

(error) Unable to read boundary leakage side file.

Description

Boundary leakage details will not be available as the boundary leakage side file could not be read.

LGL-258

(error) Unable to commit ignoreCell %s %s %s.

Description

Unable to commit cell because of: 1. Region failure. 2. Rule failure.

LGL-259

(error) File '%s' is not of expected type.

Description

File type does not match the expected type.

Feedback

LGL-260

(error) Empty _rtLayers.

Description

Cannot build the via coloring map and tracks as the rt layers vector is empty.

LGL-261

(error) Unknown violation type. Violation rule = %s.

Description

This violation rule does not have any such violation type.

LGL-262

(error) 2D checker/legalizer does not support a site row (%s) whose width is not an even multiple of the grid width (%s).

Description

Any site row which has site width odd multiple of the grid width cannot be used in Advanced Legalizer. Cannot build basic engine with such site rows. Hence an invalid design.

What Next

Make sure the site row's width is an even multiple of the grid width.

LGL-263

(error) Unable to restore %s (ref %s) to original legal state %d (last state %d; engine %s) Cell siteMap %s Lib siteDef %s Cell origin %d %d orient %s libCell %s.

Description

Cannot restore the cell to the original legal state from the last state.

LGL-264

(error) Unable to read equiv lib cell file %s.

Description

The equivalent lib cell cannot be read.

Feedback

LGL-265

(error) Library cell %s's height is a not multiple of the site height.

Description

Cannot place a cell whose height is not an integral multiple of the base site height. There is no site row in this Advanced Legalizer where it can be placed.

What Next

Change the library cell's height to integra multiple of the base site height.

LGL-266

(error) Unable to run DRC prediction.

Description

Cannot run drc predictions

LGL-267

(error) Invalid DRC prediction model.

Description

The drc prediction model is not valid. Cannot continue drc predictions.

LGL-268

(error) No DRC error file.

Description

Could not find any DRC file.

LGL-269

(error) Illegal row height specified.

Description

Row height specified here is illegal. Cannot generate 2D multi height gaps.

Feedback

LGL-270

(error) Failed to generate new mask vec.

Description

Could not generate new mask vector.

LGL-271

(error) The app option place.legalize.max_horizontal_pin_density must be a set with pair of non-zero positive integers {%d %d}.

Description

The app option should get both the values for pin density, positive integral values. Cannot initialize horizontal pin density.

What Next

Re define the app option with proper values.

LGL-272

(error) Duplicated maximum cell group constraints in PRF & json_glc_lib_cell; following PRF constraints & skipping the other!!

Description

These constraints are already present in the PRF. Hence skipping it.

LGL-273

(error) No %s height filler library cells are specified to fill %s height gaps.

Description

Cannot insert filler full/half gaps as no full/half height filler library cells specified.

LGL-274

(error) Unable to legalize %s due to max displacement constraint (%gum > %gum).

Description

The cell is surpassing the maximum displacement constraints. Hence it cannot be legalized.

Feedback

LGL-275

(error) Unable to read cell library drc side file.

Description

Could not find data in the file passed for cell library dc side.

LGL-276

(error) Failed to insert BBox{ {%d, %d} {%d, %d} }, keyX = %d, keyY = %d, lay = %lu.

Description

Could not insert bbox.

LGL-277

(error) Failed to insert Obj(%s), keyX = %d, keyY = %d, lay = %lu.

Description

Failed to insert object.

LGL-278

(error) Failed to insert Mask(%d) of BBox{ {%d, %d} {%d, %d} }, keyX = %d, keyY = %d, lay = %lu.

Description

Failed to insert mask.

LGL-279

(error) The list of OD.S.17 forbidden spacing range {min, max} is empty. Ignore OD.S.17 checking.

Description

OD.S.17 spacing forbidden range is not found.

LGL-280

(error) Dynamic OD length constriants' techfields should be 0 or 5!!

Feedback

Description

The value of dynamic OD length constraints should either by 0 or 5. Any other value is invalid.

LGL-281

(error) Cannot find dummy cell for filler lib cell %s.

Description

No dummy cell has been created for this filler library cell.

LGL-282

(error) No basic site map is found.

Description

Basic site map not found for this Advanced Legalizer. Cannot continue with the design.

LGL-283

(error) The list of OD proximity values is empty. Ignore clock min jog check.

Description

Clock min jog check will be ignored as the OD proximity value list is empty.

LGL-284

(error) Error in processing place.legalize.VT_groups app options. Layer %s is not a valid layer for VT group.

Description

The app option cannot be processed as the value passed by the user is not valid for the VT group.

LGL-285

(error) VT group %s is not defined . %s.

Description

Cannot continue this check as the VT group is not defined.

Feedback

LGL-286

(error) Layer %s is not a valid implant layer.

Description

The specified layer is not an implant layer.

LGL-287

(error) PG blockage spec {%s} is not a valid specification (e.g. VR:name|LIBCELL:name layerName blockRate).

Description

The PG blockage specification is not valid. It should be of the format as shown.

LGL-288

(error) Unable to read via ladder analysis file vialadderAnalysisFile.

LGL-289

(error) Via ladder rule %s has unmatched pin region W x H = %d x %d!

Description

The pin region does not match the specification of the via ladder rule.

LGL-290

(error) Cannot restore %s to its original library cell %s.

Description

Could not commit the instance with swapped library cell.

LGL-291

(error) The PT-ECO link has already been initiated; must terminate it first.

Description

The PT ECO has already been initialized. To re initialize it, the already existing PT ECO has to be terminated.

Feedback

What Next

Terminate the already existing PT ECO.

LGL-292

(error) Trial placement must be {instance_name reference_name} list pair.

Description

The trial placement passed by the user should be a pair of two objects: instance name and reference name. Cannot execute trial placement for the passed list.

What Next

Pass the list according to the specified format.

LGL-293

(error) Unable to find 2D checker cell named %s.

Description

The PT ECO link cannot find any instance with same name in advanced legalizer.

LGL-294

(error) Unable to %s trial placement %s file %s.

Description

PT ECO link could not read/write the input/output file as the file name is not correct.

LGL-295

(error) Instance at (%f, %f) is not covered by valid routing tracks.

Description

No valid routing tracks are present at the given location. Hence the instance cannot be covered by the tracks.

LGL-296

(error) Instance %s is not covered by valid %s routing tracks.

Feedback

Description

No valid routing tracks are present at the location where this instance is placed. Hence it cannot be covered by the tracks.

LGL-297

(error) Wrong via %s.

Description

The via does not match the requirement.

LGL-298

(error) No bot pattern.

Description

No bot pattern.

LGL-299

(error) The PT-ECO link has not been initiated; %s.

Description

Cannot perform the operation as teh PT ECO link has not been initialized yet.

LGL-300

(error) Invalid sameColorCutCenterMinSpacing.

Description

Invalid spacing constraint.

LGL-301

(error) Cannot find sameColorCutCenterMinSpacigTbl in V1.

Description

The spacing table is not found for this Advanced Legalizer.

Feedback

LGL-302

(error) Invalid AON cells spec %s.

Description

The AON cell spec passed by user from the app option "place.legalize.AON_cell_placement_spec" has invalid data. There should be 3 tokens for every entry in the list.

LGL-303

(error) Unable to find %s %s from AON placement spec.

Description

The attribute passed in the AON placement spec is not present in the Advanced Legalizer.

What Next

Check the design for this attribute.

LGL-304

(error) Invalid AON cell pin keepout spec %s.

Description

The AON cell pin keepout spec passed by user from the app option "place.legalize.AON_pg_keepout_spec" has invalid data. There should be 3 tokens for every entry in the list

LGL-305

(error) Unable to find %s %s from AON cell pin keepout spec.

Description

The attribute passed in the AON placement spec is not present in the Advanced Legalizer.

What Next

Check the design for this attribute.

LGL-306

(error) Metal/via tech layer was not found.

Feedback

Description

No metal or tech layer found. The LA rules engine cannot be initialized.

LGL-307

(error) Movable region size should be -1 or positive values, but its current value: %d.

Description

The movable region size should either be -1 or some positive value. It is currently set to 0, which is not a valid movable region size.

LGL-308

(error) For the id (%d), cross cell subnet is out of range.

Description

The value of cross cell subnet is out of range for this id.

LGL-309

(error) Cannot find library cell info for cell %s.

Description

The LA info map does not contain any library cell info for the given cell.

LGL-310

(error) Tech layer has no minimum width information.

Description

This tech layer does not have a minimum width information. Using default value for this tech layer.

LGL-311

(error) Layer's minimum widths from the tech file are not correct.

Description

The tech file does not have valid minimum width for the layers.

Feedback

LGL-312

(error) Boundary values are not set in getSpecificBox function.

Description

The boundary values should be set for specific box. Asserting.

LGL-313

(error) 3D layer %u has ZERO grid size: %lu x %lu, rt_pin_access is not enabled!

Description

Rt pin access is not enabled as the 3D layer has zero grid size.

LGL-314

(error) Pin layer has no upper grid connection at (%u, %u).

Description

The pin layer should have an upper grid connection at the given coordinates.

LGL-315

(error) 3D grid connection failed (broken num: %d).

Description

The connection for 3D grid failed.

LGL-316

(error) Unable to compile the library cell %s.

Description

The legality compiler could not compile the given library cell because: 1. It could not read the legality file. 2. Could not find site map for this library cell.

LGL-317

(error) Unable to write legality compile file %s.

Feedback

Description

Could not write legality compile file because either the pg_drc data was missing or the file name was incorrect.

LGL-318

(error) There is no legality compilation information.

Description

The legality compilation information is missing.

LGL-319

(error) Unable to read legality library file %s.

Description

The legality compiler cannot read library file because either the file name is wrong.

LGL-320

(error) PG data changed since library %s. Need to regenerate library compiler file.

Description

The data saved previously has changed. The library compiler file needs to regenerated.

LGL-321

(error) Fail to open PURE %s file: %s.

Description

Could not open the file.

LGL-322

(error) Syntax is wrong in %s layers in PURE!!!

Description

Wrong syntax for the specified layer.

Feedback

LGL-323

(error) Order of %s %d is incorrect.

Description

Order of the id is not valid for the shape/pattern.

LGL-324

(error) Too many features > 100.

Description

Features should not exceed 100.

LGL-325

(error) Layer name: %s has no mapping layer number.

Description

The layer number passed from the file has no layer number. Cannot process this layer.

LGL-326

(error) No %s in pattern, patID = %d.

Description

No layer/box in the specified pattern.

LGL-327

(error) NO layers in PURE!!!

Description

No layers found from the user passed file.

LGL-328

(error) Orientation %s is not supported in PURE!

Description

This orientation is not supported in the flip graph. Only MX, MY and R180 are allowed.

Feedback

LGL-329

(error) Cannot initialize graph with no layers!!!!

Description

There are no layers present, hence cannot initialize the pattern graph.

LGL-330

(error) Illegal pattern index %d to add violation box!!!!

Description

Cannot add violation box this pattern index.

LGL-331

(error) No box id in pattern graph!!!

Description

The pattern graph has no box.

LGL-332

(error) This pattern is not implemented yet...

Description

The specified pattern is not specified yet. Cannot continue.

LGL-333

(error) The layer %d is not defined yet.

Description

The specified layer has not been defined yet.

LGL-334

(error) ShapeBBox is not covered by patBBox. Please modify patBBox %s to cover %s.

Description

The pattern bbox should cover the shape bbox. Modify the pattern bbox to cover it.

Feedback

LGL-335

(error) There is no site def defined for the block.

Description

This block does not have any site def defined. Advanced Legalizer cannot function for such block.

LGL-336

(information) Adjusting %s to a multi-height library cell.

Description

The height of this library cell is more than equal the base site height. So marking this library cell as multi height.

LGL-337

(warning) No cells selected for IR-drop optimization.

Description

There are no cells for IR drop optimization.

LGL-338

(error) Cannot get value for max group length from library '%s'.

Description

The library has no value for max group length.

LGL-339

(warning) CPODE Layer %s has no corresponding tech layer.

Description

There is no tech layer for the CPODE layer obtained from the tech file.

LGL-340

(warning) The max length of rule max_cpode_length is not specified by app option max_vertical_stacked_length.

Feedback

Description

Cannot initialize CPODE rules as the app option place.legalize.max_vertical_stacked_length does not specify the max length of max_cpode_length.

LGL-341

(warning) The max length of rule max_cpode_length is not positive from tech file, so cpode check will be ignored.

Description

The value of max cpode length specified from tech file is not positive. Cpode rule check will be ignored.

LGL-342

(warning) Max parallel run spacing %g is less than the site width %g.

Description

Max parallel run spacing should not be less than the site width.

LGL-343

(warning) AL should get a hybrid filler at {%g %g}, but got another cell instead (cell = %s, lib = %s, orient = %s, bbox = {{%g %g} {%g %g}}), indicating this cell might not be on site.

Description

At the given location, there should be a hybrid filler but there is another instance placed here. This should be resolved before filler insertion.

LGL-344

(warning) User rule %s will be overidden.

Description

This user rule has been overidden.

LGL-345

(warning) Repeated layers during graph construction!

Feedback

Description

The layer has already been included in the pattern graph.

LGL-346

(warning) Anchor Point is invalid; it should be located at a shape's corner.

Description

The anchor point should always be present at the corner of the shape. This point is invalid.

LGL-347

(warning) Misaligned gap found; offending cell is %s ref %s origin {%g %g}, gapX1IndexU %d gapX2IndexU %d gapYIndexU %d gapX1IndexL %d gapX2IndexL %d gapYIndexL %d.

Description

The found gap is misaligned.

LGL-348

(warning) Could not find nypdLibCell for VL excluded libCell %s.

Description

No nypdLibCell found in Advanced Legalizer with same name as the given VL excluded library cell.

LGL-349

(warning) %d out of %d fixed cells need TPT recoloring!

Description

Out of the total fixed cells, these many cells need TPT recoloring.

LGL-350

(warning) There are %d fixed cells w/ TPT coloring violations.

Description

These many fixed cells show TPT colouring violations.

Feedback

LGL-351

(warning) More than 2 values in the list of OD.S.17 forbidden spacing range {min, max} are found. Only the first 2 values will be used.

Description

Only two values should be passes along the OD.S.17 spacing range. The user has passed more than two values so only first two will be used.

LGL-352

(warning) There are hybrid fillers in the filler library but the app option "%s" %s. Otherwise, hybrid fillers would be treated as normal fillers, resulting in jog violations.

Description

Hybrid filler are present in the filler library, but because of this app option, these hybrid fillers would be treated as normal fillers.

LGL-353

(warning) There is no special filler in the filler library but the app option "place.legalize.enable_1cpp_filler_rule_check" is enabled. Thus, the boundary transition rule check is "automatically" disabled, so that only filler1 and filler1 abutment rule is considered.

Description

Only the above specified rules are enabled as there are no special fillers, and this app option is enabled.

LGL-354

(warning) No instance in the design or No POD in library cells!!

Description

No POD in the library cells.

LGL-355

(warning) More than 2 proximity values in the list are found. Only the first 2 values will be used.

Feedback

Description

Only two values should be present in the list. Only first two proximity values will be used.

LGL-356

(warning) Select %d as major POD!

Description

Select major POD value as the one specified.

LGL-357

(warning) Improper setting of minWidth uJog = %d (%g um) > lJog = %d (%g um). Should set to equal.

Description

Improper setting of minWidth Jog. Will be set to eqaul.

LGL-358

(warning) Improper setting of min 1-fin diffusion length = %d (%g um) > lJog = %d (%g um). Should set to equal.

Description

The setting for min 1 fin diffusion length is not correct. Should be set to equal.

LGL-359

(warning) No OD related tech field was set. AL will automatically omit OD checking.

Description

Advanced Legalizer will skip OD rules checking as the OD related fields are not set.

LGL-360

(warning) No LUP shape of name =

Description

There is no LUP shape on the layout with the name as this.

Feedback

LGL-361

(warning) Additional power management user lib type name

Description

This lib type has already been registered in the Advanced Legalizer. Hence this will be skipped.

LGL-362

(warning) Additional power management lib type name

Description

This librry type is not present in the Advanced Legalizer. Hence the lib cell list will be ignored.

LGL-363

(warning) A tap uncover violation at {{%g %g} {%g %g}} is suppressed due to %s.

Description

The violation has been suppressed becuase of the following reasons: 1. The app option place.legalize.suppress_bndry_cover_violation. 2. Drop edge with given bbox.

LGL-364

(warning) The user tap rule table

Description

The table is empty or invalid. Hence the user tap rule will be ignored.

LGL-365

(warning) The user tap rule table one but an odd number of numbers, so the last number will be ignored.

Description

The number of values in the tap rule table should have even number ov values. If the number of values passed by user is odd,we will ignore the last value.

Feedback

LGL-366

(warning) Additional power management lib-cell name

Description

The library cell passed by the user through app option is not found in the cell library for this Advamced Legalizer.

LGL-367

(warning) Tap cover distance in site %d is too much, should be less than %d.

Description

The tap cover distance is very high.

LGL-368

(warning) No rule is specified. Please set rules via "set_tap_boundary_wall_cell_rules" before checking.

Description

There are no rules specified for checking the chip finishing. The rule set_tap_boundary_wall_cell_rules should be set before checking for rules.

LGL-369

(warning) Tap distance is not a positive number. Please check the rule setting by "set_tap_boundary_wall_cell_rules".

Description

Tap distance should always be a positive number.

LGL-370

(warning) The tap coverage distance is not defined in either rule container or app option (place.legalize.tap_cover_distance <micron>). The tap coverage checking might fail.

Description

The tap coverge might fail as the tap coverage is not defined.

Feedback

LGL-371

(warning) Failed to uncommit cell '%s'.

Description

Advanced Legalizer could not uncommit this cell.

LGL-372

(warning) Characterization data for library cell '%s' not found.

Description

No information found for this library cell in Advanced Legalizer.

LGL-373

(warning) Unable to find characterized lib-pin shape %s. Cell: %s pin: %s.

Description

Could not find characterization data for library pin shape.

LGL-374

(warning) Illegal access point at %s for shape %s.

Description

There is no access point for this shape at the given coordinates.

LGL-375

(warning) No site definition found. Unable to extract local connectivity.

Description

Could not extract local connectivity as there is no site definition for this pin access optimizer.

LGL-376

(warning) Duplicate cell found in move set. Aborting move.

Feedback

Description

Cannot normalize cells as a duplicate cell os found in the move set.

LGL-377

(warning) Debug options are defined.

Description

Debug options are defined by debug app option.

LGL-378

(warning) Failed to read value '%s' for option '%s'.

Description

Could not read values for the given option.

LGL-379

(warning) Couldn't find option '%s'.

Description

The given debug option in the app option value is not defined.

LGL-380

(error) User Rule JSON BBox has no complete L B T R values.

Description

Update the JSON bbox for complete information.

LGL-381

(error) Syntax is not correct for User Rule JSON: (name, value)=(%s, %s).

Description

No data passed for either name or value of the user rule JSON.

Feedback

LGL-382

(error) User Rule mode %s is not defined.

Description

Mode for this user rule is not defined.

LGL-383

(error) User Rule feature %s is not defined.

Description

Feature for this user rule is not defined.

LGL-384

(error) User Rule JSON BBox has no layers.

Description

No layers defined for the user rule JSON BBox.

LGL-385

(error) Unknown syntax!!!

Description

Cannot extract user rule information from JSON as the syntax is not correct.

LGL-386

(error) Syntax wrong for inputFileName: %s.

Description

Cannot read the data from file as the file name is not correct.

LGL-387

(error) ShapeOrient only support 1 orient.

Description

Syntax error in the shape orient. Only 1 orient is supported.

Feedback

LGL-388

(error) Syntax not correct at the line %s.

Description

The syntax at this line does not match the required syntax, hence closing the file without reading data.

LGL-389

(warning) Want to get a non-initialized flipped graph.

Description

The user wants to get non initialized flipped graph.

LGL-390

(warning) Gui is not running.

Description

Could not highlight the bbox as the gui is not running. Run the gui before executing this command.

LGL-391

(warning) No cells to be legalized/checked in %s.

Description

This VA or MB does not have any movable cell to legalize or check.

LGL-392

(warning) Removing the cell %s as it belongs to high local density area.

Description

The design has high local density which may lead to high runtime. So removing the cells in the high local density area to ensure reduced runtime. The area occupied by these cells will be replaced by a blockage and the design remains unlegalized.

What Next

Decrease local density for the mentioned location and rerun AL.

Feedback

LGL-393

(warning) Library cell %s has a VT layer %s (%d) that does not exist in Tech File.

Description

The layer number for this library cell does not match in the tech file.

LGL-394

(warning) Invalid value of vertical abutment. Insert spaces between values for valid input.

Description

The value of vertical abutment input by user is invalid. The vaue exceeds the maximum possible value. Insert space between abutment values to ensure correct input.

LGL-396

(information) Removing unfixed physical only cell %s.

Description

Removing the unfixed physical only cells as the app option place.legalize.exclude_unfixed_physical_only_cells is enabled.

LGL-397

(Warning) No site rows found in floorplan.

Description

This message is indicating that there was an error when analyzing site row configuration in current block.

What Next

Review the design and floorplan preparation.

LGL-398

(Error) Site row header %s has missing site definition.

Description

The specified site row header has missing site definition. Such designs with missing site definition are not valid for legalize_placement and check_legalizer_sanity.

What Next

Define a site definition for the site row header.

LGL-399

(Warning) Option design.sort_em_via_ladders is enabled. The priority of EM via ladder constraints on cell pin is modified.

Description

This warning message is to remind user the priority of EM via ladder constraints on cell pin is modified. Tool would try to preserve more routing resource for EM via ladder insertion during legalize_placement. It is expected to see larger cell displacement or longer runtime.

What Next

If you observe any unexpected cell displacement or runtime increase, please turn off app_option design.sort_em_via_ladders so that the tool would honor the original EM via ladder constraint priority.

LGL-400

(Warning) App option place.legalize.enable_early_data_support is set to true. Early data handling is enabled for Advanced Legalizer.

Description

The app option when set to true, detects and handles dirty input. It may lead to bailing out of legalizer at an early stage leading to unlegalized instances and could also involve making changes in the design to prevent any crash, hang or long runtime condition that may occur because of the dirty data input.

What Next

Check for early data warning and error messages in the log if any and make changes in the input accordingly.

LGL-401

(Error) No mask shift layer definition in Cell %s NDM %s.

There is a conflict in the setting of color-shifting flow between the app option value and the library cell attribute. Color-shifting flow would not be performed. Please reexamine your app option setting regarding color-shifting flow and the attribute of the library cell.

Feedback

What Next

Revise the aforementioned app option settings or reassign the attributes for the library cells.

LGL-402

(error) Found MX_site cell %s not placed on MX site %s origin {%g %g} orient %s.

Description

This message is indicating that MX_site cell not placed correctly on MX site.

What Next

Run command legalize_placement.

LGL-403

(Warning) All non-default voltage areas are ignored due to app option 'place.legalize.ignore_voltage_areas'.

Description

This message is indicating that the app option 'place.legalize.ignore_voltage_areas' has been turned on and all non-default voltage areas are ignored during legalization and check_legality. Even if cells are not assigned to a specific voltage area, they can be placed within a non-default voltage area.

LGL-404

(Warning) auto_stagger is enabled in router for via ladder, but it is not enabled in legalizer.

Description

route.auto_via_ladder.auto_stagger is enabled, but place.legalize.via_ladder_auto_stagger is not enabled.

What Next

The suggestion is to set the two options consistently.

LGL-405

(Warning)

Feedback

Description

place.legalize.user_route_via_pillar_map is an obsolete app option that is no longer needed. This app option will be removed in the next release. Please remove this setting before the next release.

What Next

The suggestion is to remove the usage of app option place.legalize.user_route_via_pillar_map

---

LGL-406

(Warning) Single height rectilinear lib-cell '%s' found. This lib-cell is considered as a rectangular cell.

Description

This message is indicating that there is a setup issue regarding the site definition of a rectilinear cell. Rectilinear cells need to be multi-height with respect to its sitedef.

What Next

Review the sitedef setup.

LGL-407

(Warning) Not a recommended usage for color-shifting: app option place.legalize.%s and cell %s attribute %s. Use app option definition.

There is a conflict in the setting of color-shifting flow between the app option value and the library cell attribute. Color-shifting flow would adopt the app option setting regardless of the attributes from the library cell. Please reexamine your app option setting regarding color-shifting flow and the attribute of the library cell.

What Next

Revise the aforementioned app option settings or reassign the attributes for the library cells.

LGL-408

(Error) Inconsistent between app option %s and cell %s NDM %s.

There is a conflict in the setting of color-shifting flow between the app option value and the library cell attribute. Color-shifting flow would not be performed. Please reexamine your app option setting regarding color-shifting flow and the attribute of the library cell.

Feedback

What Next

Revise the aforementioned app option settings or reassign the attributes for the library cells.

LGL-409

(Warning) No mask shift layer definition in Cell %s NDM %s, use app option definition.

There is a conflict in the setting of color-shifting flow between the app option value and the library cell attribute. Color-shifting flow would not be performed. Please reexamine your app option setting regarding color-shifting flow and the attribute of the library cell.

What Next

Revise the aforementioned app option settings or reassign the attributes for the library cells.

LGL-410

(warning) For cpode_spacing in AL, could not open the side file %s.

Description

Users need to define side file for cpode_spacing.

What Next

Please set the app_option place.legalize.cpode_spacing_side_file. You can set it to the directory name or use this format<dir>/*.txt.

LGL-411

(warning) For cpode_spacing in AL, there's missing information for cpode soft placement constraints. Need to specify target cells, attacking types and two kinds of keepout distance \n

Description

Users need to set all four app_options related to cpode_spacing.

What Next

Please check if all app_options are set correctly:
place.legalize.cpode_soft_placement_constraint_attacking_types
place.legalize.cpode_soft_placement_constraint_target_cells
place.legalize.cpode_soft_placement_constraint_target_cell_keepout_distance
place.legalize.cpode_soft_placement_constraint_attacking_cell_keepout_distance

Feedback

LGL-412

(warning) For cpode_spacing in AL, the list number of target cells, attacking types and keepout distance do not match.

Description

Users need to define same types of target cells, attacking types and corresponding keepout distance.

What Next

Please check if the type number in app_options are same:
place.legalize.cpode_soft_placement_constraint_attacking_types
place.legalize.cpode_soft_placement_constraint_target_cells
place.legalize.cpode_soft_placement_constraint_target_cell_keepout_distance
place.legalize.cpode_soft_placement_constraint_attacking_cell_keepout_distance

LGL-413

(warning) For cpode_spacing in AL, unable to find user defined group name %s in target cells and attacking types.

Description

The group name in cpode_spacing app_options do not match.

What Next

Please check if group name in app_options are set correctly:
place.legalize.cpode_soft_placement_constraint_attacking_types
place.legalize.cpode_soft_placement_constraint_target_cells
place.legalize.cpode_soft_placement_constraint_target_cell_keepout_distance
place.legalize.cpode_soft_placement_constraint_attacking_cell_keepout_distance

LGL-414

(information) Found redundancy group '%s'.

Description

Prints the names of the safety register redundancy groups that are considered by legalization.

LGL-415

(information) Found safety_error_code_group '%s'.

Feedback

Description

Prints the names of the safety error-code groups that are considered by legalization.

LGL-416

(information) Found failsafe_fsm_group '%s'.

Description

Prints the names of the safety fail-safe groups that are considered by legalization.

LGL-417

(information) Vertical abutment prohibit pattern %d-%d accepted.

Description

Prints the pattern pairs of prohibited vertical abutments of std cells. The legalizer will consider these patterns as a hard placement rule and avoids vertical abutment of std cells with these given patterns.

LGL-418

(information) Reducing rule set for cell '%s'.

Description

In early data mode when the strategy is set to limit_legalize for the zero-pass-rate legalization check, the legalizer will reduce the rule set to overlap-free and cell-on-site. This message indicates which cells are affected by this rule set reduction.

LGL-419

(information) Pass-rate based cell priority: %s.

Description

This is a debug message for lib-cell pass-rate based cell priority definition.

LGL-420

(Error) CTS is trying to legalize %u unplaced cell%s.

This error message indicates a flow problem during CTS. CTS should never try to legalize cells without a placed location.

Feedback

LGL-421

(warning) App option '%s' is enabled.

Description

This messages indicates that the given app option is enabled which might have a negative impact on the legalization result.

What Next

Check whether this setting is required.

LGL-422

(information) Short variant '%s' is wider than the M1 PG pitch. This lib-cell is allowed to be placed under M1 PG shapes.

When the app options place.legalize.avoid_wide_variants and place.legalize.limit_wide_variants are turned on, wide variants (in X direction) are only allowed to be placed under M1 PG shapes. The shorter varaints are not allowed to be placed under PG shapes. However, if the M1 PG pitch is smaller than the width of the shorter variant(s), then an exception applies and the shorter variants are allowed to straddle the PG shapes.

What Next

None

LGL-430

(Warning) Couldn't find secondary PG %s at location (%g, %g) in %d sites, for AON cell %s. Will ignore aon_under_pg on the cell in legalization to avoid large displacement.

Description

It's a sanity check for AON cells to avoid missing PG around it. Will ignore aon_under_pg rule on the cell in legalization.

LGL-431

(Error) Missing PG for more than %d AON cells. Please check if there is a region without AON PG stripe.

Feedback

Description

It's a sanity check for AON cells to avoid missing PG around it. If the number of cells who found missing PG around it exceeds the value of place.legalize.limit_aon_cells_missing_2nd_pg, this error is repored.

LGL-460

(Warning) Lib cell %s does not have any primary PG pin.

Description

This message indicates that this lib cell does not have PG pins with necessary attribute "pg_type == primary". It could lead to false track capacity violation on multi-height cells.

What Next

Please double-check the design and library and make sure all lib cells have necessary primary PG pins.

LGL-461

(Error) Legalizer encounter internal memory error... %s : %s.

Description

This message indicates that during legalization, some internal memory error related to the indicated object(s)/condition(s).

What Next

Follow message suggestion to remedy the issue if any. Run check_database before saving/continuing design and report this to Synopsys.

LGL-462

(Error) Legalizer exceed max allowed internal memory errors.

Description

This message indicates that during legalization,more than the number of allowed internal memory errors happened and therefore command exits

What Next

Look for earlier error messages to remedy the issue if possible. Run check_database before saving/continuing design and report this to Synopsys.

Feedback

LGL-463

(Warning) site '%s' polarity undetermined.

Description

You received this message because the named site polarity has not been determined.

What Next

Please file a bug report.

LGL-464

(warning) There are %n non-default %sLegalizer/Chip-Finishing app-options in use.

The design has non-default legalizer/chip-finishing app_options, which may lead to unexpected behavior.

What Next

Cross-check non-default place.legalize.* and chipfinishing.* app_options, and please check with CAE on hidden non-default settings being used.

LGL-465

(warning) The specified region is too big; it is more than %.2f percent of core area.

The region provided by cellmap client is too big, which can lead to long-runtime issue.

What Next

Ask the client to review the usage of the region-based APIs from the stack trace below the message.

LGL-466

(information) cellmap bailed out after %n trials.

We have a trial limit from cellmap runtime improvement for non-region-based cellmap query/commit.

What Next

Please use a region-based cellmap API if a far-away legal location is acceptable.

Feedback

LGL-467

(warning) CLO_ERR: LocalOTF for this thread does not exist!!!

The client did not setup CLO or ALMap to use in lock-free mode during multi-threading

What Next

Open a bug so that this can be addressed

LGL-468

(Warning) via %s doesn't have lower metal layer.

This message indicate that via doesn't have connected lower metal layer.

What Next

Please check via has associated upper and lower metal layer.

LGL-470

(information) Adding AON placement spec: %s

An AON placement specification is added as a legalization constraint

What Next

None

LGL-471

(Error) Cell %s has ndm-cm mismatch. %s

Description

This message indicates that there is inconsistency between NDM and CM in terms of the cell and describes its details.

What Next

None

LGL-472

(Error) Cell %s has no ref block, but it was loaded into cellmap

Feedback

Description

The cell was loaded into cellmap, but it has no reference block.

What Next

None

LGL-473

(info) %s

Description

The message prints summary of NDM and cellmap consistency check

What Next

None

LGL-474

(warning) In vertical abutment rule specification, the portion of pattern exceeding the width of cell %s must be an even number. Pattern %s is ignored.

Description

While specifying the vertical abutment rule, if the pattern length is larger than the cell site width, the portion exceeding the cell width must be an even number.

What Next

Re define the vertical abutment rule.

LGL-475

(Warning) AL-Cellmap cannot commit app_fixed cell %s (lib %s) at %s %s, which could lead to cell overlaps after the flow.

AL-Cellmap expects no overlaps between app_fixed cells in the incoming database; otherwise, cell overlaps after AL-Cellmap are expected. To fix the error, please ensure all app_fixed cells are legal before running the flow.

What Next

To detect all violating app_fixed cells, please enable the app_option "place.legalize.enable_check_legality_before_and_after_cellmap". Clean up all violations and rerun the flow to see the cell overlapping issue is resolved.

Feedback

LGL-476

(Warning) A large %d-row-height cell %s (Lib %s) is detected in CLO, which may cause long runtime to find a legal location.

When CLO legalizes a big cell, typically it leads to long runtime.

What Next

If there is a freezing issue, please add dont_use on the big Lib cell(s).

LGL-477

(Warning) app option place.legalize.v0vt_layer_abutment_edge_distance will be deprecated in the future release. Please use place.legalize.v0_layer_abutment_edge_distance, place.legalize.v1_layer_abutment_edge_distance, and place.legalize.vt_layer_abutment_edge_distance instead

Description

place.legalize.user_route_via_pillar_map is an obsolete app option that is no longer needed. This app option will be removed in the next release. Please remove this setting before the next release.

What Next

Please replace it with suggested app option instead

LGL-478

(warning) lib-pin %s at (%s) has %s access points, but the Via ladder constraint %s needs %s access points, this Via ladder constraint is infeasible at current location.

Description

You received this warning message since this lib pin $lp at current location is not able to grow a via ladder on it based on the given via ladder constraint, because advanced legalizer does NOT support automatically pin extension.

What Next

You can take one of the following actions to fix this warning. 1. Modify the mismatched via ladder constraints such that advanced legalizer can grow via ladders on pins without pin extension. For example, decrease the number of cut rows/cuts per row. 2. Modify the cell layout by manually extending the short pins. 3. If you want to bypass this via ladder constraint, please enable place.legalize.enable_via_ladder_early_data_support. Tool will

Feedback

automatically bypass the via ladder checks on those cell instances of the lib cell $lc, and still perform via ladder checks on other normal cells (see LGL-090).

LGL-479

(warning) Instance %s has infeasible bound constraint. Ignoring repelling group bound/ safety core group %s for this instance.

Description

This message indicate instance has move bound or voltage area constraint but there is no intersection area or intersection area is smaller then instance with repelling group bound or safety core group. This instance will ignore repelling group bound/safety core group and will honor move bound/voltage area.

What Next

Change instance's move bound/voltage area or change repelling group bound/safety core group constraint which can be intersect and intersect area is bigger then instance's size.

LGL-480

(Warning) Detected lib cells with no implant layer shapes. Please check the lib cells to see if need to use virtual implant. If user want to use virtual implant, please enable related app options. (place.legalize.use_virtual_implant_layer and set up place.legalize.virtual_implant_layer_min_width)

Description

This Lib cell doesn't have implant. Please check the lib cell to see if need to use virtual implant.

What Next

Check the libcell to see if need to use virtual implant.

LGL-481

(Warning) Detected lib cells: %s (layer %s) with colorless pins/shapes.

Description

This Lib cell has colorless pins/shapes but it also has colored pins/shapes. Please use place.legalize.enable_check_uncolored_shapes_in_libcell to check this.

What Next

Check the mask attribute of the colorless pins/shapes.

Feedback

LGL-482

(Warning) User enabled place.legalize.enable_gui_drc_error_status_support. It will be on by default in future release.

Description

place.legalize.enable_gui_drc_error_status_support enables DRC violation marked as error in GUI error browser.

What Next

App option "place.legalize.enable_gui_drc_error_status_support" will be on by default

LIB

LIB-001

(error) Current library is not defined.

Description

The current library is not defined. Some commands require that the current library is set.

What Next

You must open or create a library and set current library with the current_lib command

LIB-002

(error) Empty reference library path.

Description

A reference library path was blank or an empty string.

What Next

Check that the given reference library path has a value that can be found on the search_path.

LIB-003

(error) Reference library name %s in library path %s has the same name as path %s.

Feedback

Description

The library name is the last part of each reference library path. Each reference library path in a reference library list must have a unique library name.

What Next

Check the list of reference library paths for libraries that end in the same name. Each library name must be unique. Libraries ending in the same name must be renamed. Once the library with the duplicate name has been renamed, the library may be added to the reference library path list.

LIB-004

(error) Cannot find reference library path %s.

Description

The reference library given in the -before or -remove argument cannot be found in this library's reference library path list.

What Next

Check the ref_libs in the library with the get_attribute command or the report_ref_libs command. Use either the library name (the last part of the path), the reference library path, or the full path name to that library for the set_ref_libs command's -before or -remove argument.

LIB-005

(error) Library name cannot contain ":", "|", or white spaces.

Description

The ':' and '|' character is used to delimit library and design names. It cannot be used for library name.

LIB-006

(error) Library '%s' already exists

Description

This error message occurs because a library of the specified name already exists.

Feedback

What Next

Use another name for the new library or remove the library from the file system and rerun the command.

LIB-007

(error) Cannot load technology file '%s'.

Description

The specified technology file cannot be loaded.

When using read_tech_file xxx.tf -merge 1) If the merge tech option is opened but current tech is none, we can not load technology file. 2) If merged tech file (xxx.tf) is invalid, we can not load tech file.

What Next

Make sure the path points to a valid technology file.

LIB-008

(Error) %s failed. Library '%s' is modified.

Description

The specified operation failed because the library contains modified and un-saved data.

What Next

Try again with the -force option.

LIB-009

(error) Library directory '%s' already exists

Description

A library directory with the specified name already exists.

What Next

Use another name for the new library or remove the library from the file system and rerun the command.

Feedback

LIB-010

(error) Library name is blank or empty.

Description

A library name was blank or an empty string.

What Next

Check that the given library name is valid simple path.

LIB-011

(error) Library '%s' is not found.

Description

The specified library is not found on the current search_path.

What Next

Check that the given library name has a valid value that can be found on the search_path.

LIB-012

(error) %s failed. Library '%s' is in read mode.

Description

The specified operation failed because the library is open in read mode.

What Next

open the library again in edit mode and try again.

LIB-013

(error) %s failed because the library cell library '%s' cannot be modified.

Description

The specified operation failed because the library is a library cell library. Library cell libraries are read-only in icc2_shell. They can be modified only in the library manager shell, lm_shell.

What Next

Use the library manager shell to make changes to this library.

Feedback

LIB-014

(Information) Re-setting technology section of library '%s' with '%s'.

Description

The technology section of the specified library is being replaced.

LIB-015

(Information) Adding design '%s' to library '%s'.

Description

The specified design.view is being added the the library.

LIB-016

(Information) Removing design '%s' from library '%s'.

Description

The specified design.view is being removed the the library.

LIB-017

(Information) Incrementing open_count of library '%s' to %d.

Description

The library is already in memory. Each open_lib command on a library will increase a library's open_count by one.

LIB-018

(Information) Decrementing open_count of library '%s' to %d.

Description

The library is still in memory. Each close_lib command will decrease a library's open_count by one. The library is removed from memory when its open_count drops to zero.

LIB-019

(Error) rebuild_lib cannot be used on single-file format library.

Feedback

Description

rebuild_lib can only be used on directory-format library to rebuild a library's design catalog based on the directory contents.

What Next

Make sure the library is in directory format and try again.

LIB-020

(Error) Technology replacement failed. Technology is incompatible.

Description

The technology data must be compatible with the existing technology data in the library.

What Next

Make sure the replacement technology data is compatible.

LIB-021

(Error) Cannot copy library to self.

Description

The source and destination library are the same. Copying a library to itself is not allowed.

What Next

Try a different destination library name.

LIB-022

(Error) Cannot move library to self.

Description

The source and destination library are the same. Moving a library to itself is not allowed.

What Next

Try a different destination library name.

LIB-023

(Warning) Library '%s' is being opened in read mode because it is a library cell library.

Feedback

Description

Library cell libraries are read-only in icc2_shell. They can be modified only in the library manager shell, lm_shell.

What Next

Use the library manager shell to make changes to this library.

LIB-024

(Error) %s failed. Library '%s' is modified.

Description

The specified operation failed because the library contains modified and un-saved data.

What Next

Try again with the -force option.

LIB-025

(Error) technology library '%s' is invalid.

Description

A technology library must be a valid library and it must have a technology section.

What Next

Try again with a library with a valid technology section and that is accessible through the current search_path setting.

LIB-026

(error) Reference library path '%s' is the same as the library.

Description

The reference library path cannot point to the library itself.

What Next

Make sure the reference library path is not the same as the library path and try again.

LIB-027

(error) Reference library path '%s' is not a valid library

Feedback

Description

The reference library path does not point to a valid library given the current search_path setting.

In case that physical source files were provided to automatically create reference libraries, a technology file must also be specified. If no technology file specified, then the tool will treat all files provided as full NDM reference libraries, thus report this message.

What Next

Check that the given reference library path has a value that can be found on the search_path. If auto reference libraries creation is desired, then please also provide a technology file.

LIB-028

(Error) rebuild_lib cannot be used on library that hasn't been saved to disk.

Description

rebuild_lib can only be used on directory-format library to rebuild a library's design catalog based on the on-disk directory contents.

What Next

If you haven't saved the library to disk, you don't need rebuild_lib.

LIB-029

(Error) Library already has a technology section.

Description

read_tech_file cannot be used to replace the technology section of a library. It will fail if a library already has or associates with a technology section.

What Next

Make sure the library does not already contain a technology section.

LIB-030

(Error) Library '%s' has no technology information.

Description

The library does not have a technology section. copy or move a designs into this library will fail.

Feedback

What Next

Check that the library contains a technology section. Use read_tech_file to create a technology section.

LIB-031

(Error) Library '%s' and '%s' contain incompatible technology information.

Description

The specified libraries contain incompatible technology sections. copy or move designs between these two libraries will fail.

What Next

Check that the two libraries contains compatible technology sections.

LIB-032

(information) Overwriting library '%s'.

Description

The library is being overwritten. It will be removed from the ref_lib list of all currently opened libraries that reference it, and be replaced with a new library.

What Next

Showing the library name to help understand when a library is being overwritten.

LIB-033

(Information) Promoting open_mode of library '%s' from read to edit.

Description

The library is already open in read mode. Subsequent open_lib -edit will promote the library open_mode from read to edit.

LIB-034

(error) Cannot write out technology file '%s'.

Description

The specified library cannot write out technology file.

Feedback

What Next

Make sure the specified library was valid.

LIB-035

(warning) Library '%s' is not being saved because it is in read mode.

Description

The specified library is not saved during save_lib -all because it is open in read mode.

What Next

open this library in edit mode and try again.

```
prompt> open_lib <lib_name> -edit
```

LIB-036

(error) Library '%s' is referenced by another library '%s'.

Description

A library cannot be closed or removed if it is on another library's reference library list. The higher-level library that references it must be closed first.

What Next

Remove the library that references this library first, and then remove this library. Or force the library to be purged from memory with the *-purge* option.

```
prompt> close_lib -force ...
```

LIB-037

(information) Replacing %s file '%s' with '%s'

Description

This informational message shows the full path name and type of a file being read into the application, replacing an existing one.

What Next

Use the full path name to help understand any problems encountered while reading the file.

Feedback

LIB-038

(error) Cannot open %s library '%s' as reference library.

Description

Physical libraries can be generated from Library Manager frame flow or Library Compiler create_physical_lib. In order to use such libraries as reference libraries with physical data only, the libraries must be prepared using Library Manager “create_workspace -flow physical_only” or Library Compiler “create/compile_fusion_lib -frame” commands. Direct usage will no longer be supported starting in T-2022.03-SP3 release.

LIB-039

(error) Cannot open logical library '%s' in '%s' flow.

Description

You can save a library from the library manager shell (lm_shell) prior to checking the workspace using *save_lib*. If the source of the library was a DB or .lib file, this is considered a logical source library. These libraries can be reloaded into the library manager at a later time, but they cannot into a workspace in any of these flows: *edit*, *physical_only* or *organize_by_pvt*.

LIB-041

(error) Cannot open %s library '%s' outside of a workspace.

Description

Only complete NDM files can be opened outside of a workspace, and they will be read-only. Other NDM file types (such as frame files) cannot be opened outside of the workspace.

What Next

If you are trying to change a frame NDM, create a workspace with the frame flow, and load the ndm file using *read_ndm*.

LIB-042

(warning) Library '%s' cannot be added to the aggregate library.

Feedback

Description

Design libraries or aggregate libraries cannot be added to an aggregate library. Only libraries which were written by the library manager, lm_shell, using *commit_workspace*, using a flow other than the *aggregate* flow, can be added to an aggregate.

LIB-043

(information) Library '%s' has been added to the aggregate library.

Description

This is an informational message that you will see in the library manager shell, using the aggregate flow, indicating that a lib-cell library has been added to the aggregate library, usually after using *open_lib*.

LIB-044

(information) Library '%s' has been removed from the aggregate library.

Description

This is an informational message that you will see in the library manager shell, using the aggregate flow, indicating that a lib-cell library has been removed from the aggregate library, usually after using *close_lib*.

LIB-045

(error) Can not save %s library '%s'.

Description

This message is reported when you try to save a workspace library or uncommitted logic library in Library Manager.

What Next

Can not save workspace library or uncommitted logic library.

LIB-046

(error) Library '%s' cannot be used for the the edit flow

Feedback

Description

When creating a workspace in the library manager shell (lm_shell) with the edit flow, only a library previously committed by lm_shell can be specified. Design libraries, aggregate libraries, or libraries saved from the lm_shell with *save_lib* cannot be used in this context.

LIB-047

(warning) library '%s' is already in the aggregate library.

Description

This lib-cell library was already in the aggregate library. It cannot be added to the aggregate library multiple times.

LIB-048

(Information) Technology file was not replaced. '%s' is identical to the current technology file.

Description

This informational message tells that technology file was not replaced. The replacement technology file contains identical content as the current technology file.

LIB-049

(error) Block '%s' is open. Technology file cannot be replaced while blocks are opened in the library.

Description

It is an error to replace the technology section in a library in which there are open blocks. As technology file replacement could clobber in-memory design data. All blocks must be closed during technology file replacement.

What Next

close all opened block and try again

LIB-050

(error) Library '%s' is also bound to this tech section. Technology file cannot be replaced if the tech section is bound to more than one library.

Feedback

Description

It is an error to replace the technology section in a library if the technology section are referenced by other libraries in memory, as technology file replacement could clobber in-memory library data. All other libraries that reference this technology section must be closed during technology file replacement.

What Next

close the other libraries and try again.

LIB-051

(error) Version '%s' is not supported. Use report_versions to list available versions.

Description

The specified version is not supported. save_lib can only save to specific release versions. Please use report_versions to list the versions available.

What Next

Try again with a valid release version.

LIB-052

(error) Cannot close a member library of an aggregate library.

Description

This message indicates that you tried to close a member library of an aggregate library but the closing of a member library was not allowed. When an aggregate library is opened, all member libraries of the aggregate library are also opened automatically and will be closed when the aggregate library is closed. If a member library is specifically closed using the close_lib or remove_lib command, the member library will be removed from the containing aggregate library. However, the removal of a member library from an aggregate library can only be done in the aggregate flow in the library manager shell.

LIB-053

(error) Specified length precision '%d' does not match that of already opened libraries '%d'.

Description

This message indicates that you specified the length precision for the new library in create_lib command using "-scale_factor" option. However, libraries with a different length precision are already open. This is not allowed. All libraries open at the same time must

have the same length precision. Similarly, the length precision of any reference libraries used for create_lib, must be identical to the length precision for the new library.

What Next

Here are a few options, 1) Provide the correct length precision or remove the option, in which case length precision will be inherited from previously opened libraries. 2) If the libraries already open are not needed, please close them and rerun the command.

LIB-054

(error) Specified length precision '%d' is not valid.

Description

The specified length precision is not a valid value.

What Next

The valid values for length precision are 100, 200, 1000, 2000, 4000, 10000 and 20000

LIB-055

(error) Length precision '%u' in the input file is not compatible with the length precision '%u' used in the current library.

Description

The input file (DEF, LEF or GDS) cannot be read in as it will result in data being lost when converting length numbers from the file to the internal data in the library.

What Next

Please choose a different input file which has a length precision that can be used to translate the numbers without loss of data.

LIB-056

(error) Length precision '%d' specified for output file is not compatible with the length precision '%d' used in the current library.

Description

The file (DEF, LEF or GDS) cannot be written out with the specified length precision, as it will result in data being lost when converting length numbers from internal data in the library for output.

Feedback

What Next

Please specify a compatible length precision, which can preserve all data.

LIB-057

(error) The length precision of the library being opened '%s' does not match that of already opened libraries '%d'.

Description

This message indicates that the library being opened has a scale factor different from libraries previously opened. This can happen for a library being opened explicitly, using *open_lib*, or implicitly if it is being set as a reference library for a main library using either *create_lib* or *set_ref_libs* commands. This is not allowed. All libraries opened at the same time must have the same length precision. All reference libraries must have the same length precision as the main library.

What Next

Here are a few options, 1) If the library is used as a reference library, remove it from the list of specified reference libraries. 2) Choose reference libraries with the correct scale factor. 3) Close previously opened libraries if they are no longer needed.

LIB-058

(warning) Length precision '%d' specified for output file can result in loss of data because it is less than the precision used in the library '%d'.

Description

The file (DEF, LEF or GDS) should not be written out with the specified length precision, as it will result in data being lost when converting length numbers from internal data in the library for output.

What Next

Please specify a compatible length precision, which can preserve all data.

LIB-059

(Error) technology library '%s' does not match any library on the reference library list.

Feedback

Description

The technology library must be specified either as a simple path that matches the tail portion of an reference library entry or as a relative or absolute path that exactly match an entry on the reference library list.

What Next

Add a matching entry of the technology library on the reference library list.

Examples

create_lib -use_technology_lib technology_lib.nlib -ref_libs { technology_lib.nlib }

create_lib -use_technology_lib ../nlibs/technology_lib.nlib -ref_libs { ../nlibs/technology_lib.nlib }

create_lib -use_technology_lib technology_lib.nlib -ref_libs { ../nlibs/technology_lib.nlib }

LIB-060

(error) Version '%s' is not supported. Supported version range must be within %s and %s.

Description

The specified version is either not in the supported format, or outside the supported range. Schema version must be specified in <major>.<minor> format and between the last compatible schema version and the current schema version.

What Next

Try again with a valid schema version format within the allowable range.

LIB-061

(information) Version '%s' is truncated to '%s'.

Description

The input version cannot be found, to truncate the input version string to the character '-' from the last one to the first. The truncation will stop when the rest string is legal or without '-' in the rest.

What Next

To input legal version. User can get legal versions by report_version.

Feedback

LIB-062

(error) The length precision of the library being opened '%s' does not allow its data to be scaled correctly.

Description

This message indicates that the library being opened has a scale factor that cannot be correctly scaled for the *design.session_scale_factor*. This can happen for a library being opened explicitly, using *open_lib*, or implicitly if it is being set as a reference library for a main library using either *create_lib* or *set_ref_libs* commands. This is not allowed. The *design.session_scale_factor* must be a multiple of the length precision of the library being opened.

What Next

Here are a few options, 1) Set *design.session_scale_factor* to a different value which is a multiple of length precision of all libraries needed. Please note if *design.session_scale_factor* is changed, all open libraries must be closed and reopened. 2) If the library is used as a reference library, remove it from the list of specified reference libraries. 3) Choose reference libraries with the correct scale factor. 4) Close previously opened libraries if they are no longer needed.

LIB-063

(info) The library must be saved, closed and reopened for any change in value of half_node_scale_factor attribute to take effect.

Description

The library must be saved, closed and reopened for any change in value of *half_node_scale_factor* attribute to take effect. Further, the attibute *half_node_scale_factor* can only be set when no designs from the library are open.

What Next

Please close all designs from this library before changing *half_node_scale_factor*. After changing the attribute, save, close and reopen the library to continue.

LIB-064

(error) Specified scale factor '%d' is not compatible with the session scale factor '%d'.

Description

This message indicates that the specified the scale factor is not compatible with the session scale factor. Scale factor is also known as length precision. The session scale

factor is specified using the app option *design.session_scale_factor*. The session scale factor must be a mutliple of the scale factor for the library.

What Next

Please specify a scale factor so that the session scale factor is a multiple of that.

LIB-065

(error) Required argument '%s' was not found.

Description

This message indicates that the *-scale_factor* argument must be specified due to the app options being used. If either of *design.allow_multiple_scale_factors* or *design.is_3dic_mode* app options are set to true and *design.session_scale_factor* is also set, the *-scale_factor* must be specified when running *create_lib*.

What Next

Please specify the -scale_factor argument

LIB-066

(error) Specified scale factor '%d' does not match the session scale factor '%d'.

Description

For converting libraries from one scale factor to another, the session scale factor is the library scale factor. A different scale factor is not allowed. The session scale factor is specified using the app option *design.session_scale_factor*.

What Next

Please specify a scale factor so that it is same as the session scale factor or remove the argument from the command.

LIB-067

(warning) Length precision '%d' specified in the input file can result in loss of data because it is more than the precision used in the library '%d'.

Description

The file (DEF) being read in has distance data in length precision higher than the design library. It can potentially result in data being lost when converting length numbers to internal data in the library during read.

Feedback

What Next

Please use a library with appropriate scale factor to avoid data loss.

LIB-068

(error) Cannot open library '%s' because it has potential risk of precision loss.

Description

Physical library created with potential risk of precision loss is not allowed to be opened and used. The physical lib could be created with smaller scale factor than its tech file's length precision.

What Next

Regenerate the physical library and make sure its scale factor is equal or larger than its tech file's length precision.

LIB-068w

(Warning) The library '%s' opened has potential risk of precision loss.

Description

Physical library created with potential risk of precision loss is not allowed to be opened and used, unless lib.setting.allow_ref_lib_with_lossy_scale_factor has been turned on. The physical lib could be created with smaller scale factor than its tech file's length precision.

What Next

Regenerate the physical library and make sure its scale factor is equal or larger than its tech file's length precision.

LIB-069

(Warning) The physical library '%s' is being created with potential risk of precision loss.

Description

The physical lib is being created with smaller scale factor than its tech file's length precision, which could lead to precision loss.

What Next

Regenerate the physical library and make sure its scale factor is equal or larger than its tech file's length precision.

Feedback

LIB-070

(error) No such PVT configuration rule '%s'

Description

The rule you specified to *set_pvt_configuration -rule* does not exist. When this error occurs, for convenience, the application will show the current configuration.

What Next

Check for spelling errors and re-enter the command to change the current rule and apply changes to it.

LIB-071

(information) %s PVT configuration rule '%s'

Description

This is an informational message indicating that the *set_pvt_configuration* command either created a new rule or deleted an existing rule because you removed all constraints from it.

LIB-072

(error) No panes in lib '%s' matched your PVT configuration

Description

You created a PVT configuration using *set_pvt_configuration*. Now, when opening a reference library with *open_lib*, the information from the configuration is used to determine which logical panes of data are active. Your configuration has deactivated all of the panes from this library, effectively rendering the library useless to timing, power, and optimization. The library fails to open.

What Next

It's possible that you loaded a library that simply does not have any desirable PVTs. If this message is unexpected, consult the configuration (using *set_pvt_configuration* with no arguments) and determine why all of the panes were filtered out. Then adjust the configuration rules accordingly to enable the desired PVTs.

LIB-073

(warning) PVT configuration changes are not applied to open libs

Feedback

Description

You made a change to the PVT configuration using *set_pvt_configuration* and there were one or more reference libraries already open. The PVT configuration is only applied at the time the reference library is opened with *open_lib*. Incremental changes to libraries already opened is not possible.

What Next

If you wanted to change the available PVTs for the libraries that are already open, you need to first close these libraries, then reopen them after the configuration has been updated.

LIB-074

(error) Cannot create PVT configuration rule named '%s': %s

Description

The name you specified to *set_pvt_configuration -name* is invalid. The message will say why. Typically, the name you supplied is already in use as a rule name, or it is empty or all whitespace.

What Next

Check for spelling errors and re-enter the command to create the rule.

LIB-075

(warning) Library '%s' has no reference Libraries.

Description

The Libaries has no reference Libraries.

What Next

The reference library list can be set using set_ref_lib command.

LIB-080

(warning) Cannot find .frame/LEF/Milkyway input, the auto reference library creation will be disabled.

Description

When link_library is specified, those db files should either 1) be covered by full NDM reference libraries, or 2) there should have .frame/LEF/Milkyway physical library view

specified, so that auto reference library can be created. This message indicates that no physical library view can be found, so that the auto reference library creation will be disabled.

What Next

To create reference library automatically, please provide physical library views corresponding to the link_library.

LIB-081

(warning) No db files from link_library to create reference libraries, will create a physical-only reference library.

Description

For automatic reference library creation, the logical data comes from the db files specified in link_library setting. If full NDM reference libraries also specified, then those db files already in the full NDM reference libraries will be excluded from auto reference library creation.

This message indicates that either no db files specified in link_library, or all db files specified in link_library are already contained in full NDM reference libraries. In that case, no db files will be used for auto reference library creation, thus a physical-only reference library will be created.

What Next

If creating physical-only reference library is not desired, please provide necessary db files in link_library setting.

LIB-082

(error) Failed to create reference library %s, please check log file %s for detailed error.

Description

This message indicates that the reported reference library was not created successfully from auto reference library creation.

What Next

Please refer to the error message printed prviously, or indicated log file for detailed error information.

Feedback

LIB-083

(warning) There are %d %s not used for creating cell libraries: %s.

Description

This message reports a list of files that provided but not used for cell libraray creation. This could be caused by not reading the files successfully. For db files, it could be caused by no corresponding physical data.

What Next

Please check messages printed previously, or the log files under the log directory to know the detailed information.

LIB-084

(information) Auto created reference libraries are up-to-date, no need to rebuild.

Description

This message indicates that all automatically created reference libraries are up-to-date. There is no need to rebuild them.

What Next

This is an informational message, no action required.

LIB-085

(information) Need to rebuild auto created reference library: %s.

Description

This message indicates that automatically created reference libraries need to be rebuilt. The reason was given along with the message itself.

What Next

This is an informational message, no action required.

LIB-086

(information) Rebuild of auto created reference libraries succeeded.

Feedback

Description

This message indicates that rebuild of the automatically created reference libraries succeeded.

What Next

This is an informational message, no action required.

LIB-087

(warning) Skip the rebuild of the auto created reference libraries: %s.

Description

This message indicates that the auto created reference libraries need to be rebuild. However, some pre-conditions cannot be met so the rebuild was skipped. Most likely, the source files for rebuild the auto created reference libraries cannot be found.

What Next

To rebuild the auto created reference libraries, please make sure that all source files for building them can be found using search_path.

LIB-088

(error) Failed to rebuild the auto created reference libraries.

Description

This message indicates that the rebuild of the auto created reference libraries failed.

What Next

Please refer to the previously reported error messages for detailed information.

LIB-089

(error) %s '%s' is not valid: %s.

Description

This message indicates that the specified file is not valid. The reason is reported with the message itself.

LIB-090

(error) %s '%s' must be specified: %s.

Feedback

Description

This message indicates that required option must be specified. The reason was reported alone with the message itself.

LIB-091

(error) Failed to convert Milkyway libraries to frame view.

Description

This message indicates that convert Milkyway libraries to frame view failed.

What Next

Please refer to previously reported error messages for detailed information.

LIB-092

(error) Failed to create %d (total %d) reference libraries, please check log file '%s' for detailed error.

Description

This message indicates that auto reference libraries creation failed. There are some reference libraries not created successfully.

What Next

Check the reported log file for detailed errors.

LIB-093

(information) Successfully built %d reference libraries: %s.

Description

This message indicates that auto reference library creation was succeeded.

What Next

This is an informational message. No action required.

LIB-094

(information) Successfully converted %d Milkyway libraries: %s.

Feedback

Description

This message indicates that the Milkyway library to frame conversion was succeeded.

What Next

This is an informational message. No action required.

LIB-095

(error) Failed to create frame library %s, please check log file '%s' for detailed error.

Description

This message indicates that the reported frame library was not created successfully from corresponding Milkyway library.

What Next

Please refer to the error message printed prviously for detailed error information.

LIB-096

(error) Cannot launch %s to %s.

Description

This message indicates that launching a specific executable for a specific job failed.

What Next

If the executable is IC Compiler shell, please make sure it is a valid executable.

LIB-097

(information) db files specified in link_library already covered by full NDM reference libraries, the auto reference library creation will be disabled.

Description

When link_library is specified, those db files should either 1) be covered by full NDM reference libraries, or 2) there should have .frame/LEF/Milkyway physical library view specified, so that auto reference library can be created. This message indicates that db files already covered by full NDM reference libraries, so that the auto reference library creation will be disabled. The full NDM reference libraries specified will be used directly.

What Next

This is an informational message, no action is required.

Feedback

LIB-098

(information) Use existing reference libraries.

Description

There should be an attempt to rebuild the auto reference libraries and the attemp was failed. This message indicates that existing reference libraries will be used.

LIB-099

(warning) Override the previous label mapping, now db '%s' attaches to %s label '%s'.

Description

This message occurred when users attached the same db name with 2 or more different labels by setting app option lib.configuration.process_label_mapping. For example: When users set the process label mapping with the below command: set_app_options -name lib.configuration.process_label_mapping -value {{label1 {tcbn90ghplt_ccs.db}} {label2 {tcbn90ghplt_ccs.db}}}

The LIB-099 warning message will be displayed as below: Warning: Override the previous label mapping, now db 'tcbn90ghplt_ccs.db' attaches to process label 'label1'.(LIB-099)

What Next

Please correct the issue of the app option(lib.configuration.process_label_mapping) setting, and then set the app option with the corrected setting.

LIB-100

(warning) link_library does not cover all db files of the library '%s'.

Description

This message is reported when lib.configuration.force_update_timing_views app option is set to true. It indicates that the db files specified in the link_library app var does not cover all db files of a source library. So, one or more db files in the source library will missing in the generated cell library.

What Next

Please verify that the missing of db files is expected.

LIB-101

(error) Prebuilt library '%s' cannot be in the output directory '%s'.

Feedback

Description

This message is issued when the *lib.configuration.force_update_timing_views* application option is set to *true* and the reported prebuilt library is in the output directory specified with *lib.configuration.local_output_dir* application option.

What Next

Put the prebuilt library into another directory, or specify a different output directory with the *lib.configuration.local_output_dir* application option.

LIB-102

(error) Physical source file '%s' cannot be associated with two assembly scripts: '%s' and '%s'.

Description

This message indicates that the value specified for *lib.configuration.assembly_scripts* application option is not valid. The reported physical source file is associated with more than one assembly script. This is not allowed as the tool will not able to determine which assembly script should be used to assembly the data.

What Next

Revise the app option value to make sure every physical source file only be associated with one assembly script.

LIB-103

(error) Application option '%s' has an invalid value.

Description

This message indicates that the specified application option has an invalid value.

What Next

Provided a correct value for the application option.

LIB-104

(error) Cannot determine assembly script: physical source file '%s' associated with assembly script '%s', physical source file '%s' associated with assembly script '%s'.

Feedback

Description

This message indicates that two physical source files of one lib have different assembly scripts. In this case, tool cannot determine which assembly script to use.

What Next

Revise the lib.configuration.assembly_scripts application option to have correct mapping between assembly scripts and physical source files.

LIB-105

(error) Failed to group source data, please check log file %s for detailed error.

Description

This message indicates that the tool failed to group the source data, .db files from link_library and physical files from -ref_libs option, into groups that for reference libraries creation.

What Next

Please refer to the indicated log file for detailed error information.

LIB-106

(warning) %s will not be persistent because '%s' is a library cell library, so the setting will be lost when the session ends.

Description

The specified operation will apply in this session only because the library is a library cell library. Library cell libraries are read-only in icc2_shell. They can be modified only in the library manager shell, lm_shell. To have the setting persist without using the library manager shell, you can make the setting in a script that is called at each new session.

What Next

Use the library manager shell to make permanent changes to this library. To have the setting persist without using the library manager shell, you can make the setting in a script that is called at each new session.

LIB-107

(warning) Found duplicated db file '%s' in the link_library. The duplicated one will be ignored.

Feedback

Description

The reported db file is duplicated specified in the link_library. Only the first one will be used. All duplicates will be ignored.

What Next

Remove the duplicated db files in the link_library.

LIB-108

(information) Can reuse library %s, skip %s.

Description

This message indicates that specified library is up-to-date. The specified action can be skipped.

What Next

This is an informational message, no action required.

LIB-109

(information) Cannot reuse library %s: %s.

Description

This message indicates that specified library cannot be reused for current operation. The reason is given in the message.

What Next

This is an informational message, no action required.

LIB-110

(error) No opened physical library to save.

Description

There is no opened physical library in memory, so no library for this command to save.

What Next

Check if you need to create or open a library before save it to disk.

Feedback

LIB-111

(Error) Technology data in %s and currrent physical library's technology data is not compatible

Description

Technology data in the library which is reading and current physical library's technology data must be compatible, otherwise *read_ndm* will fail.

What Next

Try another library with compatible technology data.

LIB-112

(warning) Current physical library's technology data replaced by the technology data from '%s'

Description

read_ndm will replace the current physical library's technology data with technology data from the library which is reading. The replacement occurs when the two technology data are compatible.

LIB-113

(error) Cannot open or create multiple libraries, library '%s' has already been opened.

Description

Only one physical library is allowed to be opened or created at the same time. You can only create or open another physical library after closing current library.

What Next

Close the current the library, and then create or open the new library.

LIB-114

(error) Cannot open a none library cell library '%s'.

Description

Only library cell library is allowed to be opened with this command. You will see this error if you are trying to open a none library cell library with this command, such as design library.

Feedback

What Next

Open a library cell library instead.

LIB-115

(warning) Set app option '%s' has no effect when app option '%s' is %s.

Description

Set first app option has no effect when the second app option has specified value.

What Next

Make sure the second app option has a proper value, then set the first app option again.

LIB-116

(warning) Ignore the application option '%s': %s.

Description

The reported application option will be ignored for the given reason.

What Next

Refer to the man page of the corresponding application option and make sure it has a proper value.

LIB-117

(warning) Library configuration will not be performed: %s.

Description

This warning message indicates that the library configuration will not be performed. The possible reason is that technology file is not specified.

This message will only be reported when link_library application variable is specified.

What Next

Make sure technology file is specified if need to invoke library configuration.

LIB-118

(error) Reference library path '%s' will introduce cyclic reference libraries on the library.

Feedback

Description

The reference library path should not introduce cyclic reference libraries as it will lead to opening a library infinite times. Cyclic reference libraries structure: library 'MID' is reference library to library 'TOP' and again library 'TOP' is reference library ot library 'MID'.

What Next

Make sure the reference library path doesn't create any cyclic reference libraries. To make sure no cyclic reference libraries are formed, add the reference libraries bottom-up (BOT->MID->TOP) approach.

LIB-119

(error) Invalid value '%s' specified for application option '%s': %s.

Description

This message indicates that the specified application option has an invalid value.

What Next

Provided a correct value for the application option.

LIB-120

(error) Invalid value '%s' specified for command option '%s': %s.

Description

This message indicates that the specified command option has an invalid value.

What Next

Provided a correct value for the command option.

LIB-121

(error) Current working directory is not writable.

Description

The command being executed need a writable current working directory.

What Next

Change current working directory to a writable directory and try again.

Feedback

LIB-122

(information) There are missing or invalid reference libraries. Will try to rebuild.

Description

This message indicates that some or all reference libraries of the library to be opened is missing or invalid. It will try to rebuild reference libraries.

What Next

This is an informational message, no action required.

LIB-123

(warning) Local output directory '%s' containing cell libraries that are used by following processes: %s. Cannot remove it now. Please remove it manually when those processes exit.

Description

This warning message will reported when *lib.configuration.remove_local_output_dir* application option is true, but it cannot remove the local output directory because there are other processes are using the cell libraries in it.

What Next

Check the processes reported in the message. When they all exit, remove the local output directory manually.

LIB-124

(warning) Cannot use '%s' as local output directory. Library configuration skipped.

Description

This warning message indicates that the value of *lib.configuration.local_output_dir* application option is not valid, and the library configuration will be skipped. Usually, this means the directory is a volatile cache of another process.

What Next

Set *lib.configuration.local_output_dir* to another proper directory and try again.

LIB-125

(error) Attribute '%s' cannot be imported: You defined it as %s; db defines it as '%s'.

Feedback

Description

You receive this error message because while reading an attribute from db, there was a mismatch between the type (integer, string, etc.) that db defines for the attribute and the type that PrimeTime defines for the attribute. Usually, this is a user-defined attribute, defined with the *-import* option on *define_user_attribute*, and the types do not match.

What Next

Rerun PrimeTime and define the attribute correctly. You might need to use other Synopsys applications to determine the actual type of the attribute.

LIB-126

(information) Cannot use '%s' as local output directory. Library configuration skipped.

Description

This message indicates that the tool cannot use the specified directory as the local output directory, and the library configuration will be skipped. Usually, this means the directory is already a volatile cache of another process.

What Next

This is an informational message and no action required.

LIB-127

(Information) Find %s '%s' from %s.

Description

This message indicates where a specific executable was found.

LIB-128

(error) Cannot find %s '%s' from %s: %s.

Description

This message indicates that a specific executable cannot be found from the reported location.

What Next

Check whether the related environment variable is correct.

Feedback

LIB-129

(error) Library configuration skipped, since "%s" are different between master and current session.

Description

This message indicates that current session changed link_library or physical libraries while the shared volatile cache directory is using by the other ICC2 sessions.

What Next

Run the library configuration flow again while there is no other session using the volatile cache directory.

LIB-130

(information) Library configuration is pending, the master session is running library configuration with the same configuration as the current session.

Description

This message indicates that the current session has the same link_library and physical libraries' setting as the master session which is running library configuration to build the reference libs in the shared volatile cache directory.

What Next

This is an informational message and no action required.

LIB-131

(warning) Library '%s' is not in the reference library list of current_lib '%s'.

Description

The desired library must be a reference library of current_lib.

What Next

Either use current_lib switch to the design library which has desired library as reference library, or add the desired library to the current lib's reference library list.

LIB-132

(warning) None of panes in lib '%s' matched the specification.

Feedback

Description

The *get/set_lib_timing*, *get/set_lib_pin_capacitance*, *get/set_lib_max_cap_table*, *get/set_lib_max_trans_table* commands issue this error message when they cannot find a pane in the desired library that matched the voltage, temperature, process number, and process label data.

What Next

Either use *report_lib* to find out the exactly values of voltage, temperature, process number, and process label data, or simply delete the option -voltage/-number/-label/-temperature if you don't know the exactly values.

LIB-133

(warning) The objects do not have specified constraint table.

Description

The *get/set_lib_timing* commands issue this error message when they cannot find the desired constraint table.

What Next

Check the object with input options again. Use *get_lib_timing -table setup_hold */** to see if the desired table are there.

LIB-134

(error) The option -shift_value must be followed by a non-zero value.

Description

The *set_lib_timing* command issues this error message when giving zero to -shift_value.

What Next

Gives a non-zero value to -shift_value and run the command again.

LIB-135

(warning) The command only supports setting scalar, 1-D, and 2-D table.

Description

The *set_lib_timing* command issues this warning message when the object is the table that dimension greater than two. The table value will keep the same.

Feedback

What Next

Use *set_lib_timing* on the table which has dimension smaller or equal to two.

LIB-136

(error) The objects do not exist in reference libraries.

Description

The *get/set_lib_pin_capacitance*, *get/set_lib_max_cap_table*, *get/set_lib_max_trans_table* commands issue this error message when they cannot find the desired object in reference libraries.

What Next

Make sure the desired objects are in the reference libraries.

LIB-137

(warning) There is no %s table on this lib pin.

Description

The *get/set_lib_max_cap_table*, *get/set_lib_max_trans_table* commands issue this warning message when there is no max_cap/max_trans table on the specified library pin.

What Next

Make sure the specified library pin contains max_cap/max_trans table.

LIB-138

(warning) The desired table on the specified library pin is not a 1-d frequency based %s table.

Description

The *get/set_lib_max_cap_table*, *get/set_lib_max_trans_table* commands issue this warning message when the desired table on the specified library pin is not a 1-d frequency based max_cap/max_trans table. The *get/set_lib_max_cap_table*, *get/set_lib_max_trans_table* commands are only supporting get/set 1-d frequency based max_cap/max_trans table.

What Next

Make sure the desired table on the specified library pin is a 1-d frequency based max_cap/max_trans table.

Feedback

LIB-139

(error) When -index_1 option is specified, the -value option must be a single value.

Description

The *set_lib_max_cap_table* command issues this error message when specified -index_1 option but the argument for -value is not a single value. Using -index_1 only when you want to modify a value in max_cap table at certain index (frequency). You must to specify a single value for -value.

What Next

Give a single value for -value and run the command again.

LIB-140

(warning) Invalid -index_1 value '%f', only accepts existing table index

Description

The *set_lib_max_cap_table*, *set_lib_max_trans_table* commands issue this warning message when specified -index_1 option but none of that index_1 value is in the table index.

What Next

Use *get_lib_max_cap_table*, *get_lib_max_trans_table* to see all the index_1 values in the table.

LIB-141

(error) -value list size is '%lu', which is different to table width '%d'

Description

The *set_lib_max_cap_table*, *set_lib_max_trans_table* commands issue this error message when the given list of -value size is not equal to table width.

What Next

Use *get_lib_max_cap_table*, *get_lib_max_trans_table* to check the table size.

LIB-142

(information) There is no lib data change in the scope of current_lib: '%s'

Feedback

Description

The *report_lib_changes* command issues this informational message when there is no lib data change related to the reference libraries of current library.

What Next

This is an informational message and no action required.

LIB-143

(information) All lib data changes in the scope of current_lib are reverted back to original values.

Description

The *revert_lib_changes* command issues this informational message when it reverted all modified data within the scopt of current_lib back to original values successfully.

What Next

This is an informational message and no action required.

LIB-144

(information) Previous set lib data command attachment is now deleted

Description

This informational message means there was an attachment recording the operations of *set_lib_timing*, *set_lib_pin_capacitance*, *set_lib_max_cap_table* and/or *set_lib_max_trans_table*; and now the attachment has been deleted because you reverted all lib changes and saved it.

What Next

This is an informational message and no action required.

LIB-145

(information) Set lib data command(s) found, are saved into attachment.

Description

This informational message means there were operations of *set_lib_timing*, *set_lib_pin_capacitance*, *set_lib_max_cap_table* and/or *set_lib_max_trans_table* in the session. The operations were recorded and saved in an attachment. These operations will be reapply when you use *open_lib* to open the library again.

Feedback

What Next

This is an informational message and no action required.

LIB-146

(information) Reapplying previous lib data changes recorded in '%s'

Description

This informational message means there were operations of *set_lib_timing*, *set_lib_pin_capacitance*, *set_lib_max_cap_table* and/or *set_lib_max_trans_table* saved inside the design library, and these operations are re-applying.

What Next

This is an informational message and no action required.

LIB-147

(warning) The attachment recorded lib data change(s) failed to compile, so the previous lib data changes are not reapplied.

Description

This warning message is issued when there is an attachment recorded operations of *set_lib_pin_capacitance*, *set_lib_max_cap_table*, *set_lib_timing* and/or *set_lib_max_trans_table*, but the attachment can not be compiled successfully during *open_lib*, so that the previous lib data changes are not able to reapply. The reason could be 1. Too old Library Compiler version (require at least 19.12 version). 2. Attachment format is invalid.

What Next

Make sure your $SYNOPSYS_LC_ROOT is pointing to latest version Library Compiler. Make sure the attachment (lib.setLibDataCmd) format is valid Liberty format.

LIB-148

(warning) Library data change is applied, but not recorded.

Description

The commands *set_lib_pin_capacitance*, *set_lib_max_cap_table*, *set_lib_timing*, *set_lib_max_trans_table* issue this warning message when the settings are applied without recorded. *set_lib_pin_capacitance*, *set_lib_max_cap_table*, *set_lib_timing*, *set_lib_max_trans_table* operations will only be recorded in a design library.

Feedback

What Next

Use *current_lib* to see if current library is a design library.

LIB-149

(error) The input of option -index_1 is invalid. Please make sure the values in the list are monotonically increasing.

Description

The commands *set_lib_max_cap_table*, *set_lib_max_trans_table* issue this error message when option -index_1 is specified with a invalid list of values.

What Next

Make sure the values in the list are monotonically increasing.

LIB-150

(error) The length of the input of option -index_1 and -value should be the same.

Description

The commands *set_lib_max_cap_table* and *set_lib_max_trans_table* issue this error message when give the option -index_1 and the option -value two different length input lists.

What Next

Make sure the the input lists of the option -index_1 and -value have same length.

LIB-151

(information) Successfully configured DB+Frame reference library: %s.

Description

This message indicates that DB+Frame reference library-configuration succeeded.

What Next

This is an informational message. No action required.

LIB-152

(error) Cache-free library name must be a simple name, it cannot be absolute or relative path.

Feedback

Description

The '~' and '/' character are used in absolute and relative path. It cannot be used in name of cache-free library.

What Next

Specify a simple name for the cache-free library.

LIB-153

(warning) We do not recommend a mixture of library specific rules and non-library specific rules.

Description

A -library rule is added and there are non-library rules, or if a non -library rule is added and there are -library rules. For example: set_pvt_configuration -library "libA libB*" -temperatures 125 -voltages 1.05 set_pvt_configuration -add -temperatures -25 Such setting may lead all panes in a library being eliminated. For example: lib 1 name : rose pane0: voltage 1.1 pane1: voltage 1.8 pane2: voltage 2.0 lib 2 name : rose2 pane0: voltage 1.2 Pane1: voltage 2.0 lib 3 name : daisey pane0: voltage 1.3 pane1: voltage 1.5

For the below mix setting(not recommend), all the panes of rose2 should be filtered. set_pvt_configuration -lib rose -voltage 1.1 set_pvt_configuration -add -voltage 1.3 The setting is equal to the below setting: set_pvt_configuration -lib rose -voltage 1.1 set_pvt_configuration -add -lib * -voltage 1.3

What Next

Specify all rules with -library or without -library option For example: set_pvt_configuration -library "libA libB*" -temperatures 125 -voltages 1.05 set_pvt_configuration -add -library "moreLib" -temperatures -25 or set_pvt_configuration -temperatures 125 -voltages 1.05 set_pvt_configuration -add -temperatures -25

LIB-154

(warning) The library option must be a file name (it cannot be a path): change the path "%s" to "%s".

Description

The file name specified with the -library option must be file name only, i.e. it cannot contain any path. For example: For the following reference library: tcbn90ghplvtwc_ccs, 2 panes: Pane 0: process = "" (1), voltages: 0.9; temperatures: 125 Pane 1: process = "" (1), voltages: 1.1; temperatures: -40 Here is a correct setting with library option to set pvt for pane0: set_pvt_configuration -library tcbn90ghplvtwc_ccs -voltages 0.9

But if users set the library option as below(bad setting): set_pvt_configuration -library ./ref/tcbn90ghplvt_ccs.ndm -voltages 0.9 The tool will issue LIB-154 and try to fix the issue by changing the path name to file name. For example: Warning: The library option must be a file name (it cannot be a path): change the path "./ref/tcbn90ghplvt_ccs.ndm" to "tcbn90ghplvt_ccs". (LIB-154) Current PVT Configuration: rule_1: Process Labels : <All included> Process Numbers: <All included> Voltages : 0.9 Temperatures : <All included> Libraries : "tcbn90ghplvt_ccs"

What Next

Specify a file name instead of path name for the library option.

LIB-155

(error) Cannot merge reference library name '%s' from ref_lib list of library '%s' to ref_lib list of library '%s' because it may be overshadowed by reference library name '%s'.

Description

This message indicates that merging the ref_lib from the ref_lib list of a sub-library to it's parent during uncommit_block could cause an issue, because a ref_lib of the parent would be used for a lib-cell instead of the sub-library. present in the sub-library would change positions relative to a ref_lib present in both libraries.

For example: lib1 has ref_libs {A C}, and sub_lib2 has ref_libs {B C}, and both B and C have the a lib-cell with the same name but different versions. Merging the ref_libs from sub_lib2 into lib1 would cause the ref_libs to be {A C B}, which may cause issues with ref_lib C overshadowing the element of ref_lib B

What Next

Try to manually merge the ref_libs in such a way that avoids one ref_lib overshadowing another for your project.

LIB-156

(Error) parasitic tech library '%s' does not match any library on the reference library list.

Description

The parasitic tech library must be specified either as a simple path that matches the tail portion of an reference library entry or as a relative or absolute path that exactly match an entry on the reference library list.

What Next

Add a matching entry of the parasitic tech library on the reference library list.

Feedback

Examples

create_lib -use_parasitic_tech_lib parasitic_tech_lib.nlib -ref_libs { parasitic_tech_lib.nlib }

create_lib -use_technology_lib ../nlibs/parasitic_tech_lib.nlib -ref_libs { ../nlibs/parasitic_tech_lib.nlib }

LIB-157

(Error) parasitic tech library '%s' is invalid.

Description

A parasitic tech library must be a valid library and it must have a parasitic tech section.

What Next

Try again with a library with a valid parasitic tech section and that is accessible through the current search_path setting.

LIB-158

(error) %s library has dedicated parasitic tech library %s.

Description

Library with dedicated parasitic tech library can not create local parasitic. First remove dedicated parasitic tech library from reference library list.

What Next

Check "set_ref_libs" command to remove dedicated parasitic tech library from reference list

---

LIB-159

(error) Library '%s' is referenced by another library as parasitic tech lib.

Description

A parasitic techs can not be replaced if library is, another library's parasitic tech lib.

What Next

Remove library from another library's reference list or close another library.

Feedback

LIB-160

(error) Cannot write library '%s' which has timing data.

Description

The write_physical_lib command can only write physical library. The given library has timing data so cannot be written.

What Next

Use Library Manager to write library with timing data.

LIB-161

(warning) Open library in read only mode, only physical library can be opened in edit mode.

Description

This message indicates that the given library is not a physical only library, and the -read option was not specified to open it. Library Compiler does not support modify a library with logical information. So the library was opened in read only mode. You can query information from it. But please do not use write_physical_lib with it.

What Next

This is a warning message. No action needed.

LIB-162

(error) Mask constraints check on library '%s' failed.

Description

This message indicates that mask constraints check on reported library failed. There is either uncolored shapes on multi-pattern layers, or colored shapes on uni-pattern layers. As the *lib.setting.check_mask_constraints* is set to *strict*, the current command will error out.

If the reported library is a library cell library, then the check is performed on it directly. If the reported library is a design library, then the check is performed on all the reference libraries of it.

What Next

Either rebuild the reported library, or set *lib.setting.check_mask_constraints* to *loose* or *none*.

Feedback

LIB-163

(error) Mixture use of library configuration and fusion library not supported.

Description

This message indicates that there is fusion library specified for library configuration. This is not allowed.

What Next

Either use library configuration for all reference libraries, or create fusion libraries for all reference libraries. The mixture use of them are not supported.

LIB-164

(error) This library contains advanced technology not supported by this product. Please contact your Synopsys representative for more information.

Description

This library contains advanced technology not supported by this product.

What Next

Please contact your Synopsys representative for more information.

LIB-165

(error) Pane id %d is invalid for cell library '%s'.

Description

The pane id specified for the *-paneId* option is invalid. It is greater than the maximum pane id of the given cell library.

What Next

If the pane id was specified at the shell directly, please specify a valid pane id and try again. The maximum pane id can be got from the output of the *report_lib* command.

If *-paneId* option was not used for setting the lib data, then this error message must be reported during open a design library. It means the cell library had been changed since last time the lib data was set with the design library. There are fewer panes in the new cell library. And most likely, the change of the cell library, as the reference library of the design library, didn't through the *set_ref_libs* command. Please re-run the lib data setting with the design library to fix the error. After saving the design library again, it should have no this kind of error messages when open the design library next time.

Feedback

LIB-166

(error) Cannot find the default technology file.

Description

This message indicates that the default technology file cannot be found. The default technology file "default.tf" should be installed at <install_directory>/auxx/lc.

What Next

Check why the "default.tf" is missing from <install_directory>/auxx/lc.

LIBCHK

LIBCHK-001

(warning) Missing option %s when %s is specified.

Description

This message occurs when an option is specified but its associated option is missing. -optimization {power} requires -criteria {lvth_groups=lvt_name_list} to be associated with it. Since -all and -logic include -optimization {power}, when you specify -all or -logic, you also need to specify -criteria. -tolerance {type relative_tolerance absolute_tolerance} should be specified together. If only the type is specified without tolerance value, this message also occurs. If the associated option is not specified, the check as specified by the primary option will be ignored

What Next

Please specified the missing option.

Examples

```
Warning: Missing option -criteria {lvth_groups=lvt_name_list} when -all
 is specified. (LIBCHK-001)
```

LIBCHK-002

(warning) Specified variable or option '%s' ignored.

Description

This message occurs when an option or its value or variable is specified incorrectly in syntax or location, and will be ignored. To report line numbers, please specify set lc_check_lib_keep_line_number true before read_lib. When -compare and other options

Feedback

such as -validate are specified either in one command or separate, and there is only one library exists, this message also occurs.

What Next

If you set lc_check_lib_keep_line_number true, but still do not see line numbers reported, please make sure this variable is set before read_lib command and the library, if specified in -logic_library_name, is exactly the same as the File name with Path name when you see after issuing read_lib and list_lib or do not explicitly specify the library in -logic_library_name option in which case, the runtime library will be checked. If the group/attribute name specified in -group_attribute option is not found in the library, it will be ignored. To compare libraries, more than one libraries should be specified.

Examples

```
Warning: Specified variable or option 'lc_check_lib_keep_line_number'
 ignored. (LIBCHK-002)
```

LIBCHK-003

(warning) No check done for logic library checking. Please specify valid options and libraries.

Description

This message occurs when any of the following occurs: 1) No logic library specified or available at runtime for logic related checks including default checks. 2) Less than 2 libraries specified or available at runtime for -compare option. 3) Invalid cell names specified in -cells option. 4) Invalid voltage_name in create_scaling_lib_group -exclude_voltage_names option. 5) -logic_vs_physical specified but -logic_library_name not specified or no logic library available at runtime.

What Next

Please specify the missing libraries or option based on above scenario.

Examples

```
Warning: No check done for logic library checking. Please specify valid
 options and libraries. (LIBCHK-003)
```

LIBCHK-100

(warning) %s data found. Please refer to %s.

Feedback

Description

This message occurs when there are more serious issues that are found in the checking result listed in the table that follows. It redirects you to the message ID on next line that will give you detailed information.

What Next

Please refer to the man page of the recommended message ID for details.

Examples

```
Warning: Mismatched data found. Please refer to LIBCHK-110. (LIBCHK-100)
```

LIBCHK-101

(error) %s data found. Please refer to %s.

Description

This message occurs when there are more serious issues are found in the checking result listed in the table that follows. It redirects you to the message ID on next line that will give you detailed information.

What Next

Please refer to the man page of the recommended message ID for details.

```
Error: Mismatches data found. Please refer to LIBCHK-212. (LIBCHK-101)
```

LIBCHK-110

(information) List of cells with missing views

Description

This message is for reporting cells with missing views in physical library. All the physical cells with CEL/FRAM view missing will be reported in this table. In this report table, there are three columns: Cell name, CEL and FRAM. In the table, the CEL and FRAM columns list the cell name:version number. An X marks the view that is missing.

What Next

If FRAM view is missing, it is more critical that missing CEL view. You should use extract BPV command extract_blockage_pin_via to generate FRAM view.

Feedback

Examples

```
List of cells with missing views
-------------------------------------------------------------------------
--------
Cell name                       CEL                     FRAM
-------------------------------------------------------------------------

LIBCHK-111

(warning) List of cells with mismatched views

Description

This message is for reporting cells with mismatched veiwewss in physical library. All the physical cells with CEL/FRAM view mismatched will be reported in this table. In this report table, there are five columns: Cell name, CEL Version, CEL Modified time, FRAM Version and FRAM Modified time. the CEL version and FRAM version columns list the version numbers, and the CEL and FRAM modified time columns list the time when the view was last modified. If a cell has an earlier FRAM view than its CEL view, it is marked as mismatched. The time checked is the internal view creation or modification time in the Milkyway database, not the UNIX time. No mismatch check is performed on the cell content.

What Next

If a cell has an earlier FRAM view than its CEL view, please chec is its FRAM view is not updated. You may need to regenerate FRAM view by extracting BPV. If you read FRAM views from the LEF and then stream in CEL views, the views are shown as mismatched. You can ignore this report in this case.

Examples

```

LIBCHK-112

(information) List of cells with same names

Description

This message is for reporting cells with same names among the specified main or design library and all physical reference libraries linked to the specified library. All the physical cells with same name will be reported in this table. In this report table, there are two columns: Cell name and Library list in precedence order. If there are cells with the same name in multiple reference libraries, the tool uses the first cell in the reference control file and ignores the remaining cells. This option does not check naming among the logic libraries.

What Next

This is information only. If there are cells with the same name in multiple reference libraries, the tool uses the first cell in the reference control file and ignores the remaining cells. This option does not check naming among the logic libraries.

Examples

```
List of cells with same names
-------------------------------------------------------------
   Cell Name                 Library list in precedence order
-------------------------------------------------------------
   XOR3                      mainlib ref ref1 ref3 ref5
   DFF                       ref ref1 ref3

LIBCHK-113

(information) List of signal EM data

Feedback

Description

This message is for reporting signal EM data for routing layers in physical library. All EM data will be reported in this table. In this report table, there are three columns: Layer name, Current model and Model type. If no signal EM data at all in the library, it will not print the table but print a message: The library is missing signal EM data.

What Next

If the signal EM data is not complete, for example, it exists only in some layers but not all layers, you should check and reload the missing data.

Examples

```
List of signal EM data (LIBCHK-113)
-------------------------------------------------------------
     Layer name      Current model       Model type
-------------------------------------------------------------
     METAL1              peak                table
     METAL1              rms                 table
     METAL1              average             table
-------------------------------------------------------------
```

Examples

```
Information: List of signal EM data (LIBCHK-113)
```

LIBCHK-114

(warning) The library is missing signal EM data.

Description

This message occurs when there is no signal EM data for routing layers at all in the physical library.

What Next

For flows for and EM analysis with different temperature corners, signal EM data is required. You should check and reload the data into the physical library.

Examples

```
Warning: The library is missing signal EM data. (LIBCHK-114)
```

LIBCHK-115

(information) List of antenna rules

Feedback

Description

This message is for reporting antenna rules in the layers in the specified main library. In this report table, there are six columns: Layer name, Mode, Diode mode, Default metel ratio, Default cut ratio and Max ratio.

What Next

This is information only.

Examples

```
List of antenna rules
-------------------------------------------------------------------------
                                      Default     Default
  Layer Name    Mode   Diode mode   metal ratio  cut ratio   Max ratio
-------------------------------------------------------------------------
  M1             1         3           500.00      20.00      500.00
  M2             1         3           500.00      20.00      500.00
-------------------------------------------------------------------------
```

Examples

```

```

LIBCHK-116

(warning) The library is missing antenna rules.

Description

This message occurs when no antenna rules exist in the physical library.

What Next

Please check and load the antenna rule file after FRAM view is created.

Examples

```
Warning: The library is missing antenna rules. (LIBCHK-116)
```

LIBCHK-117

(warning) List of cells missing antenna property

Description

This message is for reporting missing antenna property for cells in physical library. All the cells that are missing antenna property will be reported in this table. In this table, it lists cell names and pin names missing the antenna property and the missing property type. If an input pin is missing the gate size, it is counted as missing the property. If an output pin is

Feedback

missing diode pro tection, it is counted as missing the property. If a macro is missing the hierarchical antenna property, then it is counted as missing the property. It is considered good practice to specify hierarchical antenna properties for macros.

What Next

For antenna fix, please check and load the antenna properties (CLF) after FRAM view is created.

Examples

```
List of cells missing antenna property
------------------------------------------------------------------------
--------
   Cell name             Cell type  Missing property     Pin name(s)

LIBCHK-121

(information) List of placement properties

Description

This message is for reporting placement properties for cells in physical library. In this report table, there are seven columns: Cell name, PR boundary, Cell Height, Symmetry, Orientation, Tile pattern and Remarks. PR boundary is represented by its lower left and upper right coordinates. Cell height is relative to the unit tile height, such as 1xH for single height. Cell symmetry includes: rxy - RXYsymmetry xy - XYsymmetry y - Ysymmetry x - Xsymmetry r - Rsymmetry a - Asymmetry Cell orientation includes: R0_MX R0_MY R180 R90_MY R90 R270 R90_MX Number in Tile pattern denotes the serial number in the associated List of tile patterns table. Remarks notes that the PR boundary mismatches the tile pattern. For macros, this table reports cell boundary and height. The unit tile size is reported in the format of width x height.

What Next

For standard cells, if mismatches are found between PR boundary and the tile pattern (Mismatch in Remarks column), please use the cmSetMultiHeightProperty command to set tile patterns for multi-height cells.

Examples

```

LIBCHK-122

(information) List of routing properties

Description

This message is for reporting routing properties for routing layers in physical library. All routing properties for layers will be reported in this table. In this report table, there are six columns: Layer, Preferred direction, Track direction, Offset, Pitch and Remarks. Remarks column denotes if the routing property on this layer has issues. If no issues are found, you will see OK in this Remarks; otherwise, it will note what issue is found, for example, if the offset is 0.46*pitch, which is neither 0 nor half pitch, offset=0.46pitch will be noted.

What Next

If remarks other than OK are noted, such as offset=0.46pitch, please check the issue and correct it. In the case of offset!=0.5*pitch, please reset the offset to be either 0 or half pitch. If blanks are left in Preferred direction, that denotes the preferred routing direction has not been set. Please define the preferred routing direction. If less than three routing layers are listed in this table, it is an error. Please check technology file and if some routing layers are missing, define them in the technology file and reload it.

Examples

```
List of routing properties
------------------------------------------------------------------------

(information) List of cell and pin properties

Description

This message is for reporting cell and pin properties for cells in physical library. In this report table, there are six columns: Cell name, Cell type, Pin name, Pin direction, Pin type and Multi PG. If a cell has either multiple power pins or multiple ground pins, multiPG will be noted in the last column. At the end of the table, it also reports the number of cells with multiple P/G pins.

What Next

If there is not any power or ground pins for a cell, it is an error. Please check the cell and may need to rerun extract BPV.

Examples

```
List of cell and pin properties

LIBCHK-124

(warning) List of pins without optimal routeability

Description

This message is for reporting pins without optimal routeability in physical library. All pins without optimal routeability will be reported in this table. Optimal routeability means pin's on-track accessibility of defined wire tracks. It also reports the total number of pins without optimal on-track routability and lists pin names, directions, layers, and tracks for each cell of this issue. In the track column, an H denotes that the pin is not accessible on a horizontal track, a V denotes the pin is not accessible on a vertical track, and H&V denotes that the pin is not accessible on both horizontal and vertical tracks.

What Next

If a pin is reported as not accessible on track, the pin might be routed by off-track wire during detailed routing. If too many pins do not have any on-track routability, adjust the offset values of the wire track (0 or half pitch preferred) and run the the create_lib_track command to reduce the number of pins without optimal accessibility. If routability checking is not successful, the cause may be no unit tile.

Examples

```
List of pins without optimal routeability
-------------------------------------------------------------
   Cell Name          Pin Name  Layer     Direction   Track
-------------------------------------------------------------
   TLATNSRX2          D         METAL1    Input       H&V
   SDFFSRHQX2         SE        METAL1    Input       H&V
   NOR4BBXL           C         METAL1    Input       H&V
   DFFRHQX1           D         METAL1    Input       H&V
   AND4X2             C         METAL1    Input       H&V
-------------------------------------------------------------
```

Examples

```

LIBCHK-125

(warning) List of cells with DRC violation

Description

This message is for reporting cells with DRC violation in physical libraries. All cells with DRC violation will be reported in this table. It checks design rules such as wire minWidth, minEdgeLength, minEnclosedArea, minSpacing, cutWidth, cutSpacing, and minEnclosure.

Feedback

In this report table, there are three columns: Cell Name, Cell type and Error cell. Error cell contains detailed information for DRC violation of the FRAM view cell.

What Next

Check the error cells for details of DRC violations. If a cell has DRC violation, it may not be used in the design without correction.

Examples

```
List of cells with DRC violation
-----------------------------------------------------------
     Cell name                    Cell type      Error cell
-----------------------------------------------------------
     ONEPIN                       Standard       ONEPIN.err
-----------------------------------------------------------
```

Examples

```
Warning: List of cells with DRC violation (LIBCHK-125)
```

LIBCHK-126

(warning) List of cells with metal density error

Description

This message is for reporting cells with metal density error in physical library. All cells with metal density error will be reported in this table. It checks macro metal density data for the cells, i.e. it checks if a cell has at least one of the following errors: (1) Metal density data in CEL view and FRAM view are inconsistent (2) Metal density windows do not cover the entire area on the layer In this report table, there are three columns: Cell Name, Inconsistency and the layer on which the density windows do not cover the entire area. Y denotes Yes or Inconsistency exists and N denotes No consistency.

What Next

If the density windows do not cover the entire area, you may need to add metal fill or smooth metal wire density. If metal density data in CEL view and FRAM view are inconsistent, please check FRAM vs. CEL view.

Examples

```
List of cells with metal density error
-------------------------------------------------------------------
   Cell name          Inconsistency       Not cover entire area
-------------------------------------------------------------------
   ADDFX1MTR          Y                   M4
   OA21X1MTR          N                   M1
                                          M2
-------------------------------------------------------------------
```

Feedback

Examples

```
Warning: List of cells with metal density error (LIBCHK-126)
```

LIBCHK-130

(information) Physical library checks FAILED.

Description

This message is a concluding statement after physical checks are done. When any issue is found, for example, no physical libary to check, or no cells need to check, this message will occur. Otherwise, it reports Physical library checks PASSED.

Examples

```
Information: Physical library checks FAILED. (LIBCHK-130)
```

What Next

You are advised to go back to the check report to see inconsistent results and resolve them as directed by the associated LIBCHK and FRAM man pages.

If you see the below message IDs in the check report, go to the related messages for details in

```
LIBCHK-112

LIBCHK-210

(information) List of cells missing in logic library

Description

This message is for reporting missing cells in logic library during logic vs. physical library checking. All the physical cells except physical only cells that are missing in logic library will be reported in this table. In this report table, there are three columns: Cell name, Cell type and Physical library. Cell type includes Core, Pad, InputPad, OutputPad, PowerPad, SpacerPad, and Unknown.

What Next

If some cells are found missing in specified logic library (.db), please check if you have not specified all the db files since logic cells may exist in different db files while the physical cells exist in one Milkyway library.

Examples

```
List of cells missing in logic library
-------------------------------------------------------------------------
Cell name                  Cell type             Physical library
-------------------------------------------------------------------------
AND2                       Core                  phys_lib
NOR1                       Core                  phys_lib
-------------------------------------------------------------------------
```

Examples

```
Information: List of cells missing in logic library (LIBCHK-210)
```

LIBCHK-211

(warning) List of cells missing in physical library

Feedback

Description

This message is for reporting missing cells in physical library during logic vs. physical library checking. All the logic cells that are missing in physical library will be reported in this table. In this report table, there are three columns: Cell name, Cell type and Logic library. The cell type includes pad_cell, non pad_cell and unknown. If no missing cells, no table will be printed out, but Number of cells missing in logic library: 0 (out of total) will be printed out.

What Next

If some cells are found missing in specified physical library (Milkyway library), please check if you have complete Milkyway library specified since physical cells may exist in different Milkyway library directories. If the cells are used in the design, the physical cells have to exist in the physical library that you are using. If the cells are not expected to be part of the physical library, then the incoming netlist must not have any of the missing cells. For example, by setting the dont_use attribute during synthesis.

Examples

```
Number of cells missing in physical library:   2 (out of 498)
   List of cells missing in physical library
-------------------------------------------------------------------------
Cell name                  Cell type            Logic library
-------------------------------------------------------------------------
gaard21                    non pad_cell         memory.lib
gaard22                    non pad_cell         memory.lib
-------------------------------------------------------------------------
```

Examples

```
Warning: List of cells missing in physical library (LIBCHK-211)
```

LIBCHK-212

(warning) List of pins missing in %s library

Description

This message is for reporting missing pins in logic (or physical) cells during logic vs. physical library checking. All the physical(or logic) pins that are missing in logic (or physical) cells will be reported in this table. In this report table, there are four columns: Physical(Logic) library, Cell name, Pin name and Pin direction It also checks pg_pin's in logic library vs. PG pins in physical library if there are pg_pin's in the logic library, and reports them in the same table.

What Next

If some signal pins are found missing in logic cells, it is a real issue and therefore an Error message LIBCHK-101 will occur to direct you to correct the cells that are missing these

Feedback

pins in the logic library. If pg_pins are missing in the logic library, it indicates that the logic library is not pg_pin based, and for UPF flow you need to use add_pg_pin_to_db utility to convert it into pg_pin based db.

Examples

```
List of pins missing in logic library
------------------------------------------------------------------------
----
Physical library        Cell name       Pin name        Pin direction
------------------------------------------------------------------------
----
NLC13IOplLib_3v         pnl_go          A                       Output
------------------------------------------------------------------------
----
```

Examples

```
Warning: List of pins missing in logic library (LIBCHK-212)
```

LIBCHK-212e

(error) List of signal and PG pins missing in %s library

Description

This message reports missing signal pins and pg_pins in logical (or physical) cells in logic vs. physical library checking. All the logical (or physical) pins that are missing in physical (or logical) cells will be reported in this table. It also reports same name physical MUSTJOIN pins if defined in DB as such pins are not logical signal pins, which indicates the pins should be either removed from logic library or added in physical library as logical signal pins. In this report table, there are four columns: Physical(or Logic) library, Cell name, Pin name and direction It also checks pg_pin's in logic library and PG pins in physical library, and reports them in the same table.

What Next

If some signal pins are found missing in logic cells, it is a real issue and you need to correct the inconsistency. If pg_pins are missing in the logic library, it indicates that the logic library is not pg_pin based. UPF flow requires pg_pin based library.

In fusion library, when you see

missing logical pins reported in LIBCHK-212e

without LIBCHK-212e table, please run one of the following to get detailed report in the table format. 1) check_fusion_lib 2) set_app_options -name fusion_lib.check_fusion_lib_verbose -value true before create_fusion_lib 3) report_check_library_records autofix0.db3 -libchk_codes LIBCHK-212e where autofix0.db3 is located in fusion lib dir or current dir.

Feedback

LIBCHK-213

(error) List of pins mismatched in logic and physical libraries

Description

This message is for reporting pins mismatched in either direction or pin type between the logic and physical cells during logic vs. physical library checking. All the mismatched pins will be reported in this table. In this report table, at the header of this table, the logic and physical library full path file names are listed followed by the table contents with four columns: Cell name, Pin name, Pin direction and Pin type. In Pin direction and Pin type columns, it lists values for both logic and physical libraries.

What Next

If some pins are found mismatched in either pin direction or pin type between logic and physical cells, it is a real issue and you need to correct the cells with this issue in either the logic or physical library or both.

Examples

```
List of pins mismatched in logic and physical libraries

LIBCHK-214

(information) List of bus naming styles

Description

This message is for reporting bus delimiters in logic and physical libraries. There are three columns in this report table: Library name, Library type and Bus naming style where Library type is either physical library or logic library. If there is no bus delimiter in the library, the field is blank in the report. To report bus naming styles, please set -bus_delimiter to set_check_library_options command. it is often true that logic libraries do not specify the bus delimiter.

What Next

This is information only. No further action is needed.

Examples

```
List of bus naming styles
-------------------------------------------------------------------
Library name                 Library type        Bus naming style
-------------------------------------------------------------------

-------------------------------------------------------------------
```

Examples

```
Information: List of bus naming styles (LIBCHK-214)
```

LIBCHK-215

(warning) List of cells with cell_footprint attribute

Description

This message is to check that the cell PR boundary or Cell boundary for Macro in the physical library is consistent among a class of cells with the same cell_footprint attribute

Feedback

specified in the logic library. This option reports cell names and their PR boundaries grouped by cell_footprint string.

What Next

If the cells are used in the design, please check their PR boundaries or cell boundaries for inconsistency. For example, if the PR boundaries of the cells with the same cell_footprint are different, you can not use them during optimization by swapping these cells.

Examples

```
List of cells with cell_footprint attribute
-------------------------------------------------------------------
Footprint  Logic library name  Cell name           PR boundary
-------------------------------------------------------------------
add42      slow                CMPR42X1            (0,0)(22.44,5.04)
           slow                CMPR42X2            (0,0)(26.4,5.04)
addf       slow                ADDFX1              (0,0)(13.86,5.04)
-------------------------------------------------------------------
```

Examples

```
Warning: List of cells with cell_footprint attribute (LIBCHK-215)
```

LIBCHK-216

(warning) List of cells with inconsistent area

Description

This message is to check the area attribute of cells in the logic library versus the actual area by cell PR boundary in the physical library. For comparison, the ratio of a stdCell PRBoundary in the rectangle (or Macro CellBoundary in the polygon) in the FRAM view to the cell area in the .db is used. If the ratio is the same for all the cells in the library, the cell areas are considered to be consistent. Otherwise, if the ratio for a cell deviates from the normal or average ratio for this library by a margin of 5%, it is counted as an inconsistent area. and will be included in the table. The average area ratio is calculated by first filtering out cells with the max and min area ratios and then dividing the total area ratios by the number of cells. There is no area check for pad cells. A pad cell is a special cell at the chip boundary with the pad_cell attribute in a logic cell. Pad cells are not checked because they are not used as internal gates and always have an area of 0. To check cell area, please set -cell_area to set_check_library_options command.

What Next

If the cell areas are inconsistent between logic and physical libraries, it will affect timing and placement accurary. The bigger the area deviation, the worse the accuracy and correlation. If the area value is 0 or no area attribute in logic cells, it is more serious and an

Feedback

Error LIBCHK-101 will occur. In this case, you need to correct logic library by adding valid area values to the cells.

Examples

```
Average cell area ratio physical/logic in the library:  0.9978
Number of cells with inconsistent area: 9

     List of cells with inconsistent area
-------------------------------------------------------------------

```

Examples

```
Warning: List of cells with inconsistent area (LIBCHK-216)
```

LIBCHK-217

(warning) List of cells mismatched in logic and physical libraries

Description

This message is for reporting cells mismatched in antenna diode type between the logic and physical cells during logic vs. physical library checking. All the mismatched pins will be reported in this table. In this report table, at the header of this table, the logic and physical library names are listed followed by the table contents with two columns: Cell name, Antenna Diode type. In Antenna Diode type column, it lists values for both logic and physical libraries.

The mapping table between .db and FRAM view is as follows.

Type name in Logic Type name in Physical power_and_ground AntennaDiodeTypePowerAndGround power AntennaDiodeTypePower ground AntennaDiodeTypeGround

What Next

If some cells are found mismatched in antenna diode type between logic and physical cells, command "update_mw_port_by_db -antenna_diode_type" may correct it.

Examples

```
List of cells mismatched in logic and physical libraries
Logic library:    saed90nm_max
```

Feedback

```
Physical library: ./design
-------------------------------------------------------------------------
----
                          Antenna Diode Type
Cell name              Logic               Physical
-------------------------------------------------------------------------
----
cell1                  power_and_ground    AntennaDiodeTypePower
cell2                  ground              missing
-------------------------------------------------------------------------
----
```

Examples

Warning: List of cells mismatched in logic and physical libraries
 (LIBCHK-217)
```

LIBCHK-220

(information) Logic library is INCONSISTENT with physical library

Description

This message is a concluding statement after cross checking is done. When any inconsistency, for example, missing cells and mismatched pins, is found during cross checking, this message will occur.

What Next

This is for your information. You need to go back to the check report to see inconsistent results and resolve them as directed by related man pages (LIBCHK).

Examples

```
Information: Logic library is INCONSISTENT with physical library
 (LIBCHK-220)
```

LIBCHK-300

(warning) List of inconsistent library group data

Description

This message is for reporting inconsistent data in logic libraries during logic vs. logic library checking. In the associated report table, it reports inconsistent values of the attributes at the library level. The attributes include. a) library version b) library type (pg_pin based or non-pg_pin based) c) units of timing, power,capacitance, etc. d) trip points e) base curve_x

Feedback

What Next

If some inconsistencies are reported at the library level, please check the libraries and correct them. Some attributes should be consistent cross the libraries. If the libraries are used for timing scaing, trip points should be consistent, and if they are used for UPF or MV flow, the libraries should be pg_pin based.

Examples

```
List of inconsistent library group data
-------------------------------------------------------------------------
-----
Library name              SR60_W_SVT_UHD.db      SR60_S_SVT_UHD.db
-------------------------------------------------------------------------
-----

base_curves/curve_x       "0.2, 0.5, 0.8"        "0.2, 0.5, 0.9"
-------------------------------------------------------------------------
-----
```

Examples

```
Warning: List of inconsistent library group data (LIBCHK-300)
```

LIBCHK-301

(warning) List of incompliant operating conditions

Description

This message is for reporting incompliant operating conditions in the logic libraries. In this report table, nom_voltage, nom_temperature, nom_process and default_operating_conditions of each library are reported. If default_operating_condition is not specified, Library Compiler will add a default name nom_pvt by creating one from nominal PVTs.

What Next

For library scaling, the operating conditions in the same scaling library group should be different in nominal voltage, temperature and/or process. For MCMM and MV/UPF, the nominal voltages should be different under different operating conditions. For -compare, the operating_consitions should be identical. For all others, this is information only. No further action is required. For voltage scaling, it is recommended that the voltages should be no more than 20% apart for good accuracy

Examples

```
List of incompliant operating conditions
-------------------------------------------------------------------------
-----
```

Feedback

```

-------------------------------------------------------------------------
-----
```

Examples

```
Warning: List of incompliant operating conditions (LIBCHK-301)
```

LIBCHK-302

(information) Voltages for library scaling are more than 20%% apart.

Description

This message is for voltage scaling, the voltages should be no more than 20% apart for good accuracy.

What Next

This is information only. However, for better accuracy, it is recommended that the voltages should be no more than 20% apart for voltage scaling.

Examples

```
Information: Voltages for library scaling are more than 20% apart.
 (LIBCHK-302)
```

LIBCHK-303

(warning) Missing libraries in scaling groups

Description

This table reports missing corner libraries in the scaling library group. It indicates the missing libraries by operating conditions (temperature and voltages on rails)

What Next

User needs to add the missing libraries into the group to make a full use of all the libraries in the group for better scaling accuracy.

Examples

```
Warning: Missing libraries in scaling groups  (LIBCHK-303)
-------------------------------------------------
Group name          Temp         VDD1   VDD2
-------------------------------------------------
```

Feedback

```
grp1                -40.0         1.10  1.21
-------------------------------------------------
```

LIBCHK-304

(information) Valid scaling library groups

Description

This table reports valid scaling library groups that meet the library formations. In the case of a complete library list are not specified, it will list the subset of the libraries meeting the formation. In the table, it also reports temperature (T) and voltage (V) ranges and adjacent voltage difference percentage in the group for scaling, or individual T & V values for exact match.

What Next

User can pick any library group from the list in the case of multiple groups are found, but it is recommended to pick the one with maximum number of libraries and maximum scaling dimensions.

Examples

```
Information: Valid scaling library groups (LIBCHK-304)
------------------------------------------------------------------------
----------------
Group name Library list      T range  V range  Max delta V
------------------------------------------------------------------------
----------------
grp1     v1t1.db v2t1.db v1t2.db v2t2.db  -40 to 125 0.9 to 1.2 33.3%
grp2       lib21 lib12 lib13     -40, 125 0.9, 1.2
------------------------------------------------------------------------
----------------
```

LIBCHK-305

(error) Library group '%s' not ready for %s.

Description

The library group is not ready for scaling because of at least one of the following reasons: 1) Library data consistency checks by check_library not passed 2) Originally defined scaling library group is missing some corners or some corner libraries are removed to generate reduced subsets that meet the formation. 3) When a library is specified in multiple library groups by create_scaling_lib_group command, or a user defined lib group has multiple groups in terms of cells. The libraries at this issue can be seen in Library grouping table LIBCHK-308.

The library group is not ready for voltage interpolation if no enough libraries form on one dimension, i.e. one variable rail (e.g. VDD) to interpolate on with other dimensions (e.g. VDD2) fixed. For quadratic interpolation, it needs at least 3 libraries with different voltage values on on rail while others are fixed.

What Next

Also refer to comments in the output script by write_scaling_lib_group, and fix library data consistency and/or add the missing corner libraries if not for -exact_match_only.

For PVT interpolation, please specify enough libraries with >=3 voltage values on a rail/voltage_name while other dimensions are fixed. To exclude rails not used for scaling/pvt_interpolation or dependent rails (most likely a bias pin), please use create_scaling_lib_group -exclude_voltage_names {VBP}, for example.

Examples

```
Error:Library group 'grp1' not ready for scaling.
```

LIBCHK-306

(warning) link_library %s '%s'.

Description

This message occurs when 1) link_library has extra libraries 2) link_library is missing a library from groups In PrimeTime, it is required that 1) one-and-only-one library in SLG to be in link_library 2) one library cannot be in more than one DSLGs. In ICC/DC, it is recommended but not required.

What Next

Remove the extra libraries from link_library or add a missing library from the group.

Examples

```
Warning: link_library has extra library: 'p1v1.db' (LIBCHK-306)
```

LIBCHK-307

(information) List of miscellaneous inconsistent library data

Description

This message is reporting different values in the same group/attributes that are not reported in any other tables when comparing 2 dbs. In this report table, Path name consists of hierarchical group/object names. If the attribute is at the library level, it is the library_name. This is mainly for internal use.

Feedback

What Next

If difference is reported for the attribute, please open the db files to view the values to see if it is expected.

Examples

```

LIBCHK-308

(information) Library grouping table

Description

This message is for reporting list of libraries with group name and group number they belong to. When a library is specified in multiple library groups by create_scaling_lib_group command, or a user defined lib group has multiple groups in terms of cells, the group number will include sub-group number, e.g. 2.1.

What Next

For library scaling, the operating conditions in the same scaling library group should be different in nominal voltage, temperature and/or process. For MCMM and MV/UPF, the nominal voltages should be different under different operating conditions. For -compare, the operating_consitions should be identical. For all others, this is information only. No further action is required. For voltage scaling, it is recommended that the voltages should be no more than 20% apart for good accuracy

Examples

```
When user defines

LIBCHK-310

(information) List of cells missing in logic libraries

Description

This message is for reporting cells missing in one or more logic libraries during logic vs. logic library checking. All the logic cells that are missing will be reported in this table.

What Next

If cells are found missing in one or more of the libraries, please check why these are existing in onle library but missing in the other. If such cells are used in design, these cells have to be in all the libraries.

Feedback

Examples

```
List of cells missing in logic libraries

LIBCHK-311

(warning) List of cells with mismatched or missing attributes in logic libraries

Description

This message is for reporting mismatched cell data in logic libraries during logic vs. logic library checking. Mismatched cells are those that have inconsistent attribute values at the cell level. For characterization values (e.g. cell_leakage_power), there are calculated absolute and relative errors along with respective values in each library. They are listed in the columns on the right-hand side.

What Next

Mismatched cells will cause issues if used in design. The same name cells existing in different libraries should have the same values for attributes such as function, dont_use and dont_touch, and same attributes should exist in all the libraries.

Examples

```
Warning: List of cells with mismatched or missing attributes in logic
 libraries (LIBCHK-311)

LIBCHK-312

(information) List of cell classification

Description

This message is for reporting cell classification of logic libraries. In this report table, numbers of total cells, inverters, buffers, level shifters, isolation cells, retention cells, switch cells, and always on cells in each library For library scaling, number of single and multi-rail cells in pg_pin based libraries is also reported. are reported.

What Next

For UPF flow, special cells such as level shifters should exist in the library. in general, the library should have inverters. For library scaling, single and multi-rail cells should be in separate libraries. For all other cases, this is information only. No further action is required.

Examples

```
List of cell classification
--------------------------------------------------------------------------
-----
Library name        SR60_W_SVT_UHD.db         SR60_S_SVT_UHD.db
--------------------------------------------------------------------------

LIBCHK-314

(information) List of mapping multi bit to single bit cells

Feedback

Description

This message occurs when checking multi bit mapping to single bit cells. It shows the mapping between multi bit cells and single bit cells. In this report table, the following columns are listed for each multibit function as a mapping between multi bit cells and single bit cells with library index: Multi bit cell(lib#) and Single bit cell(lib#). Blackbox multibit(MB) cells with single_bit_degenerate attribute will be reported in a separate table of the same LIBCHK type.

What Next

If mapping single bit cells are found missing as reported in LIBCHK-314w, please check if the specified target_library or lc_single_bit_degenerate_cell_library is correct or missing some libraries in the library list.

Examples

```
List of mapping multi bit to single bit cells (LIBCHK-314)

LIBCHK-315

(warning) List of data models and check policy in cells

Description

This message occurs when there are inconsistent early data models and/or policies in the cells. Similar to report_early_data_check_records that is reporting for single DB the early library data on the lib cells, check_library will report these data recorded in each DBs excluding error codes in the LIBCHK-315 table.

What Next

Early data models tolerated or repaired in the library compilation should be used for early stage in the design, and should not be used for sign-off.

Examples

```
Warning: List of data models and check policy in cells (LIBCHK-315)
-----------------------------------------------------------------
                                          Policy

Feedback

LIBCHK-320

(warning) List of pins missing in logic libraries

Description

This message is for reporting missing signal pins in logic cells during logic vs. logic library checking. All the logic pins that are missing in a cell but existing in other cells will be reported in this table. In this report table, the following columns are listed: Cell name, Pin name and each logic library names.

What Next

If some signal pins are found missing in logic cells, it is a real issue and therefore an Error message LIBCHK-101 will occur to direct you to correct the cells that are missing these pins in the logic library.

Examples

```
List of pins missing in logic libraries
------------------------------------------------------------------------
-----
Cell name       Pin name SR60_W_SVT_UHD.db         SR60_S_SVT_UHD.db
------------------------------------------------------------------------
-----
tieofflx_svt    AA    missing                  existing
tieofflx_svt    ZZ    missing                  existing
------------------------------------------------------------------------
-----
```

Examples

```
Warning: List of pins missing in logic libraries (LIBCHK-320)
```

LIBCHK-321

(warning) List of pins with mismatched or missing attributes in logic libraries

Description

This information message occurs when the tool finds mismatched pins in the logic cells during logic versus logic library checking. Mismatched pins are those that have inconsistent pin attributes such as pin direction, function, related_power_pin, and so forth. For characterization values (e.g. capacitancer), there are calculated absolute and relative errors along with respective values in each library. They are listed in the columns on the right-hand side. Pin level user defined attributes also are reported in this table if mismatched or missing.

The report table has the following columns:

```
Cell name
Pin name
Attribute/Group name
Attribute value of each of the logic libraries
Absolute and Relative errors
```

What Next

This is only an information message. No action is required.

However, mismatched pins will cause issues if the cells are used in the design. The same name pins should exist in the same name cells in different libraries with consistent values for attributes such as function, direction, related_power_pin, and related_ground_pin, and the same attributes should exist for the same pins in the same name cells. Characterization values such as capacitance can be different. For mcmm, mismatched pin_number's will cause MV-087 Error.

Examples

The following is an example of a mismatched pins list:

```
Warning: List of pins with mismatched or missing attributes in logic
 libraries (LIBCHK-321)
------------------------------------------------------------------------
---------------

LIBCHK-322

(warning) List of pg_pins with mismatched or missing attributes in logic libraries

Description

This information message occurs when the tool finds pg_ pins with mismatched or missing attributes in the logic cells during logic versus logic library checking. Mismatched pg_pins are those that have inconsistent pg_pin attributes.

The report table has the following columns:

```
Cell name
pg_pin name
Attribute/Group name
Attribute value of each of the logic libraries
```

What Next

Mismatched pg_pins will cause issues if the cells are used in the design. The same name pg_pins should exist in the same name cells in different libraries with consistent values for attributes such as direction, pg_function and switch_function. The same attributes should exist for the same pg_pins in the same name cells.

Examples

The following is an example of mismatched pg_pins list:

```
List of pg_pins with mismatched or missing attributes in logic libraries
-------------------------------------------------------------------------
-----
                           Attribute                Attribute value
Cell name       pg_pin name  /Group               non_pg_lib      pg_lib
-------------------------------------------------------------------------

FOOTER          VSS         pg_function            missing         "TVSS"
-------------------------------------------------------------------------
-----
```

Feedback

LIBCHK-323

(warning) List of pg_pins missing in logic libraries

Description

This message is for reporting missing pg_pins in logic cells during logic vs. logic library checking. All the logic pg_pins that are missing in logic cells will be reported in this table. In this report table, the following columns are listed: Cell name, pg_pin and each logic library names.

What Next

If pg_pins are missing in the logic library, it indicates that the logic library is not pg_pin based, and you need to use add_pg_pin_to_db utility to convert it into pg_pin based db.

Examples

```
List of pg_pins missing in logic libraries
-------------------------------------------------------------------------
-----
Cell name       pg_pin          SR60_W_SVT_UHD.db
 SR60_S_SVT_UHD.db

LIBCHK-330

(warning) List of timing arcs missing in libraries

Description

This message is for reporting timing arcs missing in the logic libraries.

What Next

For timing scaling, timing arc information should exist with consistent timing data in each library. For other cases, this is information only. No further action is required.

Feedback

Examples

```
List of timing arcs missing in libraries
-------------------------------------------------------------------------
-----
Cell name     Arc             SR60_W_SVT_UHD.db         SR60_S_SVT_UHD.db

LIBCHK-331

(warning) List of timing arcs mismatched in logic libraries

Description

This message is for reporting mismatched arcs in logic libraries during logic vs. logic library checking. It also includes inconsistent output load indices. This report table has the following columns: Cell name, Arc name, Attribute/Group name and attrbute values of each logic libraries.

What Next

For timing scaling and timing/delay calculations, consistent timing data should exist in the libraries for each timing arc.

Examples

```
List of timing arcs mismatched in logic libraries
-------------------------------------------------------------------------
-----
Cell name           Arc      Attribute             Attribute value
                              /Group         SR60_W_SVT_UHD.db

Feedback

LIBCHK-332

(warning) Library '%s' is missing CCS %s models.

Description

This warning message occurs during logic versus logic library checking, when no driver or receiver model exists in the library.

What Next

This is only a warning message. No action is required.

However, receiver models and driver models (compressed or original format) must exist in the libraries for timing scaling. For all other cases, this is information only.

LIBCHK-340

(warning) List of inconsistent CCS noise models

Description

This message is for reporting inconsistent CCS noise models in logic libraries. It reports: a) inconsistent input_voltage and output_voltage indices for CCS noise models. They should be in the same percentage of nominal voltages. b) inconsistent conditional (when) pin models (when order). c) inconsistent CCS noise models for all pins and arcs. This report table includes the following columns: Cell name, Pin name, Group name, Attrbute name and attribute value of each library.

What Next

For CCS noise scaling, consistent noise models are required. For other cases, it is for information only.

Examples

```
List of inconsistent CCS noise models

```

LIBCHK-341

(warning) List of inconsistent power models.

Description

This warning message occurs when there are inconsistent power models in the logic library. For characterization values (e.g. internal_power), there are calculated absolute and relative errors as well as error type along with respective values in each library. They are listed in the columns on the right-hand side.

It reports the following inconsistencies:

- `Inconsistent dynamic_current groups for each cell`
- `Inconsistent intrinsic_parasitic tables for each cell`
- `Inconsistent leakage_current groups for each cell`
- `Inconsistent power_cell_type attribute for each cell`
- `Inconsistent internal_power tables for each pin or cell`
- `Inconsistent leakage_power tables for each cell`

The report table includes the following columns:

```
Cell name
Group name
Attribute name
Attribute value of all logic libraries
Absolute and Relative errors and type
```

What Next

This is only a warning message. No action is required.

However, consistent power models are required for power scaling. For other cases, the report is for information only.

Feedback

LIBCHK-342

(warning) List of inconsistent data between CCS noise and NLDM models

Description

This is validation between NLDM delay/slews and those derived from CCSN with NLDM as reference. This message occurs when there are inconsistent delay and slew data between CCS noise and NLDM models in the logic library. The default relative and absolute tolerance values for delay are 2% and 5ps, respectively, and for slew, 3% and 7.5ps. In the table, N/A, if any, refers to that CCSN model does not exist on that timing arc.

What Next

This is a warning message about CCSN accuracy. It may render library cells with the reported accuracy issue unusable.

Examples

The following is an example of a list of inconsistent power models:

```

LIBCHK-343

(warning) List of sensitive CCSN models

Feedback

Description

The CCSN models of some cells are very sensitive in delay and slew to their input driving waveform. Small distortion of the input driving waveform tail can lead to a significantly different output waveform. A library cell is considered sensitive if the difference of delay or slew of output responses of the library cell to an input waveform versus a tail-distorted version of the input waveform is larger than the given tolerances. The default relative and absolute tolerance values for delay are 2% and 5ps, respectively, and for slew, 3% and 7.5ps. In the table, N/A, if any, refers to that CCSN model does not exist.

What Next

This is a warning message about CCSN sensitivity. To drive sensitive cells, it is recommended that a driver cell with better full swing (>95% VDD) be used. And library developer may choose more proper CCB cut to minimize the issue. Otherwise, it may render library cells with the reported accuracy issue unusable.

Examples

The following is an example of the report:

```

LIBCHK-344

(warning) Table of attribute value range analysis

Feedback

Description

This table lists scalar attributes and their values that are out of range as defined in set_check_library_option. In the table, the following fields are listed: Cell name, pin/subgroup, timing_type, when, Attribute, value and line_num where the second field can be pin or a subgroup name under the cell such as leakage_power. When an entry has no value in a field, it is blank. If the library is loaded from source .lib and the tcl var lc_check_lib_keep_line_number is set true, line_num field will show the line numbers where the attribute group starts.

This table also reports dc_resistance_high/low derived from dc_current tables in CCSN V1 and V2: 1) for 1-stage CCSN, check ccsn_first_stage/input_ccb 2) for multi- or 2-stage CCSN, check ccsn_last_stage/output_ccb only

What Next

Please check the attributes that have values out of range and correct them as needed. User should check the values and find out if characterization or setting have done correctly.

Examples

The following is an example table:

```
Warning: Table of attribute value range analysis (LIBCHK-344)
-------------------------------------------------------------------------
--------------------------

LIBCHK-345

(warning) Table of %s value ratios.

Feedback

Description

This table lists the dynamic_current groups, which has output switching, that:
1. The ratio of peak pg_current(power) to peak pg_current(ground) are out of range as defined in set_check_library_options -analyze {pg_current} \ -criteria {min_power_to_ground_current_ratio=...} .

1. The ratio of time constant of CCSP to time constant of NLDM/CCST are out of range as defined in set_check_library_options -analyze {ccsp_time_constant} \ -criteria { max_nldm_to_ccsp_time_const_ratio=... \ max_ccst_to_ccsp_time_const_ratio=...}

The report table includes the following columns:

```
Common columns:
  Cell name
  Group name
  When condition
  Attribute name
  index_1/index_2
  line_num1(optional)
  line_num2(optional)

For peak current check:
  Peak pg_current for Power
  Peak pg_current for Ground
  Ratio of Power/Ground
  Ratio of Ground/Power

For time constant check:
  Time of CCSP
  Time of NLDM/CCST
  Ratio of time constant
  Type : NLDM or CCST
```

If the library is loaded from source .lib and the tcl var lc_check_lib_keep_line_number is set true, line_num field will show the line numbers where the group starts.

What Next

User should check the reported group and verify if the value is correct.

Examples

LIBCHK-346

(warning) List of inconsistent data between CCS noise and CCS timing models

Description

This is validation between the times at the trip points derived from CCST and those derived from CCSN with CCST as reference. This message occurs when there are inconsistent data between CCS noise and CCS timing models in the logic library. The default relative and absolute tolerance values for all trip points are 5% and 0.005ns, respectively.

What Next

This is a warning message about CCSN vesus CCST accuracy. It may render library cells with the reported accuracy issue unusable.

Examples

The following is an example of a list of inconsistent CCS noise and CCS timing models:

LIBCHK-350

(warning) List of inconsistent data between different timing models

Description

This message is for validating library data between CCS and NLDM models. It reports: a) inconsistent output load indices between CCS and NLDM models, and inconsistent load indices for CCS drive/receiver b) inconsistent NLDM delay and slew indices and values with a default or user specified tolerance. c) inconsistent delays between NLDM and CCS timing with a user specified tolerance for both compact CCS and expanded CCS d) inconsistent data between two CCS driver model current waveforms including compact CCS with expanded CCS data with a tolerance e) inconsistent between CCS power data and NLPM data (not in 2008.09 releases) In this report table, including following columns: Cell name, Croup name, Attrbute name and attribute value of all liogic libraries.

What Next

If the difference is significantly larger between the models, please rerun the simulation to correct the libraries.

Examples

```

LIBCHK-351

(information) List of inconsistent constructs and values

Description

This message is for reporting inconsistent liberty syntax constructs and/or values of the two logic libraries

What Next

This is information only. No further action is required.

Examples

```
Information: List of inconsistent constructs and values (LIBCHK-351)
```

LIBCHK-352

(information) Table of variation-aware model analysis

Description

This table lists variation aware analysis results for driver, receiver and constraint models. For a set of va_values, there are normally three values: nominal, -Sigma and +Sigma. From the three values for each pair of indices, a linear model is used to find: a) monotonicity (trend) including - delays increase as slew and load increase. - delays increase/decrease as va_parameters increase. b) significance of each va_parameters

As trial and error procedure, the following statistics will be used in the study on the VA models. iThe linear model is used to roughly measure how significant each va_parameters affects on delay. 1) If slope ~= 0, va_parameter is insignificant (not sensitive) 2) If slope > 0, monotonously increasing 3) If slope < 0, monotonously decreasing 4) Alternating slopes may indicate issues 5) Trend: If Dnom > both D+/-sigma, or If Dnom < both D+/-sigma, not monotonous, where D is Delay. 6) coefficient of correlation to measure how closely the va_parameters are related to delays. Std error is used to measure how much va_parameter and delay points deviate from the linear model.

This report table includes the following columns: pin/related_pin, timing_type, when, Group, va_values, (index_1,2), nomimal, -Sigma, +Sigma, Slope, Std error and Trend In Trend column, / is monotonously increasing, \ is monotonously decreasing, ^ is non-monotonous up, V is non-monotonous down and - is flat.

What Next

If the difference is significantly larger between the models, please rerun the simulation to correct the libraries.

LIBCHK-353

(information) Report of the statistical analysis results of characterization models.

Description

This information message reports the statistical analysis results of characterizations between CCS and NLDM models or between the same types of models in two libraries, using the golden NLDM or first library as the base. In counting the grid points, for example, if a 7x7 NLDM table grids mismatch 7X7 CCS, it should be counted as 49, not 98. And delay/slew values passed do not include failed grid points.

The columns in the table include the following:

- Group type: Delay, Slew, Constraint, Receiver capacitance
- Mean of differences: Absolute, Relative
- Standard deviation: Absolute, Relative
- Max outlier: the maximum value of the deviations

Feedback

- Number of grid points: Passed, Failed

What Next

If the mean is far from 0, the two models or libraries have significant differences. If the standard deviation is significantly large, the differences of these two are dispersed. In any case, small numbers of mean and deviation, close to 0, should be expected if the characterizations are generated under the same operating conditions.

Examples

The following is an example report of the statistical analysis results of characterization models:

```
Information: List of statistical analysis (LIBCHK-353)

LIBCHK-354

(information) Table of characterization timing table trend analysis.

Description

This information message presents a table of single characterization timing table trend analysis results for delay, slew, driver, receiver and constraint models. The trends include the following:

```
/       monotonously increasing
\\\       monotonously decreasing
^       non-monotonous up
V       non-monotonous down
-       flat
```

```
M       Multiple peaks
W       Multiple troughs
N       2 peaks with 2nd not turning low
```

What Next

This is an information message only. No action is required.

However, if the trend indicates that the values do not increase as slew/load indices, please check that the characterizations have been done correctly.

Examples

The following is an example table:

```
Table of characterization timing table trend analysis (LIBCHK-354)

LIBCHK-355

(warning) Table of characterization table bound analysis.

Description

This warning message presents a table of single characterization table value bound analysis results for delay, slew, driver, receiver, constraint and power tables. The bound include upper bound (max value) and lower bound (min value).

The violation (table values out of bound) will be triggered and reported when 1) table-value > upper bound or 2) table-value < lower bound

If no violate found for upper criteria or lower criteria, '-' will be reported, otherwise the peak value (largest violation for upper criteria or smallest violation for lower criteria, or the larger of the absolute values if both violated) will be reported in the table.

The index field indicate the grid point that peak violation located, and the '*' in index field indicate which index direction is scaned during the analysis.

Feedback

What Next

This warning message will show the value tables that have value out of the upper bound or lower bound. User should check the value and find out if characterization have done correctly.

Examples

The following is an example table:

```
Table of characterization table bound analysis (LIBCHK-355)
-------------------------------------------------------------------------------
---------------------------------------
Cell name          pin/related_pin  timing_type         when   Group
 index_1, index_2    Min value  Max value

-------------------------------------------------------------------------------
-----------------------------------------
```

LIBCHK-356

(warning) Table of characterization table slope analysis.

Description

This warning message presents a table of single characterization table value slope analysis results for delay, slew, driver, receiver, constraint and power tables. The slope include the max slope and min slope, and defined as:

```
Slope=((V2-V1)/(S2-S1))*(Srange/Vrange)
V2, V1: the values of two adjacent points in the table;
S2, S1: the index values of two adjacent points in the table;
Vrange = V_largest - V_smallest
Srange = S_largest - S_smallest
```

When checking the slope, violation will be triggered and reported when: 1) curve-slope > max slope or 2) curve-slope < min slope

If no violate found for upper criteria or lower criteria, '-' will be reported, otherwise the peak value (largest violation for upper criteria or smallest violation for lower criteria, or the larger of the absolute values if both violated) will be reported in the table.

The index field indicate the grid point that peak violation located, and the '*' in index field indicate which index direction is scaned during the analysis.

What Next

This warning message will show the value tables that have data slope out of the max slope or min slope. User should check the value and find out if characterization have done correctly.

Examples

The following is an example table:

```
Table of characterization table slope analysis. (LIBCHK-356)
------------------------------------------------------------------------

------------------------------------------------------------------------
---------------------------------------
```

LIBCHK-357

(information) Table of characterization table index analysis.

Description

This information message presents a table of single characterization table index analysis results for delay, slew, driver, receiver and constraint models. It lists all the index tables that meet index[i+1]/index[i] > x-factor specified.

What Next

This is an information message only. However, if the index analysis indicates that the index values increase extremely, the accuracy may suffer.

Examples

The following is an example table:

```
Table of characterization table index analysis (LIBCHK-357)
index_1:    related_pin_transition
index_2:    output_net_capacitance
------------------------------------------------------------------------
------------------------------
Cell name     pin/related_pin  timing_type    when   Group/attribute
 value                    Max ratio
```

Feedback

 "0.03,2.72,...           90.6667
-------------------------------------------------------------------------
------------------------------
```

LIBCHK-358

(warning) Table of interpolation accuracy analysis

Description

This interpolation accuracy analysis is performed by fitting the rows and columns of a 2-D NLDM timing model (delay/slew/constraint) with (bi)cubic and linear models, and comparing the values at mid index points with one index fixed. For example, in a 7x7 table, there would be 6 checks along each row and 6 checks along each column at mid index points. If the difference between the two models exceeds the specified tolerances, the mid grid (index values) and the interpolated values will be reported.

What Next

If the interpolation difference is too large, the library needs to be enhanced by either increasing table size or using better spacing between the indexes.

Examples

The following is an example table:

```
Warning: Table of interpolation accuracy analysis (LIBCHK-358)
index_1:  related_net_transition
index_2:  total_output_net_capacitance
-------------------------------------------------------------------------
-------------------------------------

-------------------------------------
sdffcqs_f2 q/clk           rising_edge  !scan  cell_rise  1.11,3.71
  0.06724   0.07724   0.0100   14.87%
-------------------------------------------------------------------------
-------------------------------------
```

LIBCHK-359

(warning) Table of partial voltage ranges on timing arcs

Feedback

Description

This message presents a table of partial voltage ranges/swings on timing arcs. It lists all the timing arcs with partial voltage ranges that exceed the voltage threshold/tolerance specified.

What Next

The voltage range or swing check goes together with sensitivity check. If a driver cell whose output voltage never reaches full voltage swing and this cell drives a sensitive cell, there will be an issue. However, if the receiver cell is not sensitive, it should not be an issue.

Examples

The following is an example table:

```
Warning: Table of partial voltage ranges on timing arcs (LIBCHK-359)
-------------------------------------------------------------------------------
------------------
Cell name   pin/related_pin timing_type    when   VDD   Voltage range

-------------------------------------------------------------------------------
------------------
```

LIBCHK-360

(information) Logic library inconsistencies found for MCMM.

Description

This information message occurs when any inconsistency in MCMM is found during cross checking the libraries. MCMM requires the following:

```
a)      Same pin (pg_pin) names, directions, types, functions and
 voltage_name
b)      Same in/output_signal_level for rail-based library and same
 related_power_pin/related_ground_pin for pg_pin-based library
c)      Same derived pin_number attribute values
d)      Different PVT values for different characterizations between
 two libraries for different operation conditions, i.e. libraries with
 same-name cells have different nominal PVT values.
e)      Same cell attributes: dont_use, dont_touch and black box
f)      Same power_down_function for output/inout pins
```

Feedback

```
g)      Power data (leakage_power etc.) exist for all opconds with
 non-zero value
h)      Same threshold_voltage_group attribute values for same cells
 across corner libraries
```

What Next

You are advised to go back to the check report to see inconsistent results and resolve them as directed by the associated LIBCHK man pages.

If you see "inconsistencies found" in the summary report, go to the related tables for details in

```
LIBCHK-300

LIBCHK-361

(information) Logic library inconsistencies found for UPF.

Description

This message occurs after the checking of the libraries is completed. When any inconsistency in the UPF flow is found during the checking, this message appears. UPF requires the following:

```
a)      Same pin (pg_pin) names, directions, types, functions and
 voltage_name
b)      Same in/output_signal_level for rail-based library and same
 related_power_pin/related_ground_pin for pg_pin-based library
c)      Same derived pin_number attribute values
d)      Different PVT values for different characterizations
e)      NLDM or CCS model under different voltage conditions exists
f)      Level shifter, isolation, retention and switch cells exist with
 consistent and complete attributes
g)      voltage_map and pg_pin groups exist in multi P/G pg_pin based
 library with consistent attributes
h)      Same power_down_function for output/inout pins
i)      Power data (leakage_power etc.) exist for all opconds with
 non-zero value
j)      power_down_function must be specified on all output/inout pins
k)      always_on inverter and always_on buffer cells must be specified
l)      input/output_voltage_range specified on the same pin must have
 identical values among all PVT libraries
m)      PG/PM checking for on-the-fly UPF library update
n)      Same threshold_voltage_group attribute values for same cells
 across corner libraries
```

LIBCHK-363

(information) Logic library inconsistencies found for %s comparison.

Description

This information message occurs after cross checking between the two libraries is completed. When any the tool finds inconsistencies in the Liberty syntax construct comparison or value comparison during cross checking, this message will appears. In construct comparison, the missing or existing data is reported. In value comparison, the characterization values are reported.

What Next

This is an information only message. No action is required.

However, you are advised to go back to the above check report to see inconsistent results and resolve them as directed by the associated LIBCHK man pages.

When you see "inconsistencies found" for the construct or value comparison in the summary report, go back to the related tables for details in

```

LIBCHK-364

(information) Logic library inconsistencies found for %s validation.

Description

This information message occurs after validation checking between the two libraries or between two models (NLDM versus CCST/CCSN) is completed. When the tool finds any inconsistency in validation during validation checking, this message appears. If grid points are mismatched, the tool will not validate the delay, slew, and constraint values. In this case, you can ignore this message.

What Next

Please review the check report to see the inconsistent results and resolve them as directed by the related LIBCHK man pages.

When you see "inconsistencies found" in the summary report, review the related tables for details in the following messages:

```
LIBCHK-300
LIBCHK-301
```

Feedback

LIBCHK-365

(information) Statistics of all characterization data per library

Description

This information table reports the overall statistical analysis results of library checking with one library (group) in one row. This only includes characterization model types listed in LIBCHK-353: delay, slew, constraint, receiver_cap, ccs driver, voltage range, ccsn (dc_current), internal_power, and leakage_power. The columns in the table include the following:

- `Library name`
- `Abs/Rel mean error: Absolute/Relative mean error`
- `Abs std dev: Absolute/Relative standard deviation`
- `Cell pass rate: ratio of number of characterization model check passed cells to number of total cells checked`

Feedback

What Next

If the mean error is far from 0, the models are not so accurate. If the standard deviation is significantly large, the models are dispersed, i.e. the deviation is significant. In any case, small numbers of mean error and deviation, close to 0, should be expected for high accuracy.

Examples

The following is an example:

```
Information: Statistics of all characterization data per library
 (LIBCHK-365)
------------------------------------------------------------------------
-------------
Library name    Abs mean error Rel mean error  Abs std dev Rel std dev
 Cell pass rate
------------------------------------------------------------------------
-------------
library_typ     0.000344       1.04%           0.00176     16.86%
 79.00%
test_typ        0.000688       2.08%           0.00352     33.72%
 56.12%
------------------------------------------------------------------------
-------------
```

LIBCHK-366

(error) Logic library inconsistencies found for single mode macros.

Description

This message occurs after the checking of the single mode libraries is completed. When any incorrect data or inconsistency in the single mode libraries such as ETMs is found during the checking, this message appears. Single mode cells including ETM require the following:

```
a)      Each single model cell, e.g. ETM, has to have timing_model_type
 (for ETM, the value must be extracted) and is_macro_cell defined
b)      The single mode libraries for different modes have to have the
 same PVT
c)      Consistencies in specific library/cell/pin level attributes
 across single mode libraries at same PVTs
For details, please refer to related LC document or App Note.
The checks in check_library for ETM is consistent with merge_models
 command in PrimeTime.
Please note that for other single model cells than ETM,
 timing_model_type : extracted is not required.
```

Feedback

What Next

You are advised to go back to the above check report to see inconsistent results and resolve them as directed by the associated LIBCHK man pages.

LIBCHK-330
LIBCHK-331
```

Any of the related LIBCHK messages will lead to the conclusion of inconsistencies found.

LIBCHK-367

(error) Logic library inconsistencies found for cell electromigration.

Description

This message occurs after checking of cell electromigration/em_max_toggle_rate across corner libraries. When structural inconsistency in the EM groups is found during the checking, this message appears.

What Next

You are advised to go back to the above check e.g. report LIBCHK-321 to see inconsistencies across the libraries and resolve them as directed by the associated LIBCHK man pages. If the electromigration table is not characterized for the expected PVT corners, in PrimePower, user can use set_em_scaling_factor command to set a scaling factor on the cell max toggle rate; however, this may still compromise the accuracy.

Examples

```
Warning: List of pins with mismatched or missing attributes in logic
 libraries (LIBCHK-321)

```

LIBG

LIBG-1

(error) The Synopsys database is corrupted. The library is not created.

Description

A file is read in but no library is found in the file. It is most likely that the file is empty.

What Next

Check you library file to make sure it is a valid library.

Examples

```
Error: The Synopsys database is corrupted. The library is not created.
 (LIBG-1)
```

LIBG-2

(error) An invalid '%s' function string in the '%s' cell.

Description

This error message occurs when the string given is not valid for representing a Boolean logic defined in Synopsys format.

What Next

See the Library Compiler documentation to find out the valid format of the string.

Constant Boolean expressions do not allow multiple constants with operators; for example, the following expressions are not allowed:

```
function/when : "10" ;

function/when : "1 ^ 0" ;
```

Specify constant Boolean expressions as follows:

```
function/when : "0" ;

function/when : "1" ;
```

Feedback

Examples

This example causes an error message because the closing parenthesis is missing in the function string:

```
cell(libg2) {
  area : 1 ;
  pin (I0) {
        direction : input ;
        capacitance : 0 ;
  }
  pin ("Y") {
        direction : output ;
        function : "(I0" ;
        timing() {
                related_pin     : "I0" ;
                intrinsic_rise  : 1.0 ;
                rise_resistance : 0.0 ;
                intrinsic_fall  : 1.0 ;
                fall_resistance : 0.0 ;
        }
  }
```

Examples

The resulting error message lists the cause of the error:

```
Error: Line 400, An invalid '(IO' function string in the 'libg2' cell.
 (LIBG-2)
```

LIBG-3

(error) A bad '%s' pin name in the '%s' cell.

Description

This error gets detected during a *read_lib* and an *update_lib* commands. The pin name does not either exist or a previous error in any of the attributes of the pin group is detected. In this case the pin group is not recognized and the pin name is labeled as bad.

What Next

Check your library for a wrong pin name in any related attribute or for an incorrect pin group.

Examples

```
cell (libg3) {
  area : 4
  pin(A) {
    direction : input
    capacitance : 1
```

Feedback

```
    fanout_load : 1.0
  }
  pin(EN) {
    direction : input
    capacitance : 1
    fanout_load : 1.0
  }
  pin (Z) {
    direction : output
    function : "A"
    three_state : "E";       /* <-- This is wrong */
    max_fanout : 10
 }
```

Examples

```
Error: Line 426, A bad 'E' pin name in the 'libg3' cell. (LIBG-3)
```

LIBG-4

(error) In the '%s' cell, the '%s' noninput pin \n \tcannot be used in the function.

Description

The string associated with a *function* and *three_state* attributes should include only be of *input* or *inout* directions.

What Next

Check your library for a wrong direction of the pin in the function attribute. Another possibility is to check the use of the wrong pin name.

Examples

```
cell (libg4) {
  area : 4
  pin(A) {
    direction : input
    capacitance : 1
    fanout_load : 1.0
  }
  pin(EN) {
    direction : input
    capacitance : 1
    fanout_load : 1.0
  }
  pin (Z1) {
    direction : output
    function : "A"
    max_fanout : 10
 }
  pin (Z) {
```

Feedback

```
    direction : output
    function : "Z1"           /* <-- This is wrong */
    three_state : "Z1";       /* <-- This is wrong */
    max_fanout : 10
 }
```

Examples

```
Error: Line 431, In the 'libg4' cell, the 'Z1' noninput pin
        cannot be used in the function. (LIBG-4)
```

LIBG-5

(error) Cannot find the '%s' pin in the '%s' cell.

Description

This error is issued when a pin name attached to a *related_pin* or a *related_bus_pins* attribute does not exist in the cell.

What Next

Check your library for a wrong pin name.

Examples

```
cell(libg5) {
  area : 1 ;
  pin (I0) {
        direction : input ;
        capacitance : 0 ;
  }
  pin ("Y") {
        direction : output ;
        function : "I0" ;
        timing() {
                related_pin     : "IO" ; /* typo zero replaced by letter
 O */
                intrinsic_rise  : 1.0 ;
                rise_resistance : 0.0 ;
                intrinsic_fall  : 1.0 ;
                fall_resistance : 0.0 ;
        }
  }
```

Examples

```
Error: Line 403, Cannot find the 'IO' pin in the 'libg5' cell. (LIBG-5)
```

Feedback

LIBG-6

(error) Missing a related_pin for the '%s' pin timing group\n \tin the '%s' cell.

Description

This error is issued when the *related_pin* or the *related_bus_pins* attribute is missing in a timing group.

What Next

Check your library for a typo in the attribute or add it if it is missing.

Examples

```
cell(libg6) {
  area : 1 ;
  pin (I0) {
        direction : input ;
        capacitance : 0 ;
  }
  pin ("Y") {
        direction : output ;
        function : "I0" ;
        timing() {
           frelated_pin : "I0" ; /* typo f inserted before attribute */
           intrinsic_rise       : 1.0 ;
           rise_resistance : 0.0 ;
           intrinsic_fall  : 1.0 ;
           fall_resistance : 0.0 ;
        }
  }
```

Examples

```
Error: Line 399, Missing a related_pin for the 'Y' pin timing group
        in the 'libg6' cell. (LIBG-6)
```

LIBG-8

(error) In the '%s' cell, the '%s' input drives more than one function.

Description

This error is issued when attribute three_state on a port has common input ports with attribute inside ff, ff_bank, latch, latch_bank, or seq group.

What Next

Either delete one of the attributes or associate a unique string to each of them.

Feedback

Examples

```
cell(libg8) {
         area : 6.50;
         pin(D TE) {
           direction : input;
           capacitance : 3.0;
         }
        pin(CLK) {
                direction : input;
                capacitance : 1.5;
        }
        ff("IQ","IQN") {
                next_state : "D";
                clocked_on : "CLK";
                preset     : "TE";
                }
        pin(Q) {
                direction : output;
                function : "IQ";
                three_state : "D";   /* wrong, D is shared with
 next_state. */
        }
        pin(QN) {
                direction : output;
                function : "IQN";
        }
      }
```

Examples

```
Error: Line 411, In the 'libg8' cell, the 'D' input drives more than one
 function. (LIBG-8)
```

LIBG-10

(warning) Failed to recognize the functionality of cell '%s'.

Description

The warning message is to notify users that Library Compiler fails to synthesize a netlist structure representing functionality of this cell. In order to other cells to recognize the cell, user can specifiy the "user_function_class" attribute either in the .lib file or in Design Compiler.

Note, although the function id of the cell is unknown, it may not be black-box. That is why we are saying that it may not be recognized by Design Compiler.

This message can be used to identify a cell for which pin-class conflict exists. Pin-class is defined as the set of pins which can be swapped without changing the functionality of the gate and is used for DC mapping. In the following simple example, we have PO =

Feedback

~(PAD * PI) and Y=PAD, and it will cause pin-class conflict because: After parsing the 1st function, we have pin_class(PAD) = pin(PI) because PAD and PI can be exchangable without changing the functionality of the pin PO. However it will break the functionality of the 2nd function cause Y=PAD and Y=PI are totally different.

When pin-class conflict happens, the function id of the cell is set to unknown.

What Next

Check your library.

Examples

```
cell(libg28) {
          area : 1;
          ...
          pin(PAD) {
            direction : input;
            ...
          }
          pin(PI) {
            direction : input;
            ...
          }

          pin(PO) {
            direction : output;
            capacitance : 0;
            ...
            function: "!(PAD * PI)"
          }
          pin(Y) {
            direction : output;
            capacitance : 0;
            ...
            function: "PAD"
          }
        }
```

Examples

```
Warning: Line 34,   Failed to recognize the functionality of cell '%s'.
 (LIBG-10)
```

LIBG-16

(warning) The '%s' Pin/bus on the '%s' cell has no 'function' attribute.\n \tThe cell becomes a black box.

Feedback

Description

This warning is issued when any output of a given cell does not have a valid function(missing or wrong information associated with the function of the pin). A function can be defined either by a *function* attribute, a *three_state* attribute, a *memory_read* group, or an *internal_node* attribute.

What Next

Check your library for missing or wrong attributes.

Examples

```
cell(libg16) {
  area : 1 ;
  pin (I0) {
        direction : input ;
        capacitance : 0 ;
  }
  pin ("Y") {
        direction : output ;
/*      function : "I0" ;  */
        timing() {
                related_pin     : "I0" ;
                intrinsic_rise  : 1.0 ;
                rise_resistance : 0.0 ;
                intrinsic_fall  : 1.0 ;
                fall_resistance : 0.0 ;
        }
  }
```

Examples

```
Warning: Line 39, The 'Y' Pin/bus on the 'libg16' cell has no 'function'
 attribute.
        The cell becomes a black box. (LIBG-16)
```

LIBG-17

(error) The 'function' of the '%s' pin/bus on the '%s' cell\n \tcan only be '%s' or '%s'.

Description

This error is issued when either the noninverted output (first variable) or the inverted output (second variable) of a sequential model, defined by a ff, a ff_bank, a latch, or a latch_bank group are not assigned to a primary output.

A function statement of each primary output must include either the first variable or the second variable.

Feedback

What Next

Make the appropriate correction in your library, as indicated in the error message. For more information on sequential models, refer to the *Library Compiler Reference* and *User Guide Manuals*.

Examples

```
cell(libg17) {
        area : 6.50;
        pin(CLK) {
                direction : input;
                capacitance : 1.5;
        }
        pin(SET) {
                direction : input;
                capacitance : 3.0;
        }
        ff("IQ","IQN") {
                next_state : "IQ'";
                clocked_on : "CLK";
                preset     : "SET'";
        }
        pin(Q) {
                direction : output;
                function : "IQ1";       /* wrong, should be IQ */
        }
        pin(QN) {
                direction : output;
                function : "IQN";
        }
      }
```

Examples

```
Error: Line 23, The 'function' of the 'Q'  in/bus on the 'libg17' cell
        can only be 'IQ' or 'IQN'. (LIBG-17)
```

LIBG-18

(information) The '%s' equation on the '%s' cell is not recognized.

Description

This information is issued when the function is not recognized. The function can be a complex *state_function*, a corrupted string in a *three_state*, a *clocked_on*, or a *clocked_on_also* attribute.

Feedback

What Next

Check your library to determine under which case the information is given. It it is due to the previous error LIBG-4, fix the library. Otherwise, ignore it.

Examples

```
cell(libg18) {
        area : 6.50;
        pin(CLK) {
                direction : input;
                capacitance : 1.5;
        }
        pin(SET) {
                direction : input;
                capacitance : 3.0;
        }
        ff("IQ","IQN") {
                next_state : "IQ'";
                clocked_on : "CLK";
                preset     : "SET'";
        }
        pin(Q) {
                direction : output;
                function : "IQ";
        }
        pin(QN) {
                direction : output;
                function : "IQN";
                three_state : "Q"; /* non-input pin not used in
 function*/
        }
      }
```

Examples

```
Information: Line 218, The 'three_state' equation on the 'libg18' cell is
 not recognized. (LIBG-18)
```

LIBG-19

(warning) Failed to recognize the functionality of cell '%s'.

Description

Library Compiler fails to synthesize a netlist structure representing functionality of this cell. If the function of a cell is too complex for LC to recognize, the cell becomes a black box. In order to other cells to recognize the cell, user can specifiy the "user_function_class" attribute either in the .lib file or in Design Compiler.

Feedback

What Next

To specify "user_function_class" attribute as described above.

LIBG-20

(error) The '%s' equation on the '%s' cell evaluates\n \tto a '%s' constant.

Description

This message is generated when Library Compiler encounters a three-state cell whose enable signal string is 1 or always evaluates to 1.

What Next

Verify the cell and check the library description of the offending cell for correctness.

Examples

```
cell(libg20) {
        area : 6.50;
        pin(CLK) {
                direction : input;
                capacitance : 1.5;
        }
        pin(SET) {
                direction : input;
                capacitance : 3.0;
        }
        ff("IQ","IQN") {
                next_state : "IQ'";
                clocked_on : "CLK";
                preset     : "SET'";
        }
        pin(Q) {
                direction : output;
                function : "IQ";
        }
        pin(QN) {
                direction : output;
                function : "IQN";
                three_state : "1";
        }
      }
```

Examples

```
Error: Line 218, The 'three_state' equation on the 'libg20' cell
 evaluates
        to a '1' constant. (LIBG-20)
```

Feedback

LIBG-21

(error) The derived equality relationship between '%s' and \n \t'%s' pins conflicts with the user-specified 'pin_opposite' for the '%s' cell.

Description

This error is generated if a cell is read by the library compiler with a pin_opposite attribute that conflicts with the derived equality of the pins. The function statements associated with the pins are the same.

What Next

Check your library for a typo in the function strings of the cell or remove the pin_opposite attribute.

Examples

```
cell(libg21) {
        area : 6.50;
        pin(CLK) {
                direction : input;
                capacitance : 1.5;
        }
        pin(SET) {
                direction : input;
                capacitance : 3.0;
        }
        ff("IQ","IQN") {
                next_state : "IQ'";
                clocked_on : "CLK";
                preset     : "SET'";
        }
        pin(Q) {
                direction : output;
                function : "IQ";
        }
        pin(QN) {
                direction : output;
                function : "IQ";        /* typo, it should be IQN */
        }
          pin_opposite("Q","QN");         /* No, they're equal. */
      }
```

Examples

```
Error: Line 215, The derived equality relationship between 'QN' and
        'Q' pins conflicts with the user-specified 'pin_opposite' for the
 'libg21' cell. (LIBG-21)
```

Feedback

LIBG-22

(error) The derived opposite relationship between '%s' and \n \t'%s' pins conflicts with the user-specified 'pin_equal' for the '%s' cell.

Description

This error is generated if a cell is read by the library compiler with a pin_equal attribute that conflicts with the derived opposite relationship of the pins . The function statements associated with the pins are opposite.

What Next

Check your library for a typo in the function strings of the cell or remove the pin_equal attribute.

Examples

```
cell(libg22) {
        area : 6.50;
        pin(CLK) {
                direction : input;
                capacitance : 1.5;
        }
        pin(SET) {
                direction : input;
                capacitance : 3.0;
        }
        ff("IQ","IQN") {
                next_state : "IQ'";
                clocked_on : "CLK";
                preset     : "SET'";
        }
        pin(Q) {
                direction : output;
                function : "IQ";
        }
        pin(QN) {
                direction : output;
                function : "IQN";
        }
          pin_equal("Q QN");          /* No, they're opposite. */
      }
```

Examples

```
Error: Line 215, The derived opposite relationship between 'QN' and
        'Q' pins conflicts with the user-specified 'pin_equal' for the
 'libg22' cell. (LIBG-22)
```

Feedback

LIBG-24

(information) Unable to honor the 'prefer_tied' attribute onthe '%s' pin\n \tof the '%s' cell.

Description

Library Compiler honors as many prefer_tied attributes as possible while it is still able to implement D flip flop functionality. However, it cannot honor all of them. For example, if the library developer specified *prefer_tied : 0* on all the inputs, Library Compiler honors as many as possible and the rest are ignored. If they are ignored, this message is issued during read_lib.

The prefer_tied attribute also can be used to indicate which pin(s) are tied to fixed logic during three_state degeneration for three-state pad cell.

What Next

Check your library for the use of the prefer_tied attribute.

Examples

```
cell(libg24)  {
        area : 0.0;
        pad_cell : true;
        pin(Z)  {
            is_pad : true;
            direction : output;
            drive_current : 2.0;
            function : "A";
            three_state : "en tn";
            timing()  {
                timing_type : three_state_disable;
                intrinsic_rise : 0.1;
                intrinsic_fall : 0.1;
              related_pin : "tn";
            }
            timing()  {
                timing_type : three_state_disable;
                intrinsic_rise : 0.1;
                intrinsic_fall : 0.1;
              related_pin : "en";
            }
            timing()  {
                intrinsic_rise : 0.1;
                intrinsic_fall : 0.1;
                related_pin : "tn";
            }
            timing()  {
                intrinsic_rise : 0.1;
                intrinsic_fall : 0.1;
                related_pin : "en ";
            }
```

Feedback

```
            timing()  {
                intrinsic_rise : 0.1;
                intrinsic_fall : 0.1;
                related_pin : "A";
            }
        }
        pin(A)  {
            direction : input;
            capacitance : 0.0;
        }
        pin(en)  {
            direction : input;
            capacitance : 0.500;
        }
        pin(tn)  {
            prefer_tied : "0";  /* in this case the value should be 1 */
            direction : input;
            capacitance : 0.500;
        }
    }
```

Examples

```
Information: Line 306, Unable to honor the 'prefer_tied' attribute on the
  'tn' pin
       of the 'libg24' cell. (LIBG-24)
```

LIBG-25

(warning) Duplicated test signals of '%s' type is found on\n \tthe '%s' library cell.

Description

The test_cell has more than one of the following valid signal_types: - test_scan_in - test_scan_in_inverted - test_scan_enable - test_scan_enable_inverted - test_scan_out - test_scan_out_inverted - test_scan_clock - test_scan_clock_a - test_scan_clock_b - test_clock

This warning informs you that the port in the test_cell pointed to has more than one signal_type that are listed previously.

What Next

Vendors/Library developers should check the test_cell pointed to and make sure that it is the behavior they meant to have. Otherwise,r delete the duplicate signal_type.

If a designer finds this problem, he should contact the vendor or library developer and explain the problem. This problem can only be fixed by the vendor/library developer.

Feedback

Examples

```
cell(libg25) {
            area : 12;
            pin(D) {
              direction : input;
              capacitance : 1;
            }
            pin(CK,CK2,IH) {
              direction : input;
              capacitance : 1;
            }
            pin(A,B) {
              direction : input
                capacitance : 2;
            }
            pin(SI) {
              direction : input;
              capacitance : 1;
              timing() {
                timing_type : setup_falling;
                intrinsic_rise : 2.8000;
                intrinsic_fall : 2.8000;
                related_pin : "A";
              }
              timing() {
                timing_type : hold_falling;
                intrinsic_rise : 1.2000;
                intrinsic_fall : 1.2000;
                related_pin : "A";
              }
            }
            pin(Q) {
              direction : output;
              timing() {
                timing_type : rising_edge;
                intrinsic_rise : 2.5500;
                intrinsic_fall : 2.4000;
                rise_resistance : 0.0700;
                fall_resistance : 0.0300;
                related_pin : "CK IH CK2";
              }
              timing() {
                timing_type : falling_edge;
                intrinsic_rise : 2.5500;
                intrinsic_fall : 2.4000;
                rise_resistance : 0.0700;
                fall_resistance : 0.0300;
                related_pin : "B";
              }
            }
            pin(XQ) {
              direction : output;
```

Feedback

```
    }
    test_cell(){
      pin(D CK){
        direction : input;
      }
      pin(IH CK2){              /* duplicate test_clock */
        direction : input;
        signal_type : "test_clock";
      }
      pin(SI){
        direction : input;
        signal_type : "test_scan_in";
      }
      pin(A){
        direction : input;
        signal_type : "test_scan_clock_a";
      }
      pin(B){
        direction : input;
        signal_type : "test_scan_clock_b";
      }
      state("IQ","IQN"){
        clocked_on : "CK CK2";
        next_state : "D";
      }
      pin(Q){
        direction : output;
        function : "IQ";
        signal_type : "test_scan_out";
      }
      pin(XQ){
        direction : output;
        function : "IQN";
        signal_type : "test_scan_out_inverted";
      }
    }
  }
```

In this case, there are two test_clock attributes for both 'IH' and 'CK2' pins.

MESSAGE EXAMPLE

```
Warning: Line 67, Duplicated test signals of test_clock type is found on
        the 'libg25' library cell. (LIBG-25)
```

LIBG-26

(error) The '%s' test cell pin on the '%s' cell\n \thas no 'function' attribute. The test cell is removed.

Feedback

Description

The specified pin has neither a test *signal_type* nor a *function* attribute. This incomplete functional description results in a black-box test cell, which is removed from the library.

What Next

Add a proper *function* attribute or *signal_type* attribute to the faulty pin group.

Examples

```
cell(libg26) {
            area : 12;
            pin(D) {
              direction : input;
              capacitance : 1;
            }
            pin(CK IH) {
              direction : input;
              capacitance : 1;
            }
            pin(A,B) {
              direction : input
                capacitance : 2;
            }
            pin(SI) {
              direction : input;
              capacitance : 1;
              timing() {
                timing_type : setup_falling;
                intrinsic_rise : 2.8000;
                intrinsic_fall : 2.8000;
                related_pin : "A";
              }
              timing() {
                timing_type : hold_falling;
                intrinsic_rise : 1.2000;
                intrinsic_fall : 1.2000;
                related_pin : "A";
              }
            }
            pin(Q) {
              direction : output;
              timing() {
                timing_type : rising_edge;
                intrinsic_rise : 2.5500;
                intrinsic_fall : 2.4000;
                rise_resistance : 0.0700;
                fall_resistance : 0.0300;
                related_pin : "CK IH";
              }
              timing() {
                timing_type : falling_edge;
```

Feedback

```
        intrinsic_rise : 2.5500;
        intrinsic_fall : 2.4000;
        rise_resistance : 0.0700;
        fall_resistance : 0.0300;
        related_pin : "B";
      }
    }
    pin(XQ) {
      direction : output;
    }
    test_cell(){
      pin(D CK){
        direction : input;
      }
      pin(IH ){
        direction : input;
        signal_type : "test_clock";
      }
      pin(SI){
        direction : input;
        signal_type : "test_scan_in";
      }
      pin(A){
        direction : input;
        signal_type : "test_scan_clock_a";
      }
      pin(B){
        direction : input;
        signal_type : "test_scan_clock_b";
      }
      state("IQ","IQN"){
        clocked_on : "CK CK2";
        next_state : "D";
      }
      pin(Q){
        direction : output;
      }
      pin(XQ){
        direction : output;
        function : "IQN";
        signal_type : "test_scan_out_inverted";
      }
    }
  }
```

In this case, the pin 'Q' needs to have a function : "IQ" or signal_type : "test_scan_out" statement

MESSAGE EXAMPLE

```
Error: Line 385, The 'Q' test cell pin on the 'libg26' cell
        has no 'function' attribute. The test cell is removed. (LIBG-26)
```

Feedback

LIBG-27

(warning) The '%s' pin is eliminated from the '%s' pin \n \tfunction on the '%s' cell. The cell becomes a black box.

Description

This message is issued to warn users about the redundant ports in a function string. Redundant ports are ports which are eliminated from the boolean function due to normal boolean simplification.

What Next

Check the library for a possible error in the function string.

Examples

```
cell(libg27) {
  area : 10;
  pin(D) {
    direction : input;
    capacitance : 1;
  }
  pin(CP) {
    direction : input;
    capacitance : 1;
  }

  statetable ( "D CP", "Q QB") {
    table : "L/H R  : - - : L/H H/L,\
              -   ~R : - - : N   N";
  }

  pin(Q) {
    direction : output;
    internal_node : "Q";
  }
  pin(QB) {
    direction : output;
    state_function : "D * 0";
  }
}
```

Examples

```
Warning: Line 448, The 'D' pin is eliminated from the 'QB' pin
        function on the 'libg27' cell. The cell becomes a black box.
 (LIBG-27)
```

Feedback

LIBG-28

(warning) The '%s' three state pin has no 'function' or\n \tthe function is too complex to be recognized;\n \tthe '%s' cell becomes a black box.

Description

This message identifies a cell for which one of its output pins with a three_state attribute has no valid function defined, or its function is too complex to be mapped onto. In this case the library compiler treats the cell as a black box.

What Next

Check your library and add the functional information, in case it is absent, to the tri-statable pin. The functional model can be defined by the 'function' attribute, or ff, latch, memory, or unigen statements.

Examples

```
cell(libg28) {
          area : 1;
          pin(A) {
            direction : input;
            capacitance : 0;
          }
          pin(TA) {
            direction : output;
            three_state : "A'"; /* missing a function attribute */
          }
        }
```

Examples

```
Warning: Line 34, The 'TA' three state pin has no 'function' or
        the function is too complex to be recognized;
        the 'libg28' cell becomes a black box.  (LIBG-28)
```

LIBG-29

(warning) The state group needs more statements to be\n \tmeaningful; cell becomes black-box.

Description

This message is issued when a clocked_on or a next_state statement is missing. This message also appears when a latch does not have a minimum of two force statements (force_00, force_01, force_10, and force_11). Library Compiler treats a cell without a functional model as a black-box.

Feedback

What Next

Check the library for a wrong model and add the missing statement of the corresponding group.

Examples

```
cell(libg29) {
            area : 12;
            pin(D) {
              direction : input;
              capacitance : 1;
            }
            pin(CK) {
              direction : input;
              capacitance : 1;
            }
            pin(Q) {
              direction : output;
            }
              state("IQ","IQN"){
                next_state : "D";       /* clocked_on : "CK"; missing */
              }
          }
```

Examples

```
Warning: Line 460, The state group needs more statements to be
        meaningful; cell becomes black-box. (LIBG-29)
```

LIBG-30

(warning) The '%s' equation on the '%s' cell evaluates\n \tto a constant '%s'. Since this implies the output will never become\n \t%s, this equation is ignored.

Description

The sequential library cell has both a force_00 and a force_11 declared. The translation algorithm cannot handle library cells with both of these declarations. This warning message is specific to structural models.

What Next

Declare instead either a pair of force_10 and force_01, force_10 and force_11, force_00 and force_01, force_00 and force_10, or force_01 and force_11. The Q and QN outputs of the specified sequential cell are not complementary. Possible reasons for this are: 1. The library specifies that the outputs are not complementary; 2. The functions driving the force_00 and force_11 inputs of the degenerated sequential cell are not logical zero. For purposes of verification, every sequential cell is degenerated into a primitive sequential cell. The outputs (sourcepoints) of the primitive are Q and QN. The inputs (endpoints)

of the primitive are next_state, force_00, force_01, force_10, force_11, clocked_on, and clocked_on_also (for Master-slave cells only). The functions driving the force endpoints characterize the asynchronous properties of the primitive sequential cell. The library might also contain an attribute asserting that the outputs Q and QN are complementary. The force_01 function represents the conditions under which the Q pin can be driven to zero and the QN driven to 1 simultaneously. The other force inputs have a similar interpretation. When the attribute is not present, verification tries to determine that Q and QN are effectively complementary by establishing that both force_00 and force_11 are logically zero. The exact degeneration process depends on the library characterization of the sequential cell and is not described here.

Sequential cells should be modeled using the flip-flop and latch attributes. If you model sequential cells with state attributes, use a local function to describe the asynchronous behavior of each output pin. These functions are hard-coded as async_IQ and async_IQN. The async_IQ, async_IQN, and active functions are based on the forceXX expressions. An example is this flip-flop with Preset and Clear: state (IQ,IQN) { ... force00 : "!CD & ! SD" force01 : "!CD & SD" force10 : "CD & !SD" ... } When CD is low, Q is always 0, so the VHDL library generator ORs these two expressions together; instead of (!CD & SD) | (! CD & !SD), the equation becomes !CD. The ORed expression is simplified by Boolean algorithms, which use only 1 and 0 values. If you specify an X for one of these values, the library generator might modify the results.

Examples

```
cell(libg30) {
        area : 6.50;
        pin(CLK) {
                direction : input;
                capacitance : 1.5;
        }
        pin(SET) {
                direction : input;
                capacitance : 3.0;
        }
        ff("IQ","IQN") {
                next_state : "IQ'";
                clocked_on : "CLK";
                preset     : "SET'";
        }
        pin(Q) {
                direction : output;
                function : "IQ";
        }
        pin(QN) {
                direction : output;
                function : "IQN";
                three_state : "0";
        }
      }
```

Feedback

Examples

```
Warning: Line 218, The 'three_state' equation on the 'libg30' cell
 evaluates
        to a constant '0'. Since this implies the output will never
 become
        tri-stated, this equation is ignored. (LIBG-30)
```

LIBG-31

(warning) The test cell on cell '%s' does not have any function.

Description

This message indicates that no output port of the test cell has a function attribute.

What Next

An output port in the test cell must have a function attribute, a signal_type attribute, or both. At least one output port must have a function attribute. The function attribute can reflect only the nontest behavior of the cell.

LIBG-32

(error) The '%s' parallel sequential cell must use bus/bundle for outputs.

Description

One of the requirements of the parallel sequential cells that are described by the ff_bank or latch_bank groups, is that all the outputs are busses or bundles.

This message applies to a parallel sequential cell whose outputs are not busses or bundles. However, this message does not apply to a multibit scan cell with a single-bit output pin, when the *function* attribute is not specified on the pin.

What Next

Check your library for parallel sequential cells with single-bit output pins with the *function* attribute specified on them. Define these pins as busses or bundles.

Examples

```
cell (LSFDS) {
                area : 31.000000 ;
                dont_touch : true ;
                dont_use : true ;
                bus (D) {
                        bus_type : BUS4;
                        direction : input ;
                        capacitance : 2.000000 ;
```

Feedback

```
                }
                pin (CK) {
                        direction : input ;
                        capacitance : 1.000000 ;
                }
                ff_bank (IQ,IQN,4) {
                        next_state : "D" ;
                        clocked_on : "CK" ;
                }
                bus (Q) {
                        bus_type : BUS4;
                        direction : output ;
                        function : "IQ" ;
                }
                pin (SO) {
                        direction : output ;
                        function : "IQN" ;
                }
        }
```

In this case, the pin 'SO' must be defined as a bus of type BUS4.

Examples

```
Error: Line 168, The 'libg32' parallel sequential cell must use
bus/bundle for outputs. (LIBG-32)
```

LIBG-33

(warning) In the '%s' cell, the '%s' inout pin\n \tcannot have feedback in its function. The cell becomes a black box.

Description

The inout pin is in its own function. Library Compiler does not support combinational functions with feedback.

What Next

Either break the feedback or try to use a sequential definition.

Examples

```
cell (libg33) {
    pin(C) {
        direction : input;
    }
    pin(D) {
        direction : inout;
        function : "A'";
        three_state : "C";
    }
```

Feedback

```
    pin(A) {
        direction : inout;
        function : "D'";
        three_state : "C"; /* It will cause loop combinational function
 loop in the design.
                           * To break the loop, change "C" into "C'" */
    }
  }
```

Examples

```
Warning: Line 64, Cell 'libg33', In the 'libg33' cell, the 'A' inout pin
        cannot have feedback in its function. The cell becomes a black
 box. (LIBG-33)
```

LIBG-34

(error) The '%s' pin in the '%s' cell has the '%s' direction\n \tThe direction must be '%s'.

Description

The pin on the programmable cell must have the direction specified.

What Next

Replace the pin direction attribute by the correct direction.

LIBG-35

(warning) The 'nextstate_type' attribute on the '%s' pin/bus in\n \tthe '%s' cell is inconsistent with its function. The attribute is ignored.

Description

In a pin group, nextstate_type defines the type of a next_state attribute to be used in an ff group, a seq group, or a ff_bank group.

Any pin with the *nextstate_type* attribute must be in the *nextstate* function. A consistency check is also made between the pin's nextstate_type attribute and the nextstate function. This message is generated when the attribute 'nextstate_type' does not match the functional information specified in the cell's sequential state description.

What Next

Check your library for a pin with a nextstate_type attribute but not used in the next_state statement of a sequential group and correct the inconsistency.

Feedback

Examples

```
cell(libg35) {
        area : 6.50;
        pin(D) {
           direction : input;
           capacitance : 3.0;
        }
        pin(CLK) {
           direction : input;
           capacitance : 1.5;
        }
        pin(SET) {
           direction : input;
